Part 1

Welcome to PRTG Network Monitor

1 Welcome to PRTG Network Monitor

Welcome to PRTG Network Monitor! You have chosen an easy-to-use software product that comes with a powerful set of features to monitor your entire network.

Why Network Monitoring is Important

Today, nearly every business relies on a computer and network infrastructure for internet, internal management, telephone, and email. A complex set of servers and network equipment is required to ensure that business data flows seamlessly between employees, offices, and customers. The economic success of an organization is tightly connected to a hitch-free flow of data.

That's why your computer network has to work successfully: reliability, speed, and efficiency are crucial. But, like all other technical objects, network devices may fail from time to time—potentially causing trouble and loss of sales, no matter what migration efforts have been made up-front.

So network administrators need to take three key steps to maintain network uptime, reliability, and speed:

1. Set up a well-planned network with reliable components.
2. Create recovery plans for the event of device failure.

3. Monitor the network to get informed about failures when they build up or actually happen.

PRTG Network Monitor, the software described in this document, is a **complete solution** for monitoring **small, medium, and large networks**.

Monitoring Networks with PRTG Network Monitor

PRTG Network Monitor is a powerful network monitoring application for Windows-based systems. It is suitable for small, medium, and large networks and capable of LAN, WAN, WLAN, and VPN monitoring. You can also monitor physical or virtual web, mail, and file servers, Linux systems, Windows clients, routers, and many more.

PRTG monitors network availability and bandwidth usage, as well as various other network parameters such as quality of service, memory load, and CPU usages, even on remote machines. PRTG provides system administrators with live readings and periodical usage trends to optimize the efficiency, layout, and setup of leased lines, routers, firewalls, servers, and other network components.

The software is easy to set up and use and monitors a network using Simple Network Management Protocol (SNMP), Windows Management Instrumentation (WMI), packet sniffer, Cisco NetFlow (as well as IPFIX, sFlow, and jFlow), and many other industry standard protocols. It runs on a Windows-based machine in your network for 24 hours every day. PRTG Network Monitor constantly records the network usage parameters and the availability of network systems. The recorded data is stored in an internal database for later analysis.

PRTG Network Monitor offers two options to monitor your network: PRTG on premises and PRTG hosted by Paessler. With PRTG on premises, the core server and local probe run within your network. PRTG hosted by Paessler is the PRTG cloud solution, where we at Paessler run the core server and hosted probe for you. The [PRTG web interface](#) for monitoring configuration and reviewing monitoring data is the same for both, PRTG hosted by Paessler and PRTG on premises.

 Do you want to get an overview of PRTG in 90 seconds? See this video on our website: [PRTG Network Monitor in 90 Seconds](#)

1.1 About this Document

This document introduces you to the system concepts of **PRTG Network Monitor** and explains how to set up the software to achieve the best monitoring results. You will learn how to plan your monitoring setup, how to set up your devices and sensors, dependencies, reports, notifications, maps, user accounts, and clustering for fail-safe monitoring.

This document is also meant to be a reference for all available settings in PRTG. Short contextual help is already provided within the Ajax web interface of PRTG. In this manual you often get some more help regarding the different options that are available. No matter whether you use PRTG hosted by Paessler or PRTG on premises, you will find all of the information that you need in this document.

This document does **not** explain monitoring protocols and file formats in-depth. Also, the use of the Application Programming Interface (API) built into PRTG is only briefly addressed. Whenever possible, hyperlinks to more detailed resources are provided, such as articles in the [Paessler Knowledge Base](#).

 To start using PRTG right away, see the [Quick Start Guide](#)^[46] section. To learn more about monitoring with PRTG, see section [Introduction: Monitoring with PRTG](#)^[34]. For more detailed instructions, browse the manual content or use the manual search with keywords and choose the section you want to read.

 For an overview of the icons and abbreviations that are used in this document, see the [Appendix](#)^[3740] section.

1.2 Key Features

PRTG Network Monitor follows and analyzes your network and requires no third-party software. It's quick to download and install, or you create a PRTG instance in the cloud, hosted by Paessler, with a few clicks. PRTG will be up and running in a just a few minutes including a first auto-configuration. [Smart Setup](#)^[52], the built-in interactive guidance dialog, will lead you through the whole process.

What is PRTG for?

- Monitoring and alerting you to up and downtimes or slow servers
- System health monitoring of your various hardware devices
- Network device monitoring, bandwidth accounting

- Application monitoring
- Monitoring virtual servers
- Service Level Agreement (SLA) monitoring
- System usage monitoring (for example, CPU loads, free memory, free disk space)
- Database performance and table values monitoring
- Email server monitoring and reviewing various backup solutions
- Monitoring your network's physical environment
- Classifying network traffic by source or destination, as well as content
- Discovering unusual, suspicious, or malicious activity with devices or users
- Measuring Quality of Service (QoS) and Voice over IP (VoIP) parameters
- Cloud monitoring services
- Discovering and evaluating network devices
- Collecting system information for various hardware types
- Finding unexpected relationships between your network components to detect potential security issues and assessing the real usage of your network and hardware
- Fail-safe monitoring using a failover cluster setup

What is Included in PRTG?

The PRTG on premises installer or a PRTG hosted by Paessler instance contains everything necessary to run your monitoring system immediately without any third-party modules.

- High performance: the fast and efficient database system that PRTG includes stores raw monitoring results, as well as logs, toplist, and tickets (outperforms SQL servers for monitoring data), accessible through the Application Programming Interface (API). You can distribute high loads on multiple probes.
- Low system requirements: For PRTG on premises an average PC (not older than 2 years) is sufficient and even a netbook can monitor over a thousand sensors. For detailed system requirements see [here](#)^[23]. PRTG hosted by Paessler does not even require any hardware for the PRTG core server!
- High security standards: SSL encryption for connections and web servers, a personalized user rights management, and much more.
- A built-in SSL-secured web server with HTTP and HTTPS support for the user interface.
- Fast web interface, works as Single Page Application (SPA) to avoid time-extensive reloading of pages.
- A built-in email relay server for automatic email delivery.
- Customizable, personalized alerting
 - Various notification technologies, for example, email, push, SMS text messages, syslog and SNMP traps, HTTP requests, event logs, Amazon SNS, executing scripts.

- Multiple triggers, for example, status alerts, limit alerts, threshold alerts, multiple condition alerts, escalation alerts.
- Gradual dependencies to avoid alarm floods, acknowledging certain alarms to avoid further notifications for this alarm, and alert scheduling.
- In-depth report generator to create reports on-the-fly as well as scheduled reports in HTML, PDF, and as CSV or XML data files. Several report templates are available by default.
- Graphics engine for user-friendly live and historic data graphs.
- Network analysis modules to automatically discover network devices and sensors.
- Distributed monitoring to monitor several networks in different locations.
- Special features for Managed Service Provider (MSP) to monitor customer networks and increase the quality of service.
- Data publishing with real-time dashboards—private and public—including live performance and status information. You can design these maps as you like with many different objects, as well as integrate external custom objects.
- Multiple languages such as English, German, Spanish, French, Portuguese, Dutch, Japanese, Russian, and Simplified Chinese.
- Customization: The PRTG Application Programming Interface (API) allows you to develop your own features. Additionally, you can create custom sensors, notifications, and device templates according to your specific requirements.

PRTG Network Monitor supports monitoring up to several thousand sensors per installation, depending on various parameters. It can optionally work with multiple remote probes to monitor multiple sites or network segments from one central core installation, and to distribute high monitoring loads. You can also configure fail-safe monitoring using a cluster installation to perform automatic failovers. Single failover installations are allowed with every PRTG license.

PRTG Network Monitor offers two options to monitor your network: PRTG on premises and PRTG hosted by Paessler. With PRTG on premises, the core server and local probe run within your network. PRTG hosted by Paessler is the PRTG cloud solution, where we at Paessler run the core server and hosted probe for you. The [PRTG web interface](#) for monitoring configuration and reviewing monitoring data is the same for both, PRTG hosted by Paessler and PRTG on premises.

The software is based on Paessler's reliable monitoring technology that has been constantly improving since 1997. There are already more than 200,000 PRTG installations running all over the world. Our outstanding [support](#) ensures your inquiries are answered within one business day for best possible network monitoring. Attractive licensing packages from freeware (up to 100 sensors) to enterprise level (with thousands of sensors) and the free choice between PRTG on premises and PRTG hosted by Paessler make sure every user finds the best-possible solution.

1.3 New in This Version

Our **continuous development and rollout** constantly improves and expands the functionalities provided by PRTG. Instead of delivering only a few versions each year with massive changes in every update, PRTG is automatically and seamlessly enhanced with new features and fixes—fast and with high quality.

We provide three release channels for PRTG on premises:

- **Stable:** Best tested version of PRTG for live systems. It is updated about once or twice a month and for use on live systems.
- **Preview:** Offers the latest features and fixes and is updated several times a month. Consider this version as "beta", so **do not use** this version on live systems you depend on!
- **Canary:** Providing "nightly builds" and is updated very often. It is not tested extensively. **Never use** on live systems you depend on!

Via these three channels, you can choose either maximum stability, early access to new features, or a mix of both.

 PRTG hosted by Paessler does not have release channels. Instead, we roll out the latest Stable version to PRTG hosted by Paessler instances in stages.

 For an overview of all recent changes in the current version, visit the [release notes for the stable release channel](#) on our website.

- <https://www.paessler.com/blog/prtg-12-introduces-continuous-rollout>

1.4 Available Licenses

Our licenses count by sensors. We define one sensor as one aspect that you monitor on a device.

There are three different PRTG flavors available.

Freeware Edition

The Freeware Edition is a good solution to get started with PRTG or for private use:

- Free for personal and commercial use.
- Can monitor up to 100 sensors.
- Supports all available sensor types.

 If you want to use the Freeware Edition, please first install the [Trial Edition](#)^[21] and get a free trial key. After the trial period has ended, your Trial Edition automatically turns into a Freeware Edition.

 This option is not available in PRTG hosted by Paessler.

Trial Edition

The Trial Edition is intended for evaluation purposes for customers who are interested in purchasing commercial licenses:

- Can monitor an unlimited number of sensors.
- Supports all available sensor types.
- For PRTG on premises you have to request the temporary license key from our website. Usually you see the license details including the key if you click the free download button on paessler.com
- The trial period of PRTG on premises is limited to 30 days and automatically reverts to [Freeware Edition](#)^[21] afterwards.
- PRTG hosted by Paessler provides a 10 days trial. Afterwards, your instance will be deleted if you do not purchase a commercial edition.
- Each PRTG on premises license includes one single failover [cluster setup](#)^[130], consisting of two nodes. Cluster installations with two and three failover nodes will require one additional trial license key. A cluster installation with four failover nodes will require two additional trial license keys.

After the trial period has ended, a PRTG on premises Trial Edition automatically turns into a Freeware Edition, allowing you to monitor up to 100 sensors for free.

Commercial Editions

There are several licenses of PRTG Network Monitor available to suit the demands of smaller as well as larger customers and organizations:

- Can monitor a maximum number of sensors (please consider our [recommendations](#)^[28]).
- Supports all available sensor types.
- Each PRTG on premises license includes one single failover [cluster setup](#)^[130], consisting of two nodes. Cluster installations with two and three failover nodes will require one additional license of the same size. A cluster installation with four failover nodes will require two additional licenses of the same size.

 For more information about available commercial licenses, please see the Paessler FAQs: [What is the difference between the PRTG Network Monitor licenses?](#)

Paessler FAQs: What is the difference between the PRTG Network Monitor licenses?

- <https://www.paessler.com/support/faqs#e1912>

1.5 System Requirements

PRTG Network Monitor consists of two main system parts, the PRTG core server and one or more probes.  For details, see section [Architecture and User Interfaces](#) ^[125].

- If you want to use PRTG on premises, you need to install the PRTG server on a computer that meets the [System Requirements for PRTG Core Server \(PRTG on Premises\)](#) ^[23].
- If you want to use PRTG hosted by Paessler, you need to install at least one remote probe on a computer that meets the [System Requirements for PRTG Remote Probes](#) ^[23].

System Requirements for PRTG Core Server (PRTG on Premises)

To install a PRTG on premises server and work with it, you need to meet the following requirements:

- A current PC or server with at least a dual core CPU and a minimum of 2048 MB RAM memory is sufficient for the PRTG server.
- We recommend that you use the operating system **Microsoft Windows Server 2012 R2** for best performance.
- A web browser to access the web interface. The following browsers are officially supported:
 - Google Chrome 67 or later (recommended)
 - Mozilla Firefox 61 or later
 - Microsoft Internet Explorer 11

 PRTG hosted by Paessler does not require any hardware for the PRTG server, but at least one remote probe installation is necessary to monitor your local network when using PRTG hosted by Paessler.

System Requirements for PRTG Remote Probes

- **Hardware**
A current PC or server with at least a dual core CPU and a minimum of 2048 MB RAM memory is sufficient for remote probes.
- **Operating system**
We recommend that you use the operating system **Microsoft Windows Server 2012 R2** for best performance. Microsoft Windows 10 and Windows Server 2016 are also good options for remote probes.
- **Stable network connection**
Remote probes require a stable network connection between the PRTG server and the remote probe. Remote probes that connect to a PRTG hosted by Paessler server need a reliable internet connection. Unstable connections, for example via 3G, might work but it is possible that you lose monitoring data if the connection is non-reliable.

 Why are remote probes helpful for monitoring with PRTG? Because you can extend your monitoring.

- Remote probes allow you to monitor different sub-networks that are separated by a firewall from your PRTG on premises core server and to keep an eye on remote locations. You can install [one or more remote probes](#)^[3708].
- Remote probes are useful if you want to distribute monitoring load by taking it from the system running the PRTG core server and putting it on one or more remote probe machines.
- You will need a remote probe if you want to monitor your local network using a PRTG hosted by Paessler instance.
- Remote probes may be suitable monitoring components in several individual scenarios that depend on your custom network setup.

Planning a PRTG on Premises Installation With Hundreds of Sensors or More?

The maximum number of sensors you can monitor with one PRTG on premises installation mainly depends on the monitoring technology and the monitoring intervals you use. In general, we recommend that you use a dedicated physical machine to run both the PRTG core server and PRTG remote probes.

 For more information, see section [Detailed System Requirements](#)^[26].

 PRTG hosted by Paessler is restricted to max. 5,000 sensors, more sensors are not possible. This number of sensors is available in the PRTG-5000 subscription.

1.5.1 Detailed System Requirements

This section shows different aspects of system requirements for PRTG. Please consider these requirements to avoid issues while monitoring your network.

- [Supported Operating Systems](#) ^[26]
- [Hardware Requirements](#) ^[27]
- [Network Size: Recommendations](#) ^[28]
- [Running PRTG on Virtual Machines](#) ^[30]
- [Running PRTG in a Failover Cluster](#) ^[30]
- [Web Browser Requirements](#) ^[31]
- [Screen Resolution](#) ^[31]
- [Requirements for Monitored Devices](#) ^[31]
- [Requirements for the Enterprise Console](#) ^[32]
- [Requirements for Smartphones](#) ^[32]
- [More](#) ^[32]

 PRTG hosted by Paessler does not require any hardware for the PRTG server, but at least one remote probe installation is necessary to monitor your local network when using PRTG hosted by Paessler.

Supported Operating Systems for PRTG Server and Remote Probes

The 32-bit and 64-bit versions of the following operating systems are officially supported for PRTG **Core Service** and **Probe Service**:

- Microsoft Windows Server 2012 R2* (recommended)
- Microsoft Windows Server 2016*
- Microsoft Windows Server 2012*
- Microsoft Windows 10**
- Microsoft Windows 8.1
- Microsoft Windows 8
- Microsoft Windows 7
- Microsoft Windows Server 2008 R2*

* Windows servers in **Core** mode or **Minimal Server Interface** are not officially supported.

** The PRTG Enterprise Console is not fully compatible with Windows 10.

The version (32-bit or 64-bit) of the PRTG Core Server depends on the version of your operating system. The 64-bit version of the PRTG Core Server will be installed if

- the operating system is a 64-bit Windows system, **and**

- the system provides 6 GB RAM or more.

Otherwise the 32-bit version of the PRTG Core Server will be installed.

- For best performance of VMware sensors, EXE/Script sensors, and some other sensor types, we recommend Windows Server 2012 R2 on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#).
- For best performance of hybrid sensors using Windows Performance Counters and Windows Management Instrumentation (WMI), we recommend Windows 2008 R2 or higher on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#).
- **Microsoft .NET Framework:** We recommend that you provide Microsoft .NET Framework versions 4.5 or later (with latest updates) on all systems running a PRTG probe. The .NET framework is imperatively needed for monitoring VMware and XenServer virtual environments. Also some other sensor types need the Microsoft .NET Framework to be installed on the computer running the PRTG probe. This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#). Required versions are 4.5, 4.6, or 4.7. For details, see the Knowledge Base: [Which .NET version does PRTG require?](#)
- **Disabled FIPS Mode:** Ensure the **FIPS (Federal Information Processing Standards)** mode (Windows security option "System Cryptography: Use FIPS compliant algorithms for encryption, hashing, and signing.") is disabled on Windows systems running the PRTG core or probe service. FIPS-compliant encryption may cause errors of sensors which use the .NET framework. For details, see the Knowledge Base: [Why should I disable the FIPS mode under Windows?](#)

Hardware Requirements for PRTG Server and Remote Probes

Hardware requirements for PRTG **Core Service** and **Probe Service** mainly depend on the sensor types and intervals used. The following values are provided as reference for common usage scenarios of PRTG (based on a default sensor interval of 60 seconds).

- **CPU**
A current PC or server with at least a dual core CPU can easily monitor up to 2,000 sensors (see sensor type specific notes below). PRTG supports native x86/x64 architectures.
- **RAM memory**
Minimum requirement: 2048 MB RAM. You need about 150 KB of RAM per sensor.
- In general, we recommend at least 1 additional CPU core and 1 GB RAM per additional 1,000 sensors.
- **Hard Disk Drive**
You need about 200 KB of disk space per sensor per day (for sensors with 60 second interval).
- **Internet connection**
An internet connection is required for license activation (via HTTP or email).
- **Stable network connection for remote probes**
Remote probes require a stable network connection between the PRTG core server and the remote probe. Unstable connections, for example via 3G, might work but it could be possible that you lose monitoring data if the connection is non-reliable.

There are also non-hardware dependent limitations for some sensor types, for example, WMI and SNMP V3 sensors. These limitations can be overcome by distributing the sensors across multiple [remote probes](#)³⁷⁰⁷. For clusters we recommend that you stay below 2,500 sensors per cluster.

 It is crucial for a properly working PRTG server to have a certain amount of hardware resources available. If the server runs out of resources, PRTG will send warning and emergency messages to the primary email address of the **PRTG System Administrator** user. You will receive **warning** messages if available disk space falls below **1 GB** or memory below **500 MB**, and **emergency** messages if available disk space or memory falls below **50 MB**. Please react immediately and free system resources!

Network Size: Recommendations

- Rule of thumb: Typical PRTG installations almost never run into performance issues when they stay under 5,000 sensors, under 30 remote probes, and under 30 user accounts.
- PRTG can scale much higher if the installation is well planned. Please read on if you plan to go beyond these numbers and/or if you plan elevated use of resource intensive features like reporting, xFlow sensors, or clustering.
- If you plan an installation that monitors more than 10,000 sensors from one instance of PRTG on a physical device or more than 5,000 sensors with PRTG running on a virtual machine we ask you to [contact your presales team](#) for consultation.
- To give you an impression: To monitor 5,000 sensors in a 1-minute interval, PRTG takes 7.2 million measurements and evaluates, notifies, and stores them—this adds 700 MB of additional data to the database every single day.

 PRTG hosted by Paessler is restricted to max. 5,000 sensors, more sensors are not possible. This number of sensors is available in the PRTG-5000 subscription.

Apart from the processing power required for the monitoring itself, several aspects can affect the number of sensors that you can use with PRTG. The following recommendations are for a PRTG single core setup (without clustering) on a physical machine. You can overcome some of these limitations if you distribute the sensors across multiple remote probes.

SIZE RECOMMENDATIONS

Operating System	We recommend that you use Windows Server 2012 R2 to run the PRTG core server and probes. This offers superior performance for monitoring, especially if you have more than 2,000 sensors.
Sensor Types	Ping ¹⁵²⁹ and SNMP sensors ⁴³¹ create much less load than complex sensors like xFlow sensors ³⁵¹⁴ , VMware sensors ⁴³⁵ , Sensor Factory sensors ¹⁷²⁰ , WMI sensors ⁴³³ , or Syslog ²⁶⁵⁶ / Trap receiver ²⁴⁷⁹ sensors, for example.
Scanning Interval	We recommend that you mainly use 1-minute scanning intervals ³⁴⁵ for up to 2,000 sensors and 5-minute intervals if you have more sensors.

SIZE RECOMMENDATIONS

Number of Users	We recommend that you stay below 30 active user accounts for each PRTG core server. You can work well with more users if these do not all use the user interfaces at the same time (including public dashboards).
Number of Remote Probes	Our general recommendation is to stay below 30 remote probes on one PRTG core server. PRTG still scales well up to 60 probes as long as you have less than 100 sensors per probe.
CPU Intensive Features	Try keeping the usage of the following features down: Many quickly refreshed dashboards , frequent generation of huge sensor reports , heavy usage of packet sniffing , factory sensors , and toplists , frequent automatically scheduled auto-discoveries for large network segments, constant queries of monitoring data via the API , among others.
Network Connection Quality	The quality of your network also plays an important role. When monitoring via UDP, for example, a high packet loss rate can lead to frequent timeouts. Remote probes that connect via unstable (WAN) connections can lead to delays as well.

In general, consider the following rules for the performance impact of different sensor types:

- **SNMP V1 and V2, Ping, Port, and HTTP**
We recommend that you use these sensor types for scenarios with thousands of sensors.
- **SNMP V3**
You can monitor about 5,000 SNMP V3 sensors with an interval of 60 seconds on a common two core computer, and about 10,000 sensors on a four core system (the main limiting factor is your CPU power).
- **WMI**
Try to keep the number of WMI sensors per probe below 120 sensors (with 60s interval), or 600 sensors (with 300s interval).
- **xFlow (IPFIX, NetFlow, sFlow, jFlow)**
Monitoring the maximum number of sensors depends on the traffic pattern, the number of xFlow packets per second received by the PRTG probe, as well as the performance of the probe system.
- **Packet Sniffer**
These sensors create the highest CPU load on the probe system. This technology is only recommended for monitoring of low traffic connections (<50 Mbit/s steady stream). When traffic is often over 10 Mbit/s a dedicated remote probe should be used.
- **VMware Monitoring**
Monitoring of VMware is limited to about 20 sensors at a 60 seconds monitoring interval, or 100 sensors at a 5 minutes interval. On probes running on Windows Server 2012 R2, you can use more VMware sensors. These limitations issue from the VMware platform. For details, see this Knowledge Base article: [Increasing Maximum Connections for VMware sensors](#)

▪ Other sensor types

The impact of a specific sensor type on performance is indicated by a color range when adding a sensor to a device. It ranges from dark green (very low impact) to bold red (very high impact).

To overcome any limitations mentioned above you should distribute the sensors over two [remote probes](#)³⁷⁰⁹ or more.

Running PRTG on Virtual Machines

You can run the PRTG core server as well as PRTG remote probes on virtualized platforms. However, we strongly recommend that you use a dedicated physical machine to run the PRTG core server or the [PRTG remote probes](#)³⁷⁰⁹.

There are several reasons why we recommend that you run PRTG (core server and remote probes) on real hardware, especially for thousands of sensors. Each sensor request will have to go through many virtualization layers, which costs performance and makes measurements less exact. In our experience, a physical machine simply works best for a thousand sensors and more.

Our recommendation to use real hardware is valid for the PRTG core server and for remote probes. If you must run PRTG on a virtual machine, please stay below 5,000 sensors per virtual machine and consider running several PRTG core server instances instead.

 We cannot offer technical support regarding performance and stability problems for PRTG installations on virtual machines that run with more than 5,000 sensors. In this case, please migrate PRTG to one or more, preferably physical, machines.

 When running PRTG on a virtual machine, do **not** use dynamic resource allocation, but please make sure that full resources are available to the virtual machine at any time. In our experience, dynamic resource allocation is not working efficiently for a monitoring software and can lead to massive performance issues. Do not distribute CPU cores over different CPU sockets in your VM configuration. Scheduling threads does not work properly in this case, which results in performance issues.

 For more details, see this Knowledge Base article: [Checklist for Running PRTG on VMware](#)

Running PRTG in a Failover Cluster

We recommend a single [failover setup](#)¹³⁰ if you need fail-safe monitoring. This consists of two PRTG core servers, each working as a cluster node.

In a PRTG failover cluster, the monitoring load doubles with each cluster node, so you will encounter half performance for each additional cluster node. In a single failover cluster, please divide our recommended numbers from above in half.

 This feature is not available in PRTG hosted by Paessler.

Web Browser Requirements

The following browsers are officially supported by the PRTG web interface (in order of performance and reliability):

- Google Chrome 67 or later (recommended)
- Mozilla Firefox 61 or later
- Microsoft Internet Explorer 11

For security and performance reasons, we strongly recommend that you always use the latest version of Google Chrome to access the PRTG web interface.

- ❗ Firefox is potentially vulnerable for **cross-site scripting (XSS)** attacks. These XSS exploits are possible if you click **phishing** links that contain malicious code, for example, in emails, and you are currently logged in to PRTG with Firefox. For more information, see this Knowledge Base article: [How secure is it to access the PRTG web interface with Firefox?](#)
- ❗ Microsoft Internet Explorer 11 and Microsoft Edge, as well as other current browsers that are not officially supported have issues with some functionalities of the PRTG web interface. However, you can access the web interface with any browser.
- ❗ Deprecated Internet Explorer versions as well as some mobile browsers might not be able to display the fully featured [Ajax web interface](#)^[166].
- ❗ Plugins may have an effect when viewing the PRTG web interface. Please make sure to add exceptions for PRTG in the plugins' settings, especially when using ad blockers. See also this Knowledge Base article: [The logs page in the PRTG web interface does not load. What can I do?](#)

Screen Resolution

A screen resolution of at least 1024x768 pixels is sufficient for most functions of PRTG. However, we recommend a screen resolution of 1200x800 or higher.

Requirements for Monitored Devices

- **SNMP monitoring**
The monitored device(s) must be equipped with SNMP Version 1, 2c, or 3 (an SNMP-compatible software must be installed on the device). SNMP must be enabled on the device and the machine running PRTG must be granted access to the SNMP interface. For details, see section [Monitoring via SNMP](#)^[3489].
- **Windows/WMI monitoring**
To use Windows Management Instrumentation (WMI) monitoring, you need a Windows network. For client PCs monitored with WMI, only the [operating systems as given above](#)^[26] are officially supported, but do not use Windows 2008 for WMI monitoring (strong performance issues). For details, see section [Monitoring via WMI](#)^[3507].

- **xFlow (IPFIX, NetFlow, sFlow) monitoring**
The device must be configured to send NetFlow data packets (NetFlow version 5, 9, or IPFIX) or sFlow packets (version 5) to the machine running the PRTG probe. For details, see section [Monitoring Bandwidth via Flows](#)^[3514].
- **Packet Sniffer monitoring**
Only data packets passing the local machine's network card can be analyzed. Switches with so-called 'monitoring ports' are necessary for network-wide monitoring in switched networks. For details, see section [Monitoring Bandwidth via Packet Sniffing](#)^[3512].
- **Other sensor types**
Depending on the specific sensor type, you can find requirements (for example, modules, components, device configurations) that may have to be fulfilled in the corresponding manual section, as well as when adding the sensor to a device.

Requirements for the Enterprise Console

The optional PRTG [Enterprise Console](#)^[3430] (EC) runs under all [supported Windows versions](#)^[26], but it is not fully compatible with Windows 10. Running the EC on Windows 10 results in several issues so please use another operating system. We will consider full Windows 10 support for future PRTG desktop clients.

 PRTG hosted by Paessler does not support connections from the Enterprise Console. If you want to use it, please connect the Enterprise Console to a PRTG on premises instance.

The EC has a built-in webkit browser engine and requires no specific browser installed on the system. See also [Enterprise Console—Requirements for Connections to PRTG Web Server \(s\)](#)^[3431].

Requirements for Smartphones and Tablets

PRTG supports optional mobile apps for iOS and Android devices.

 For more information and system requirements, see section [PRTG Apps for Mobile Network Monitoring](#)^[3484].

1.6 Introduction: Monitoring with PRTG

This manual section provides an overview of basic principles of PRTG Network Monitor. It shows you how you can prepare your IT infrastructure for monitoring with PRTG. Of course, you do not have to re-configure your whole network for PRTG, but there are several topics that are useful to consider before actually using PRTG.

You can immediately start monitoring without complicated configuration steps. See the [Quick Start Guide](#) for details. If you want to know more details right from the beginning, read through the manual section below. It covers these topics:

- [Overview](#)
- [What PRTG Does](#)
- [Where to Install PRTG](#)
- [How to Monitor](#)
- [What can PRTG Monitor](#)
- [How to Prepare](#)
- [What Hardware Do I Want to Monitor](#)
- [Types of Logins and Credentials](#)
- [Monitoring Technologies](#)
- [Notifications from PRTG](#)
- [Advanced Topics](#)

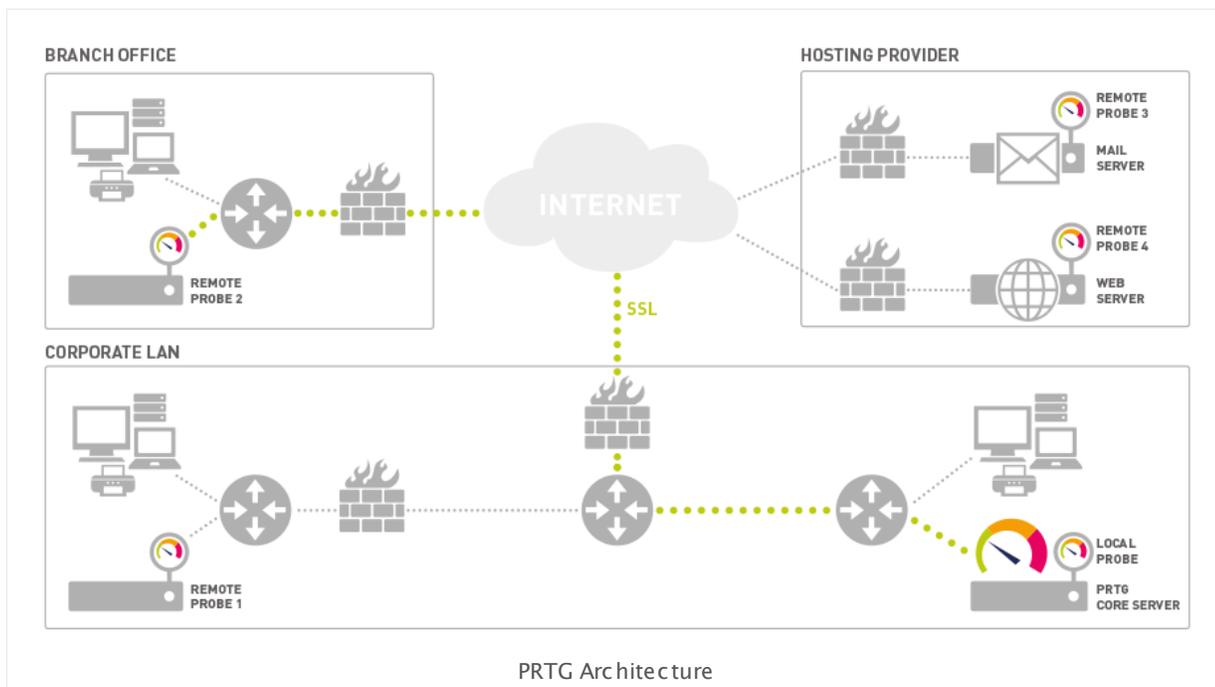

Overview

PRTG Network Monitor is a monitoring software that is flexible and easy to use. You can [download, install, and configure](#) PRTG on premises or [create a PRTG hosted by Paessler instance](#) within minutes and start monitoring right away.

That said, you will not immediately have full access to all relevant information unless your network is completely ready for monitoring—for example, PRTG needs credentials to access devices in your network. During the PRTG on premises install process, PRTG will automatically add devices with some default sensors, such as the [Ping sensor](#). But it will only add devices and sensors where no credentials or certain technologies are needed. For PRTG hosted by Paessler you will need to install a remote probe in your LAN first to monitor your network.

What PRTG Does

PRTG is a **Unified Monitoring Tool** that allows you to monitor pretty much anything with an IP address. PRTG consists of a [core server](#) which is responsible, for example, for the configuration, data management, and web server, and one or more [probes](#) (local or hosted, [remote](#)), which perform data collection and monitoring processes on [devices](#) via [sensors](#).

Sensors are the basic building blocks of PRTG and are organized in an [Object Hierarchy](#)¹³³. A sensor can tell you about one or more aspects (referred to as [channels](#)¹³⁶) of a device or node. For example:

- Uptime
- Load
- Interface throughput
- Bandwidth usage (for example, flows)
- Loading times
- Speed
- Hardware status
- Temperature
- Quality
- Resource consumption
- User counts
- Record counts
- Log events
- Database requests

Where to Install PRTG

For best performance, we will always recommend that you install PRTG on premises on a physical machine. Any current PC or server with at least a dual core CPU and 2048 MB RAM will suffice for most average installations. PRTG can also run on a virtual machine (VM), but we have a [recommended limit](#)^[30] on the number of sensors due to the hypervisor overhead.

For remote sites and for offloading work, you can use the [PRTG Remote Probe](#)^[3709]. Remote probes offer a smaller footprint data collector that reports back to the PRTG core server and so helps minimize performance impacts. At least one remote probe is required for PRTG hosted by Paessler to monitor your local network.

 PRTG hosted by Paessler does not require any hardware for the PRTG server, but at least one remote probe installation is necessary to monitor your local network when using PRTG hosted by Paessler.

How to Monitor

There are the following ways for PRTG to receive monitoring data from target devices:

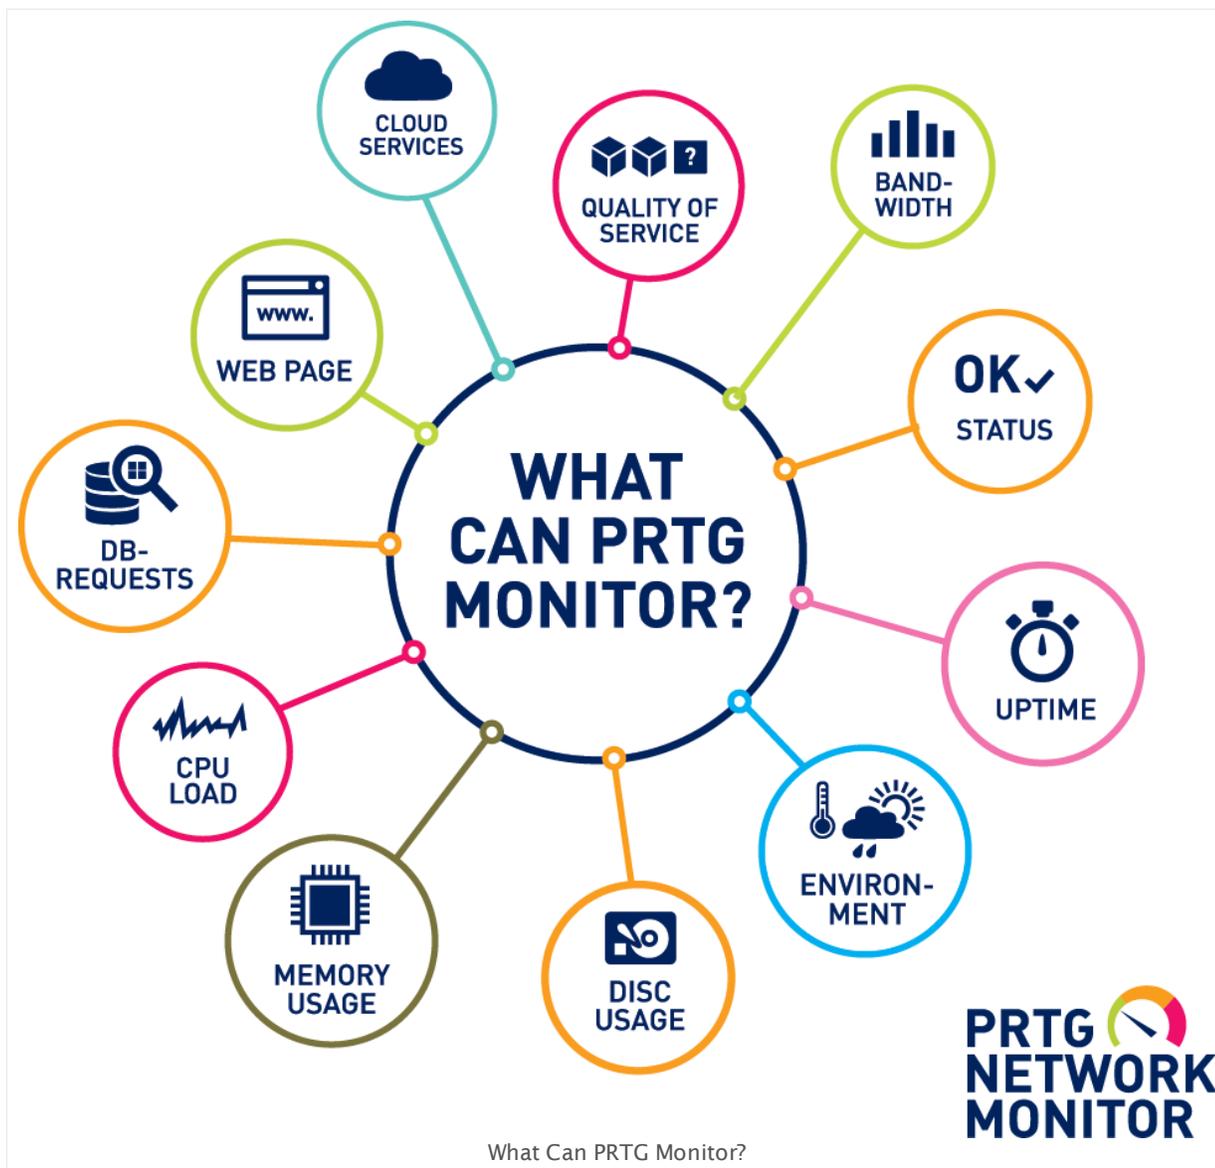

- Polling or querying sensor data: PRTG actively obtains data from a device and refreshes it in regular intervals. This includes, for example, device status, resource usage, and performance metrics. Most sensor types use this method. PRTG can also consume and collect sensor data based on interface with, for example, HTTP(S) requests, port checks, email checks, FTP downloads, and database requests.
- Listening or receiving sensor data: PRTG passively receives data that is pushed to PRTG by a device or application. This includes, for example, unexpected events, Syslogs and SNMP traps, detailed data flow (bandwidth monitoring), and event log messages.

Most of the monitoring data that PRTG collects is actively queried. It is the basis for statistical sampling to see how a device or application is performing over time. For more information, see section [Monitoring Technologies](#)^[39] below.

What Can PRTG Monitor

Out of the box, PRTG comes with more than [200 different sensor types](#)^[429] ranging from specific platform sensors over generic hardware and bandwidth sensors to custom scripts. Specific sensors that are pre-configured for common configurations allow you to quickly gather the information you need. Just add these sensors to the target devices they are designed for and receive monitoring data instantly.

Additionally, PRTG provides the possibility to add custom sensors. For example, you can create individual sensors for devices that PRTG does not provide sensor types for out of the box, or write scripts that return data from some application. See also the [PRTG Script World](#) for custom sensors that are ready to use.

How to Prepare

Best practice for the first step in good monitoring is to make a plan. Think about the following questions.

1. What needs to be monitored in my IT infrastructure?
2. How can I retrieve the needed information? Which technologies and credentials are required?
3. Which notification methods do I want to use to get alerted if there is something wrong?

You can take the following sections as a basis for your monitoring planning.

What Hardware Do I Want to Monitor

When choosing what to monitor, we recommend that you add the most important devices within your infrastructure first. Start with the core network and other infrastructure that all network devices depend upon, your **Business Critical Tier-1**. This usually includes key infrastructure such as core routers, switches, Virtual Private Network (VPN), firewalls, and basic network services such as Dynamic Host Configuration Protocol (DHCP), Domain Name Service (DNS), and authentication like Lightweight Directory Access Protocol (LDAP).

As an example, if you are a web business, your web infrastructure is absolutely critical. You will want to add devices in order of importance to your business: file services, databases, and other systems. Usually, you would monitor devices from several perspectives, like hardware health, service availability, and performance.

 See also our video tutorial on [webserver monitoring](#).

Hardware Overview

There is a huge number of different vendors with uncountable variations of hardware devices, so hardware details go beyond the scope of this article. Every IT infrastructure is individual, but here are the main points you should consider.

1. Core infrastructure
 - a. Routers, switches, firewalls
 - b. Core network services: DNS, Active Directory, LDAP servers
2. For your hardware devices, you need statistics on availability, usage, and performance.
3. PRTG will retrieve data using standard protocols:
 - a. Ping, Simple Network Management Protocol (SNMP); web queries via HTTP and HTTPS; email via Post Office Protocol version 3 (POP3), Internet Message Access Protocol (IMAP), Simple Mail Transfer Protocol (SMTP)
 - b. Hardware parameters via SNMP, SSH, Simple Object Access Protocol (SOAP)
 - c. Bandwidth usage via xFlow (NetFlow, IPFIX, sFlow, jFlow), packet sniffing, SNMP
 - d. Windows systems via Windows Management Instrumentation (WMI)
 - e. Other interfaces via Secure Shell (SSH) and scripts (for example, PowerShell and Python)

PRTG will monitor, track, and chart data, as well as generate alarms.

Types of Logins and Credentials

Many of the sensors included in PRTG rely on access through logins to specific systems. You will need different credentials with sufficient permission for all the different devices, operating systems, and domains. The configuration may also be different if you want PRTG to act as a Syslog or SNMP trap receiver or for tracking flows.

In most cases, PRTG will use the following credential types to access the devices that you want to monitor.

- SNMP credentials
- Windows credentials (WMI)
- Linux, Solaris, and macOS credentials (SSH/WBEM)
- VMware and XenServer credentials
- Database Management Systems (DBMS) credentials
- Other credentials (for example, Amazon CloudWatch keys, HTTP proxy)

Define your (administrative) credentials for all types of target devices that you want to monitor in the **Root** group of the device tree. Devices that you add to PRTG will [inherit](#)¹³⁷ these automatically, so often you will not have to re-enter credentials, depending on the used monitoring technology.

Monitoring Technologies

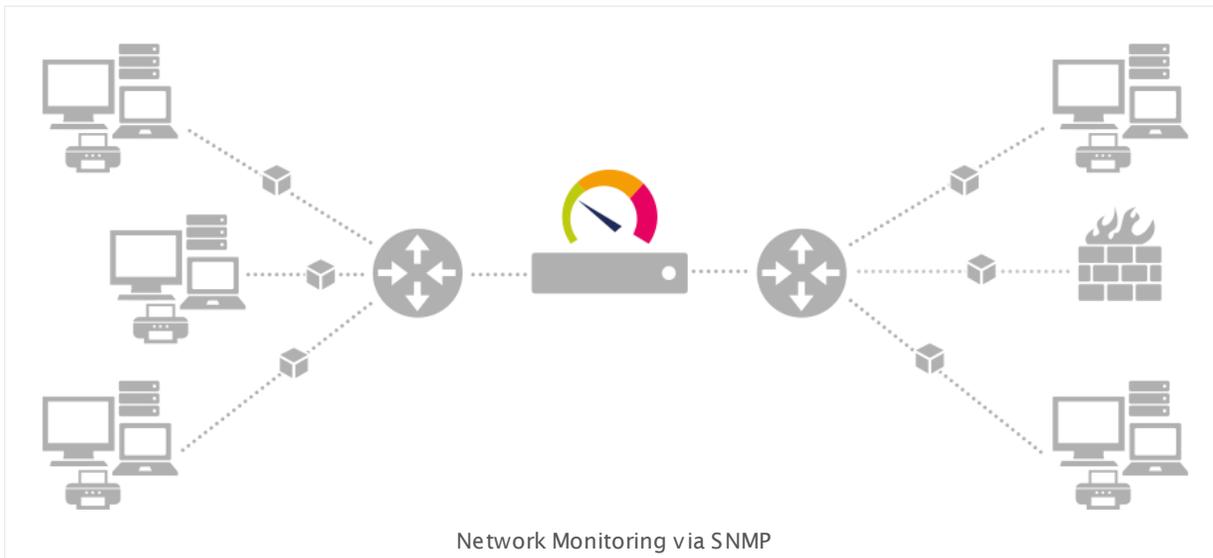

This section briefly describes the most common monitoring technologies.

 For details, see manual section [Sensor Technologies](#)³⁴⁸.

Monitoring with Simple Network Management Protocol (SNMP)

SNMP is a set of standards for communication with devices in a TCP/IP network. SNMP monitoring is useful if you are responsible for servers and network devices such as hosts, routers, hubs, and switches. It enables you to keep an eye on network and bandwidth usage, and monitor important issues such as uptime and traffic levels.

You can use SNMP to monitor the bandwidth usage of routers and switches on a port-by-port basis, as well as device readings such as memory and CPU load. The target devices must support SNMP. Most devices with enabled SNMP require the same configuration like SNMP version and community string. To find out how to set up SNMP on a specific device, search in the internet for your device name or model and SNMP configuration. You will likely get plenty of information on how to configure SNMP.

When you use a sensor with this technology, PRTG sends small data packets to devices, for example, querying routers, switches, and servers for the traffic counters of each port. These queries trigger reply packets from the device. Compared to PRTG's other bandwidth monitoring technologies via flows, packet sniffing, or WMI, the SNMP option creates the least CPU and network load.

PRTG supports three versions of the SNMP protocol: Version 1, version 2c, and version 3.

SNMP Version 1

This is the oldest and most basic version of SNMP.

- Pro: Supported by most SNMP-compatible devices; simple to set up.
- Con: Limited security because it only uses a simple password ([community string](#)³⁴⁹²) and sends data in clear text (unencrypted). Because of this, you should only use it inside LANs behind firewalls, but not in WANs. Version 1 only supports 32-bit counters, which are not enough for high-load (gigabits/second) bandwidth monitoring.

SNMP Version 2c

This version adds 64-bit counters.

- Pro: Supports 64-bit counters to monitor bandwidth usage in networks with gigabits/second loads.
- Con: Limited security (same as with SNMP V1).

SNMP Version 3

This version adds authentication and encryption to SNMP.

- Pro: Offers user accounts and authentication for multiple users and optional data packet encryption, increasing available security; plus all advantages of Version 2c.

- Con: Difficult to configure and higher overhead for the probe, which will reduce the number of devices that you can monitor (see [here](#)^[3491] for more information).

SNMP Traps

Various devices can send SNMP trap messages to notify you of system events.

- PRTG supports SNMP v1 and SNMP v2c traps.
- Destination for SNMP traps: IP address of the trap receiver, which is the IP of the PRTG probe system (server with either a local or remote probe running on it) to which you add the [SNMP Trap Receiver Sensor](#)^[2479].

Which SNMP Version Should I Choose?

The SNMP version to choose depends on your environment, but as a guideline:

- If your network is publicly accessible, you may want to use SNMP v3, which has encryption and secure access. However security and encryption adds overhead, which results in less performance.
- If your network is isolated or well protected behind firewalls, the lower security of SNMP v1 or SNMP v2c may be sufficient.
- From the PRTG perspective, if you have a lot of devices to monitor, the SNMP v2c is preferable. It will allow you to monitor more devices on a shorter monitoring interval and supports 64-bit counters.

The most important thing is to set the same SNMP version in the PRTG settings (for example, on **Root** level) as you have configured in your target device. If you select an SNMP version that is not supported by the server or device you want to monitor, you receive an error message. Unfortunately, in most cases, these error messages do not explicitly point to the possibility that you use the incorrect SNMP version. These messages provide minimum information only, such as **cannot connect** or similar. Similar errors occur when community strings, usernames, or passwords do not match.

 For basic requirements for SNMP monitoring, see this Knowledge Base article: [My SNMP sensors don't work. What can I do?](#)

Monitoring Windows Systems

You can monitor Windows systems via [Windows Management Instrumentation \(WMI\)](#)^[3507] and [Windows Performance Counters](#)^[3509]. WMI is the Microsoft base technology for monitoring and managing Windows-based systems. PRTG uses this technology to access data of various Windows configuration parameters and status values. However, sensors using the WMI protocol generally have a high impact on system performance. In addition to strict WMI sensors, there are sensors that can use Performance Counters to monitor Windows systems.

To monitor via WMI and Performance Counters, it is usually sufficient to provide **Credentials for Windows Systems** in PRTG. However, monitoring via WMI is not always trivial and often causes issues.

 See this article in our Knowledge Base if you run into issues: [My WMI sensors don't work. What can I do?](#)

It is also possible to use Simple Network Management Protocol (SNMP) for Windows devices. The same information is often available using any of these protocols. From a performance perspective, the preference would be SNMP, and then WMI or Performance Counters.

Bandwidth and Traffic Monitoring: Flows and Packet Sniffing

Using flow protocols, you can monitor the bandwidth usage of all packets going through a device. In PRTG, you can view [Toplists](#) for all xFlow (NetFlow, IPFIX, sFlow, jFlow) sensors.

Flows are a type of monitoring data pushed from network devices to PRTG. You can use it to monitor where data is traveling to and from, and how much. This way it determines which machine, protocol, and user is consuming bandwidth. PRTG currently supports the following flow types:

- NetFlow v5/v9 and IPFIX: Originally introduced by Cisco and supported by several vendors
- jFlow: Traffic sampling technology introduced by Juniper networks
- sFlow: Short for sampled flow, introduced by HP. sFlow uses statistical sampling of the traffic at defined intervals to achieve scalability for high volume interfaces.

You can also use [packet sniffing](#) for bandwidth monitoring if your hardware does not support any of these flow versions.

Monitoring Passively Received Data

PRTG provides the option to monitor passively received data. For this purpose, you can set up a device in a way that it automatically sends the data to PRTG. Specific sensor types can receive this data and alarm you based on your individual settings. For example, all Linux/Unix and most network devices support remote devices generating data that has to be configured on each device, and sending the messages to a [PRTG probe system](#). Usually, only the destination IP and port are required.

Examples of this monitoring technology are [HTTP Push](#) sensors, as well as [Syslog](#) and [SNMP Trap](#) receivers.

 For more information, see our tutorial videos about the [Syslog Receiver sensor](#) and the [SNMP Trap Receiver sensor](#).

Monitoring with Hypertext Transfer Protocol (HTTP)

The Hypertext Transfer Protocol (HTTP) is a standard application layer protocol and the basis for data communication in the internet. HTTP is a request-response method for client-server architectures, where the client sends a request and the server processes and responds to the request.

Monitoring via HTTP is useful if you want to monitor websites or web servers. It enables you to keep an eye on the availability and download times of a website or the performance statistics of a web server. There are also a lot of other possible use cases for HTTP sensors. For example, you can request any Application Programming Interface (API) that is reachable via HTTP and monitor returned values. This approach makes it possible to include almost any type of device or application into your monitoring.

Notifications from PRTG

PRTG can notify you in [various ways](#) if it detects that there is something wrong in your network. You can individually define in which case (for example, [based on thresholds](#) or [on sensor states](#)) and how you want to receive notifications from PRTG. The most common methods would be [email](#), [SMS text message](#), and [push notifications](#) to your smartphone which runs a [PRTG mobile app](#).

For your critical infrastructure it is best practice to set up two redundant notifications with different delivery methods (for example, email and SMS via a gateway).

 For more information about notifications, see our video tutorials [PRTG – Notifications](#) and [Use Cases for PRTG Notifications](#).

Email Notifications

The most common notification method is to send emails using a Simple Mail Transfer Protocol (SMTP) server built-in in PRTG. This means no SMTP server setup or configuration is required, but if you want to deliver through your email server, you will have to configure it in the [PRTG SMTP settings](#).

SMS Text Notifications

PRTG on premises can also notify you on your mobile phone. To [deliver SMS text notifications](#), you can select one of the SMS service providers that PRTG includes by default and use it with your credentials for this provider. Of course, you can also use any other service provider by defining a custom URL (look in your provider's documentation for the required format). You can also use an SMS gateway to receive messages even if your internet connection is down. See our Knowledge Base for a [list of third-party tools](#).

Push Notifications

PRTG can send push notifications to iOS and Android, when you run the according PRTG mobile app on your smartphone.

 See the article [How can I use push notifications with PRTG?](#) in our Knowledge Base for more details.

Advanced Topics

So, now that you are ready for monitoring with PRTG, enjoy having all important information about your IT infrastructure available at a glance. To dive deeper into network monitoring with PRTG we entrust you to have a look at our [video tutorials for advanced topics](#). Of course, you will also find all relevant information about network monitoring in the PRTG User Manual!

Part 2

Quick Start Guide

2 Quick Start Guide

Welcome to PRTG Network Monitor! This section gives a quick start into PRTG, so you can start monitoring your network right away!

Setting up monitoring for your network is easy! You only need to download the PRTG installer from the Paessler website and run through the installation wizard, or set up a PRTG hosted by Paessler instance on <https://my-prtg.com> and install a remote probe in your LAN. Provide some information about your network in the [Smart Setup](#) and PRTG will start monitoring your network immediately without any further complicated stumbling blocks! Of course, later on, you can still adjust everything to your needs.

See the following quick steps.

Quick Start Guide—Topics

- [ONE—Download, Installation, and First Login](#) ⁴⁸
- [TWO—Smart Setup](#) ⁵²

2.1 ONE—Download, Installation, and First Login

We offer two options to monitor your network with PRTG Network Monitor: use PRTG on premises to run the PRTG in your network, use PRTG hosted by Paessler to run PRTG on a server that Paessler hosts for you.

- If you want to use PRTG on premises, just download it from our website and install it on a Windows computer.
- ☁ PRTG hosted by Paessler does not require a download or installation to set up the PRTG server, just create an instance on <https://my-prtg.com>
- 📺 For video tutorials with PRTG basics, see the [video sections on paessler.com](#).

Download PRTG on Premises

You can find the installer for PRTG on our website <https://www.paessler.com>. There you can also login to the Paessler shop to buy or upgrade your license, or to renew your maintenance.

- ☁ This only applies to PRTG on premises instances, not to PRTG hosted by Paessler.

PAESSLER
THE NETWORK MONITORING COMPANY

HOME PRODUCTS DOWNLOADS SHOP SUPPORT PARTNERS BLOG COMPANY LOGIN SEARCH

Home > Products > PRTG Network Monitor > Download

INSTALLATION OF PRTG TAKES LESS THAN 2 MINUTES!

Monitor your network now! No additional software is required. All you need is a Windows PC or VM.

Running PRTG in your network is quick&easy. After installation it will scan your network and the Auto-Discovery will create all the [sensors](#) that are required to monitor your network.

FREE TRIAL DOWNLOAD
No limitations for 30 days

FREEMWARE DOWNLOAD
Limited to 100 Sensors, Free Forever

Christine, Business Development Manager at Paessler

Version Number, File Size	Version 17.2.31.1977 (May 10th, 2017), 157 MB
Available Translations	English, German, Spanish, French, Portuguese, Dutch, Czech, Japanese, Russian and Simplified Chinese
Operating Systems	All Windows versions (Windows 7 or later, see System Requirements)
What's new?	See Version History/Release Notes
Already PRTG customer?	Please log in to our website to download the full version

Download PRTG Network Monitor

Downloading PRTG Network Monitor

Please download the latest publicly available program version from the Paessler website. Simultaneously, you will receive a trial key. Enter this license key during the installation of PRTG. If you have already purchased a commercial license, use your commercial key. Please log in to the Paessler website to find your license key,

- <https://www.paessler.com/prtg/download>
- <https://shop.paessler.com/accounts/login/>

Every freeware installation starts as a trial version that allows you to use an unlimited number of sensors for 30 days. After the trial period has expired, your installation automatically reverts to the freeware edition with 100 sensors. Please understand that customers with a commercial license get prioritized support.

To upgrade your running trial or freeware version to a commercial edition, please purchase a commercial license key on <https://shop.paessler.com> and enter this key on the [license page](#) ^[3414] in the PRTG web interface.

Updates are free to customers with an active maintenance contract. If you do not have an active maintenance contract, please log in to the Paessler shop to renew it or contact sales@paessler.com.

 Once installed, the PRTG [Software Auto-Update](#) ^[3407] will automatically download and install new software versions. This helps you keep PRTG up to date without manually installing new PRTG versions.

Install PRTG on Premises

Double-click the setup file on the computer that you want to use as PRTG server. Follow the installation wizard and install the software.

 This only applies to PRTG on premises instances, not to PRTG hosted by Paessler.

At the end of the installation, PRTG opens a new browser window automatically. It connects to the PRTG web interface, shows the [device tree](#) ^[181], and starts the [setup assistant](#) ^[52]. Please load the web interface with one of the officially supported browsers:

- Google Chrome 67 or later (recommended),
- Mozilla Firefox 61 or later,
- Microsoft Internet Explorer 11

We recommend that you use Google Chrome to access the PRTG web interface. Firefox has security issues and Internet Explorer as well as Microsoft Edge and other current browsers might have issues with some functionalities. See [Detailed System Requirements](#) ^[31] for more details.

 Due to scripting incompatibilities, you might not be able to use all functionalities of the PRTG Ajax web interface with Internet Explorer 10 or earlier and other older browsers. If you cannot access the PRTG web interface, please open the URL of PRTG in another browser.

Create a PRTG hosted by Paessler Instance

PRTG hosted by Paessler runs in the cloud, so setting up the PRTG server does not require a download or installation.

- Open <https://my-prtg.com> with a browser.
- You can directly start a free trial from there: enter your desired domain name (between 4 and 60 characters) and click **Start Free Trial Now**. You can reach your PRTG hosted by Paessler instance with your browser under `<yourdomain>.my-prtg.com` later.
- A window where you have to sign in will appear. You can directly sign in using your Google, Facebook, Windows, or Amazon account (via **Auth0**). In this case, click the desired service and sign in with your credentials. Alternatively, you can register at my-prtg.com using dedicated credentials.
- After signing in, choose your subscription plan, for example, you can start with a free trial for 10 days. Click **Subscribe Now** and PRTG will create an instance for you.

As soon as your instance is ready, the PRTG web interface will open, show the device tree, and start the [smart setup](#)^[52]. You can also instantly monitor all servers, services, and devices that are publicly available via the internet.

Please make sure you load the web interface with one of the [supported browsers](#)^[31]. We recommend that you always use the latest version of Google Chrome.

Login

If everything works fine, the first thing you will see will not be the login screen, but the device tree. You only have to log in manually if you use a different browser.

- <https://www.paessler.com/support/videos>

2.2 TWO—Smart Setup

PRTG will automatically start the **Smart Setup** on a new PRTG instance. This setup assistant, represented by a member of the Paessler team, will guide you through the initial setup of your network monitoring system. The Smart Setup will reappear until you have completed all steps. You can skip the introduction altogether right at the beginning.

The Smart Setup in PRTG hosted by Paessler differs in some details from the Smart Setup in PRTG on premises. For example, it will ask you right at the beginning to [install a remote probe](#) in your local network. This is required to monitor your LAN, so we strongly recommend that you follow the smart setup!

First Start

When logging in for the first time, PRTG will show you the [device tree](#). PRTG on premises already contains several [devices](#) with [sensors](#) that monitor your network, ordered in different suitable [groups](#). PRTG automatically creates the device tree during the installation process by using its [Auto-Discovery](#) function. You do not have to fill out any forms but will directly see the availability and first monitoring results of various devices in your network when you first start PRTG!

PRTG scans your network by pinging IP addresses in the subnet of your PRTG system and adds all reachable devices to your specific network monitoring structure.

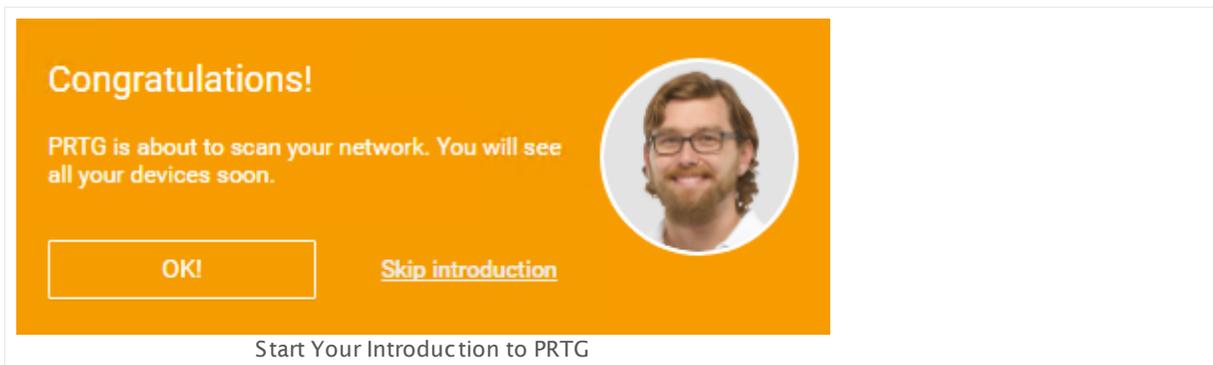

The smart setup scans only for devices with IP addresses in private network ranges. You can manually start an auto-discovery for other subnets later.

Device Tree after Initial Auto-Discovery

You will notice a Paessler employee in the upper-right corner of the PRTG web interface. He will guide you through 5 simple setup steps where you can enter more information about your network. PRTG will run another auto-discovery with this information to add additional devices and sensors to your monitoring. Of course, you can still edit the monitoring settings provided during the Smart Setup later on. And you can always adjust the monitoring to your needs.

Click **OK!** to start a guided tour, follow the instructions, and discover your network with PRTG!

i If you choose **Skip introduction** now, then the Smart Setup assistant will never appear again! We strongly recommend that you take the guided tour if you are new to PRTG.

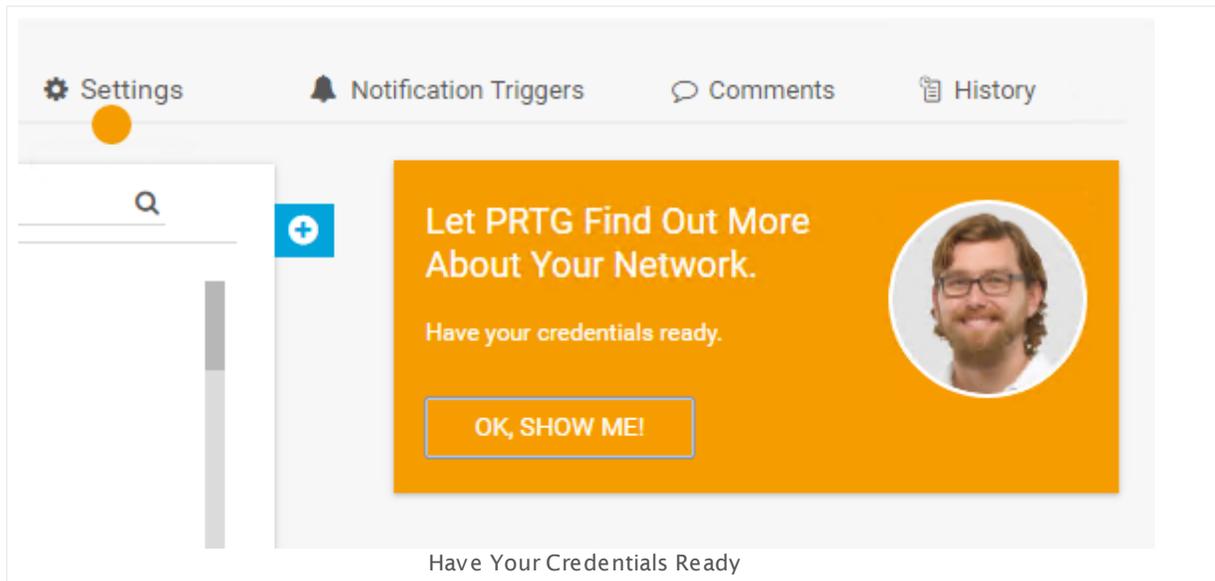

The steps to take are:

- [Provide Credentials](#)^[53]
- [Enter Location Information](#)^[56]
- [Change Your PRTG Login Password](#)^[56]
- [Confirm Your Email Address](#)^[57]
- [Switch to SSL](#)^[58] (if you access PRTG from another computer)

Step 1: Provide Credentials

Your personal setup assistant Greg asks you to provide credentials for devices in your network. Click **OK, show me!**, follow the animated yellow mouse pointer, and open the **Settings** tab of the **Root** group.

In the **Settings** tab, enter various administrator credentials for your network environment. With these credentials, PRTG can add a large number of additional devices and sensors automatically to your device tree. This way, PRTG helps you set up your network monitoring so there is no need for you to manually add every single device one by one.

Credentials for Windows Systems

Domain or Computer Name

User

Password

How Can PRTG Access Your Systems?

Please enter administrator credentials so PRTG can discover more sensors for your devices.

[OK, DONE!](#)

Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems

User

For WBEM Use Port Set automatically (port 5988 or 5989)
 Set manually

SSH Port

SSH Rights Elevation Run the command as the user connecting (default)
 Run the command as another user using 'sudo' (with password)
 Run the command as another user using 'sudo' (without password)
 Run the command as another user using 'su'

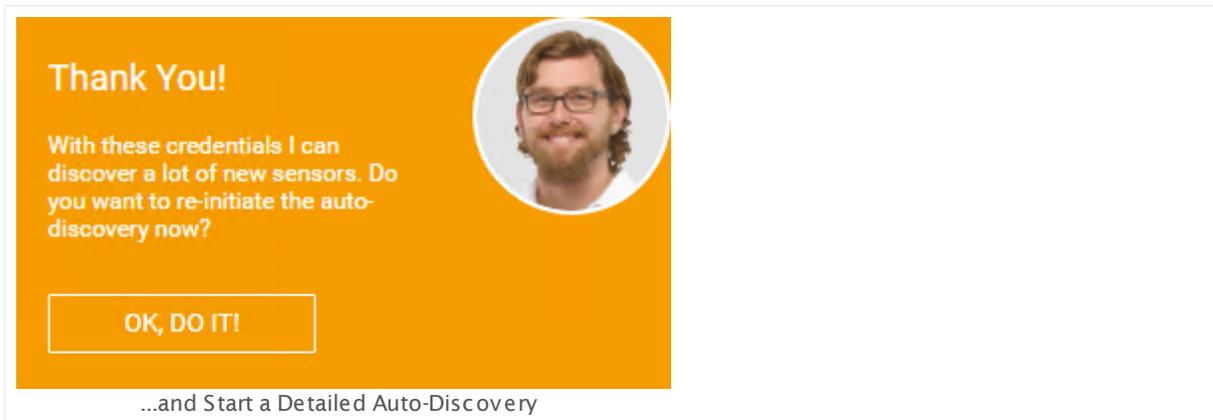

SSH Engine Default (recommended)
 Compatibility Mode (deprecated)

Provide Credentials...

- To monitor your Windows clients and servers via Windows Management Instrumentation (WMI), enter Windows administrator credentials for your network. We recommend that you use Domain Administrator credentials (if you use an Active Directory). For a general introduction to the technology behind WMI, see the manual section [Monitoring via WMI](#)^[3507].
- If you have systems running on Linux, Solaris, or Mac OS X, enter root access credentials for these systems. For a general introduction to SSH monitoring, see the manual section [Monitoring via SSH](#)^[3510].
- If you use the virtual environments VMware or Citrix XenServer, enter root access credentials for these systems. For a general introduction to the monitoring of virtual environments, see the manual section [Monitoring Virtual Environments](#)^[3527].
- To monitor your hardware (router, switches, etc.), Simple Network Management Protocol (SNMP) is the most commonly used protocol. Usually, all SNMP-enabled devices use the same settings by default: SNMP v2c, community string **public**, and SNMP port **161**. For a general introduction to the technology behind SNMP, see the manual section [Monitoring via SNMP](#)^[3489].

PRTG will store these credentials in the [Root](#)^[331] group of your device tree. All dependent devices automatically inherit and use them for monitoring. You can discontinue [Inheritance of Settings](#)^[137] at any level if you enter other credentials instead.

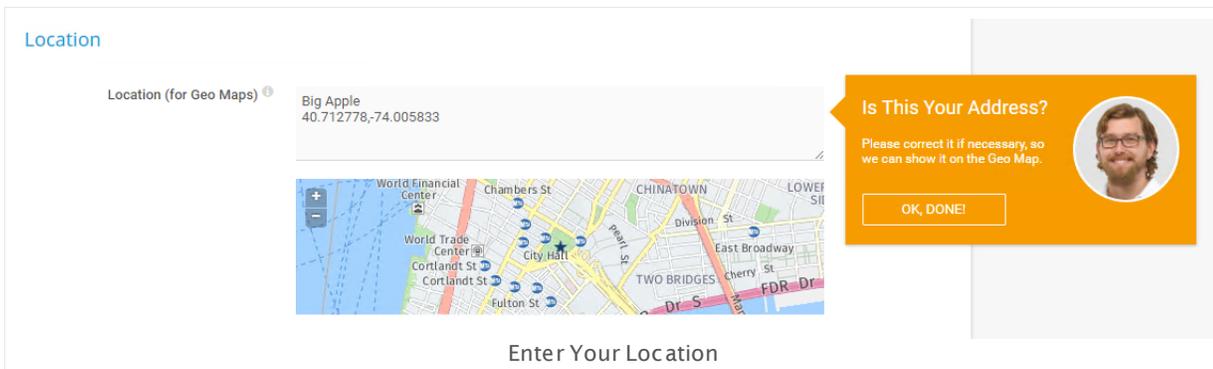

Click **OK, done!** to finish this setup step and confirm to start a detailed auto-discovery with the **OK, do it!** button.

For details about the available options, see the manual section [Root Group Settings](#)³³².

Step 2: Enter Location Information

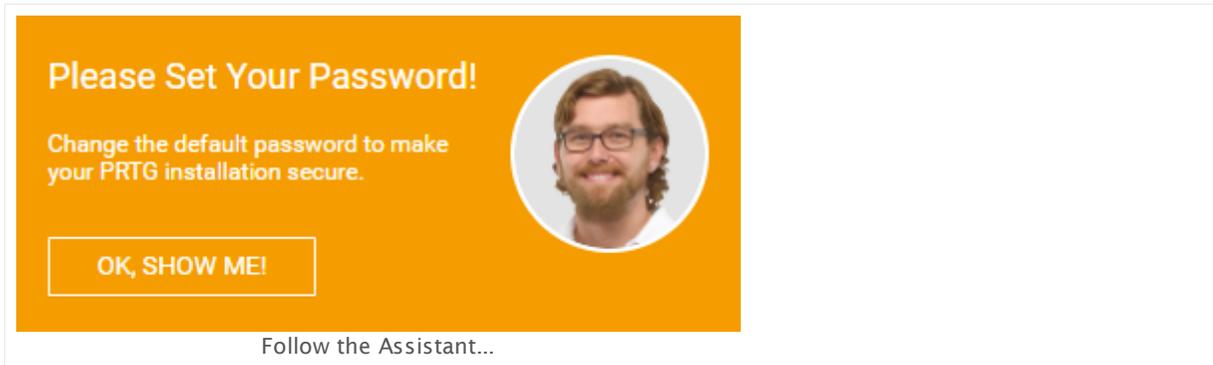

While PRTG runs a new auto-discovery in your network with the provided credentials, the setup assistant asks you to provide the location of your PRTG server. This information will be displayed on PRTG [Geo Maps](#)³²¹. Enter your location and confirm with **OK, done!**. Click **OK, show me!** to get back to the device tree.

For details about the available options, see the manual section [Root Group Settings](#)³³¹.

Step 3: Change Your PRTG Login Password

Back on the device tree, the PRTG on premises setup assistant asks you to change your password. Click **OK, show me!** and follow the assistant to your account settings. By default, PRTG uses the administrator account with login name **prtadmin** and password **prtadmin**. So we strongly recommend that you change the password to secure your PRTG installation against unauthorized access.

Please Set Your Password!

Change the default password to make your PRTG installation secure.

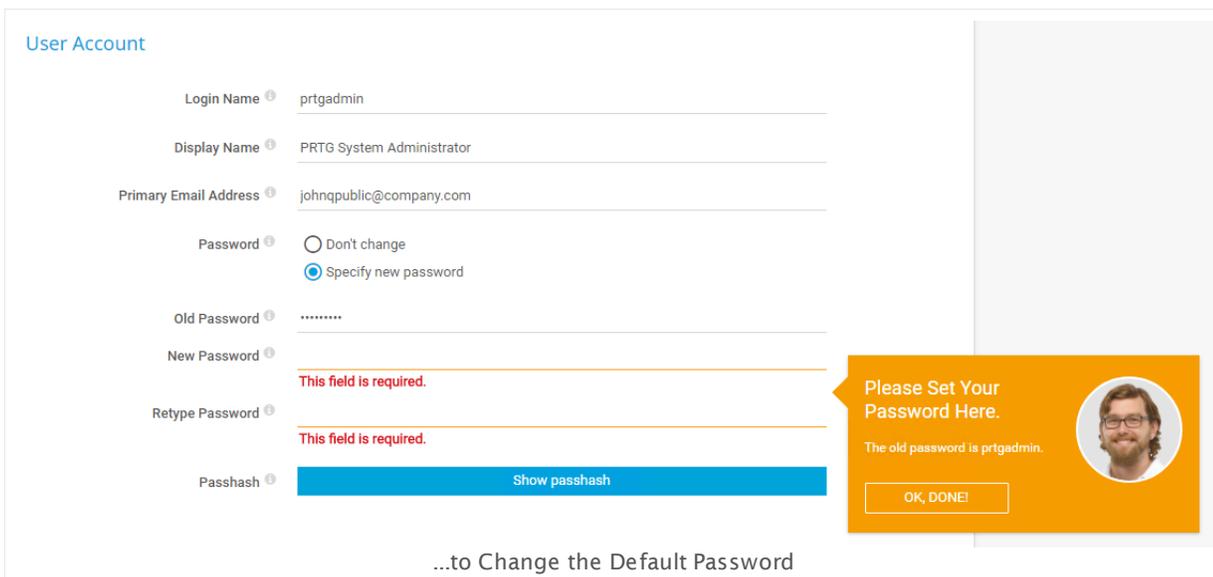

OK, SHOW ME!

Follow the Assistant...

Enter your **New Password**, confirm it with **Retype Password**. The password must meet the following requirements:

- at least eight characters long
- at least one numeral
- at least one capitalized letter

Click **OK, done!** to save your new password.

User Account

Login Name [ⓘ] prtgadmin

Display Name [ⓘ] PRTG System Administrator

Primary Email Address [ⓘ] johnqpublic@company.com

Password [ⓘ] Don't change
 Specify new password

Old Password [ⓘ]

New Password [ⓘ]
This field is required.

Retype Password [ⓘ]
This field is required.

Passhash [ⓘ]

...to Change the Default Password

Please Set Your Password Here.

The old password is prtgadmin.

OK, DONE!

 For details about the available options, see the manual section [Account Settings—My Account](#) ³³⁰⁴.

Step 4: Confirm Your Email Address

To complete the PRTG Smart Setup, check whether the email address that you have entered during the installation is correct.

 A working email address is absolutely mandatory for PRTG to reach you via email notifications, alarms, and for other important messages.

If the address is correct, click **OK, done!** and follow the assistant back to the device tree.

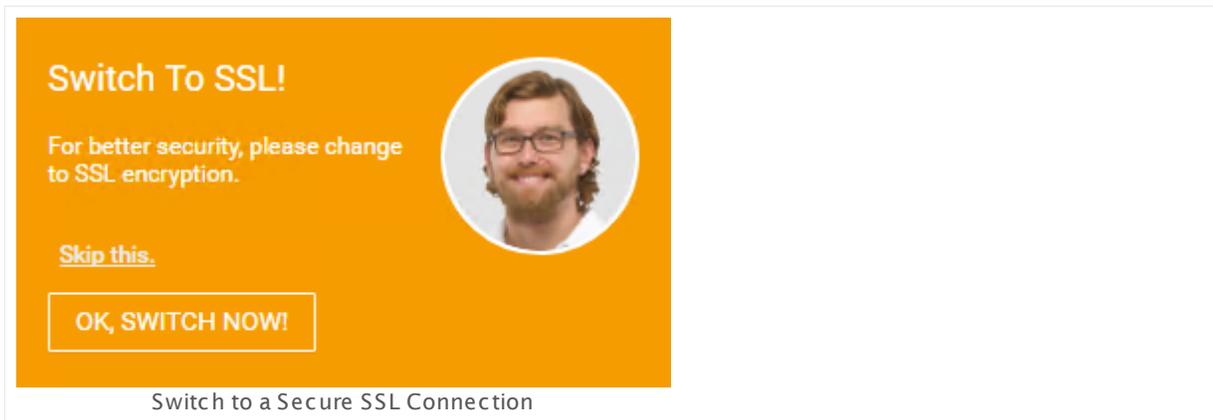

The screenshot shows the 'Account Settings' interface. At the top, there are tabs for 'My Account', 'Notification Templates', 'Notification Contacts', and 'Schedules'. The 'My Account' tab is active. Below the tabs, there are sections for 'Mobile App' and 'User Account'. The 'Mobile App' section has a 'Use Mobile App' button and a 'Show QR code for Mobile App Login' button. The 'User Account' section contains input fields for 'Login Name' (prtgadmin), 'Display Name' (PRTG System Administrator), and 'Primary Email Address' (johnpublic@company.com). There are radio buttons for 'Password' (Don't change) and 'Specify new password', and a 'Show passhash' button. An orange notification box on the right side of the form says 'Please Verify Your Email Address. This way PRTG informs you about alarms and other notifications.' and has an 'OK, DONE!' button. At the bottom of the form, it says 'Verify Your Email Address'.

For details about the available options, see the manual section [Account Settings—My Account](#)³³⁰⁴.

Step 5: Switch to SSL

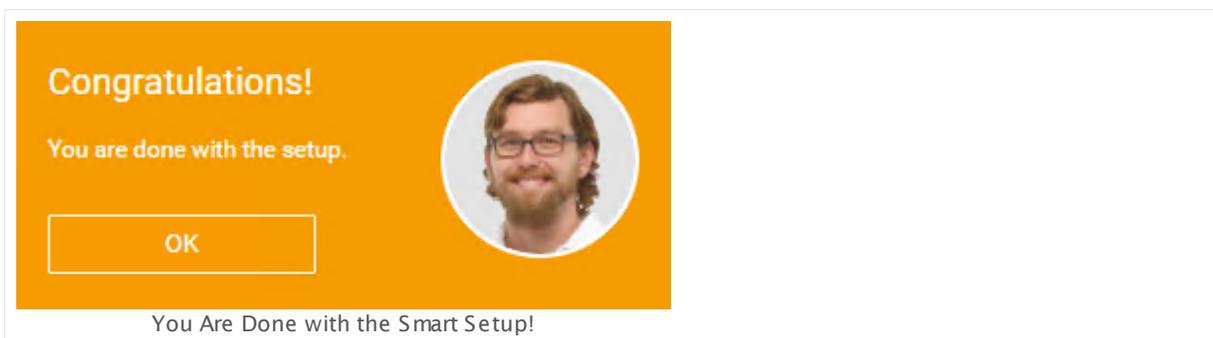

If you access the PRTG on premises web interface from a computer other than the computer where you installed PRTG, the assistant will appear and ask you to switch to a secure connection with Secure Sockets Layer (SSL)/Transport Layer Security (TLS) encryption. We strongly recommend that you run the PRTG web interface using SSL encryption (Hypertext Transfer Protocol Secure (HTTPS)), especially if you make your web interface available from the internet. Without encryption, your passwords are sent unencrypted over your network.

- Click **OK, switch now!** to get more information about using SSL for the PRTG web server.
- In the new window, click the button **Yes, switch to SSL now** to switch to an SSL-encrypted connection.
- PRTG must restart its services to apply the changes and is reachable under an **HTTPS** URL afterwards.
- When the web interface reloads, most likely it will show a [certificate warning](#)¹⁷². Confirm it to proceed to the login screen.

For more details, see the manual sections [System Administration—User Interface](#)^[3346] and [SSL Certificate Warning](#)^[172].

You Are Done!

While you were busy with the Smart Setup, PRTG created additional devices and sensors for you. There are first monitoring values available, too. Now you are all-in in your personal unified network monitoring!

 To become familiar with the PRTG web interface, we recommend that you read on in the manual section [General Layout](#)^[187] of the web interface.

Part 3

Using PRTG Hosted by Paessler

3 Using PRTG Hosted by Paessler

PRTG Network Monitor offers two options to monitor your network: PRTG on premises and PRTG hosted by Paessler. With PRTG on premises, the core server and local probe run within your network. PRTG hosted by Paessler is the PRTG cloud solution, where we at Paessler run the core server and hosted probe for you. The [PRTG web interface](#)^[168] for monitoring configuration and reviewing monitoring data is the same for both, PRTG hosted by Paessler and PRTG on premises.

The following sections show you how to [Create a PRTG hosted by Paessler Instance](#)^[63] and how to [Manage a PRTG hosted by Paessler Subscription](#)^[71].

See the Paessler website for [PRTG hosted by Paessler – Service Description](#) and [FAQ – PRTG hosted by Paessler](#).

Using PRTG hosted by Paessler—Topics

- [Create a PRTG hosted by Paessler Instance](#)^[63]
- [Manage a PRTG hosted by Paessler Subscription](#)^[71]

3.1 Create a PRTG Hosted by Paessler Instance

To create a PRTG hosted by Paessler instance, open your web browser (Google Chrome 67 or later (recommended)) and go to <https://my-prtg.com>. This is the PRTG hosted by Paessler web portal.

The screenshot shows the PRTG Network Monitor website. The header includes the PRTG Network Monitor logo and navigation links: HOME, BENEFITS, FEATURES, PRICING, SUPPORT, and LOGIN. The main content area features a blue background with a network diagram. The headline reads: "Simply focus on your network. Leave the hosting to us." Below this, a bullet point states: "Cloud-based monitoring with PRTG: No server installation or manual upgrades required. We handle the hosting, you get peace of mind." A prominent yellow button says "START YOUR FREE TRIAL NOW >>". Below the button is a "LEARN MORE" link with a downward arrow icon. In the bottom right corner, there is a "Chat with us" button. A vertical "FEEDBACK" button is visible on the left side. At the bottom of the page, the text "Start Your Free Trial Now" is displayed.

Click **Start Your Free Trial Now** to create your PRTG hosted by Paessler instance. PRTG hosted by Paessler automatically assigns a domain name to your instance. You can change this in the [Dashboard](#)^[73] at any time.

By signing up I agree to the [terms and conditions](#) and [privacy policy](#).

SIGN UP >

Sign Up to PRTG Hosted by Paessler

You can sign up with your Google+, Facebook, Windows, or Amazon account via single sign-on (Auth0). This account will then always be automatically used for login and will be connected to your PRTG hosted by Paessler account. Just click the respective button and follow the instructions there.

Alternatively, you can sign up via email by entering a valid **Email** address, a **Password**, and confirming it with **Confirm Password**. The password must meet the following requirements:

- at least 8 characters long
- at least one uppercase letter
- at least one lowercase letter
- at least one numeral

Make sure to agree to the terms and conditions and privacy policy. Click **Sign Up** to register for your PRTG hosted by Paessler instance. PRTG then notifies you that a verification email has been sent to your inbox.

Thank you for signing up. Please check your email inbox, we have just sent you an email to verify your email address.

Go to your inbox and open the email.

VERIFY EMAIL ADDRESS

Thank you for signing up for PRTG.

Enter your credentials and click **Login** to log in to PRTG hosted by Paessler.

While we prepare your subscription, a welcome video plays that introduces the basics of network monitoring with PRTG hosted by Paessler.

When your subscription is ready, click the URL with your domain to open the [PRTG web interface](#)¹⁶⁶.

Part 3: Using PRTG Hosted by Paessler | 1 Create a PRTG Hosted by Paessler Instance

The screenshot displays the PRTG Network Monitor interface. At the top, there's a navigation bar with options like Home, Devices, Libraries, Sensors, Alarms, Maps, Reports, Logs, Tickets, and Setup. A search bar and 'New Log Entries 3' are also visible. The main header area says 'Welcome John Q. Public!' and includes a 'TRUSTPILOT' rating section. Below this, two large circular gauges show 'All Sensors' with a value of 4 and 'Current Alarms' with a value of 0. To the right of the 'All Sensors' gauge is a legend for sensor states: Down (0), Down (Acknowledged) (0), Warning (0), Up (4), Paused (0), Unusual (0), and Unknown (0). Below the gauges are three main content blocks: 'Your PRTG' with links for 'View Results', 'Install Smartphone App', 'Get Help and Support', and 'Manage Subscription'; 'Yesterday's Activity' showing 0 for Sensor Scans Performed, Sensor State Changes, Notifications Sent, Reports Generated, and Web Pages Served; and 'Paessler Blog' with several article titles like 'Monitoring Healthcare IT With PRTG: A Video' and 'Monitor Your Palo Alto Firewall with PRTG'. At the bottom, there's a 'Welcome' message and a 'View All Tickets' button showing 1 ticket.

Congratulations, your PRTG hosted by Paessler instance is up and running! To open the device tree, click **View Results** or **Devices** in the [main menu bar](#)^[263].

PRTG hosted by Paessler has automatically created a **Hosted Probe** that runs on the hosted PRTG instance. It shows several health values of the instance and you can instantly monitor all servers, services, and devices that are publicly available via the internet with this probe. See also section [Architecture and User Interfaces—Probe\(s\)](#)^[126].

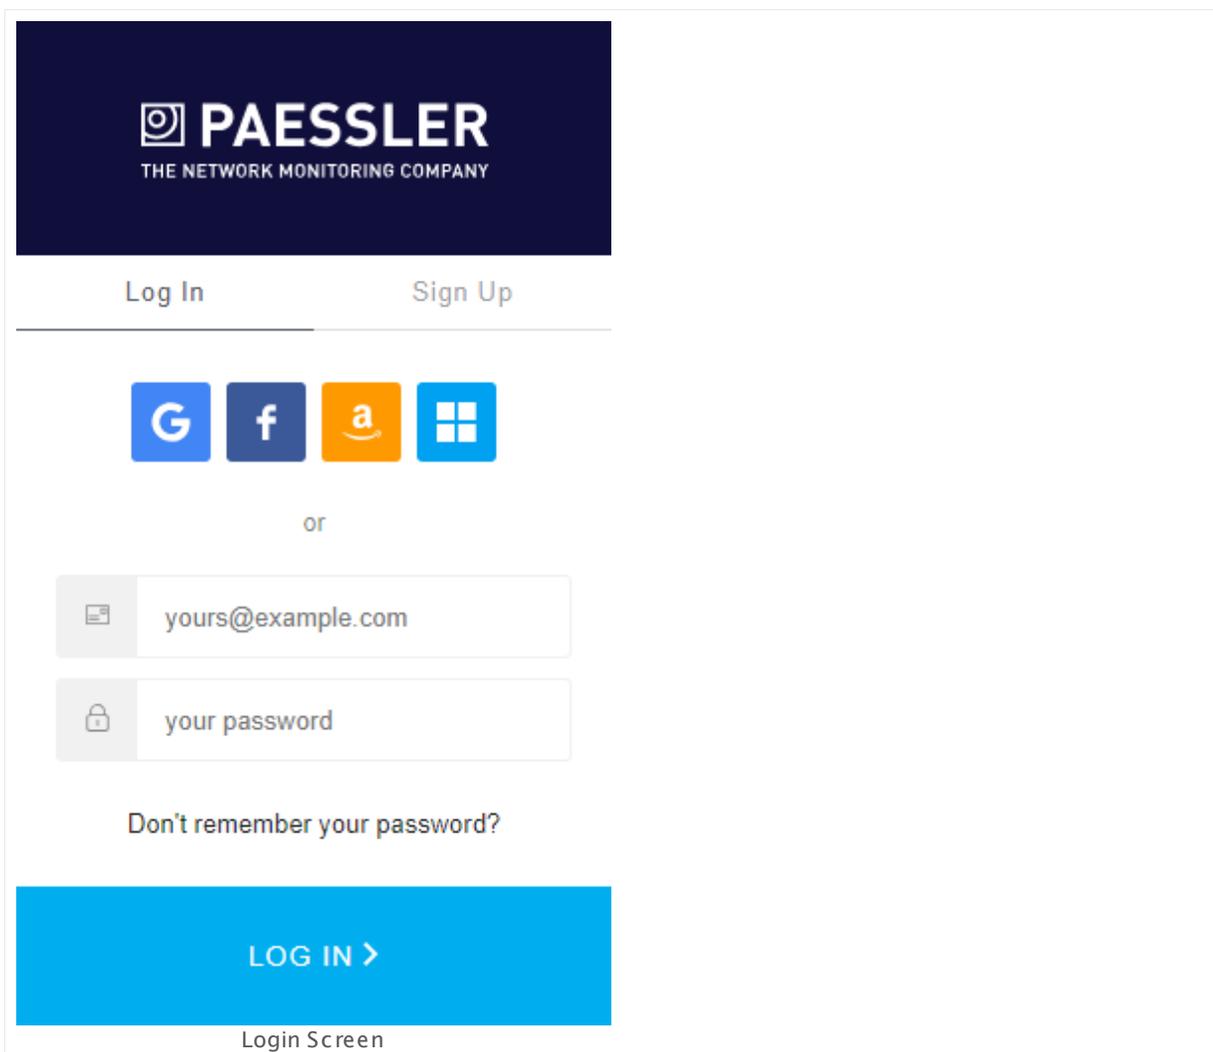

A Paessler employee will guide you through the [Smart Setup](#)^[52]. In particular, you will install a [remote probe](#)^[370], which is required for monitoring your LAN. We strongly recommend that you follow the instructions for best monitoring experience!

3.2 Manage a PRTG Hosted by Paessler Subscription

PRTG Network Monitor offers **Monitoring as a Service** with PRTG hosted by Paessler. PRTG hosted by Paessler runs in the cloud and does not require a PRTG core server installation inside your network, making monitoring even easier. We offer subscription plans that you can tailor to your needs and manage via the PRTG hosted by Paessler web portal on my-prtg.com.

All you need to do is open a web browser (Google Chrome 67 or later (recommended)), go to <https://my-prtg.com>, and log in to manage your subscription.

 For details about setting up a PRTG hosted by Paessler instance, see manual section [Create a PRTG Hosted by Paessler Instance](#)⁶³¹.

Provide the credentials you entered when signing up and click **Login** or use single sign-on and continue with your Google+, Facebook, Windows, or Amazon account via the respective button.

System Status

The **System Status** gives you an overview of the overall status of PRTG hosted by Paessler, including services and features. Clicking the icon opens a new browser window.

The screenshot shows the PRTG System Status page. At the top left is the PRTG Network Monitor logo. Below it, the text reads "System status for PRTG hosted by Paessler" next to a "SUBSCRIBE TO UPDATES" button. A green bar below this indicates "All Systems Operational". The "About This Site" section explains that this is the status page for PRTG hosted by Paessler. Below this is a table with the following data:

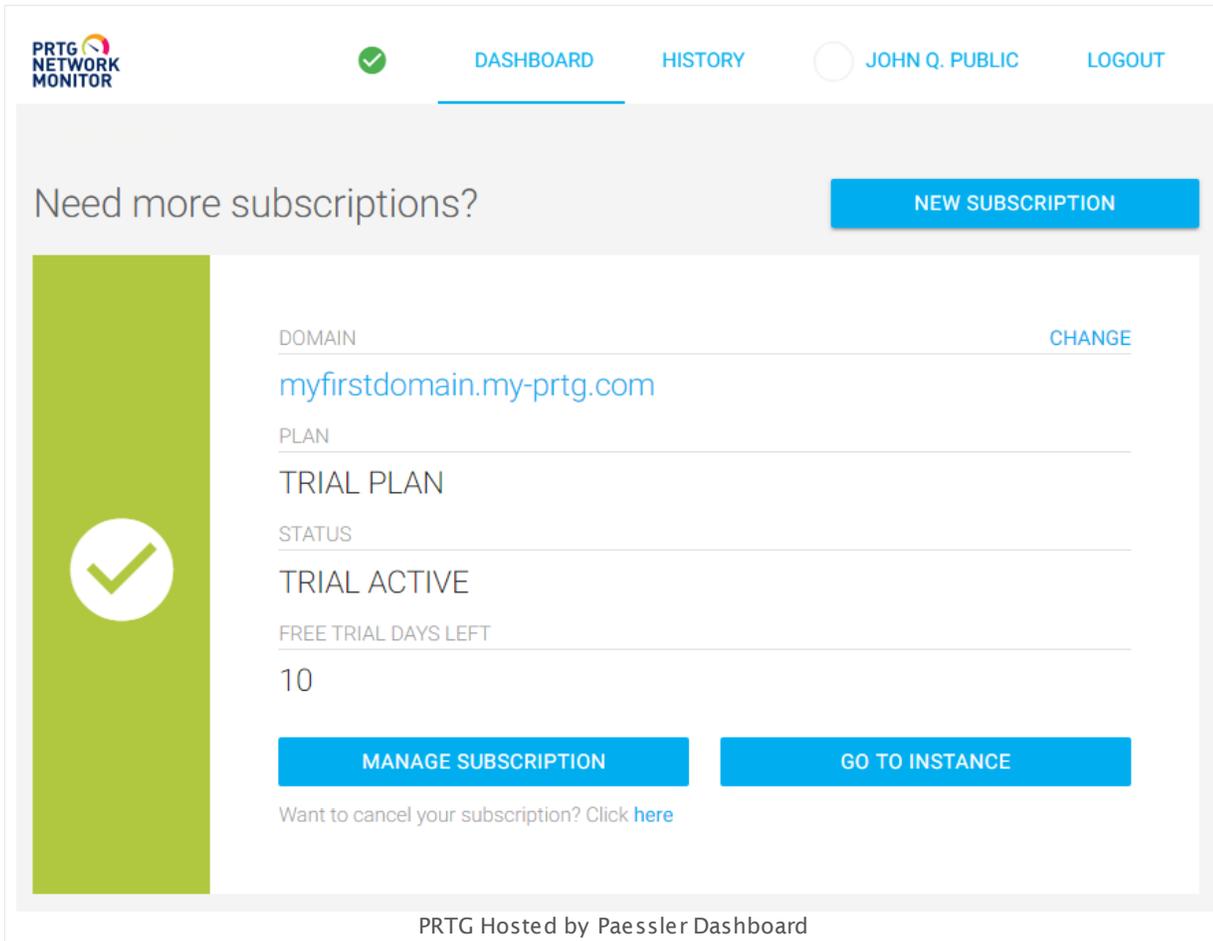

⊞ PRTG Instances	Operational
⊞ my-prtg.com	Operational
Authentication	Operational
⊞ Subscriptions	Operational

System Status

Here you can see the status of your PRTG instances, my-prtg.com, authentication, and your subscriptions. You can also see a list of reported incidents such as version updates or scheduled maintenance. If you want to receive updates when there are issues, click the **Subscribe to Updates** button. You can receive updates via email or SMS text message. You can also contact support or view web feeds.

Dashboard

The **Dashboard** tab gives you an overview of your PRTG hosted by Paessler subscription. Here you can manage or cancel your subscription, or add a new subscription. If you have purchased a subscription, you will also see when your next payment is due. You can also click the link under **Domain** to open the [PRTG web interface](#) or click **Change** to change the domain name. The domain name can be anywhere from 4 and 60 characters long. Enter a domain name of your choice, such as **myfirstdomain**. So if you enter **myfirstdomain** as the domain name here, your PRTG hosted by Paessler instance will be reachable under **myfirstdomain.my-prtg.com**.

The screenshot shows the PRTG Network Monitor dashboard. At the top left is the PRTG Network Monitor logo. To its right is a green checkmark icon. Further right are navigation links: **DASHBOARD** (underlined), **HISTORY**, **JOHN Q. PUBLIC** (with a profile icon), and **LOGOUT**. Below the navigation is a header area with the text "Need more subscriptions?" and a blue button labeled "NEW SUBSCRIPTION". The main content area features a green vertical bar on the left with a white checkmark icon. To the right of this bar, the subscription details are displayed in a list format:

- DOMAIN**: myfirstdomain.my-prtg.com (with a "CHANGE" link to the right)
- PLAN**: TRIAL PLAN
- STATUS**: TRIAL ACTIVE
- FREE TRIAL DAYS LEFT**: 10

At the bottom of this section are two blue buttons: "MANAGE SUBSCRIPTION" and "GO TO INSTANCE". Below these buttons is a link: "Want to cancel your subscription? Click here". At the very bottom of the dashboard area, the text "PRTG Hosted by Paessler Dashboard" is centered.

Click **Manage Subscription** to view your subscription details. The following information is displayed where you can edit your plan, payment, or billing address. Click **Change Plan** to save your changes.

Installing the Software

4 Installing the Software

The following sections show you how to download and install your PRTG on premises instance. If you want to use PRTG hosted by Paessler, just go straight to section [Create a PRTG hosted by Paessler Instance](#)^[63] to get started.

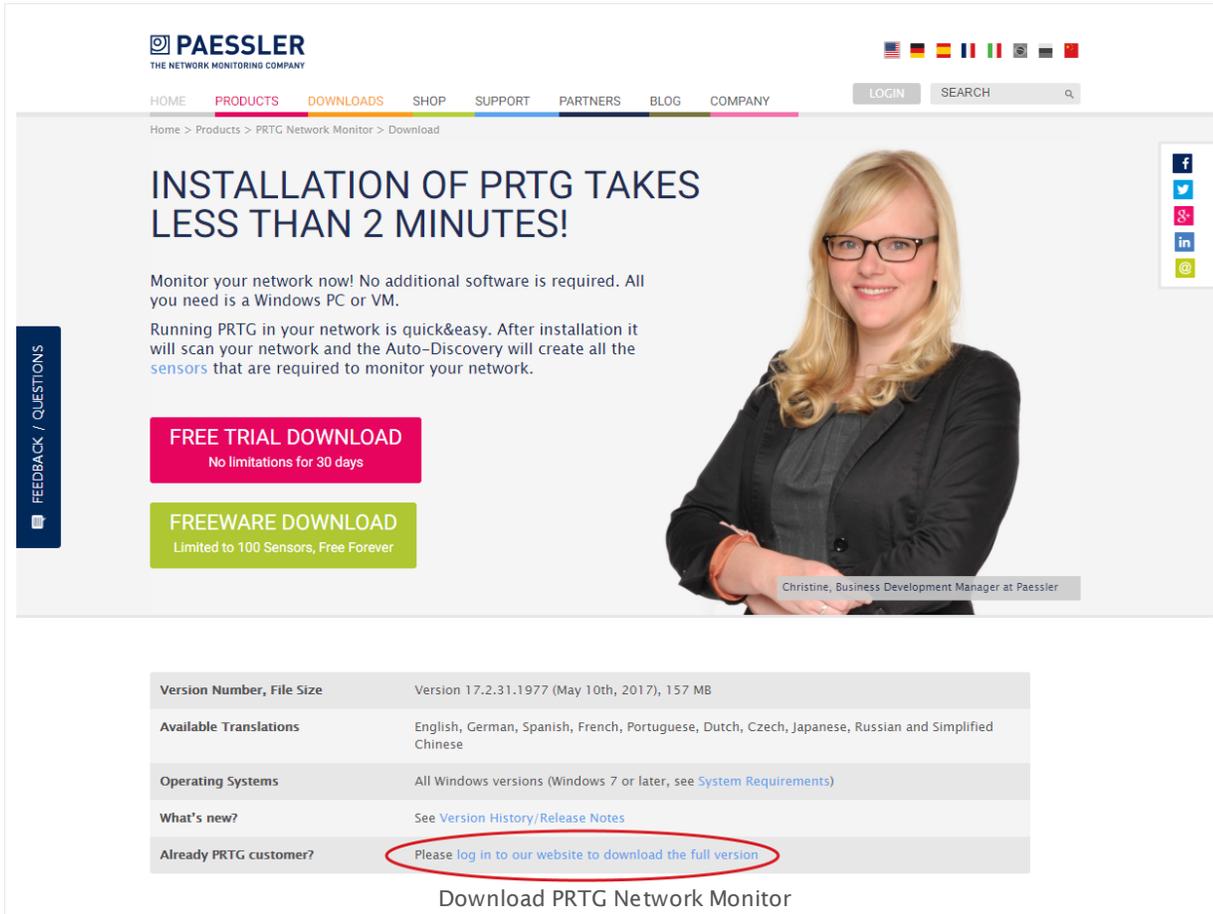

Installing the Software—Topics

- [Download PRTG](#)^[81]
- [Update From Previous Versions](#)^[83]
- [Install a PRTG Core Server](#)^[89]
- [Create a PRTG hosted by Paessler Instance](#)^[63]
- [Install a PRTG Cluster](#)^[95]
- [Enter a License Key](#)^[96]
- [Activate the Product](#)^[99]
- [Install a PRTG Remote Probe](#)^[101]
- [Install the Enterprise Console](#)^[113]
- [Uninstall PRTG Products](#)^[119]

4.1 Download PRTG

You can find the installer for PRTG on our website <https://www.paessler.com>. There you can also login to the Paessler shop to buy or upgrade your license, or to renew your maintenance.

 This only applies to PRTG on premises instances, not to PRTG hosted by Paessler.

PAESSLER
THE NETWORK MONITORING COMPANY

HOME PRODUCTS DOWNLOADS SHOP SUPPORT PARTNERS BLOG COMPANY LOGIN SEARCH

Home > Products > PRTG Network Monitor > Download

INSTALLATION OF PRTG TAKES LESS THAN 2 MINUTES!

Monitor your network now! No additional software is required. All you need is a Windows PC or VM.

Running PRTG in your network is quick&easy. After installation it will scan your network and the Auto-Discovery will create all the **sensors** that are required to monitor your network.

Christine, Business Development Manager at Paessler

Version Number, File Size	Version 17.2.31.1977 (May 10th, 2017), 157 MB
Available Translations	English, German, Spanish, French, Portuguese, Dutch, Czech, Japanese, Russian and Simplified Chinese
Operating Systems	All Windows versions (Windows 7 or later, see System Requirements)
What's new?	See Version History/Release Notes
Already PRTG customer?	Please log in to our website to download the full version

Download PRTG Network Monitor

Downloading PRTG Network Monitor

Please download the latest publicly available program version from the Paessler website. Simultaneously, you will receive a trial key. Enter this license key during the installation of PRTG. If you have already purchased a commercial license, use your commercial key. Please log in to the Paessler website to find your license key,

- <https://www.paessler.com/prtg/download>
- <https://shop.paessler.com/accounts/login/>

Every freeware installation starts as a trial version that allows you to use an unlimited number of sensors for 30 days. After the trial period has expired, your installation automatically reverts to the freeware edition with 100 sensors. Please understand that customers with a commercial license get prioritized support.

To upgrade your running trial or freeware version to a commercial edition, please purchase a commercial license key on <https://shop.paessler.com> and enter this key on the [license page](#)  in the PRTG web interface.

Updates are free to customers with an active maintenance contract. If you do not have an active maintenance contract, please log in to the Paessler shop to renew it or contact sales@paessler.com.

 Once installed, the PRTG [Software Auto-Update](#)  will automatically download and install new software versions. This helps you keep PRTG up to date without manually installing new PRTG versions.

4.2 Update From Previous Versions

If you already have a previous software version installed, there are several things you have to consider before you update to the current PRTG version. Please see section [Detailed System Requirements](#)^[26] to see all requirements for the current PRTG version.

 We recommend that you always have a proper backup of your monitoring data and configuration. In most cases both will be maintained when upgrading. Anyway, we recommend a backup before upgrading. For details, see the Knowledge Base: [How do I backup all data and configuration of my PRTG installation?](#)

 In certain cases, antivirus software like Windows Defender interfere with the PRTG installer. This might cause high CPU load on the PRTG server, which might prevent a successful update of PRTG. Please temporarily disable Windows Defender and other antivirus software if you have issues installing PRTG updates.

 On PRTG hosted by Paessler instances, the update process is managed automatically, so you do not have to care about updating your PRTG.

Update from PRTG Network Monitor 16.1.22 or later

If you run PRTG Network Monitor with version 16.1.22 or later, simply [install](#)^[89] the latest version on top of the previous version. Your configuration will be kept. PRTG updates [remote probes](#)^[379] automatically as well. If you have configured PRTG as a [cluster](#)^[130], you only have to install an update on any node server (master or failover). PRTG deploys the new version to the cluster automatically.

We recommend that you use the [Auto-Update](#)^[340] of PRTG to install the latest version. Please always have a proper backup of your monitoring data.

Important notes:

- **PRTG 17.3.34** comes with a completely rewritten web interface. If you have customized the PRTG web interface using one of the dedicated files in a prior version, all your customizations will be lost as soon as you install PRTG 17.3.34. You will have to redo your changes to keep the customizations. For details, see the Knowledge Base: [Customizing and Re-Branding the PRTG Web Interface](#)
- As of **PRTG 17.3.34**, sensor types that require the .NET framework need version .NET 4.5 or later. For details, see the Knowledge Base: [Which .NET version does PRTG require?](#)
- With **PRTG 16.3.26**, the Mobile Web GUI has been removed from PRTG.
- With **PRTG 16.2.25**, several sensor types have been [removed from PRTG](#)^[84].

Update from PRTG Network Monitor 13.1.1 through 16.1.21

As of version 16.1.22, PRTG is signed with renewed certificates. To be able to seamlessly update to version 16.1.22 or later an **intermediate update** is required for the PRTG core server and all probes if you currently run a PRTG version previous to 16.1.21.1691/1692. If you [auto-update](#)³⁴⁰⁷ from previous versions (lower than 16.1.21.1691/1692), PRTG will automatically install this intermediate version first. You have to perform an additional auto-update to install the latest version. PRTG will notify you with a [ticket](#)²³⁶¹ about this approach. Your configuration will be kept.

 We recommend that you use the [auto-update](#)³⁴⁰⁷ to install the latest PRTG version. If you update manually with an installer downloaded from the Paessler online shop, the intermediate update is only necessary if you currently run a PRTG version **previous to 16.1.21.1691/1692 with one or more remote probes or in a cluster setup**. If you do not perform this intermediate update, you will have to update your remote probes and cluster nodes manually. Please [contact our technical support team](#)³⁴²⁴ to get the installer for this version if you do not use the auto-update.

- As of PRTG 14, **Internet Explorer 9 is no longer officially supported** for access to the PRTG web interface.
- Also as of PRTG 14, PRTG core and probes no longer officially support **Windows XP and Windows Server 2003** (including SP1 and SP2).
- As of PRTG 15, **Internet Explorer 10 is no longer officially supported** for access to the PRTG web interface.

Removed Sensor Types as of PRTG Network Monitor 16.2.25

We have removed several sensor types from PRTG with version 16.2.25. Sensors of these types that you still use in your PRTG installation will stop monitoring and show a down status as soon as you update to 16.2.25 or later. Most of the affected sensor types have been deprecated as of PRTG version 16.2.23 or before. You will receive tickets from PRTG that inform you if your PRTG setup is affected.

These sensor types were used by very few PRTG users and/or created substantial load for both our technical support and development team. We believe that the majority of PRTG users prefers that we focus on features that many customers use everyday rather than spending our precious energy on niche issues. We want to keep PRTG as easy to use as possible!

 For a list of all discontinued sensors, possible alternatives, and more details about this approach, see this article: <https://kb.paessler.com/en/topic/68227>

Web Interface Customizations as of PRTG Network Monitor 13.2.3

As of PRTG version 13.2.3, the **website** folder of the PRTG program directory is not used anymore. This means that if you update from a PRTG version older than 13.2.3 to the current version, all existing customizations of the web interface will be disabled and you have to revise them. You may find a way for a similar customization that you can add to the files in the current **webroot** folder that contains the web interface files now.

 For details, see the Knowledge Base: [What about my web interface customizations as of PRTG 13.2.3?](#)

Update from PRTG Network Monitor 9 and 12

 We strongly recommend that you perform a clean install of the latest PRTG version instead of updating from an existing PRTG 9 or 12!

If you use PRTG 9 or 12 now, your configuration will be kept when installing the current PRTG version in **Standalone Mode** or when installing a **Master Node**. There are only a few things you should consider.

 We recommend that you always have a proper backup of your monitoring data.

- **Intermediate versions:** You have to install two intermediate versions before you can update to the latest version.
 - If you currently run PRTG version 12.4.5.3164/3165 or lower, install the **intermediate version 12.4.7.3507** before you proceed.
 - If you have installed version 12.4.7.3507, install the **intermediate version 16.1.21.1691/1692** before you proceed. Afterwards you can seamlessly update to the latest PRTG version. For details about this intermediate update, see section [Update from PRTG Network Monitor 13.1.1 through 16.1.21](#)^[84] above.
 - We recommend that you use the [Auto-Update](#)^[3407] feature. In this case PRTG will automatically install the intermediate versions. Run the auto-update three times if you come from a version previous to 12.4.7.3507, run it twice if you come from a version previous to 16.1.21.1691/1692. If you do not use the auto-update, please [contact our technical support team](#)^[3424] to get the installers for these intermediate versions.
- **Discontinued Sensors:** Existing instances of the following sensor types will stop working as of PRTG V12 and must be replaced with their successor sensor types!
 - VMware Host Server (SOAP)
 - VMware Virtual Machine (SOAP)
 - Xen Virtual Machine

If your configuration contains these sensor types, they will stop monitoring after upgrading to the current version. We recommend that you to pause them to keep their data. To continue monitoring, please add the sensors anew (for example, using the auto-discovery).

- **Please install .NET 4.0:** We strongly recommend that you install .NET 4.0 on systems that run the core server (and the remote probes, if you use those). Otherwise the following features will not work: [VMware](#)^[435] auto-discovery and monitoring, [Citrix XenServer](#)^[599] auto-discovery and monitoring, [SIP Options Ping Sensor](#)^[1786], Windows Last Update Sensor (deprecated as of PRTG 16.x.23).
- **Changed Geo Maps Provider:** When you update to the current PRTG version, the provider for geographical maps will automatically be switched from Google Maps to MapQuest (using Open Street Map data).

- **Windows 2000 Not Supported:** Since PRTG 7 we do not officially support Windows 2000 systems anymore. This means that PRTG cannot be installed on systems running Windows 2000, and you cannot officially monitor Windows 2000 systems (for example, via WMI). However, if you could successfully monitor your Windows 2000 systems with PRTG 9, this might actually not be possible anymore with the current PRTG version.
- ❗ We recommend that you to have a look at the [Detailed System Requirements](#)^[26] before updating to the current version! Officially supported operating systems, browsers, and other requirements may have changed since version 9.

Update from PRTG Network Monitor 7 or 8

- ❗ We strongly recommend that you perform a clean install of the latest PRTG version instead of updating from an existing PRTG 7 or 8!

If you use PRTG 7 or 8 now, you have to update PRTG to intermediate versions first to ensure all data is carried over correctly. You **cannot update to PRTG 15 or later directly** from PRTG 7 or 8!

- We recommend that you first update to the latest PRTG 8 version.
- From the latest PRTG 8 version update to PRTG version 9.
- From PRTG 9, update to both [intermediate versions](#)^[85] 12.4.7.3507 and 16.1.21.1691/1692 and then to the current PRTG version.

Please [contact our technical support](#)^[375] to obtain download links for these PRTG versions. Always keep a proper backup of your configuration and monitoring data!

Updating from PRTG 7 or 8 to Current PRTG Version

- Packet Sniffer (Content) sensors are not supported anymore. Existing sensors of this type will automatically be switched to Packet Sniffer (Header) sensors after the update. As a benefit, you can now also sniff IPv6 traffic.
- Internet Explorer 8 is no longer supported for access to the PRTG Ajax web interface.
- You may experience a slow [Enterprise Console](#)^[343] (former 'Windows GUI') due to different reasons.
- When installing a failover node on top of an existing stand-alone PRTG 7, 8, 9, 12, or 13+ installation, the configuration cannot be kept and is written to a backup folder. Then, the new cluster configuration is received from the master node of the cluster. As all nodes work with the same configuration, a failover node's old configuration and monitoring data can no longer be used. If you want to keep a configuration of PRTG 7, please install the master node on top of the old installation and use other servers for the failover node installations.
- Since PRTG 9 the SNMP sensors use the **IPv4 Outgoing IP** set for the probe service (this setting was formerly ignored by those sensors, using the **auto** setting instead). If you experience failing sensors, please check the setting in the [probe settings](#)^[371].
- If you have (manually) configured the PRTG probe or PRTG core service to run under a different Windows user account (for example, for successful internet access through an ISA server firewall), please apply the respective Windows user account for the "PRTGProbeService" and/or "PRTGCoreService" anew after installing the current PRTG version.

- System Requirements for the PRTG core server and probes: please have a look at our latest [Detailed System Requirements](#)^[26].
 - If you use the default data path in your PRTG setup, it will be changed automatically. Up to version 8 all data was stored in a sub folder reflecting a PRTG version number (v7 or v8). As of version 9 this sub folder is omitted, and data is stored directly at `%ALLUSERSPROFILE%\Application data\Paessler\PRTG Network Monitor`. During setup, all data will be moved to the new directory. If you use a custom data path it will not be changed.
 - Up to version 8 all data in the registry was stored in a sub key reflecting a PRTG version number (v7 or v8). As of version 9 this sub key is omitted, and registry data is stored directly under the key `HKEY_LOCAL_MACHINE\SOFTWARE\Paessler\PRTG Network Monitor` (on 32-bit systems) respectively `HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Paessler\PRTG Network Monitor` (on 64-bit systems). During setup, all existing registry values will be moved to the new key.
-  We strongly recommend that you have a look at the [Detailed System Requirements](#)^[26] before updating to the current version! Officially supported operating systems, browsers, and other requirements may have changed since version 8.

Updating from PRTG 7 to Current PRTG Version

- Regarding custom sensors, the interpretation of returned values is handled more strictly as of PRTG 8. If you use custom sensors with PRTG 7, these may not work with the current PRTG version if they do not fully apply to the [API definition](#)^[366].

Update from Older PRTG Products

For all other predecessor products, a direct data import into the current version is not possible.

If you have been using IPCheck 5 or PRTG Traffic Grapher 6, please perform a clean installation of PRTG Network Monitor and set up your configuration anew. Using the [Auto-Discovery](#)^[282] in PRTG is the easiest way to quickly configure a monitoring of your entire network.

 For more information, see the manual section [Quick Start Guide](#)^[46].

4.3 Install a PRTG Core Server

Installing PRTG Network Monitor is easy and works like other Windows-based applications. To install PRTG, run the installation setup program from the ZIP file that you have downloaded.

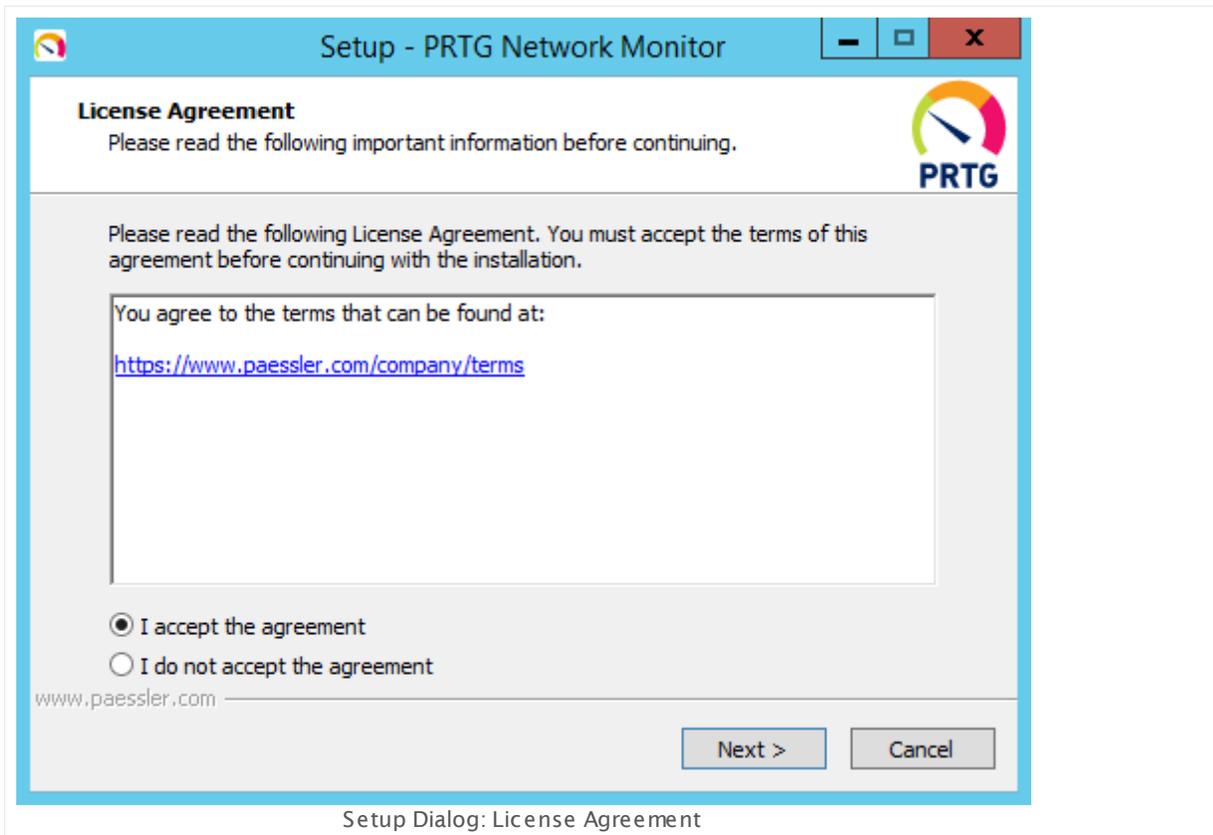

☁ This only applies to PRTG on premises instances, not to PRTG hosted by Paessler.

Confirm the question of the Windows **User Account Control** with **Yes** to allow the program to install. The PRTG installation dialog will guide you through the installation process.

Select a language for the program and click the **OK** button. The available language options depend on both your Windows version and the setup file.

Accept the [license agreement](https://www.paessler.com/company/terms) and click **Next**.

Your Email Address
The following information is required to continue with the installation

Whenever the sensors in your installation discover outages or suspicious values, PRTG can send notifications to alert you. Please enter your email address to make sure you receive these important system alerts. Paessler will also use this address to provide support.

Your Email Address:
john.q.public@example.com

We protect your personal data!
[See our privacy policy for more information.](#)

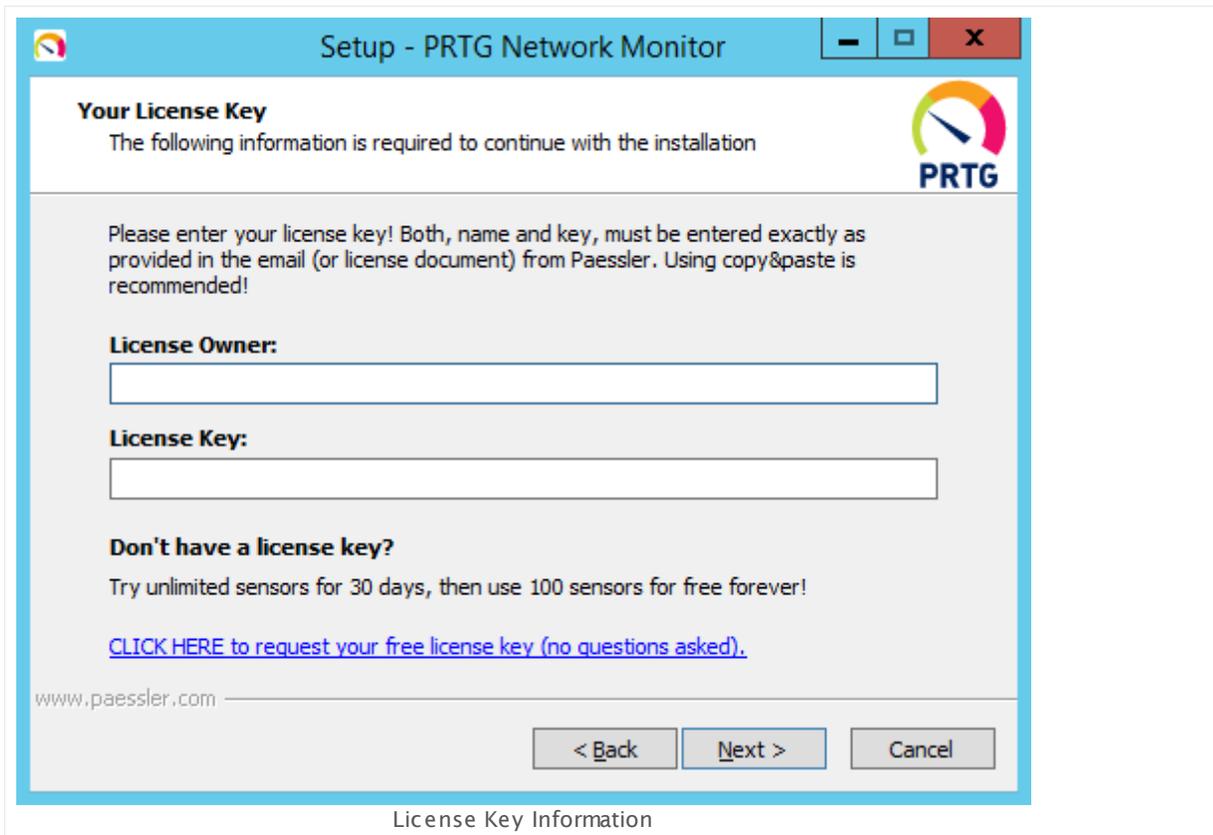

www.paessler.com

< Back Next > Cancel

Administrator Email Address

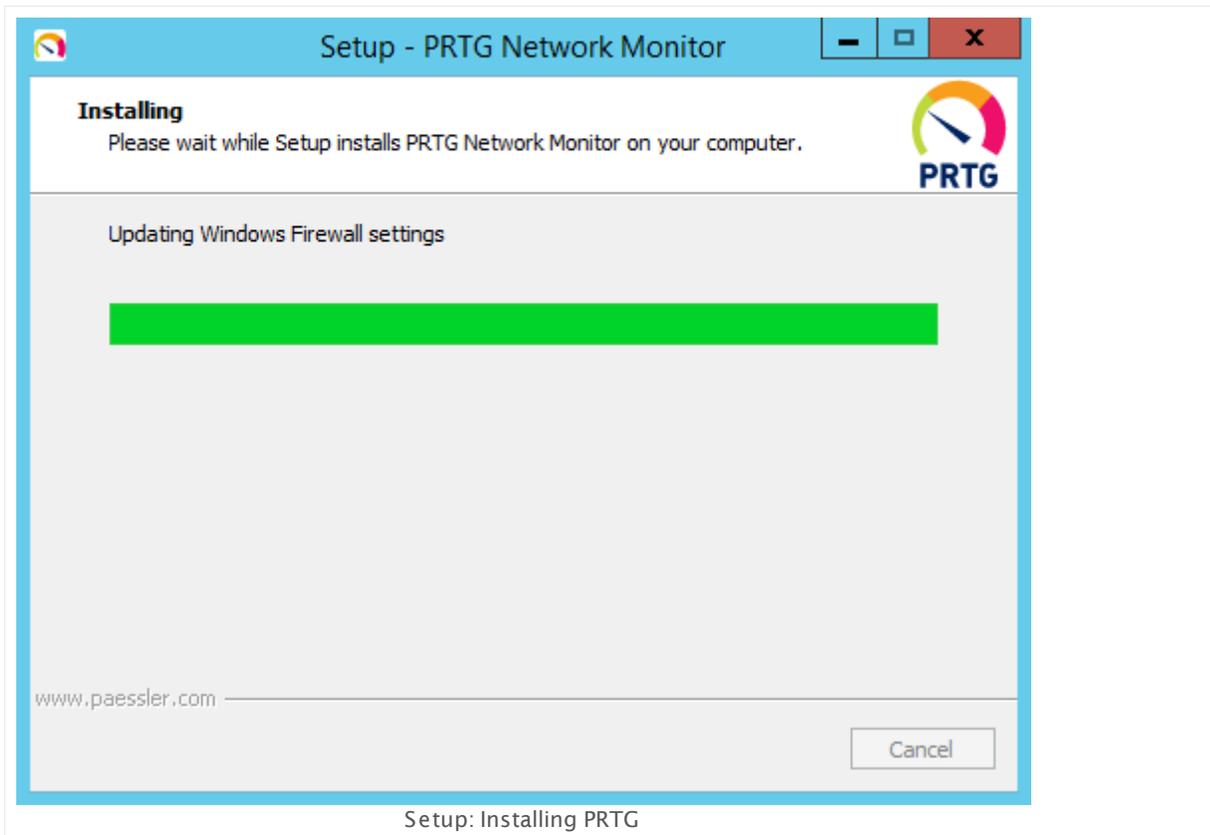

Enter a valid email address. Your PRTG server will send important and urgent system alerts to this address. Click the **Next** button to continue.

 For more information on how we process your personal data, see our [Privacy Policy](#).

Enter your license information. You have to provide the **License Name** and the **License Key** exactly as you received it in the email or license document from us, the Paessler AG. We recommend that you use copy&paste to avoid typos. Click **Next** to confirm.

i You will find the label License Owner in some documents from the Paessler shop. License Owner is the same as License Name for which you will be asked while installing PRTG or when you [change your license key](#)⁹⁶.

After installation, PRTG opens the [Ajax Web Interface](#)^[166] in your system's default browser. Make sure there is Google Chrome 67 or later (recommended), Mozilla Firefox 61 or later, or Microsoft Internet Explorer 11 available on the system, and set as default browser (see [System Requirements](#)^[23]).

! In certain cases, antivirus software like Windows Defender interfere with the PRTG installer. This might cause high CPU load on the PRTG server, which might prevent a successful installation of PRTG. Please temporarily disable Windows Defender and other antivirus software if you have issues installing PRTG.

Enter License Information

PRTG will validate your license information during the install process by connecting to the activation server. If you have entered incorrect license information before, PRTG will ask you to re-enter a correct License Name and key. Please enter both **License Name** and **License Key** exactly as received from Paessler. We recommend that you use copy&paste to avoid typing mistakes.

+ For more details, see [Enter a License Key](#)^[96].

If you think that you have correctly entered your license information but get a **License Invalid** message, please contact sales@paessler.com.

i You will find the label License Owner in some documents from the Paessler shop. License Owner is the same as License Name for which you will be asked while installing PRTG or when you [change your license key](#)⁹⁶.

Privacy Policy

- <https://www.paessler.com/company/privacypolicy>

4.4 Install a PRTG Cluster

PRTG offers single failover clustering in all licenses—even using the freeware edition. A single failover cluster consists of two servers ("Current Master" Node and "Failover Node"), each of them running one installation of PRTG. They are connected to each other and exchange configuration and monitoring data. You can run a cluster with up to 5 nodes.

☁ This feature is not available in PRTG hosted by Paessler.

📖 For detailed information, see [Failover Cluster Configuration](#)³⁷²⁰.

More

Knowledge Base: What's the Clustering Feature in PRTG?

- <https://kb.paessler.com/en/topic/6403>

4.5 Enter a License Key

A license key for PRTG Network Monitor consists of the **License Name** and a **License Key**. The key is a string that consists of 8 blocks with 5 characters each.

 This only applies to PRTG on premises instances, not to PRTG hosted by Paessler.

Your Personal License Information

You have received the **License Name** and the **License Key** from Paessler via email or in a license document on [Paessler shop](#). Please copy this information and insert it when PRTG asks you to about your license information in the setup dialog.

 You will find the label License Owner in some documents from the Paessler shop. License Owner is the same as License Name for which you will be asked while installing PRTG or when you [change your license key](#)^[96].

 For the Trial and Freeware editions, you will receive the required license information on the Paessler webpage when you download the trial or freeware version of PRTG. For a commercial edition, use your commercial license information.

EXAMPLE OF LICENSE INFORMATION

License Name: **John Q. Public**
License Key: **P1000-FFSEJ-ZHGRD-UR1CS-U73FG-G645F-YVF1D-H8323**

During the setup process, PRTG will ask you to enter your license information. Please use copy and paste to fill out the form in the installer dialog.

- **Trial/Freeware license key:** When entering a Trial license key, you can experience unlimited functionality of PRTG during the 30-day trial period. Your installation automatically switches to a Freeware Edition afterwards. For details about how to get your free Trial edition, please see [Download PRTG](#)^[81] section.
- **Commercial license key:** You can only enter this key if you have purchased a commercial license. Your installation allows the number of sensors according to your [license](#)^[21].

Change License Key

Usually you do not need to enter a key manually after the installation to activate it, because PRTG asks for it during the install process. However, there are still scenarios where you need to change your key and activate this license. You have to provide your commercial license key, for example, if you have purchased a PRTG Commercial Edition and want to upgrade your running PRTG Freeware or Trial installation, or if you upgrade an existing commercial license to a higher edition.

- To enter a new license key, log in to the [PRTG web interface](#)^[166].
- Choose **Setup | License** from the [main menu bar](#)^[263].

Part 4: Installing the Software | 5 Enter a License Key

- <https://www.paessler.com/support/videos/prtg-basics/sensor-count>

Knowledge Base: How do I upgrade to a higher edition of PRTG?

- <https://kb.paessler.com/en/topic/4193>

4.6 Activate the Product

PRTG will activate your license automatically via the internet during the install process. Only if PRTG cannot connect to the internet directly and so cannot access the activation server, will you have to activate your license manually.

You have to complete the product activation process once to use PRTG, otherwise it will not run. Do not forget to activate your commercial license when you want to upgrade your trial or freeware installation!

 This only applies to PRTG on premises instances, not to PRTG hosted by Paessler.

Online Activation

Usually you do not need to enter a key manually after the installation to activate it, because PRTG asks for it during the install process. However, there are still scenarios where you need to change your key and activate this license. You have to provide your commercial license key, for example, if you have purchased a PRTG Commercial Edition and want to upgrade your running PRTG Freeware or Trial installation, or if you upgrade an existing commercial license to a higher edition.

- To enter a new license key, log in to the [PRTG web interface](#) ¹⁶⁶.
- Choose **Setup | License** from the [main menu bar](#) ²⁶³.
- Click **Change License Key**.
- The **Update Your License** page appears where you can activate your new license.
- Choose the activation type **Automatic (online activation with optional HTTP proxy)** if your PRTG server can connect to the internet.
 - ❗ Without internet access, you have to choose **Manual (offline activation)**. The activation process works a bit different in this case and requires manual interactions.
- Provide your license information and click **Update License**.
- PRTG will connect to the Paessler activation server via SSL on port 443 and validate your license.
- If everything works fine, you will see the message **Activation was successful** as **License Status** on top of the page.

 For details, see manual section [PRTG Status—Licensing Status and Settings: Update Your License](#) ³⁴¹⁶.

❗ The PRTG core server needs an internet connection on port 443 to activate. If a proxy connection is needed, please configure it in [Step 3: Activate](#) ³⁴¹⁷ on the **Update Your License** page. If activation fails, you can also try an offline activation.

 This option is not available in PRTG hosted by Paessler.

Offline Activation

If there is no internet connection available, you have to activate PRTG manually.

 This option is not available in PRTG hosted by Paessler.

- In the [PRTG web interface](#)¹⁶⁶, choose **Set up | License** from the [main menu bar](#)²⁶³.
- Click **Change License Key**.
- The **Update Your License** page appears where you can activate your license.
- Choose the activation type **Manual (offline activation)** if your PRTG server cannot connect to the internet.
- Provide your license information and follow the instructions in [step 3](#)³⁴¹⁶ and [step 4](#)³⁴¹⁶.
- Click **Update License**.
- If everything works fine, you will see the message **Activation was successful** as **License Status** on top of the page.

 For details, see manual section [PRTG Status—Licensing Status and Settings: Update Your License](#)³⁴¹⁶.

 If your PRTG server is offline, you need to manually activate your license after you have renewed your maintenance. This ensures you can enjoy the benefits of an active maintenance like the possibility to install updates. Your maintenance information has to fit the PRTG installer, so accomplish your offline activation before you install an update.

- <https://kb.paessler.com/en/topic/32513>

4.7 Install a PRTG Remote Probe

- ✳ Why are remote probes helpful for monitoring with PRTG? Because you can extend your monitoring.
 - Remote probes allow you to monitor different sub-networks that are separated by a firewall from your PRTG on premises core server and to keep an eye on remote locations. You can install [one or more remote probes](#)^[3703].
 - Remote probes are useful if you want to distribute monitoring load by taking it from the system running the PRTG core server and putting it on one or more remote probe machines.
 - You will need a remote probe if you want to monitor your local network using a PRTG hosted by Paessler instance.
 - Remote probes may be suitable monitoring components in several individual scenarios that depend on your custom network setup.

All you need is a computer on which you can install your remote probe. See also the [System Requirements for PRTG Remote Probes](#)^[23].

Steps to Go

To install a PRTG Remote Probe, follow these steps:

- [1. Prepare the PRTG Core Server](#)^[102]: only required for PRTG on premises 
- [2. Download the Remote Probe Installer](#)^[104]: start here if you use PRTG hosted by Paessler 
- [3. Install the Remote Probe](#)^[105]
- [4. Approve New Probe and Start Monitoring](#)^[107]

 Your PRTG on premises or PRTG hosted by Paessler installations already include a [local probe](#)^[3744] or [hosted probe](#)^[3745] on the PRTG core server. This is why you cannot additionally install a remote probe on your core server system.

 PRTG updates remote probes automatically, but in rare cases a manual probe update is required. You will receive a [ToDo ticket](#)^[230] in this case. Please follow the steps [below](#)^[104] to manually update a remote probe.

 If you have issues after the installation, see this section: [Debugging Remote Probe Connection Problems](#)^[109]

 Do you run PRTG in a cluster? Then mind this [important note](#)^[103].

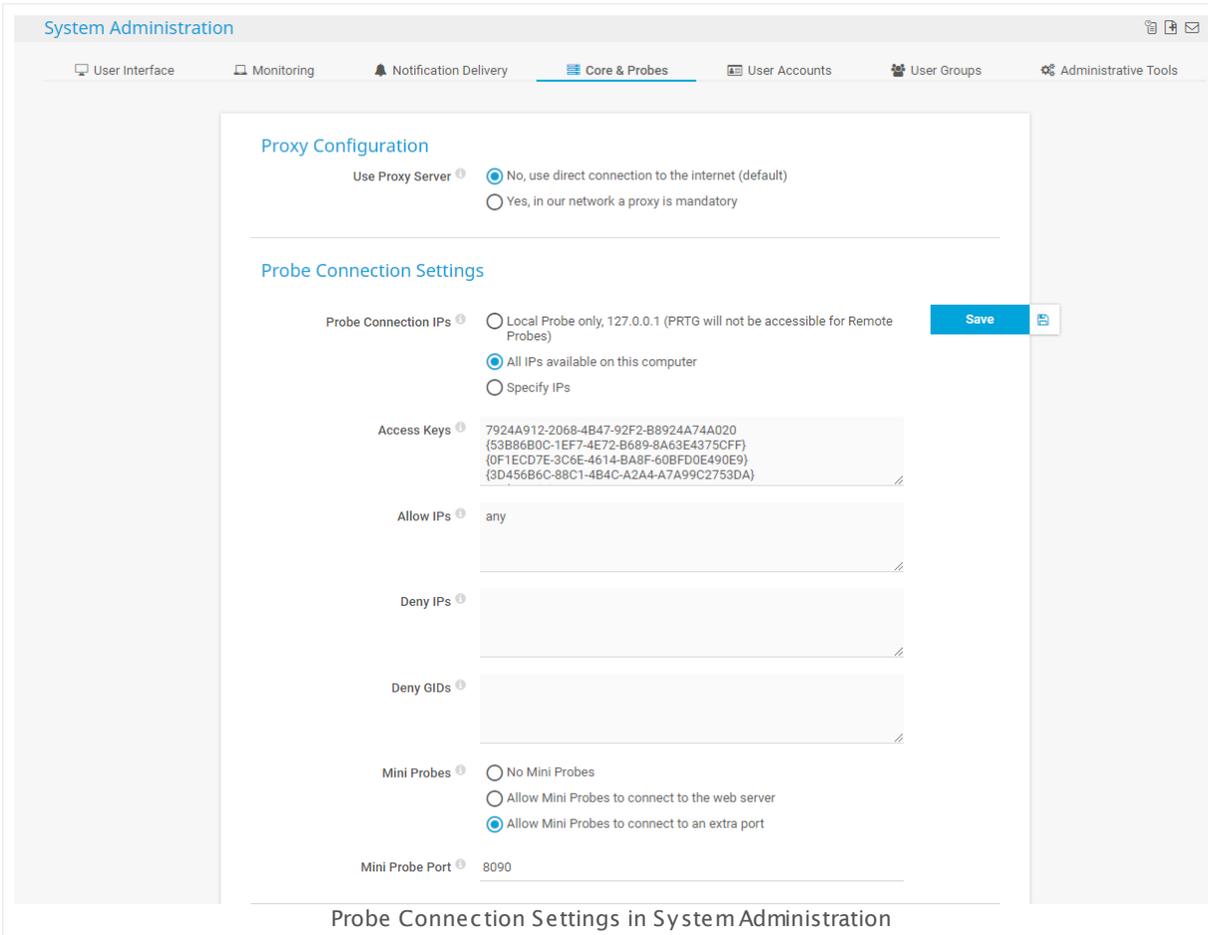

1. Prepare the PRTG Core Server

 This only applies to PRTG on premises instances, not to PRTG hosted by Paessler.

So, if you use PRTG hosted by Paessler, you can start with [2. Download the Remote Probe Installer from the PRTG Web Interface](#)^[104] right away.

 Because your remote probe needs to connect to your PRTG core server, PRTG needs to accept incoming remote probe connections. So, on PRTG on premises, prepare your PRTG server first when you want to install the remote probe.

Edit the relevant settings in [System Administration—Core & Probes](#)^[338]. From the main menu in the [PRTG web interface](#)^[168], select **Set up | System Administration | Core & Probes** to access the probes settings and go to the **Probe Connection Settings**.

The screenshot shows the 'System Administration' interface with the 'Core & Probes' tab selected. The 'Proxy Configuration' section has 'Use Proxy Server' set to 'No, use direct connection to the internet (default)'. The 'Probe Connection Settings' section is expanded, showing 'Probe Connection IPs' set to 'All IPs available on this computer'. Other settings include 'Access Keys' (a long alphanumeric string), 'Allow IPs' set to 'any', 'Deny IPs' and 'Deny GIDs' (empty), 'Mini Probes' set to 'Allow Mini Probes to connect to an extra port', and 'Mini Probe Port' set to '8090'. A 'Save' button is visible next to the 'Probe Connection IPs' setting.

System Administration

User Interface | Monitoring | Notification Delivery | **Core & Probes** | User Accounts | User Groups | Administrative Tools

Proxy Configuration

Use Proxy Server ¹ No, use direct connection to the internet (default)
 Yes, in our network a proxy is mandatory

Probe Connection Settings

Probe Connection IPs ¹ Local Probe only, 127.0.0.1 (PRTG will not be accessible for Remote Probes) **Save** 
 All IPs available on this computer
 Specify IPs

Access Keys ¹ 7924A912-2068-4B47-92F2-B8924A74A020

 (0F1ECD7E-3C6E-4614-BA8F-60BFD0E490E9)
 (3D456B6C-88C1-4B4C-A2A4-A7A99C2753DA)

Allow IPs ¹ any

Deny IPs ¹

Deny GIDs ¹

Mini Probes ¹ No Mini Probes
 Allow Mini Probes to connect to the web server
 Allow Mini Probes to connect to an extra port

Mini Probe Port ¹ 8090

Probe Connection Settings in System Administration

Step 1: Probe Connection IPs

By default, a core server accepts connections from the **Local Probe only** (IP address **127.0.0.1**). This setting is the most secure setting, but it does not allow any remote probe to connect to your PRTG core server.

To accept remote probes, choose one of the following settings:

- **All IPs available on this computer:** Any IP on your core server system accepts incoming probe connections.
- **Specify IPs:** Specify selected IP addresses that accept incoming connections.

Step 2: Allow IPs

In the **Allow IPs** field, you can enter the IP address of the computer you want to install a remote probe on. To make things easier, you can also enter the word **any**. Any will set the PRTG core server to accept remote probes connecting from any IP address.

- ❗ If you use **any**, make sure you write the word in lower case only! Any other variations will not be valid!

Changing other settings is not required. For details about the fields for **Access Keys**, **Deny IPs**, and **Deny GIDs** see section [System Administration—Core & Probes](#).

When you are done, click **Save** to save your settings.

- ❗ If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears that asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the [Enterprise Console](#), or of [PRTG Apps for Mobile Network Monitoring](#) will be disconnected and reconnected.

- ❗ To edit the core-probe connection settings you can also use the [PRTG Administration Tool](#) on your core server.

PRTG Cluster and Remote Probes Outside the LAN

- ⚠ If you use the [Clustering](#) feature of PRTG and you want to run remote probes outside your local network, you have to make sure your cluster nodes and the addresses they use are reachable from the outside! Check your cluster node settings under [System Administration—Cluster](#) before installing a remote probe outside your local network. Enter addresses (DNS names or IPs) that are valid for both cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. Remote probes outside your LAN cannot connect to your cluster nodes if they use local addresses.

- 📄 If you already have a remote probe installed outside your LAN and the probe is disconnected because of this, please follow these steps:

1. Uninstall the current remote probe.
2. Update the [cluster node settings](#) with addresses that are reachable from outside your LAN.
3. Restart your PRTG core servers.

4. Install the remote probe again. It will then obtain the IP address or DNS name entries that it can reach.

See also section [Failover Cluster Configuration—Remote Probes in Cluster](#).

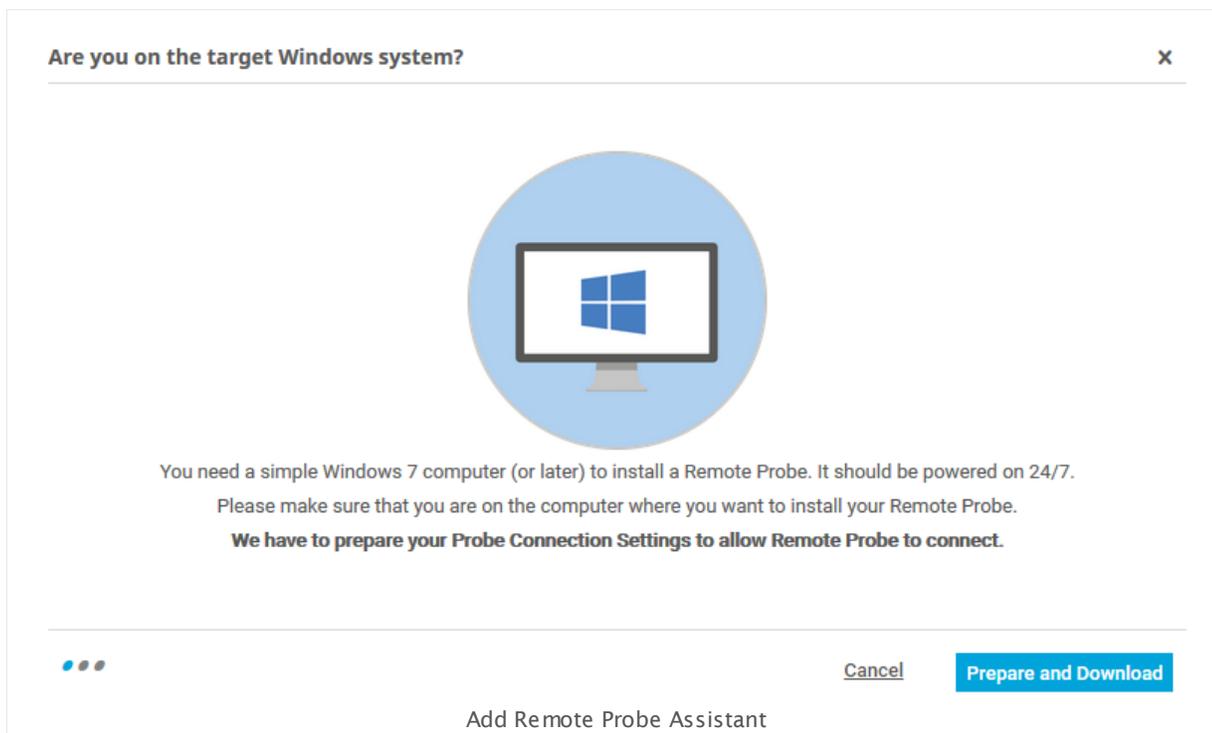

2. Download the Remote Probe Installer from the PRTG Web Interface

On the computer on which you want to install a remote probe, [log in to the PRTG web interface](#). From the [main menu bar](#), select **Set up | Downloads and Tools | Remote Probe Installer**. Click **Add Remote Probe** to start the installation assistant. In the appearing dialog window, click **Prepare and Install** to start the download. Save the setup program to your local disk.

The **Add Remote Probe** button is also available in the device tree.

Using the installation approach with the assistant, PRTG will guide you through the install process. If you **Download the Remote Probe Installer directly**, you have to install the remote probe without the assistant.

If you connect your remote probe to a PRTG on premises instance, [prepare](#) your **Probe Connection Settings** first.

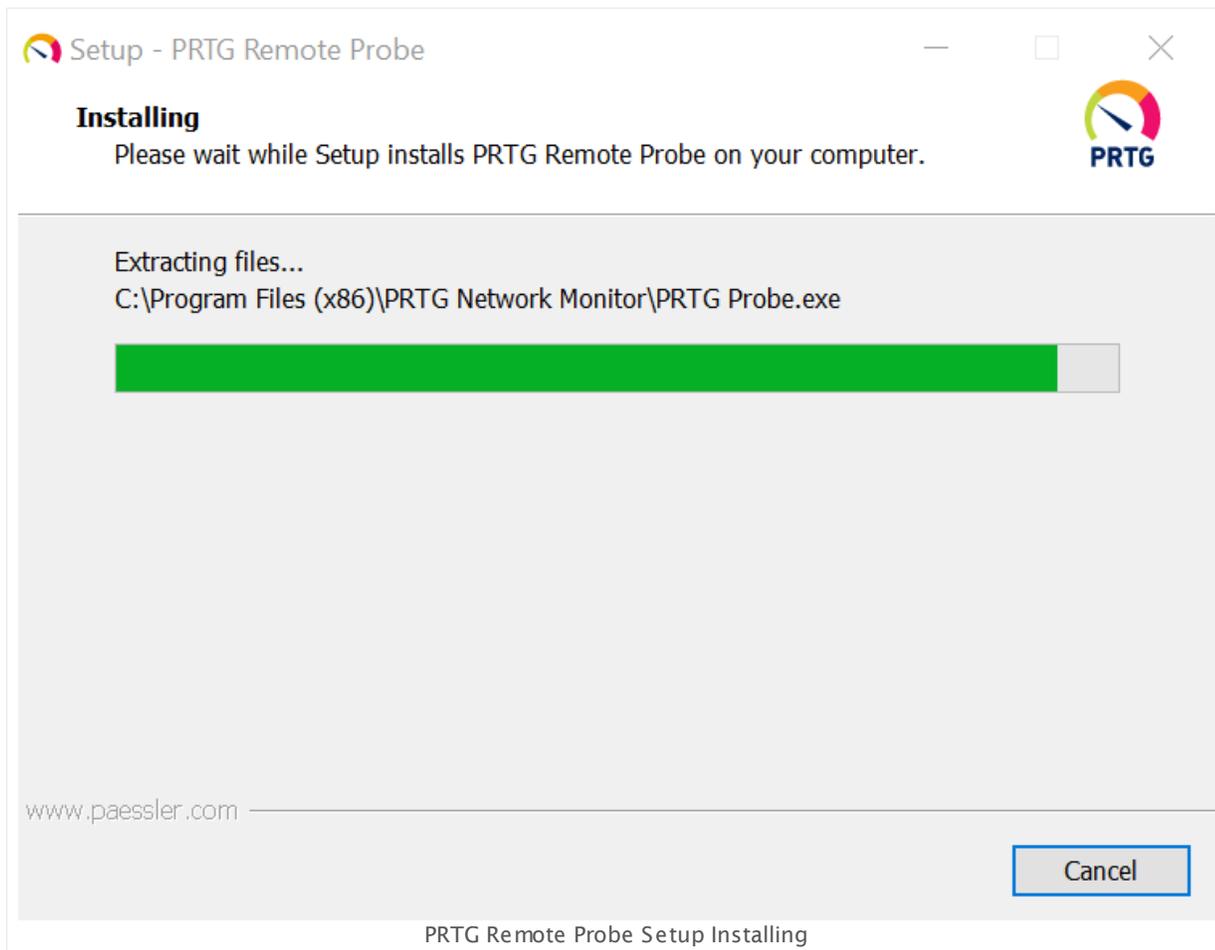

The version numbers of core and probe services must match. PRTG updates probes automatically when a new version is installed on the PRTG core server. If PRTG advises you to update your remote probe manually, open a web browser on your remote computer and download the remote probe installer as described in this manual section.

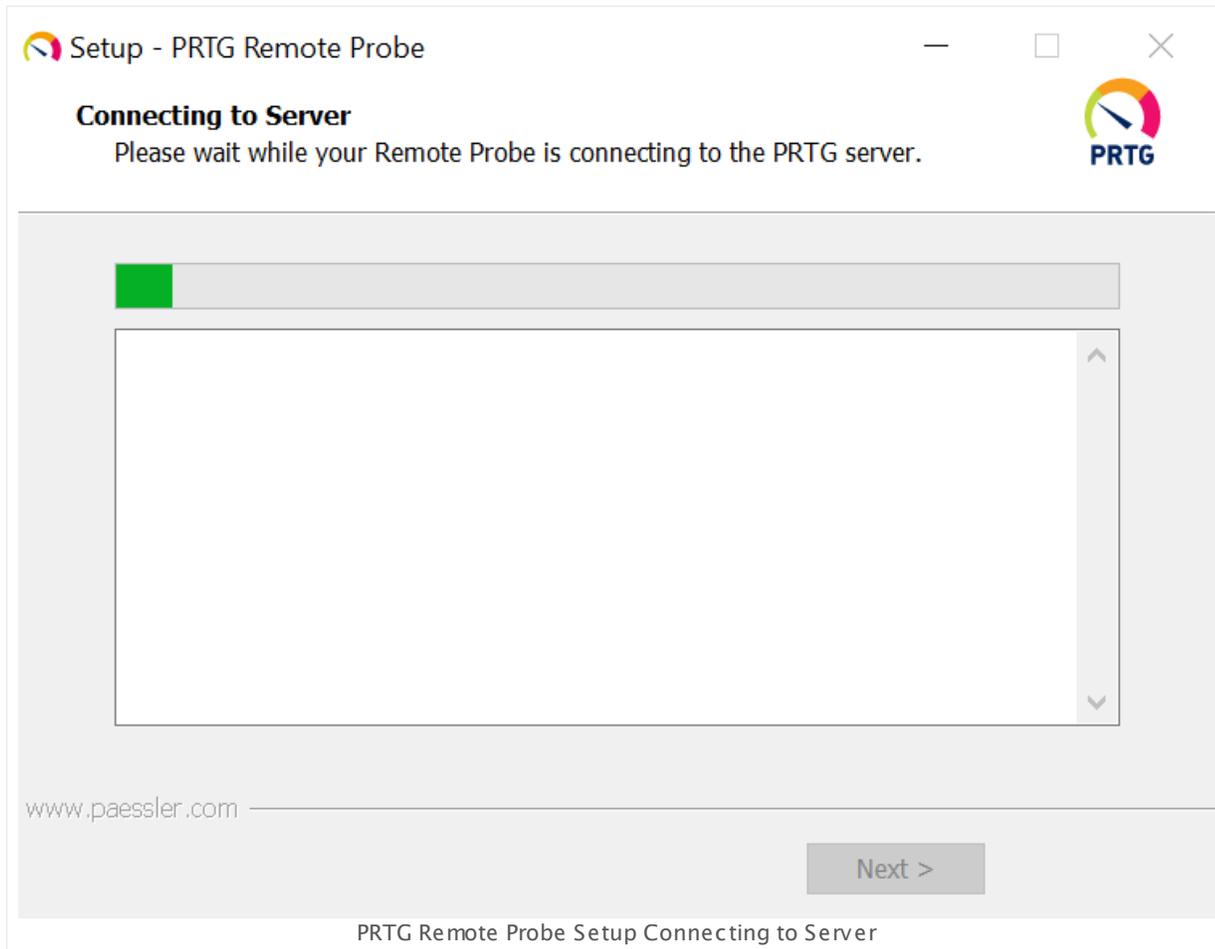

- i** The PRTG core system already includes a local probe or hosted probe service. This is why you cannot additionally install a remote probe on that system.

3. Install the Remote Probe

- Execute the setup program that you have just downloaded.
- Confirm the Windows User Account Control dialog with **Yes** to allow the installation. The usual software installation wizard will guide you through the installation process.
- Click **Install** to start the installation process of your remote probe.

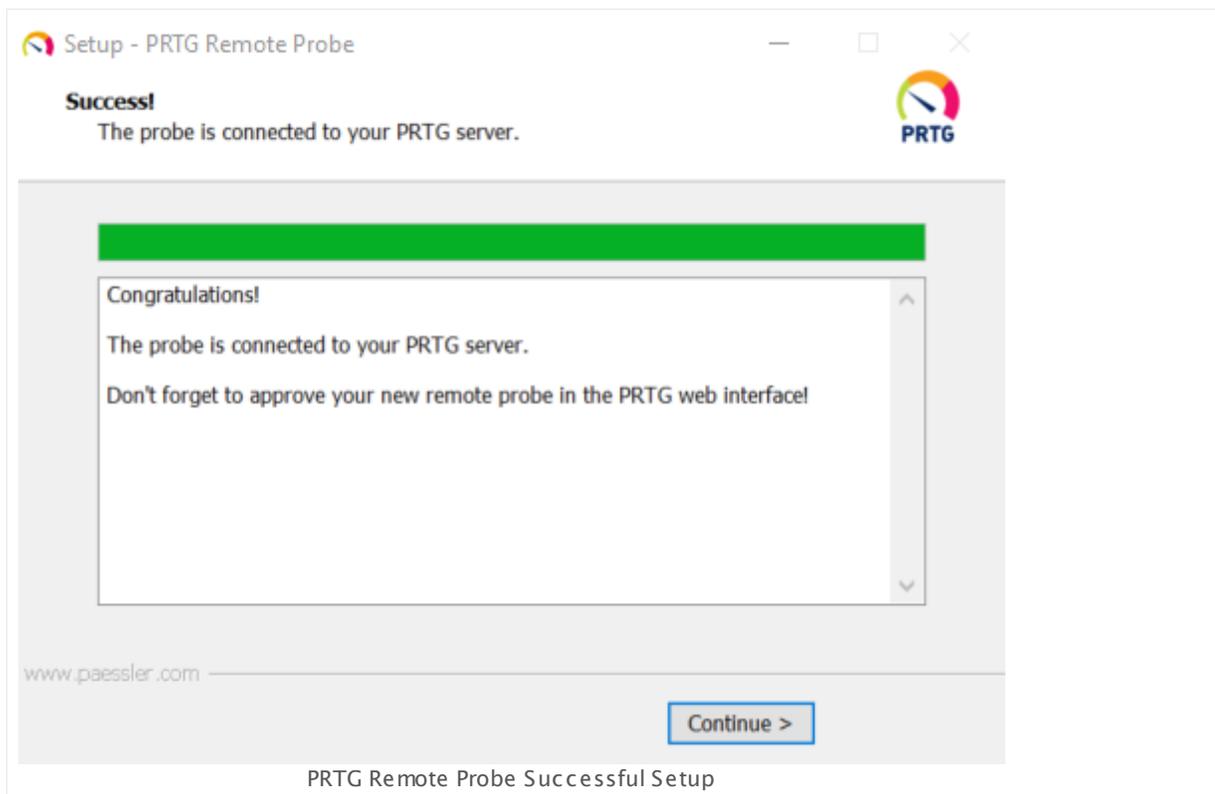

Please wait until the installation is completed. The remote probe will automatically connect to your PRTG core server.

If the remote probe successfully connects to your PRTG core server, you can complete the setup of your new remote probe.

i To allow your new remote probe to connect to a PRTG hosted by Paessler instance, PRTG automatically sets the **Allow IPs** field in [System Administration—Core & Probes](#) to **any**. You can also use **any** for PRTG on premises, but we recommend that you use this setting in intranets only. If **any** is not an option for you, cancel it in the **Allow IPs** field and enter the IP address of your remote probe instead.

Click **Continue** to finish the remote probe installation.

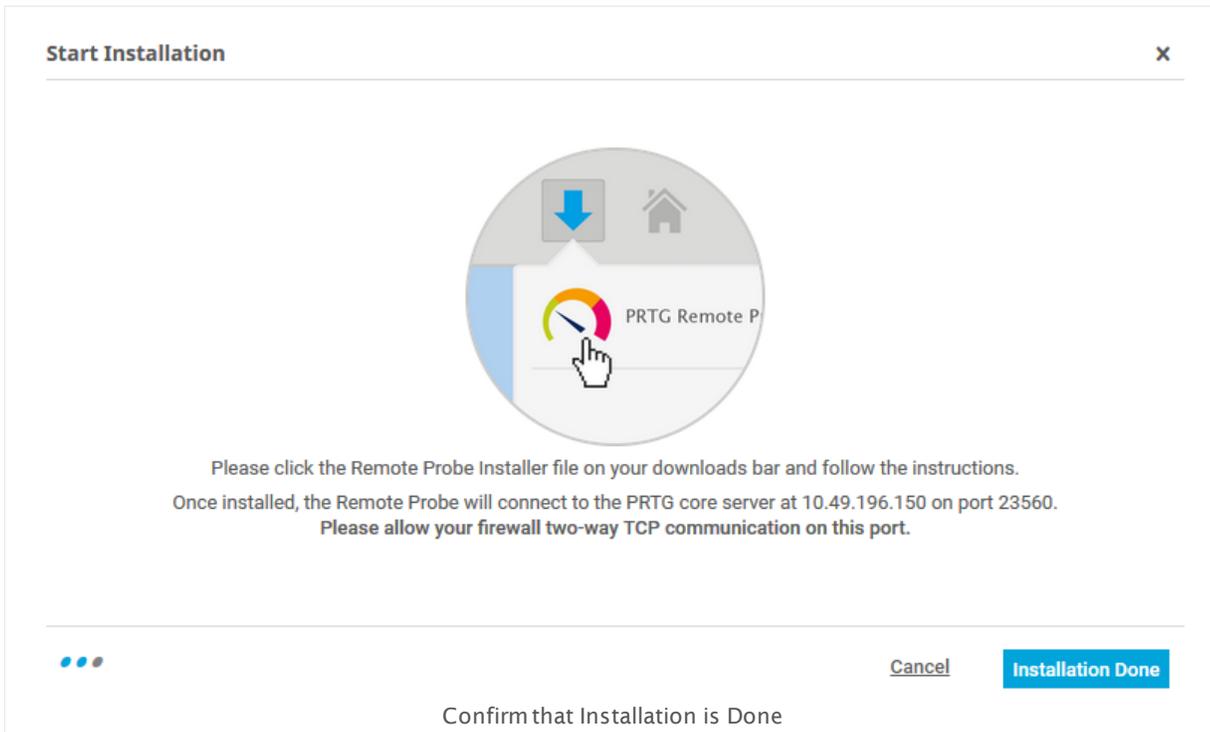

Finally, click **Finish** to exit the installation wizard. The remote probe is now installed on your computer as a Windows service.

Approve the New Probe and Start Monitoring

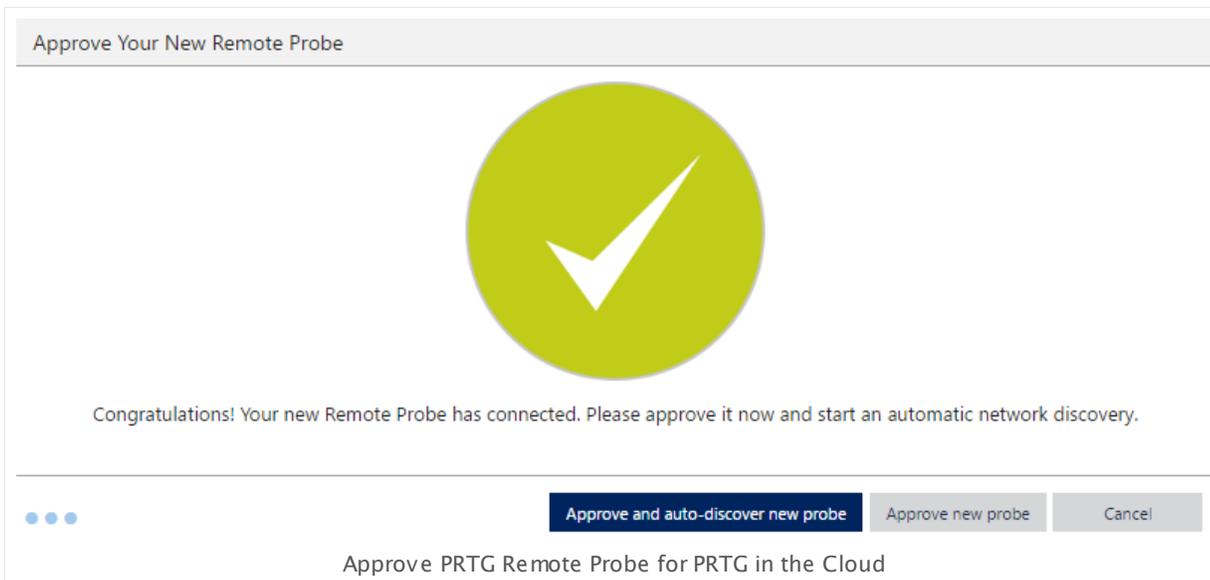

Remember to log in to the PRTG web interface, confirm that the installation is done, and acknowledge your new remote probe!

In the installation assistant, click **Installation Done**.

Part 4: Installing the Software | 7 Install a PRTG Remote Probe

☁ If you successfully installed the remote probe from a PRTG hosted by Paessler installation, you will see the following dialog box.

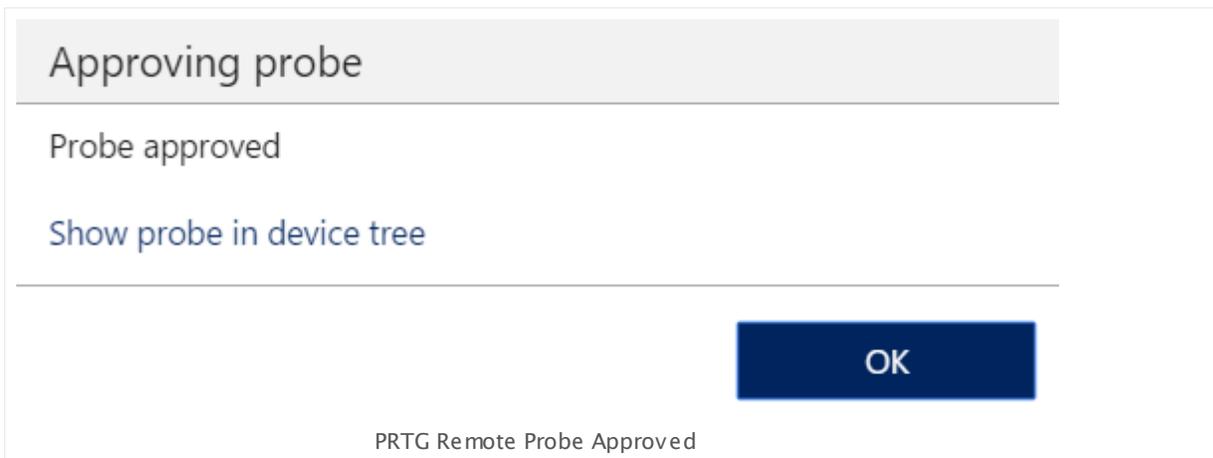

Click **Approve and auto-discover new probe** to include your new remote probe device and network in your device tree and to start the PRTG [auto-discovery](#)²⁸². It helps you discover devices and automatically create suitable sensors. Optionally, you can also choose to only approve your remote probe without starting an auto-discovery by clicking **Approve new probe**. The probe now appears as a new object in your device tree.

For unwanted probe connections, you can click **Deny new probe**. Note that this does not uninstall the remote probe, but only prohibits the probe from connecting to the PRTG core server.

i If you deny or remove a remote probe, PRTG will automatically add this device's global ID (GID) to the **Deny GIDs list** in [System Administration—Core & Probes](#)^[3368]. Future probe connections from this device will be denied automatically.

i Denying the remote probe in the PRTG device tree does **not** uninstall the probe, but only denies access to the core server. The probe will continue to run on the target system until you uninstall it manually.

In the **Approving probe** dialog, click **OK** to exit the dialog, or click **Show probe in device tree** to open the new probe in the device tree directly.

Once approved, PRTG automatically creates a set of sensors for the probe to ensure you can detect bottle-necks on the probe system immediately. We recommend that you keep these sensors. You can now create groups, devices, and sensors for monitoring via the new probe.

i You do not have to approve remote probes after updates.

When a new probe connects to the core server for the first time, you will receive a new [ToDo ticket](#)^[2301] in the PRTG ticket system.

Debugging Remote Probe Connection Problems

If you have trouble with your core probe connection, make sure that you meet the following requirements:

- The IP address of the computer on which you want to install a remote probe is not listed in the **Deny IPs** field in [System Administration—Core & Probes](#)^[3368].
- On your PRTG core server side, the default port **23560** for probe connections is not blocked by firewall rules, and, on the probe side, the TCP port **23560** is open for outgoing connections as well.

Part 4: Installing the Software | 7 Install a PRTG Remote Probe

 If you need to set a different port (not recommended), see this Knowledge Base article: [How can I customize PRTG's ports for core-probe-connections?](#)

- You can also take a look at the probe's logfiles. The probe process writes logfiles with a file name in the format **PRTG Probe Log (x).log**. Open the one with the most recent date.

For a correct connection the probe log should look similar to this:

```
11/6/2017 1:21:58 PM PRTG Probe V17.4.36.3253
11/6/2017 1:21:58 PM System time zone: (UTC+01:00) Amsterdam, Berlin, Bern, Rome, Stockholm, Vienna
11/6/2017 1:21:58 PM libeay32.dll=1.0.2.11
11/6/2017 1:21:58 PM ssleay32.dll=1.0.2.11
11/6/2017 1:21:58 PM PRTG Probe "example-DNS" starting on "example-DNS" (GID={AAAA1111-22BB-33CC-DD44-EEEE
11/6/2017 1:21:58 PM Memory Manager: NexusMM4
11/6/2017 1:21:58 PM OS: Microsoft Windows 10 Enterprise (10.0 Build 15063), 4 CPUs (Quad x64 Model 78 Ste
11/6/2017 1:21:58 PM Data Path: C:\ProgramData\Paessler\PRTG Network Monitor\
11/6/2017 1:21:58 PM System Path: C:\Program Files (x86)\PRTG Network Monitor\
11/6/2017 1:21:58 PM Local IP: 0.0.0.0
11/6/2017 1:21:58 PM Core Server IP: example-DNS.exampledomain.com
11/6/2017 1:21:58 PM Core Server Port: 23560
11/6/2017 1:21:58 PM SSL Enabled
11/6/2017 1:21:58 PM Probe GID: {AAAA1111-22BB-33CC-DD44-EEEEEE555555}
[...]
11/6/2017 1:21:58 PM Start Connection
11/6/2017 1:21:58 PM Start Done
11/6/2017 1:21:58 PM (14608):Initializing WMIConnectionPool
11/6/2017 1:21:58 PM (14608):WMIConnectionPool maximum number of concurrrent establishing is set to: 20
11/6/2017 1:22:03 PM Connect from to example-DNS.exampledomain.com:23560
11/6/2017 1:22:03 PM TCP connected from 10.49.12.51:55199 to example-DNS.exampledomain.com:23560
11/6/2017 1:22:03 PM State changed to connected (example-DNS.exampledomain.com:23560)
11/6/2017 1:22:03 PM Reconnect
11/6/2017 1:22:04 PM Connected
11/6/2017 1:22:10 PM Send Login
11/6/2017 1:22:10 PM Local: 11/6/2017 1:22:10 PM UTC: 11/6/2017 12:22:10 PM
11/6/2017 1:22:10 PM MarkUnused
11/6/2017 1:22:10 PM Login OK: Welcome to PRTG
```

If the connection fails, for example due to an incorrect **Access Key**, or due to incorrect **IP** settings (see [Prepare the PRTG Core Server](#)^[102]), you will see:

```
11/6/2017 1:42:02 PM Try to connect...
11/6/2017 1:42:02 PM Connected to 10.0.2.167:23560
11/6/2017 1:42:07 PM Login NOT OK: Access key not correct!
```

If you need to adjust any probe settings for the connection to the PRTG core server, use the [PRTG Administration Tool](#)^[3387] on your remote probe system.

Remote Probe Settings in PRTG Administrator

In the **Connection to PRTG Core Server** tab, you can then edit the following settings:

- **Server:** Enter the IP address or DNS name of the core server the remote probe will connect to. If Network Address Translation (NAT) is used, this has to be the IP address that is externally visible, because the remote probe will connect from outside your network.
- **Probe Access Key** and **Confirm Access Key:** Enter the access key that the probe will send to the core server. This access key has to be defined on the PRTG core server in [System Administration—Core & Probes](#)^[3388]. Make sure the key phrases match exactly.

Remember to always click **Save & Close** to confirm your settings and to (re)start the probe service.

 For more detailed information about these settings, see section [PRTG Administration Tool](#)

More

Knowledge Base: How can I customize PRTG's ports for core-probe-connections?

- <https://kb.paessler.com/en/topic/65084>

4.8 Install the Enterprise Console

The Enterprise Console is already included in a [PRTG core server installation](#)^[89] (PRTG on premises only) You can install additional Enterprise Consoles on other computers.

☁ PRTG hosted by Paessler does not support connections from the Enterprise Console. If you want to use it, please connect the Enterprise Console to a PRTG on premises instance.

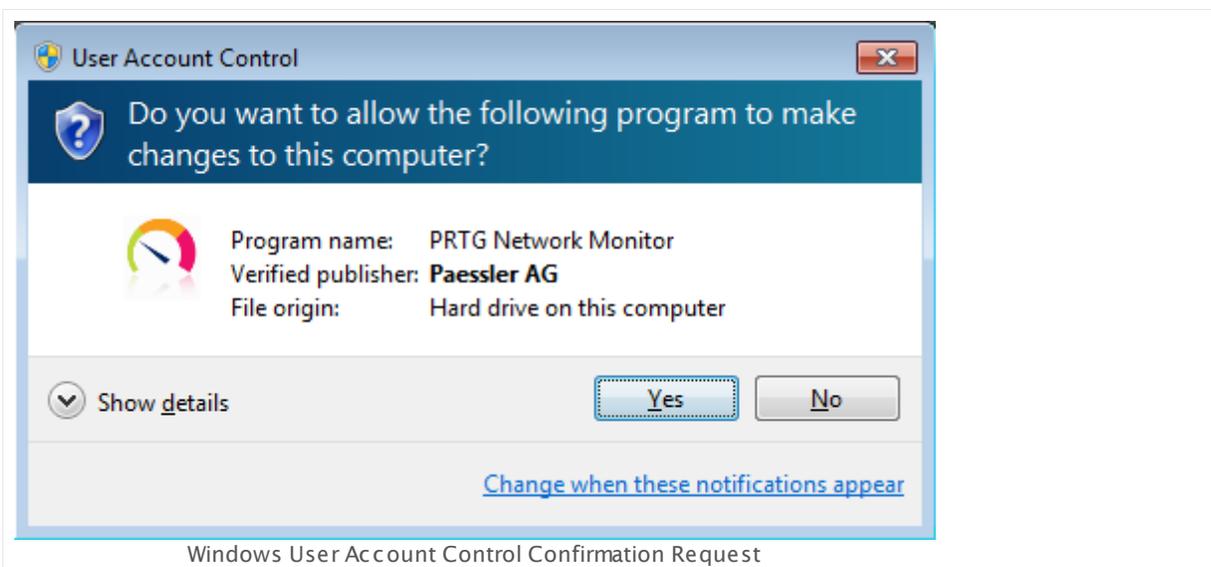

Download Enterprise Console from the Web Interface

The version of the Enterprise Console (EC) has to match the PRTG core server version you want to connect to. It can connect to a PRTG server where the third entry in the version number is equal to the third entry of the EC version number. For example, EC version 15.1.16.2023 can connect to any PRTG server with version 15.1.16.xxxx.

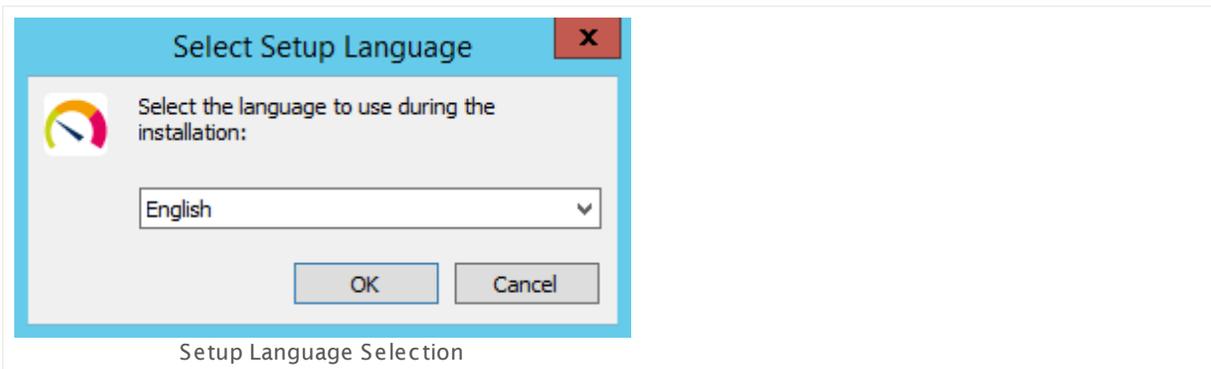

1. From the computer you want to install the Enterprise Console on, connect to the [Ajax](#)^[166] web interface of PRTG.
2. On the [login screen](#)^[168] of the web interface, enter login name and password and click **Download Client Software (optional, for Windows, iOS, Android)**.
3. You will see the [downloads page](#)^[3420] where you can download the EC.
4. Click **Download: PRTG Enterprise Console** and save the setup program to the local hard disk drive.

Install Enterprise Console

Execute the setup program `PRTG_Enterprise_Console_Installer.exe` that you have downloaded.

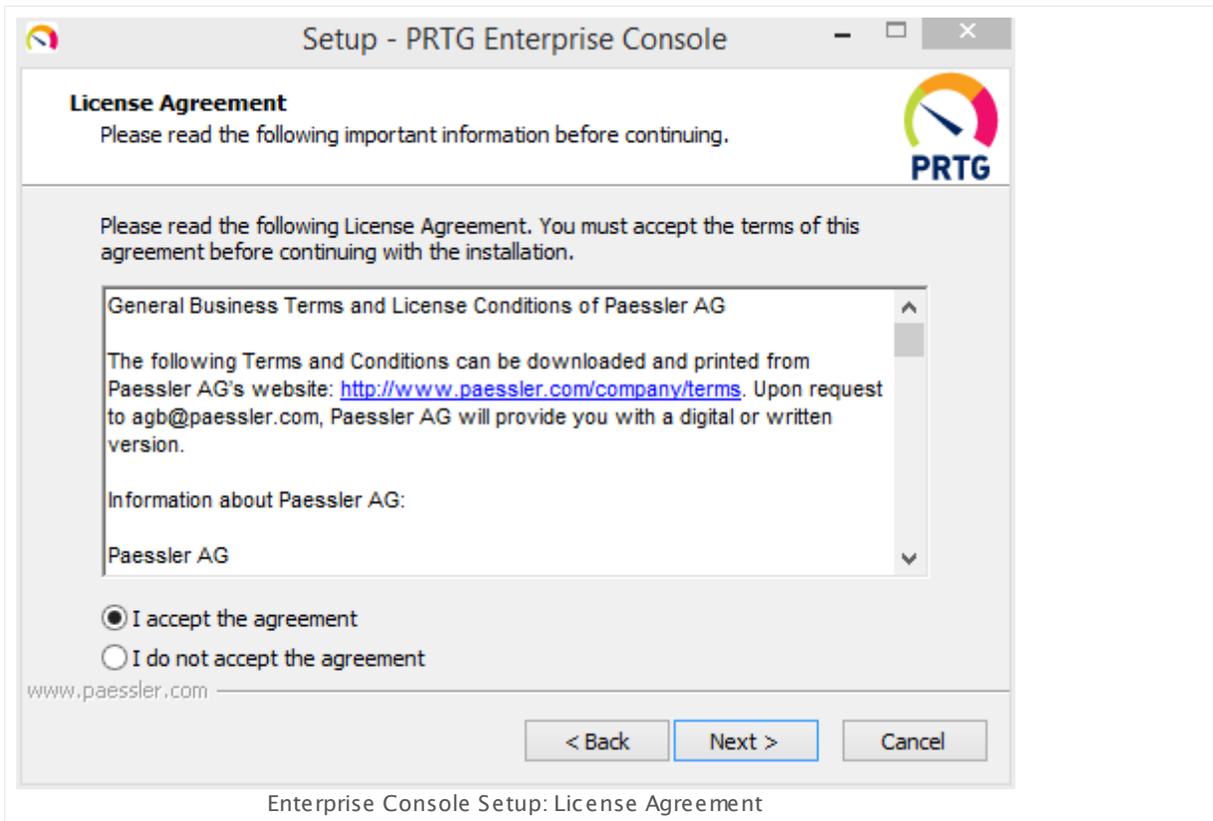

Confirm the question of the **Windows User Account Control** with **Yes** to allow the program to install. The usual software installation assistant will guide you through the installation process.

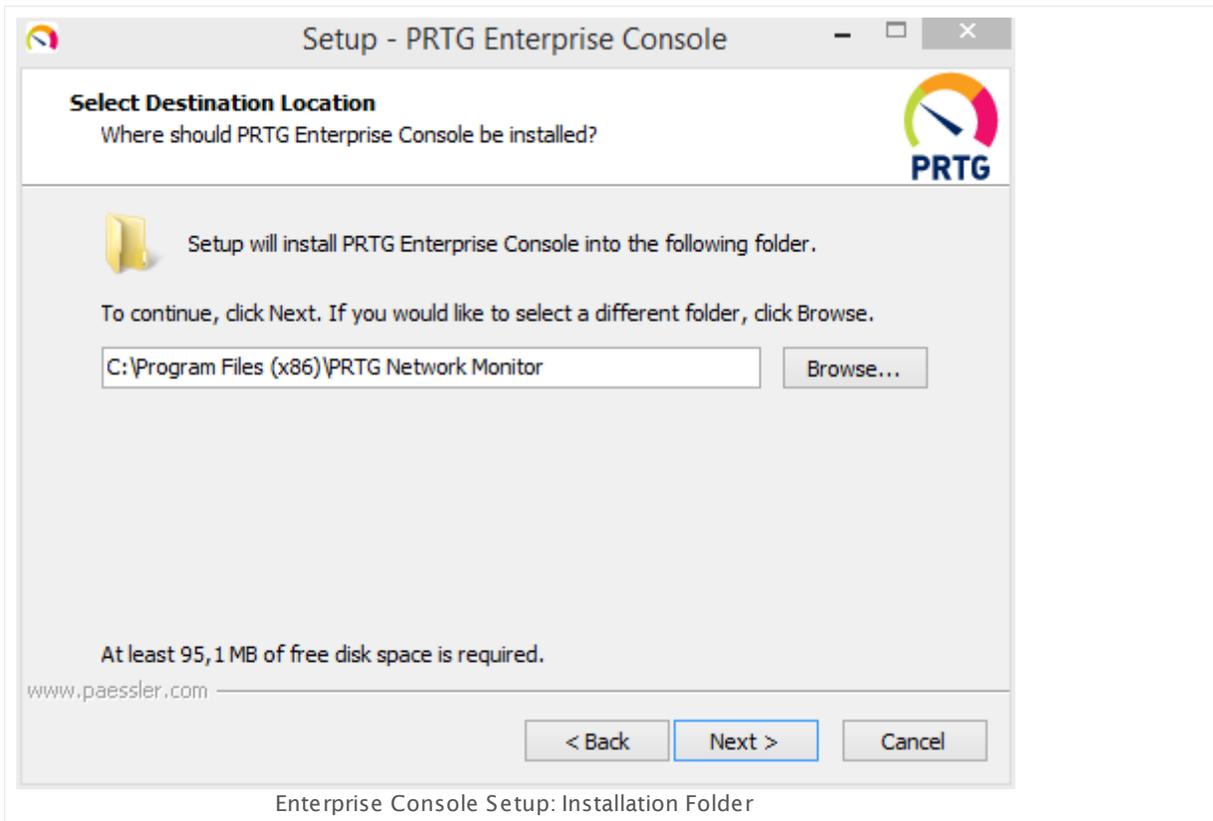

Select a language for the program and click the **OK** button. The available language options depend on both your Windows version and the setup file.

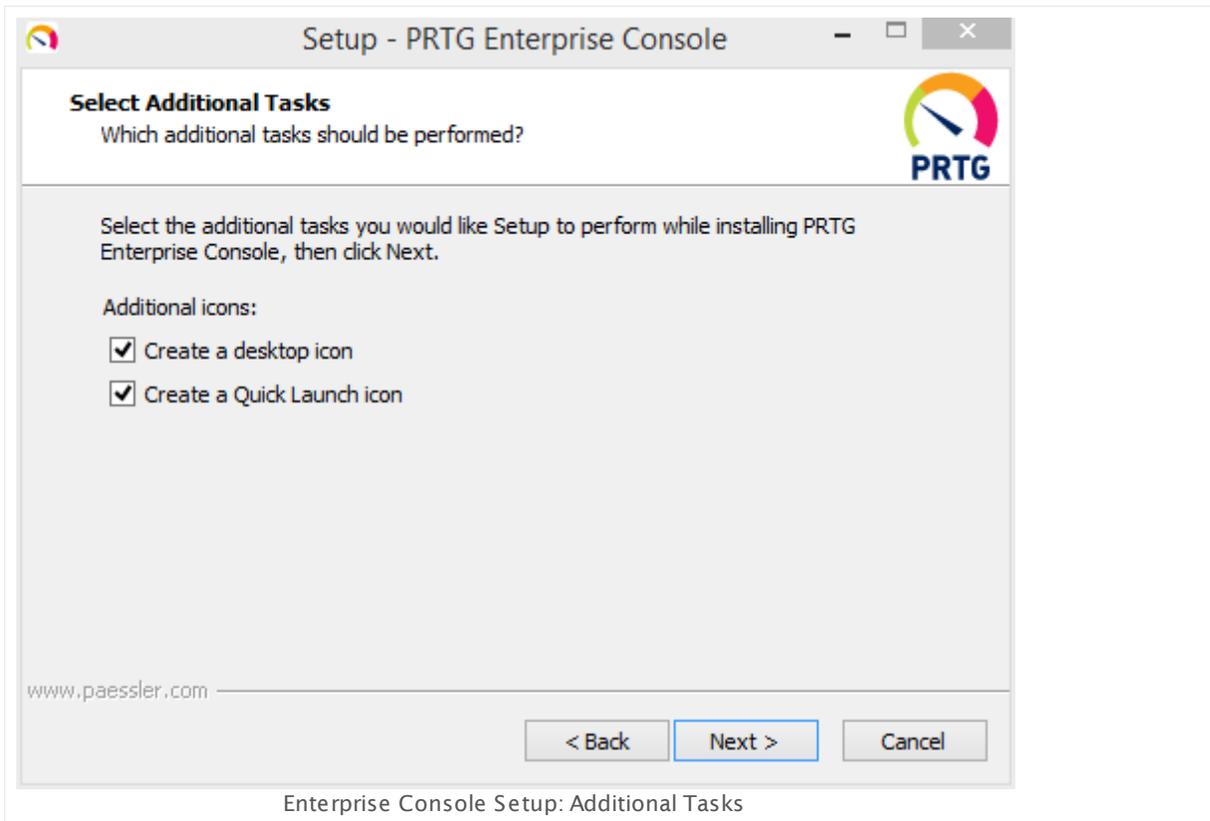

Click **Next** to walk through the wizard.

After accepting the license agreement, you can choose the folder you wish to install the software in. We recommend that you use the default value.

Select the start icons you want to create for the Enterprise Console. We recommend that you use the default value.

Click **Next** to copy the necessary files to the disk of your computer.

After installation, click **Finish** to start the Enterprise Console. Enter [the settings for the connection to your PRTG server](#) ³⁴³¹ in the appearing dialog.

More

See the section [Enterprise Console](#) ³⁴³⁰ for more information on how to use this Graphical User Interface (GUI).

4.9 Uninstall PRTG Products

The uninstall process has six steps—regardless of if you are uninstalling an entire PRTG Network Monitor installation, a single Enterprise Console installation, or a PRTG Remote Probe installation. Use the Windows uninstall routines to remove the PRTG software from your system.

Step 1

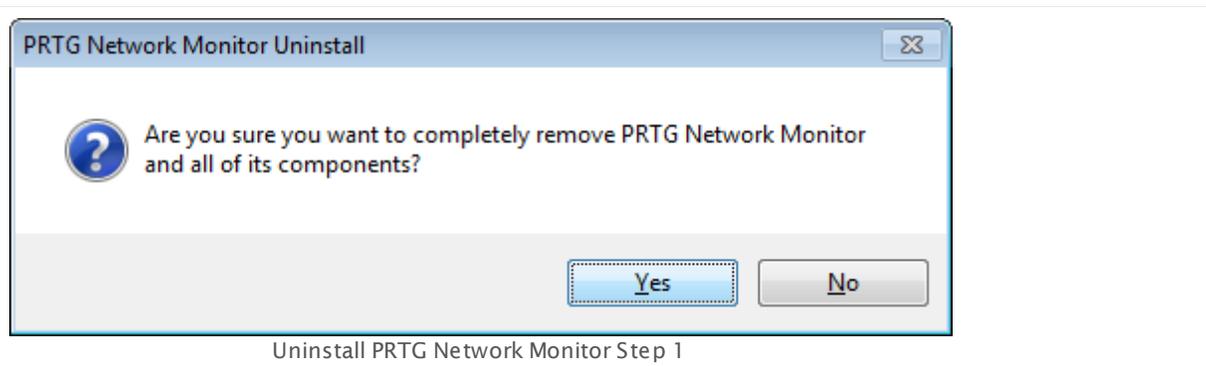

From the Windows Start Menu, run **Uninstall PRTG Network Monitor**, **Uninstall PRTG Enterprise Console**, or **Uninstall PRTG Remote Probe**, or open your Windows Control Panel and choose the desired entry in the **Programs** section. Depending on the installed products, not all uninstall programs are available.

Step 2

If asked, confirm the question of the Windows User Account Control with **Yes** to allow the program to uninstall. The software uninstall dialog will guide you through the uninstall process.

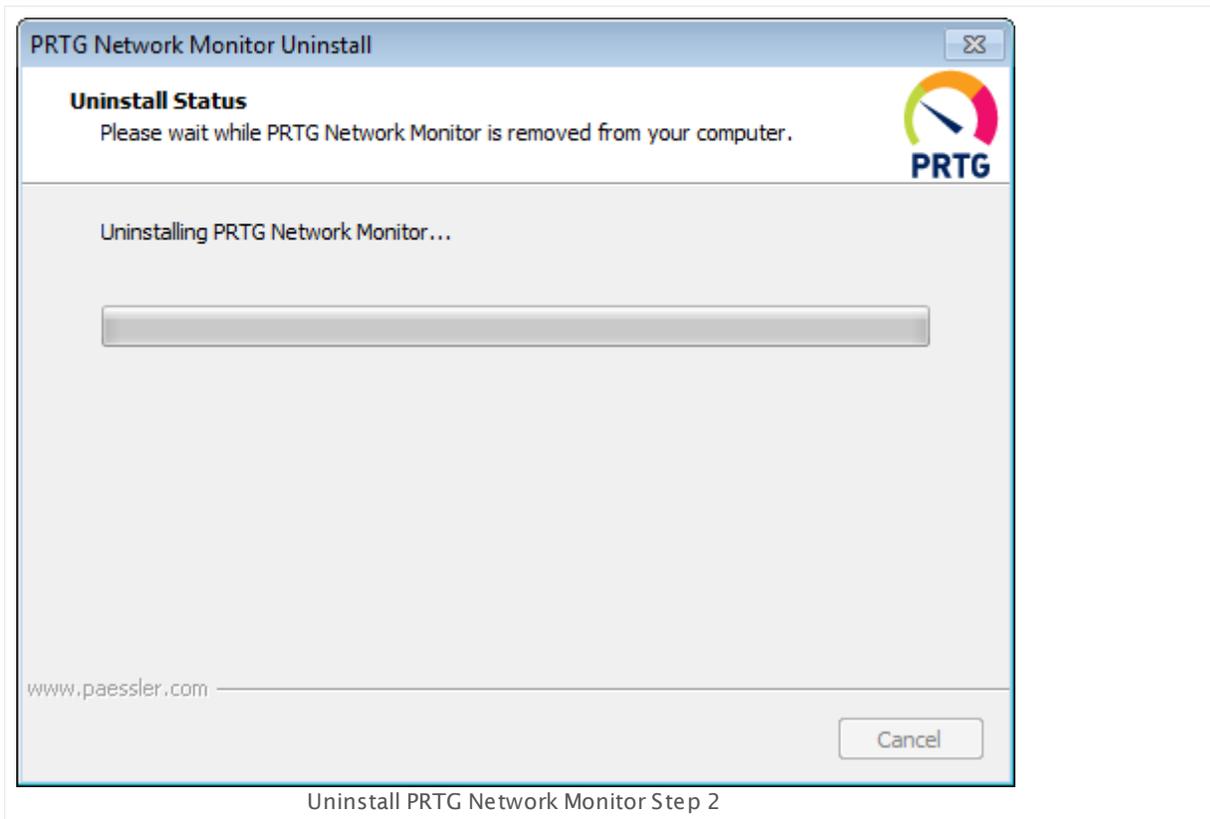

Step 3

Confirm the removal of the software by clicking the **Yes** button.

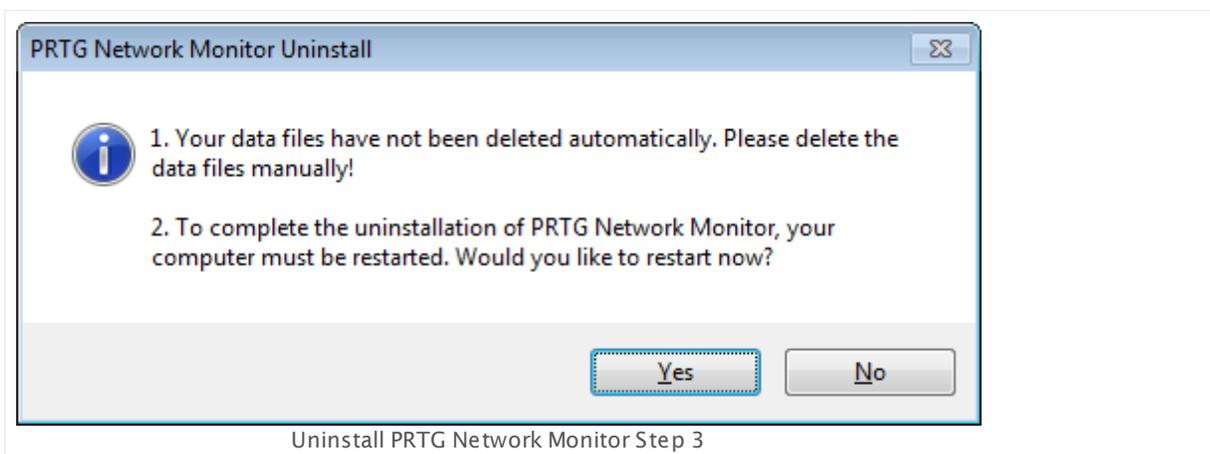

Step 4

Wait while the software is being removed.

Step 5

Confirm a system restart by clicking the **Yes** button.

Step 6

After system restart, the software is removed, but there still will be some custom data in the PRTG program folder. If you have uninstalled an entire PRTG Network Monitor installation or a remote probe installation, your monitoring data is still stored on the system. To completely remove all PRTG data, delete the **PRTG Network Monitor** program folder as well as the **Paessler\PRTG Network Monitor** folder in your data path.

 For more information on where the data is stored see the [Data Storage](#)  section.

More

Knowledge Base: Can we remotely and silently uninstall a Remote Probe?

Part 5

Understanding Basic Concepts

5 Understanding Basic Concepts

There is a number of basic concepts that are essential for understanding the functionality and ease of use of PRTG Network Monitor. We have made using our software as easy as possible. Setting it up for the first start and getting first monitoring results happens almost [automatically](#) ^[52].

Nevertheless, there are some basic principles we would like to explain to you. Please read these sections carefully to understand the underlying workflow like architecture of the monitoring system, hierarchy of objects, settings inheritance, and notifying. You will be able to enhance your monitoring experience permanently as soon as you know the basic principles of PRTG!

5.1 Architecture and User Interfaces

What is PRTG Network Monitor and how does it work? If you are new to PRTG or simply want to check if you got PRTG right, you are welcome on this page! We are glad to introduce PRTG and its components to you.

Overview

You can classify the PRTG Network Monitor components in three main categories: System parts, control interfaces, and a basic administration interface.

TYPE	PART OF PRTG
System Parts	<p>Core Server¹²⁶</p> <p>This is the central part of a PRTG installation and includes data storage, web server, report engine, a notification system, and more. The core server is configured as a Windows service that runs permanently.</p>
	<p>Probe(s)¹²⁶</p> <p>The part of PRTG that performs the actual monitoring. There are local probes, remote probes, and cluster probes in PRTG on premises, and there are hosted probes and remote probes in PRTG hosted by Paessler. All monitoring data is forwarded to the central core server. Probes are configured as Windows services that run permanently.</p>
	<p> We assume that all computers on which the PRTG core server with its local probe or any remote probes run are secure. It is every administrator's responsibility to make sure that only authorized persons can access these machines. For this reason we highly recommend that you use dedicated machines for your PRTG system parts.</p>
User Interfaces	<p>PRTG Web Interface¹⁶⁶</p> <p>The Ajax-based web interface is used for configuration of devices and sensors, as well as for the review of monitoring results. Also system administration and user management are configured here.</p>
	<p>Enterprise Console³⁴³⁰</p> <p>A native Windows application as alternative to the web interface to manage your monitoring. With the Enterprise Console, you can connect to different independent PRTG core server installations and review their data at a glance!</p>
	<p>PRTG Apps for Mobile Network Monitoring³⁴⁸⁴</p> <p>Monitor your network on the go with PRTG and apps for iOS and Android.</p>

TYPE	PART OF PRTG
System Administration Program	<p>PRTG Administration Tool on Core Server System³⁵⁶¹  </p> <p>Used to configure basic core server settings in PRTG on premises, such as administrator login, web server IPs and port, probe connection settings, cluster mode, system language, and more.</p> <p>PRTG Administration Tool on Remote Probe System³⁵⁸⁷ </p> <p>Used to configure basic probe settings such as name of the probe, IP and server connection settings, and more.</p>

Core Server

The core server is the heart of your PRTG system and performs the following processes:

- Configuration management for monitoring objects (for example, servers, workstations, printers, switches, routers, virtual machines, and many more)
- Management and configuration of the connected probes
- Cluster management
- Database for monitoring results
- Notification management including a mail server for email delivery
- Report generator and scheduler
- User account management
- Data purging (culling data that is older than 365 days, for example)
- Web server and API server

In a PRTG on premises [cluster](#)¹³⁰¹, the current master node is responsible for all of these tasks.

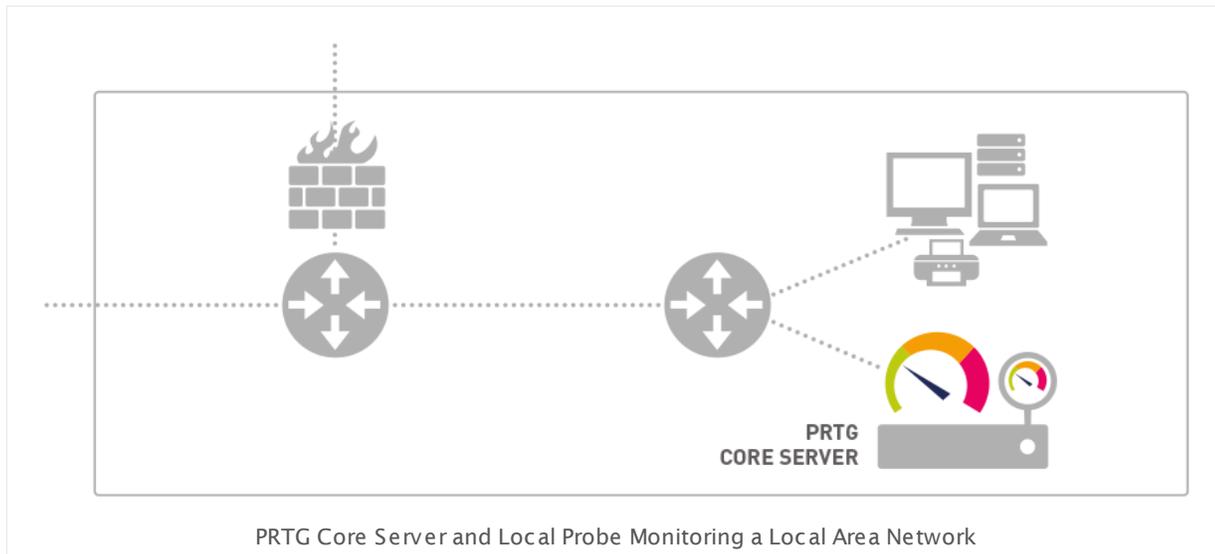

The built-in, fast, and secure web server (no additional IIS or Apache is required) supports HTTP as well as secure HTTPS (via SSL). It serves the web interface when you access it via a browser and also answers PRTG Application Programming Interface (API) calls (for example, for user scripts or the Enterprise Console).

-  Core server and probe(s) are configured as Windows services that are permanently run by the Windows system without the requirement for a logged-in user.

Probe(s)

On a probe, PRTG performs the actual monitoring via the sensors created on a device (for example, computer, router, server, firewall). The probe receives its configuration from the core server, runs the monitoring processes, and delivers monitoring results back to the core server.

- On every system running a PRTG on premises core server, there is always a local probe running on the same machine.
- ☁ In PRTG hosted by Paessler instances, there is always a hosted probe running on the PRTG core server system that we host for you.

The actual monitoring is performed by PRTG probe processes that run on one or more computers.

- ⓘ Core server and probe(s) are configured as Windows services that are permanently run by the Windows system without the requirement for a logged-in user.

Local Probe in PRTG on premises

During installation of PRTG on premises, the system automatically creates the **Local Probe**. In a single-probe installation—which is the default setup—the local probe performs all monitoring.

The PRTG on premises core server with the local probe inside the corporate LAN (bottom-right in the figure above) is able to monitor services and servers in the entire Local Area Network (LAN). In PRTG hosted by Paessler you need at least one [remote probe](#)^[101] installation in your network for this purpose.

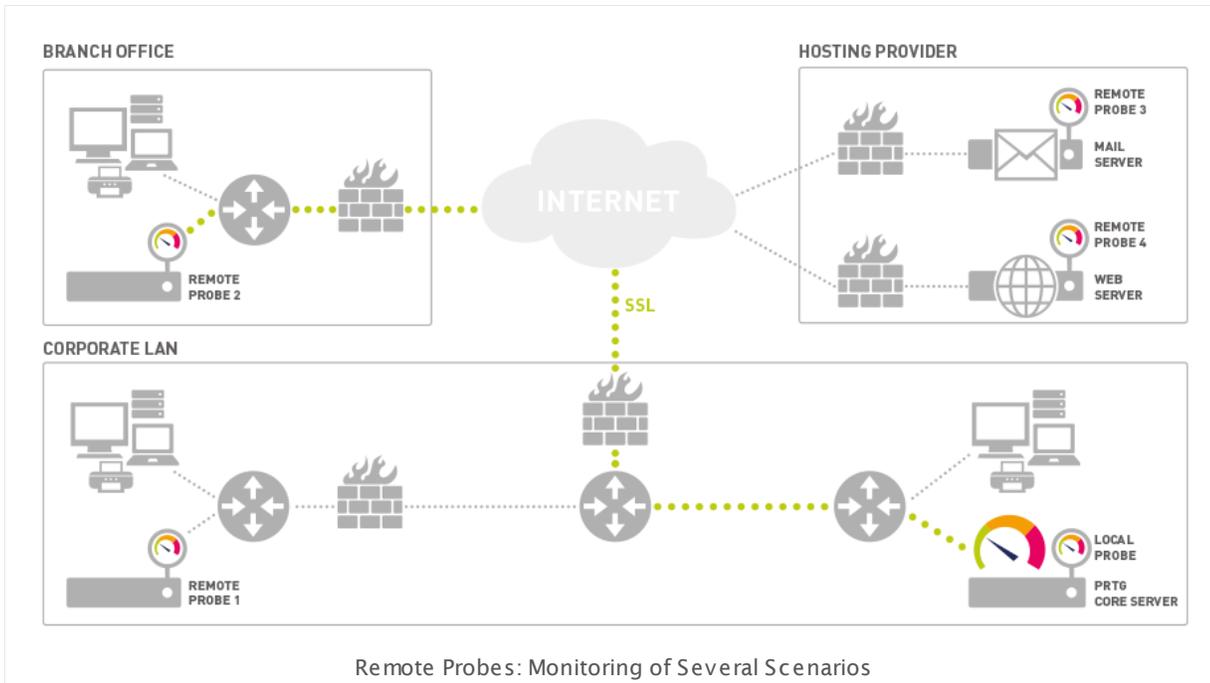

Hosted Probe in PRTG hosted by Paessler

When creating a PRTG hosted by Paessler instance, the system automatically adds the **Hosted Probe**. The hosted probe shows monitoring values of the hosted PRTG instance and is able to monitor devices, servers, and services that are publicly accessible in the internet like, for example, websites. To monitor your Local Area Network (LAN), you need at least one [remote probe](#)^[101] installation in your network. The local probe is not available in PRTG hosted by Paessler.

Remote Probes

You can create additional **Remote Probes** to achieve monitoring of multiple locations, for LAN monitoring with PRTG hosted by Paessler, or for several other scenarios. They use Transport Layer Security (TLS)-secured connections to the core and allow you to securely monitor services and systems inside remote networks that are not openly accessible or are secured by firewalls. For more information, please see [Remote Probes and Multiple Probes](#)^[370].

For more information, see this video tutorial on our website: [Distributed Monitoring with PRTG using Remote Probes](#)

Cluster Probes in PRTG on premises

In a [cluster setup](#)^[130], a cluster probe runs on all nodes. This is the additional **Cluster Probe**. All devices that you create on it are monitored by all nodes in the cluster, so data from different perspectives is available and monitoring for these devices always continues, also if one of the nodes fails.

Mini Probes in PRTG on premises

PRTG Mini Probes allow you to create small probes on any device (not just on Windows systems). You can implement mini probes to gather monitoring data exactly like you need it and you can create them on any platform.

For more information, see section [Mini Probe API](#)^[360].

System Health Monitoring

PRTG automatically monitors system health of its own core server and of each probe to discover overloading situations that may distort monitoring results. To monitor the system status of the probe computer, PRTG automatically creates a few sensors. These include [Core Health](#)^[652] and [Probe Health](#)^[1990], [System Health](#)^[2660], [Cluster Health](#)^[638], [disk free](#)^[2933], and [bandwidth](#)^[2795] sensors for all installed network cards, as well as a [Common SaaS sensor](#)^[644] that checks the availability of widely used SaaS providers.

We recommend that you keep these sensors, but you can optionally remove all except the **Health** sensors. They measure various internal system parameters of the probe system hardware and the probe's internal processes and computes a resulting value. Frequent or repeated values below 100% should be investigated. Please check the [channels](#)^[198] of a particular sensor for details.

5.2 Clustering

The main goal of any monitoring solution is to help you reach 100% availability of your IT and network infrastructure and avoid costly downtimes. Because of this, it is necessary to permanently monitor the IT infrastructure and so the objective is to reach true 100% uptime for the monitoring tool. It needs a **high availability mechanism** for this purpose like, for example, **clustering**.

PRTG Network Monitor not only allows you to monitor all your infrastructure with only one tool, but also to monitor it twenty-four hours a day and offers a high availability cluster out-of-the-box. With clustering, the uptime will no longer be degraded by failing connections because of an internet outage at a PRTG server's location, failing hardware, or because of downtime due to a software update for the operating system or PRTG itself.

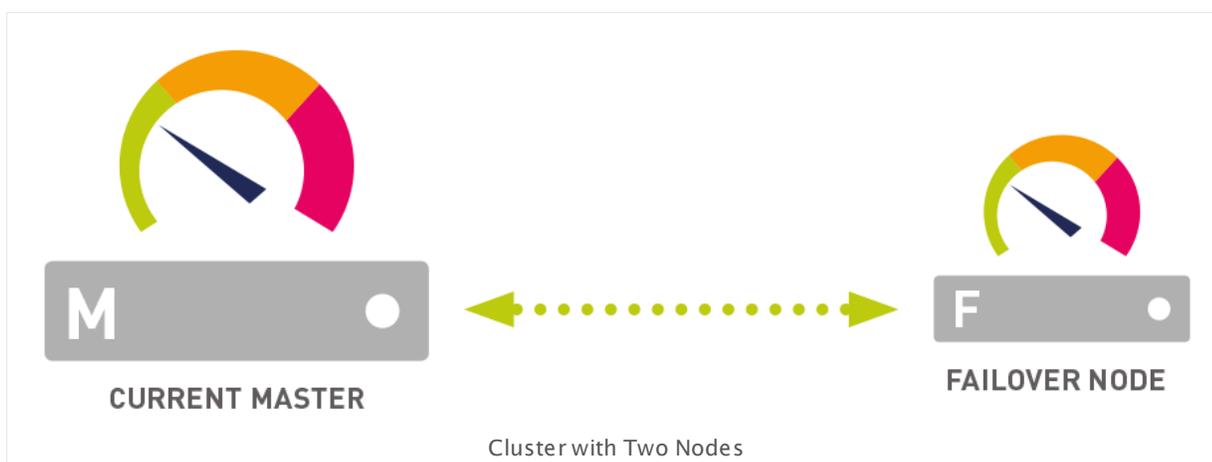

A **PRTG Cluster** consists of two or more [installations of PRTG](#)^[89] that work together to form a high availability monitoring system. All PRTG on premises licenses allow you to have a simple cluster, composed of two PRTG installations working together.

☁ This feature is not available in PRTG hosted by Paessler.

How a PRTG Cluster Works

A PRTG cluster consists of at least two nodes: one **Primary Master Node** and one or more **Failover Nodes**, where up to 4 failover nodes are possible. Each cluster node is simply a full installation of PRTG that could perform the whole monitoring and alerting on its own.

Cluster nodes are connected to each other using two TCP/IP connections. They communicate in both directions and a single node only needs to connect to one other node to integrate into the cluster.

During normal operation you configure devices, sensors, and all other monitoring objects on the **Primary Master** using the [web interface](#)^[166] or [Enterprise Console](#)^[343]. The master node automatically distributes the configuration to all other nodes in real time.

All devices that you create on the **Cluster Probe** are monitored by all nodes in the cluster, so data from different perspectives is available and monitoring for these devices always continues, even if one of the nodes fails. If the **Primary Master** fails, one of the **Failover Nodes** will take over the master role and control the cluster until the master node is back. This ensures a fail-safe monitoring with gapless data.

A PRTG cluster works in **active-active** mode. This means that all cluster nodes are permanently monitoring the network according to the common configuration received from the current master node and each node stores the results into its own database. The storage of monitoring results is also distributed among the cluster. PRTG updates need to be installed on one node only. This node will automatically deploy the new version to all other nodes.

If downtimes or threshold breaches are discovered by one or more nodes, only one installation, either the Primary Master or the Failover Master, will send out notifications (for example, via email, SMS text message, push message). Because of this, the administrator will not be flooded with notifications from all cluster nodes in case failures occur.

 During the outage of a node, it will not be able to collect monitoring data. The data of this single node will show gaps. However, monitoring data for this time span is still available on the other node(s). There is no functionality to actually fill in other nodes' data into those gaps.

Because the monitoring configuration is managed centrally, you can only change it on the master node, but you can review the monitoring results by logging in to the web interface of any of the failover nodes in read-only mode.

If you use [remote probes in a cluster](#)³⁷²³, each probe connects to each node of your cluster and sends the data to all cluster nodes, the current primary master as well as the failover nodes. You can define **Cluster Connectivity** of each probe in the [Probe Administrative Settings](#)³⁷¹.

Performance Considerations for PRTG Cluster

As a consequence of this concept, monitoring traffic and load on the network is multiplied by the number of used cluster nodes. Moreover, the devices on the cluster probe are monitored by all cluster nodes, so you will encounter an increase of monitoring load on these devices.

This will not be a problem for most usage scenarios, but consider the [Detailed System Requirements](#)³⁰. As a rule of thumb, each additional node in the cluster results in dividing the number of sensors that you can use by two.

 More than 5,000 sensors per cluster are not officially supported. Please contact your [presales team](#) if you exceed this limit and see this Knowledge Base article for possible alternatives to a cluster: [Are there alternatives to the PRTG cluster when running a large installation?](#)

Set Up a PRTG Cluster

For detailed information, see [Failover Cluster Configuration](#)³⁷²⁰.

5.3 Object Hierarchy

All objects in a PRTG monitoring configuration are arranged in a tree-like hierarchy to create an easy-to-navigate list and to give the user the possibility to arrange them in groups that monitor similar devices, services, or particular locations. This hierarchical order is also used to define common settings for larger groups of objects, for example, settings of the **Root** group apply by default to all other objects underneath (see section [Inheritance of Settings](#)¹³⁷).

The figure shows the object hierarchy in PRTG:

- **Root** group contains all objects in your setup; all probes are directly under the root node.
- A **Probe** contains one or several groups.
- A **Group** contains one or several devices.
- A **Device** represents a physical or virtual component in your network that is reachable via an IP address. Several sensors are attached to one device.
- A **Sensor** monitors one single aspect of a device and has at least one channel.
- A **Channel** tracks one specific data stream and displays it as part of a sensor.

Root Group

The **Root** group is the topmost instance in PRTG. It contains all other objects in your setup. Using the [inheritance](#)¹³⁷ mechanism, we recommend that you [adjust the default settings for the Root group](#)³³¹. This will make configuration easier later on, because all other objects then inherit these standard settings by default. Thus, you will not have to set up the same configuration for each object anew.

Probe

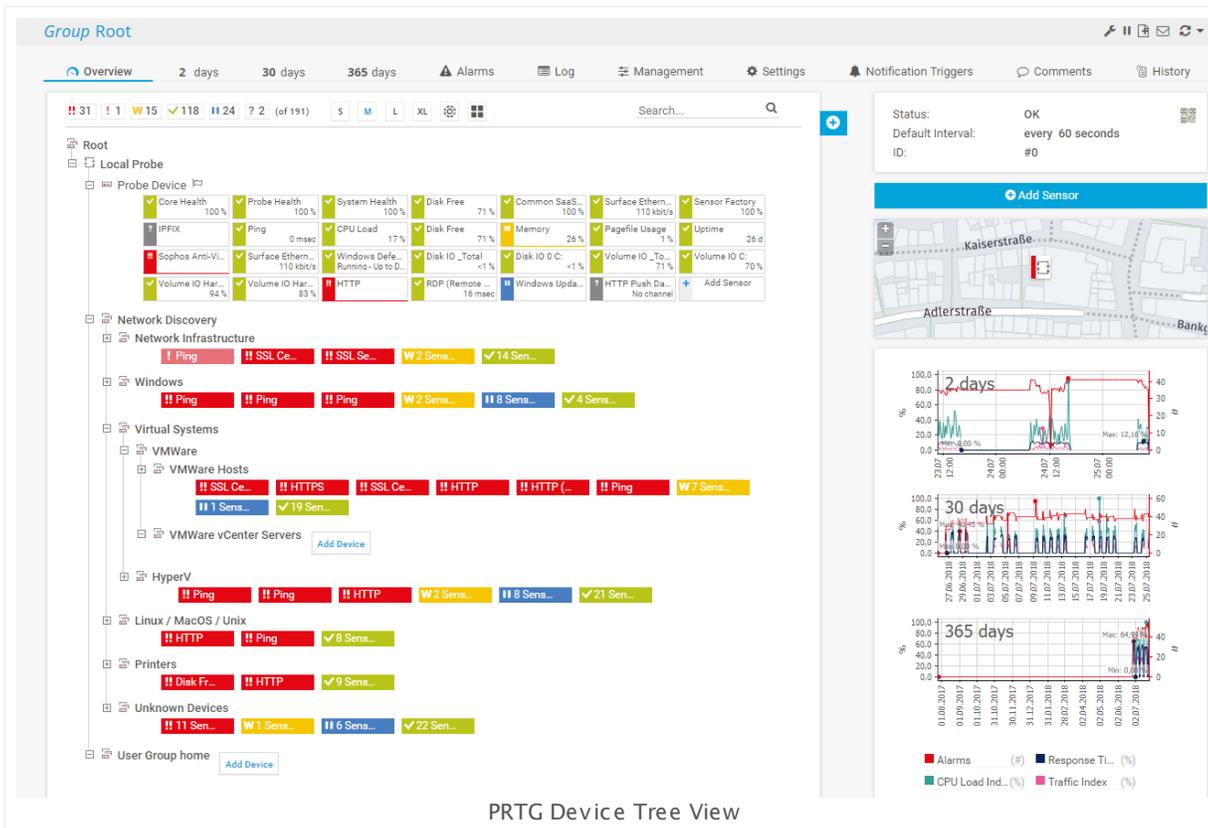

Each group (except the **Root** group) is part of a **Probe**. This is the platform where the monitoring takes place. All objects configured below a probe will be monitored via that probe. Every PRTG on premises core server installation automatically installs a **Local Probe** service, every PRTG hosted by Paessler instance comes with a **Hosted Probe**.

You can add additional probes and remote probes to your configuration to include remote devices from outside your network into the monitoring (see section [Multiple Probes and Remote Probes](#)). In a PRTG on premises cluster, there is an additional **Cluster Probe** running on all nodes. Devices on the cluster probe are monitored by all nodes of the cluster, so data from a different perspective is available and monitoring for these devices will always continue, even if one of the nodes fails.

Group

On each probe, there are one or more **Groups**, which serve merely structural purposes. Use groups to arrange similar objects so that they inherit the same settings. To a group, you add devices. You can arrange your devices in different nested groups to reflect the structure of your network.

Find below a sample configuration: A device tree with local probe, several groups, devices and their sensors.

PRTG Device Tree View

Device

You can add **Devices** that you want to monitor to each probe or group. Each device in your PRTG configuration represents a real hardware or virtual device in your network. These can be, for example:

- Web or file server
- Client computer (Windows, Linux, or Mac OS)
- Router or network switch
- Almost every device in your network that has its own IP address

 Sometimes you may want to add the same device in PRTG several times to receive a better overview when using a large number of sensors for very detailed monitoring, or to use different device settings for different groups of sensors. In PRTG you can simply add multiple devices with the same IP address or DNS name. The sensors on all of these PRTG devices will then query the same real hardware device in your network.

PRTG additionally adds a so called **Probe Device** to the local probe. This is an internal system device. It has access to the computer where the probe is running and monitors its health parameters with several sensors running on it.

To get a better and more detailed picture about your devices, PRTG automatically analyzes the devices that you add and recommends appropriate [sensor types](#)^[429] on the [device overview tab](#)^[198]. In the **Recommended Sensors** table, click the **Add These Sensors** button in the corresponding table row to create recommended sensor types with one click.

 You can turn off the sensor recommendation in [System Administration—Monitoring](#)^[339].

Sensor

On each device you can create a number of **Sensors**. Every sensor monitors one single aspect of a device. This can be, for example:

- One network service like SMTP, FTP, HTTP, etc.
- One network switch port's traffic
- CPU load of a device
- Memory load of a device
- Traffic on one network card
- One NetFlow device
- System health of a device
- Other content (for example, of databases, mails, HTTP, XML, files, etc.)
- etc.

 For more information, see this video tutorial: [What is a sensor?](#)

Channel

Every sensor has a number of **Channels** through which it receives the different data streams. The available channels depend on the type of sensor. One sensor channel can contain, for example:

- **Downtime** and **uptime** of a device
- **Traffic in** of a bandwidth device (for example, a router)
- **Traffic out** of a bandwidth device (for example, a router)
- **Traffic sum** of a bandwidth device (for example, a router)
- **WWW traffic** of a NetFlow device
- **Mail traffic** of a NetFlow device
- **Other traffic** of a NetFlow device
- **CPU load** of a device
- **Loading time** of a web page
- **Download bandwidth** of a web page
- **Time to first byte** of a web page
- **Response time** of a Ping request to a device
- **Response time** of a Remote Desktop service
- etc.

More

Video Tutorial: What is a sensor?

- <https://www.paessler.com/support/videos/prtg-basics/what-is-a-sensor>

5.4 Inheritance of Settings

The [hierarchical tree](#)^[133] does not only help organize the devices and keep everything neat and tidy. There is also an important aspect involved that we call **inheritance**. To ensure administration is quick and easy—especially for large monitoring setups—certain settings are inherited from the higher level. For example, you can change the monitoring interval for all sensors by editing the interval setting of the topmost **Root** group (unless no other setting is defined below).

Settings are Inherited to Child Objects

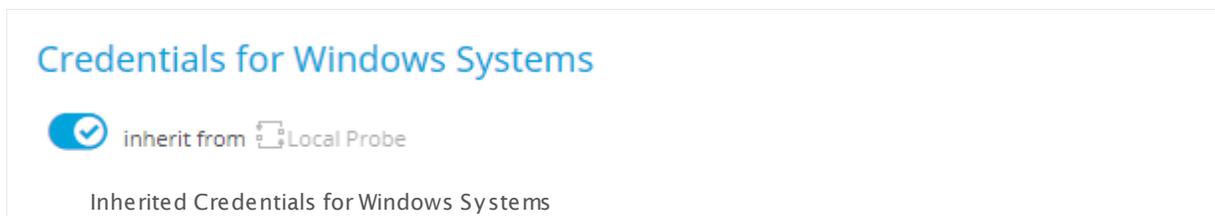

You can override this inheritance on any level of the hierarchy by setting a different value for a specific probe, group, device, or sensor. All objects below will inherit these new settings; object settings from levels above will not be affected.

Settings that are inherited among all objects include:

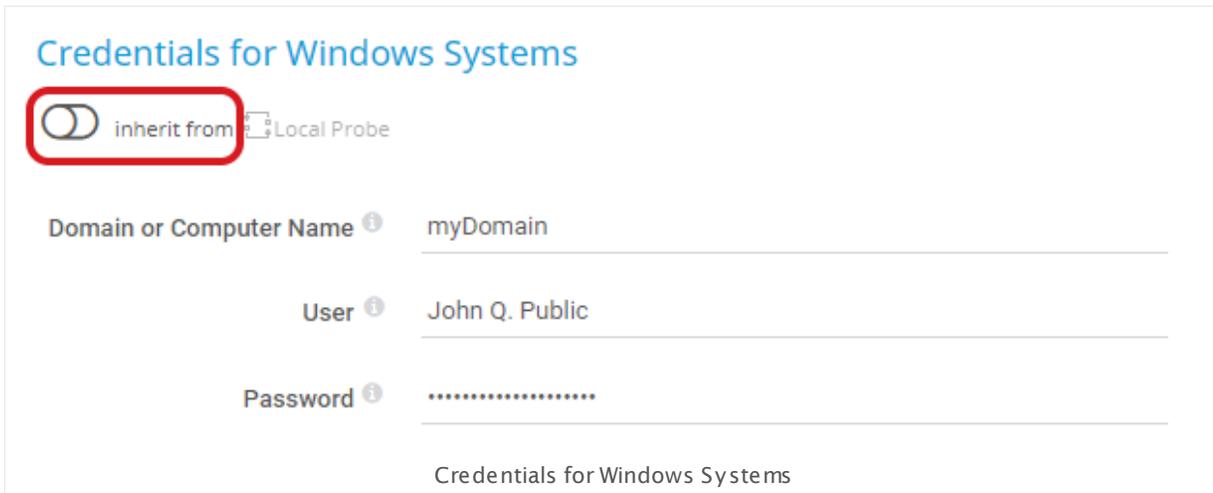

- Monitoring interval
- Notification triggers
- Authentication settings for several systems
- Compatibility settings (for certain types of sensors)
- Channel and unit configuration
- [User access rights](#)^[158]
- [Tags](#)^[139]
- Paused status: If an object is paused by the user, or a schedule, all sensors on it are paused as well

There is one exception for devices and sensors: the **IP address** or **DNS name** of a device and compatibility settings are always inherited by sensors and cannot be changed on sensor level.

The screenshot below shows the Windows systems credentials settings inherited from the parent.

Click  next to **inherit from [parent object]** to override the parent's settings and enter new settings for this object and all objects underneath in the hierarchy.

Credentials for Windows Systems

inherit from Local Probe

Domain or Computer Name ⓘ

User ⓘ

Password ⓘ

Credentials for Windows Systems

⚠ Click **Save** for your settings to take effect. Clicking after entering your settings inherits the parent settings again and your settings will not take effect.

Default Values Set in Root Group

For all settings (except passwords), PRTG already includes a set of default values so you can get started with the software immediately. For example, the following settings will be inherited by all sensors from the **Root** group:

- Default monitoring interval of one minute
- SNMP version 1 with community string set to **public** (default values for most devices)
- Dependency type **Use parent**
- etc.

You may need to change some of the default entries as you become used to the interface. However, these settings will initially suffice for most situations.

Before sensor setup, please review the **Root** group settings and set the default values to suit your setup. This should include the credentials for the types of systems in your network that you want to monitor (Windows, Linux, virtual servers, etc.).

📖 See section [Root Group Settings](#)^[331] for more details.

Inheritance of Notification Triggers

If you add notification triggers at probe, group, or device level, these will also be inherited to all sensors underneath, unless you break the inheritance manually.

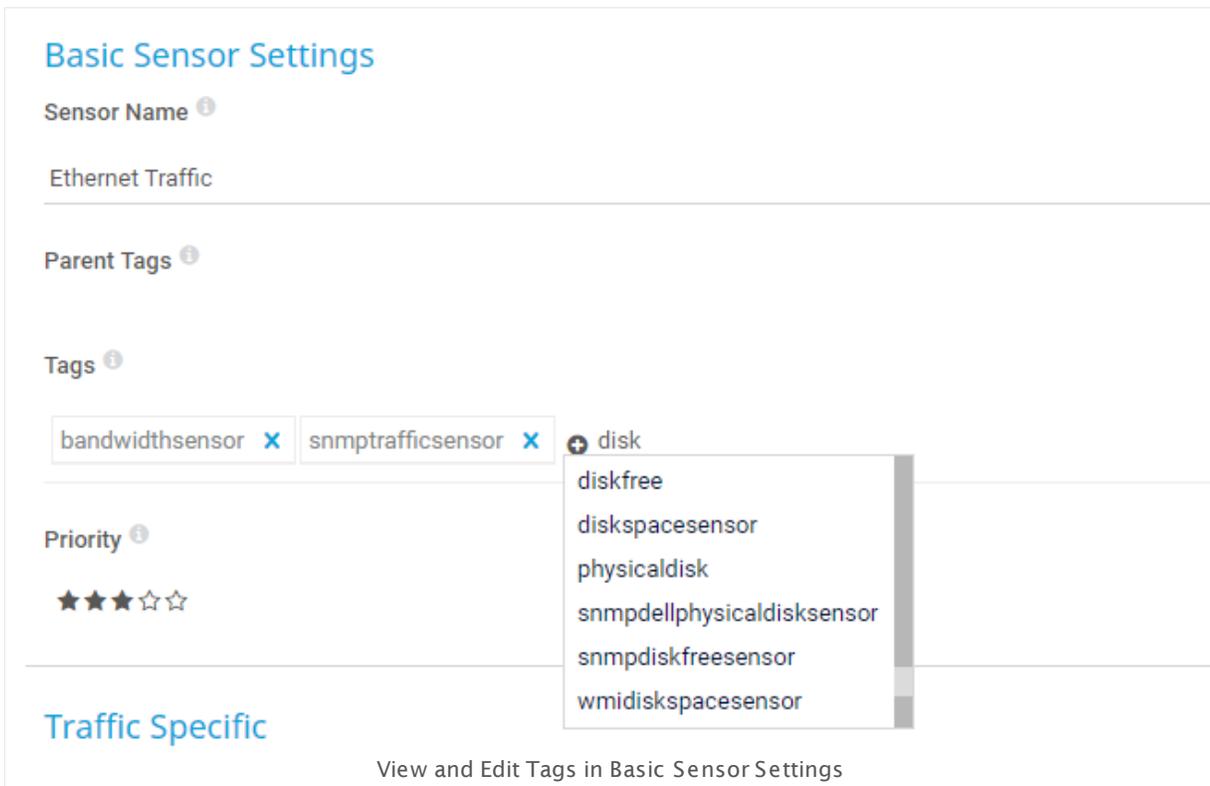

📖 See section [Sensor Notification Triggers Settings](#)^[3170] for details.

5.5 Tags

For every object in your PRTG setup, you cannot only name objects, you can also define tags in the [object settings](#)^[217] to additionally mark an object as a member of certain categories. Although some tags are automatically predefined when [adding objects](#)^[301], you are completely free in which tags you want to add. For example, you can mark all of the bandwidth sensors that are especially important for you with the tag **bandwidth_important**.

Later on, you can view lists of objects with certain tags (helpful for [multi-edit](#)^[3197] of settings), or select sensors via tags when creating [reports](#)^[3252]. A smart arrangement of tags can be a huge time saver. The keys enter, space, or comma confirm a tag.

- i** You can also change tags for several objects simultaneously using the [multi-edit](#)^[3197] function.
- i** It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

View and Edit Tags in Basic Sensor Settings

Tags are Inherited

The tags in the settings of an object are automatically **inherited** by all other objects underneath in the **Object Hierarchy**. You can view inherited tags in section **Parent Tags** in the settings of a **sensor**, **device**, or **group**. So, for example, a device with the tag **myExampleTag** automatically passes on this tag to all sensors that you add to it. These sensors appear in lists whenever you search for **myExampleTag**. This is useful, for example, when you include sensors by tag in **reports** settings, because you do not have to tag every single sensor manually.

 Inheritance for tags cannot be disabled.

Filtering with Tags

You can use tags to filter **table lists** for specific objects, or to add sensors to **Libraries** and **Reports**. For example, you can restrict the **sensors overview page** to the sensors that have the tag **bandwidth_important**. You can also use more than one tag to filter for monitoring objects like sensors.

When filtering with tags, you can also use plus (+) and minus (-) signs in front of the tags to include or exclude them:

- Tags with + must exist for an object to be shown
- Tags with - must **not** exist for an object to be shown
- At least one tag of the tags without either a + or - must exist on an object

The filter shows an object only if all three conditions are true. The order of the tags in a tag field does not matter.

For example, if you enter **-windows** into a tag field, all sensors/devices that do not have "windows" as tag are shown. With **+windows** or **windows** you filter for objects that are tagged with "windows".

You can use more than one logical operator in a tag field: For example, if you enter **+netflow - bandwidth_important** into a tag field, the corresponding list, library, or report includes all sensors that are tagged with "netflow" but not with the tag "bandwidth_important". If you enter **netflow bandwidth_important**, a sensor has to be tagged with "netflow" or "bandwidth_sensor" or both to be affected.

Tag Display Limits

For performance reasons, PRTG has a display limit of 1000 tags when filtering **By Tag** under **Sensors** in the **PRTG main menu**. If you have more than 1000 tags, no tags are shown here. You can still use tags in this case, for example, for filtering and searching.

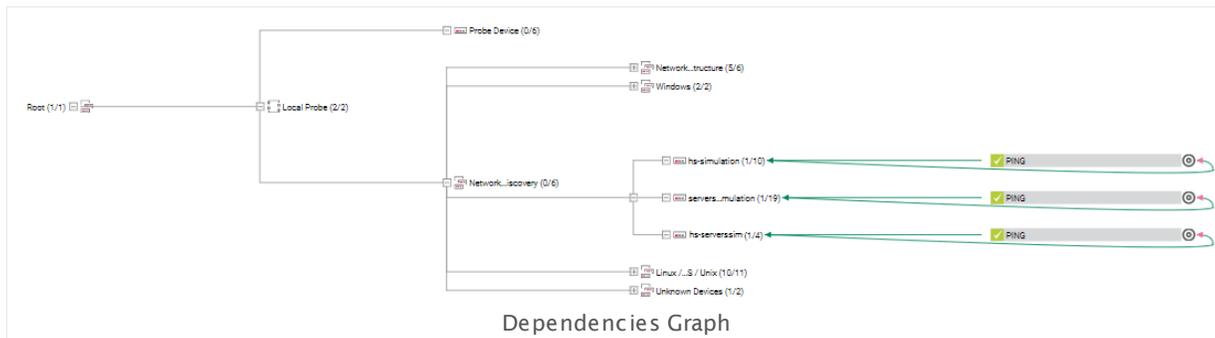

5.6 Dependencies

You can use dependencies to make PRTG pause sensor monitoring based on the [status](#)^[195] of another (master) sensor to avoid false alarms and incorrect downtime recording. A dependency stops the monitoring of one sensor or a set of sensors as soon as a specific sensor is in **Down** status or in **Paused** status caused by another dependency. This means, for example, that you can stop monitoring remote network services when the corresponding firewall is down due to connection problems.

When using the [auto-discovery](#)^[282] function, the [Ping Sensor](#)^[1529] on a device is by default set as the **master** object for this device. This means that monitoring for the entire device is paused if the Ping sensor is in **Down** status or in **Paused** status caused by another dependency. Usually, it makes little sense to monitor any other parameters while the **Ping** sensor indicates that the device can't even be reached.

i You do not trigger a status change by dependency if you manually pause a master object or if you pause it by [schedule](#)^[142]. See also this Knowledge Base article [Why will dependent objects not go into paused status automatically when I pause the master object?](#)

To view the list of dependencies, choose **Devices | Dependencies** and the corresponding dependencies path from the [main menu](#)^[265]. From there you can also access the [Dependencies Graph](#)^[3209] that visualizes all dependencies within your network.

+ For more information about the dependency settings, see the [settings of the object](#)^[217] you want to set a dependency for, section [Schedules, Dependencies, and Maintenance Window](#)^[422] respectively.

5.7 Scheduling

With the help of schedules you can [pause](#)^[245] the monitoring of certain objects automatically for a certain time, for example, on Sundays between 4 and 8 a.m. A paused sensor will not collect monitoring data, will not change its status, and will not trigger any [notifications](#)^[143]. You can also pause monitoring for planned system maintenance time spans to avoid false alarms. You can apply different schedules to every object. Schedules are also used for reports and notifications.

i If you pause a master object by schedule or manually, you do not trigger a status change by [dependency](#)^[141]. See also this Knowledge Base article [Why will dependent objects not go into paused status automatically when I pause the master object?](#)

Schedules, Dependencies, and Maintenance Window

inherit from Root

Dependencies, schedules and maintenance windows always pause all sensors inside a group/device. This pausing is always inherited to all sub-objects and the inheritance can not be disabled. Below you can set additional schedules, maintenance windows or dependencies that will be used on top of any inherited setting.

Schedule ⓘ	None ▼
Maintenance Window ⓘ	None
Dependency Type ⓘ	Saturdays [GMT+0100]
	Sundays [GMT+0100]
	Weekdays [GMT+0100]
	Weekdays Eight-To-Eight (8:00 - 20:00) [GMT+0100]
	Weekdays Nights (17:00 - 9:00) [GMT+0100]
	Weekdays Nights (20:00 - 8:00) [GMT+0100]
	Weekdays Nine-To-Five (9:00 - 17:00) [GMT+0100]
	Weekends [GMT+0100]

Access Rights

inherit from Root

Available Default Schedules in Device Settings

Schedules are user account specific. To change the default pre-defined schedules or to add your own schedule, see [Account Settings—Schedules](#)^[338] section.

i If you use failover clustering with nodes in different timezones, scheduling applies at the local time of each node. For more information, see section [Failover Cluster Configuration—Before Getting Started](#)^[372].

5.8 Notifying

PRTG Network Monitor keeps the administrator or other responsible persons informed about the current status of the network. There are several methods how the administrator can stay up to date.

Notifications

This is the most powerful information tool. Whenever PRTG discovers downtime, an overloaded system, threshold breaches (for example, a disk runs full), or similar situations, it can send a notification. Notifications use various methods with which you can be notified (for example, [email](#)^[3317], [SMS](#)^[3311], [push messages](#)^[3319], and others). After creating notification templates in the system settings, you can select them on the notification triggers tab of probes, groups, devices, and sensors, as well as on the root group.

 See [Notifications](#)^[3216] section for more details and [Setting Up Notifications Based on Sensor Limit: Example](#)^[3219] for a step-by-step guide.

Limits

In a [sensor channel's settings](#)^[3160], you can set limits to change the status of the sensor when certain limits are breached. This way, you can set, for example, a traffic sensor (typically never in an error status) to **Down** status whenever bandwidth values are measured that you consider critical. This sensor will then show up in the alarms list.

Alarms

The alarms list shows all sensors that are currently in a **Down**, **Down (Acknowledged)**, **Warning**, or **Unusual** status. This is useful for keeping track of all irregularities in your network. In the table list, you can re-sort the items by clicking on the column's header items. See [Alarms](#)^[219] section for more details.

Logs

In the logs list, the logfile with all monitoring events is shown. In a typical setup, a huge amount of log data is produced. As the activity of every single object is minuted, you can use this data to check exactly if your setup works as expected. See [Logs](#)^[228] section for more information.

Tickets

The tickets list shows items with important system information or action steps for the administrator to take. You should view every ticket and take appropriate actions. By default, an email is sent to the administrator for every new ticket that is created by the system or another user. If a ticket is assigned to a specific user, this user will get an email by default. See [Tickets](#)^[230] section for more information.

5.8.1 Alerts

Alerting is a helpful and important part of monitoring that informs you when there are issues, when values exceed thresholds or a sensor status has changed, for example. PRTG offers many ways to alert you about your monitoring data like internal sensor alerts, limits, and lookups. You can also create custom alerts and define trigger notifications as extensions to alerts. If a sensor does not have pre-configured limits, you can also configure them accordingly so that you are notified when something is wrong.

Internal Sensor Alerts

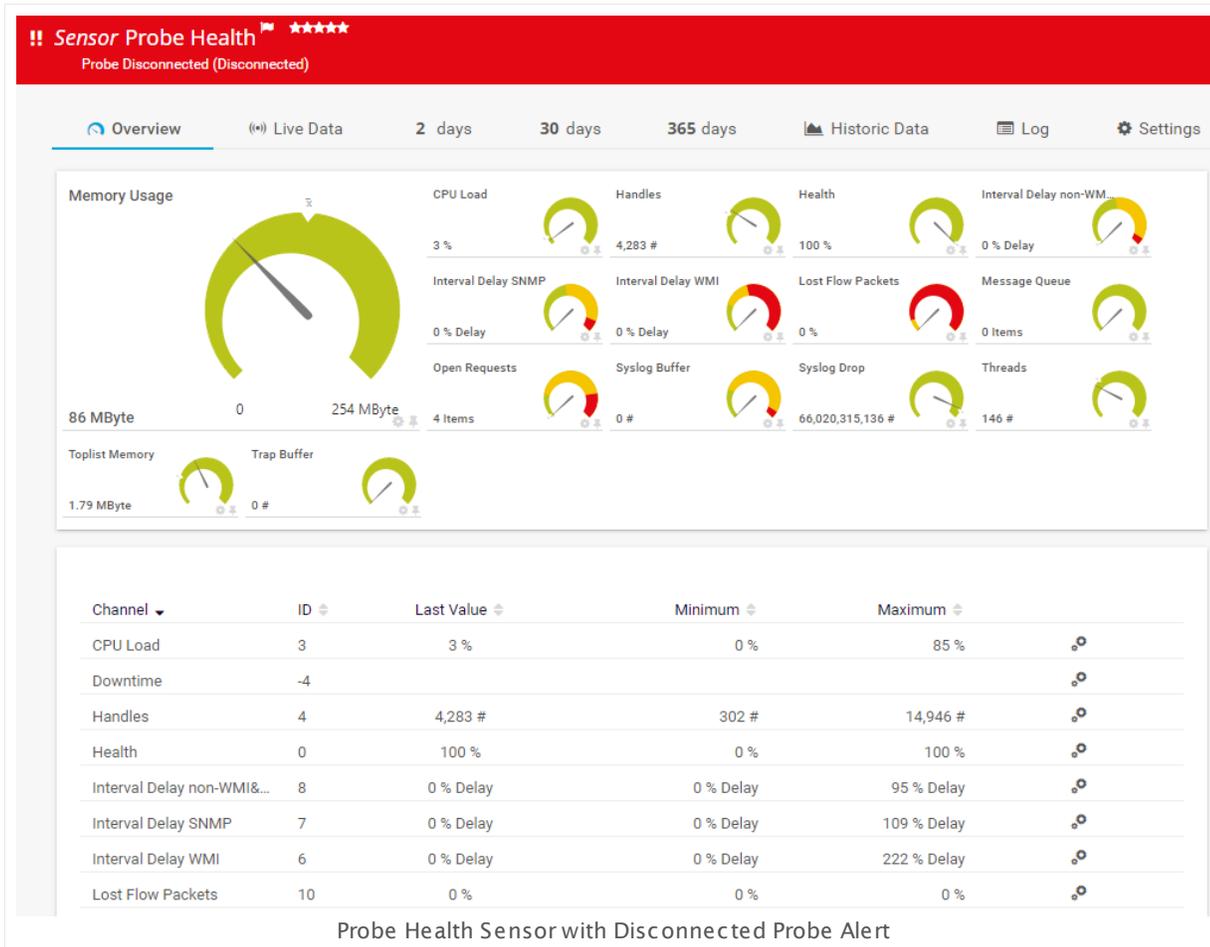

Some sensor types display internal alerts when there are errors. These default alerts range from disconnected probes to socket or timeout errors. For example, the HTTP sensors show pre-configured internal alerts according to certain HTTP status codes.

There are also sensor types that let you modify the internal sensor alerts. To see if you can modify an alert, check the sensor's settings for customizable options.

 See [Which HTTP status code leads to which HTTP sensor status?](#) for more information.

 See [What does error code PExxx mean?](#) for more information on error codes.

Here is an example of a sensor that is in **Down status**  because of an internal sensor alert.

Standard Limits for Channels

Another type of alerts are alerts due to limits. These alerts are triggered when the measured value of a sensor is below or above a configured threshold limit. These limits change the sensor's status when they are breached. For example, you can set an SNMP CPU Load sensor to **Warning** status whenever it measures values that you consider critical. This sensor then shows up in the [alarms](#) list.

- i This type of alert is only displayed when the value breaches the configured limits. If the value is normal again in the next sensor scan, the sensor returns to the **Up** status.
 - To review or modify threshold limits for single sensors, open the [sensor's channel settings](#) via the gear icon in the respective channel gauge or in the channels table.
 - **Enable alerting based on limits** and specify your desired limits in the correct fields.
 - You can also optionally add messages that appear in the sensor message on the **Overview** tab or leave these fields empty to display the default message.
- i This limit only applies to the respective channel.

Setting Limits for Sensor Channels

📺 For more information on setting limits, see this video on our website: [How to Set Channel Limits](#)

With the above configuration, the sensor turns to a **Warning** status (the gauge needle points to the yellow area in the example below) if the channel values exceed the upper warning limit of 60 percent and the **Warning Limit Message** is displayed in the sensor status. If the channel value exceeds the upper error limit of 80, the sensor will turn to a **Down** status (the gauge needle will point to the red area) and the **Error Limit Message** will be displayed.

You can use [Multi-Edit](#) if you want to apply the same limits for sensors of the same type in a batch operation.

- To see all sensors of this type at a glance, just filter for it: From the PRTG main menu bar, choose **Sensors | By Type | SNMP CPU Load**.
- Mark the check boxes of the sensors you want to edit.
- Click the wrench symbol in the menu.
- Open the **Channel Settings** tab.
- Select the channel you want to add a limit for; in this example we use the channel **Total**, which is common to all selected sensors.
- Then **Enable alerting based on limits** and enter the number in the correct field as described above.

When you are done, **Save** these settings—the new limit is then applied to all selected channels from all selected sensors.

Multi-edit is only available for channels that are common to all selected sensors.

Setting Channel Limits with Multi-Edit

ⓘ Some sensors have pre-defined limits in the sensor settings, for example the [SNMP Linux Disk Free Sensor](#)^[2251]. Refer to the sensor's settings to adjust the limits (or behavior) for these sensors.

Absolute and Delta Values in Limits

- i** The value that needs to be configured in the limits depends on the type of data that the sensor's channel delivers.

For channels that measure absolute values (for CPU load and memory usage, for example) limits will also be set using absolute values like in the example above.

You can also set limits for channels that measure delta (x.xx/sec) values. Let's say you have an [SNMP Traffic Sensor](#) and want to receive an alert when it reports errors. In this case, you need take into account that this is a delta measurement. In this example, you could set the following limits for the channel **Errors in** with a standard scanning interval (60 seconds).

- Set the sensor to **Warning** status when **1** error occurs
- Set the sensor to **Down** status when **30** errors occur

This example shows how to configure the limits for delta channels.

Table Rendering ⓘ

Show in Tables

Setting Channel Limits with Delta Values

Because this channel uses per second (delta) measurements, a single error that occurs over a standard 60-second scanning interval is reported as 0.016 # per second. So the warning limit for one single RX error within an interval is 0.1 (errors/sec). To get an alert when there are 30 errors within a scanning interval, the limit needs to be 0.5 (errors/sec).

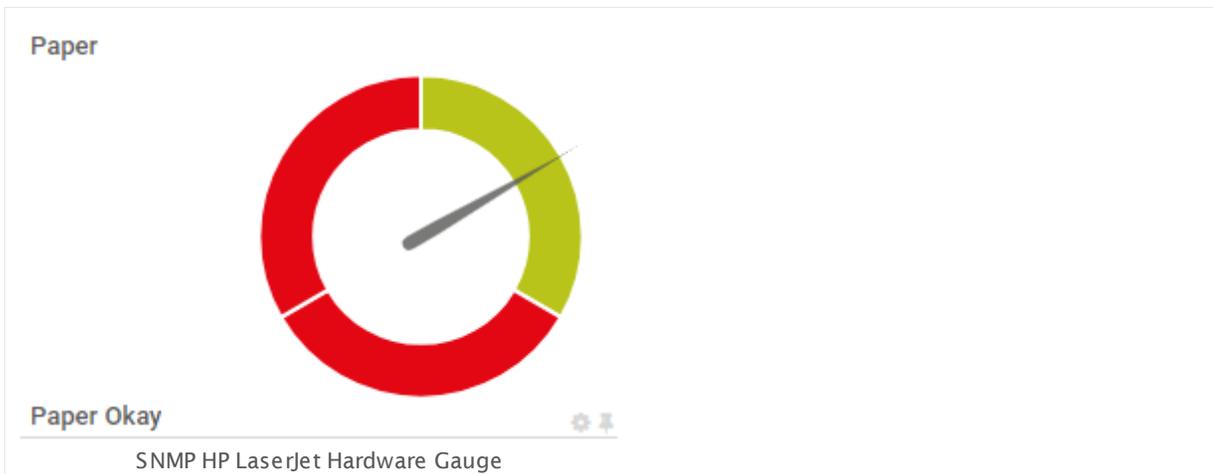

! If no new errors occur in the next scanning interval, the sensor will turn back to the **Up** status. To ensure that you do not miss any notifications for this sensor, set a notification trigger with **0** seconds. For more information, see [Notification Triggers as Extensions to Alerts](#)¹⁵⁵ below.

Standard Lookups for Channels

PRTG also uses lookups for some sensor types. In general, lookups make data more human friendly because they map status values as returned by a device (usually integers) to more informative expressions in words that show you the status of a monitored device as a clear message.

Additionally, lookups can also define the sensor status that will be shown in correlation with certain status codes, just like sensor channel limits can define a sensor status, too. For example, PRTG can show a sensor in a gray **Inactive** status with channel values, provided by lookups, like **Inactive** instead of a numerical value like **-1**.

i The various states displayed in gauges always follow the clockwise order **Up** (green) < **Warning** (yellow) < **Down** (red) < **Unknown** (Gray / Black).

Modifying a Standard Lookup: Example

You can also modify standard lookups to include new definitions according to your monitoring needs. The following code illustrates the lookup definition for the paper status of the [SNMP HP LaserJet Hardware](#)²¹⁰⁸ sensor:

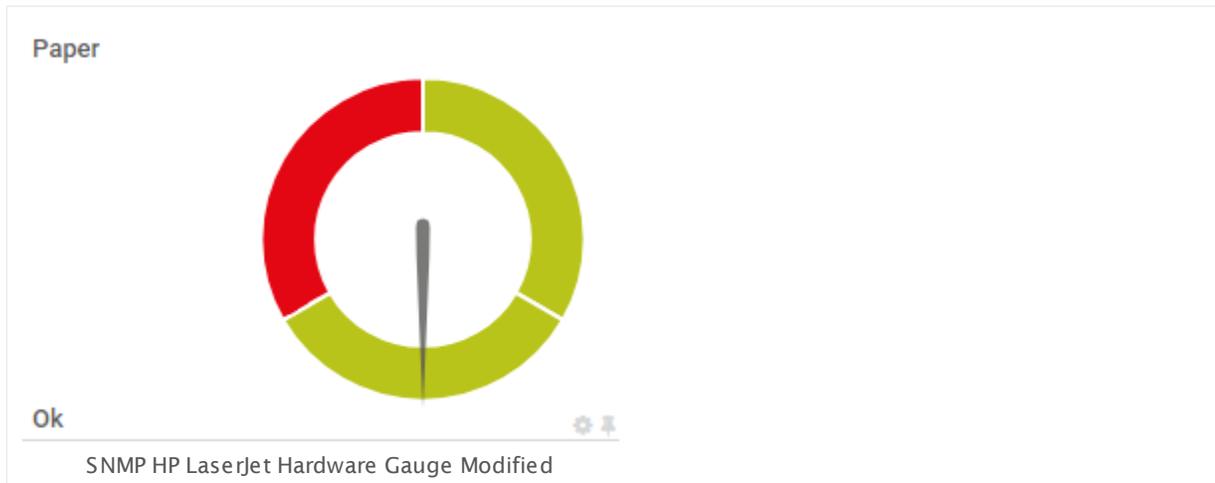

Part 5: Understanding Basic Concepts | 8 Notifying 1 Alerts

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="oid.paessler.hplaserjet.paperstatus" desiredValue="0"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:noNamespaceSchemaLocation=
"PaeValueLookup.xsd">
  <Lookups>
    <SingleInt state="Ok" value="0">
      Paper Okay
    </SingleInt>
    <SingleInt state="Error" value="1">
      Out of Paper or No Cassette Loaded
    </SingleInt>
    <SingleInt state="Error" value="2">
      Manual Paper Feed Required
    </SingleInt>
  </Lookups>
</ValueLookup>
```

Imagine you do not want to be alerted in case the printer is out of paper. You basically have to do the following:

1. Copy the file `oid.paessler.hplaserjet.paperstatus.ovl` to the `\lookups\custom` subfolder of the [PRTG program directory](#) (ensure you do not change the file name!).
2. Open this file with an editor.
3. Replace the first `SingleInt` state "Error" with "Ok".
4. Optionally replace the message "Out of Paper or No Cassette Loaded" to "Ok".
5. Save the file.
6. [Reload](#) the custom lookup folder in PRTG.

The channel gauge now displays the new state and the new message.oid

For more information on how lookups are defined, see section [Define Lookups](#).

Creating a New Lookup

It is also possible to create new lookups to use with any custom or standard sensor that supports lookups. If you want to create a new lookup with the [example](#) above, you basically follow the same procedure except you save the lookup file in the `\lookups\custom` subfolder with a new name, for example `oid.paessler.hplaserjet.mynewpaperstatus.ovl`. Select the newly created lookup file in the sensor's channel settings.

Selecting a Newly Created Lookup

Custom String Lookups

You can also set up custom string lookups, which can exclusively be used with the [SNMP Custom String Lookup Sensor](#)^[1982]. This is useful if you are using an OID that returns a known string value stating possible states or values. To inform PRTG of the possible statuses or values, you have to create a new lookup file defining them.

See the Knowledge Base article [Monitor and "Lookup" a SNMP String value](#) for more information.

Notification Triggers as Extensions to Alerts

The status or the data of a sensor can trigger notifications. Using this mechanism, you can configure external alerting tailored to your needs. Which trigger types are available depends on the kind of object you edit. You can define triggers that are activated by an 'on change' event. Some sensors offer the option to send such a trigger whenever sensor values have changed.

Create Notification Triggers to Alert You When a Value Changes

Before you set up a change trigger, make sure that the **Trigger 'change' notification** setting is enabled in the sensor's settings, otherwise the notification will never be sent.

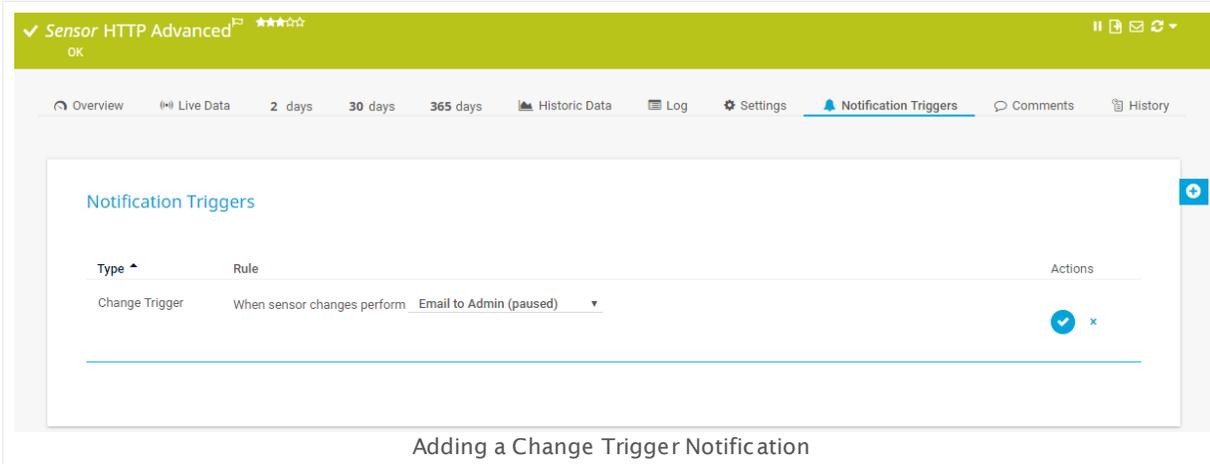

Advanced Sensor Data

Protocol Version ⓘ	<input type="radio"/> HTTP 1.0 <input checked="" type="radio"/> HTTP 1.1

Trigger 'Change' Notification Setting

Part 5: Understanding Basic Concepts | 8 Notifying 1 Alerts

Select the **Notification Triggers** tab to create a change trigger for this sensor. Hover over  and select **Add Change Trigger** from the menu to add a new trigger, or click the **Edit** button next to an existing trigger to change it. Every trigger will provoke one or more [notification\(s\)](#)  to be executed.

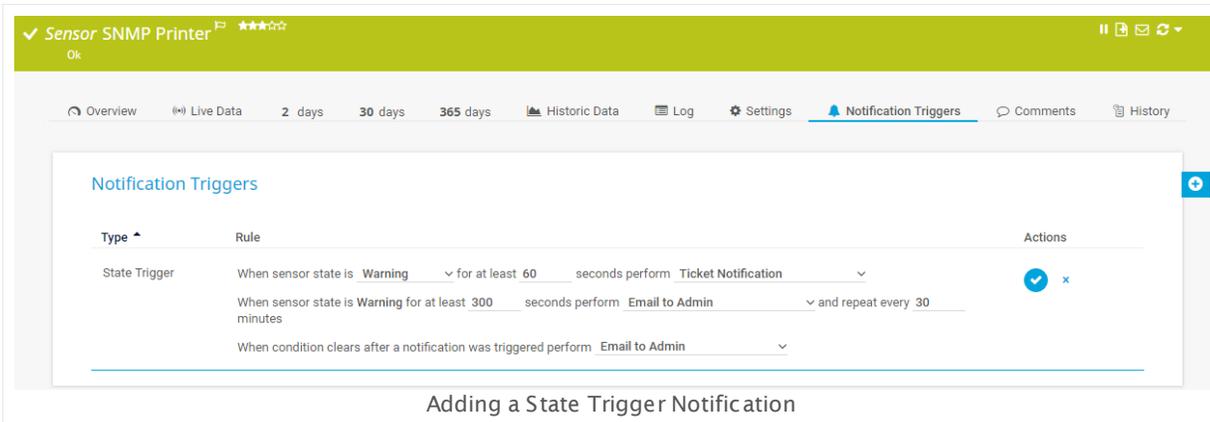

Adding a Change Trigger Notification

Save the trigger. You will now be notified when sensor values change.

 For more information on triggers, see section [Sensor Notification Triggers Settings](#) .

Create Triggers to Match Your Limits/Lookups (status-based)

After you have set up alerts using limits or lookups, you can complement them with state-based triggers. On the **Notification Triggers** tab, hover over  and select **Add State Trigger** from the menu to add a new trigger.

Adding a State Trigger Notification

Save the trigger. You will now be notified according to the notification settings.

 If you want to receive alerts for more than one status, you have to add a trigger for each status.

-  A sensor's status can change for other reasons such as [internal sensor alerts](#)¹⁴⁴. If you configure state-based triggers, you will be notified of these changes as well.

Video Tutorial: How to Configure Lookups in PRTG Network Monitor

- <https://www.paessler.com/support/videos/prtg-advanced/prtg-lookups>

5.9 User Access Rights

Define which user can access what in your PRTG Network Monitor installation and manage all user rights with the access rights system of PRTG.

The default administrator can be the only user of a PRTG installation, but can also create a nearly unlimited number of other users. Individual users are organized in a nearly unlimited number of user groups. Each user group can separately have [access rights for each individual object](#)^[133] in your PRTG device tree (except for sensor channels). Objects can also [inherit](#)^[137] access rights according to the hierarchic structure of the device tree.

In addition, every user has specific rights: There are administrator users, read/write users, and read-only users. You can define these settings in [System Administration—User Accounts](#)^[3376]. Via these tools, you can create an access rights management that allows you to specify exactly what users will be able to see and edit and what they will not be able to access.

Account Control

Account Type ⓘ	<input type="radio"/> Read/write user <input checked="" type="radio"/> Read-only user
Acknowledge Alarms ⓘ	<input type="radio"/> User may acknowledge alarms <input checked="" type="radio"/> Deny the right to acknowledge alarms (default)

Status ⓘ	<input checked="" type="radio"/> Active <input type="radio"/> Inactive
Last Login ⓘ	5/29/2017 5:19:07 PM

User Rights in User Account Settings

Individual user rights, in combination with the access rights of the group(s) they belong to, determine the access rights to certain objects in the device tree. This means that group membership specifically determines what a user is allowed to do and which objects the user will see when logged in.

The actual access rights for each object in the device tree can be defined in the object's settings. You can define different access rights for all sensors, devices, groups, or probes via the corresponding [Context Menus](#)^[247] or in the [Object Settings](#)^[217].

Access Rights Overview

The following classes of access rights for objects are available in hierarchical order as they can be given to user groups (lowest rights to highest rights):

- **None:** The object will not be displayed to the users of the group; no logs, no tickets, no alarms regarding this object will appear.
- **Read:** You can only see monitoring results and change your own password if allowed by your administrator.
- **Write:** You are allowed to review monitoring results and edit settings. In addition, you can add objects to and delete them from the device tree.
- **Full:** Review monitoring results, edit settings, and edit access rights. In addition, you can add objects to and delete them from the device tree.
- **Admin rights:** If a user group has administrator rights, all options are available, including creating users, creating user groups, and deleting objects from the device tree. Users in the administrator user group always have maximum access rights to all objects and will never have access restrictions.

i Access rights that are defined locally on an object, for example, on a device, override inherited rights. For a certain object, the highest directly defined access right applies for a user group. If there is no access right set directly on an object, the next higher object level will be checked for access rights. This process is repeated until defined access rights are found to be [inherited](#) or there is no higher object level.

Edit Rights for Sonicwall Firewall
✕

Different Access Rights Depending on User Groups

See the table below for which user rights apply when. Column headings show access rights of user groups for objects in the device tree; line headings show the type of user.

i Users are either members in PRTG user groups or in Active Directory Domain user groups. They cannot be members in both. We recommend that you use only one type of user group (either PRTG or Active Directory) to minimize your administration effort.

▪ PRTG User Group	▪ PRTG User Group	▪ PRTG User Group	▪ PRTG System Administrator
▪ Domain User Group	▪ Domain User Group	▪ Domain User Group	▪ Domain Administrator
READ ACCESS	READ/WRITE ACCESS	FULL ACCESS	

- **PRTG User Read Only** Read-only rights Read-only rights Read-only rights Admin rights
- **Domain User Read Only**
- **PRTG User Read/Write** Read-only rights Read/write rights Full access Admin rights
- **Domain User Read/Write**
- **Users in an administrator group** always have administrator access rights, no matter what access rights have been defined for an object.
- **Read-only users** just have reading permission, no matter what access rights their group has. Users who are members of an administrator group are an **exception**. Read-only users can change their own passwords in their [user account settings](#)³³⁷⁶, if the administrator has enabled them to do so.
- **Read/write users** in a group with full access to a given object have full access rights to this object only.
- If a user is in **more than one group**, access rights of the user group with the highest rights apply.
- Administrator rights can only be granted by membership in the **administrator group**.

 For more information about defining access rights, see the following sections:

- [System Administration—User Accounts](#)³³⁷⁶
- [System Administration—User Groups](#)³³⁸³

 For information about connecting PRTG to an existing Active Directory, see [Active Directory Integration](#)³⁶⁰³.

5.10 Data Reporting

With [Reports](#) ³²⁵² you can analyze and review monitoring data for specific time spans. There are several ways to create data reports in PRTG for your individual needs.

View Historic Data

To get a report for a single sensor, there is a function included to review historic data in PRTG. It allows you to generate reports and charts for a single sensor's data. See the [Historic Data Reports](#) ²⁰⁴ section for more information.

Generate Reports

You can use the sophisticated reports machine included in PRTG to create comprehensive and detailed reports for all monitoring data. See the [Reports](#) ³²⁵² section for more information.

Export Data Using the API

You can also export all monitoring raw data to XML or CSV files and generate your own reports using any third-party software. See the [Application Programming Interface \(API\) Definition](#) ³⁶⁰⁰ section for more information.

Make Data Available

You can make monitoring data available to other persons using a special user with read-only rights (see the [User Access Rights](#) ¹⁵⁸ section), or you can create public or semi-public HTML pages with monitoring data using the Maps feature. See the [Maps](#) ³²⁷⁰ section for more information.

Bill Customers

You can also create custom billing reports based on PRTG's monitoring data, using the open source **Billing Tool** for PRTG.

For details and download, see the Paessler website: [Billing Tool](#)

More

- [Data Storage](#) ³⁷³⁴

Paessler Website: Billing Tool

- <https://www.paessler.com/tools/billingtool>

5.11 IPv6

PRTG supports the IPv6 protocol for most sensor types. You can choose whether you want PRTG to query data from your network devices via an IPv4 or IPv6 connection. Indicate your preference in the [Device Settings](#)^[402] of each device. The sensors you add to the device will use the protocol you have indicated.

In the **Outgoing IP Settings** of the [PRTG Administration Tool](#)^[3592], you can additionally choose which IPv6 address will be used for outgoing monitoring requests. The the same option is also available for IPv4.

-  Not all sensor types are IPv6 compatible. You can see which sensors support IPv6 in the [Add Sensor](#)^[328] dialog. Incompatible sensors are not selectable on IPv6 devices.
-  The [Cloud HTTP Sensor](#)^[619] and the [Cloud Ping Sensor](#)^[629] do not support IPv6 although you can add them to IPv6 devices. You will receive an error message if you do so.

Part 6

Ajax Web Interface—Basic Procedures

6 Ajax Web Interface—Basic Procedures

The PRTG web interface is the feature complete access to PRTG Network Monitor via the web. Use the PRTG web interface as default interface to setup your monitoring and bring it to perfection.

Configure devices and sensors, set up notifications, review monitoring results, create reports, visualize your monitoring on dashboards, and use many more PRTG features to complete your monitoring.

The PRTG web interface is based on Asynchronous Java Script and XML (AJAX) and designed to optimally adjust to your systems by its **responsive design**. It shows all object setting dialogs as pop-up layers, so you never lose the current context. The web interface adjusts to the size of your screen, so you always get information displayed in an optimized way.

While you are [logged in](#)^[168], the PRTG web interface continuously refreshes the data on the screen via AJAX calls and you always are up to date on the current monitoring results. You can [set](#)^[3376] the refresh interval and method individually.

Thanks to **Single Page Application (SPA)** technology, your system will stay highly performant because only single page elements are refreshed when necessary.

The following sections introduce the features and concepts of the Ajax Graphical User Interface (GUI).

 If you are interested in a video overview of the PRTG web interface, see this video tutorial: [The PRTG Web User Interface—Overview](#)

6.1 Login

For PRTG on premises instances, you can log in to the web interface once the PRTG core server is [installed](#)^[89]. In your browser, load the IP address or DNS name of the computer PRTG is installed on and log in using the **Login** button. For PRTG hosted by Paessler instances, open your registered PRTG hosted by Paessler domain and log in to the web interface.

You can look up and change the web server settings of PRTG on premises instances at any time using the [PRTG Administration Tool](#)^[362] Windows application on the system where the PRTG core server is installed. Especially when accessing PRTG from the internet, you should use an SSL-encrypted connection. You can easily switch to SSL using the **Yes, switch to SSL** button shown on the welcome screen.

Loading the Web Interface

In a web browser window, please enter the IP address or URL of the system PRTG is installed on. When using a cluster, please connect to the primary master node. You can also double-click on the **PRTG Network Monitor** icon on the desktop of the system PRTG is installed on. If you are using PRTG hosted by Paessler, enter the URL of your instance, for example [myfirstdomain.my-prtg.com](#) to access the web interface with a [supported browser](#)^[31].

 If you run PRTG on localhost, please do not use the DNS name [http://localhost](#) to log in to the web server, as this may considerably slow down the PRTG web interface. Please use your local IP address or [http://127.0.0.1](#) instead.

If you see a certificate warning in your browser, you can usually just confirm it. For more information please see [SSL Certificate Warning](#)^[172].

Login Screen PRTG on Premises

 This only applies to PRTG on premises instances, not to PRTG hosted by Paessler.

After loading the web interface, the login screen is visible. You can either login as default administrator or as any other PRTG user. As **PRTG Administrator** user you can use all functionalities of the web interface. Administrators can [create additional users](#)^[376] with administrator rights or with more restricted privileges (for example, read-only users).

There are Many Reasons in Favor of HTTPS and None (Really) Against It

PRTG Login Screen

Login as Default Administrator (First Time Login)

This only applies to PRTG on premises instances, not to PRTG hosted by Paessler.

When logging in for the first time, login name and password for the default administrator login are both **prtgadmin**. PRTG automatically fills in the default credentials and shows the password in plain text.

- After login you should change the default password. To do so, go to **Set up | Account Settings | My Account** and specify a new password in section **User Account**.
- If you are not logged in into the web interface, you can change the credentials for this default user account any time in the [PRTG Administration Tool](#)³⁵⁷⁴ Windows application.
- If you enter another login name or change your password, the password is no longer shown in plain text.

Login as PRTG User

This only applies to PRTG on premises instances, not to PRTG hosted by Paessler.

If you have received user credentials from your administrator, please enter them here to log in. Also, when using other administrator credentials, please enter them here.

Login Options

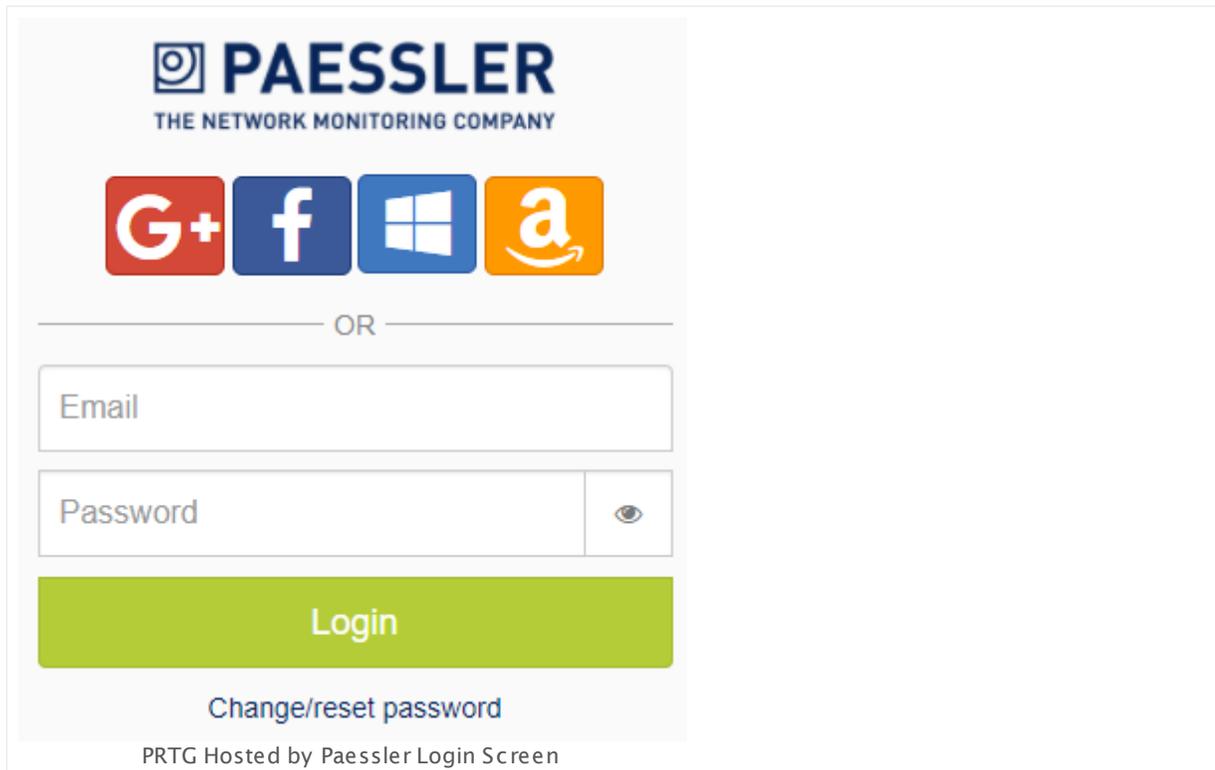

This only applies to PRTG on premises instances, not to PRTG hosted by Paessler.

- **Login:** Log in to the fully featured Ajax web interface, which is the standard interface. We recommend that you use this option for PRTG whenever possible. It offers the full functionality of PRTG. Use Google Chrome 67 or later (recommended) or Mozilla Firefox 61 or later for best performance. In some browsers, the Ajax option is not shown, for example, in old browser versions.
- ❗ Although you can log in using Microsoft Internet Explorer 11, the Ajax web interface might **not** be fully compatible with Internet Explorer! When using Microsoft Internet Explorer 11, please set the security level to **Medium-high** (or lower) and make sure no **Compatibility View** is enabled!
- **Download Client Software (optional, for Windows, iOS, Android):** This option opens the PRTG [download page](#)^[3420] in the web interface. You can optionally download the native Windows application **Enterprise Console** to the desktop. You have to [install](#)^[3430] it on the client computer before use. The [Enterprise Console](#)^[3430] provides full functionality. However, for some functions the Ajax Web GUI opens. As an additional feature, the Enterprise Console can view data of several independent PRTG core installations in one single application.
 - ❗ Also, when using this download option, your name and password (or the default credentials) are required for login!
- ❗ Only Google Chrome 67 or later (recommended) and Mozilla Firefox 61 or later are fully compatible with the Ajax web interface.

Enter specific credentials or use the default credentials, which are automatically filled in, and click the **Login** button to proceed to the PRTG web interface.

Login Screen PRTG hosted by Paessler

For PRTG hosted by Paessler instances, load the PRTG web interface with the domain you have registered at <https://my-prtg.com> and use the login method that you chose when signing up.

The image shows the PRTG login screen. At the top, the Paessler logo is displayed with the tagline 'THE NETWORK MONITORING COMPANY'. Below the logo are four social media icons: Google+, Facebook, Windows, and Amazon. A horizontal line with the word 'OR' in the center separates these icons from the login fields. There are two input fields: 'Email' and 'Password'. The 'Password' field has a small eye icon to its right. Below the input fields is a large green 'Login' button. Underneath the button is a link that says 'Change/reset password'. At the bottom of the screen, it says 'PRTG Hosted by Paessler Login Screen'.

To log in with Facebook, Google+, Windows, or Amazon, click the respective button. A popup window appears where you can enter your credentials for the respective account. Alternatively, you can log in with the email and password that you chose when signing up. If you have received an invitation to PRTG hosted by Paessler, click the link in the invitation and proceed to log in.

Recover Password

If you cannot remember your PRTG on premises password, click the **Forgot password?** link. The **Password Recovery** page opens. Enter your **Login Name**, click **Request a New Password**, and PRTG will send a new password to the primary email address of this PRTG user account. The **Need Help?** link will open the current manual page.

If you cannot remember your PRTG hosted by Paessler password, click the **Change/reset password** link. You are then asked to enter your email address. Click **Change/reset password** again and PRTG will send you an email to reset your password.

6.2 SSL Certificate Warning

If you use PRTG on premises outside your internal LAN, especially when you use it on the internet, you should [switch the internal web server to use SSL](#)^[172]. After doing so, your browser shows a certificate warning because the certificate that comes with PRTG cannot be signed by a valid authority. Anyway, the connection to your PRTG web server is secured via SSL, and you can confirm the claimed security risk.

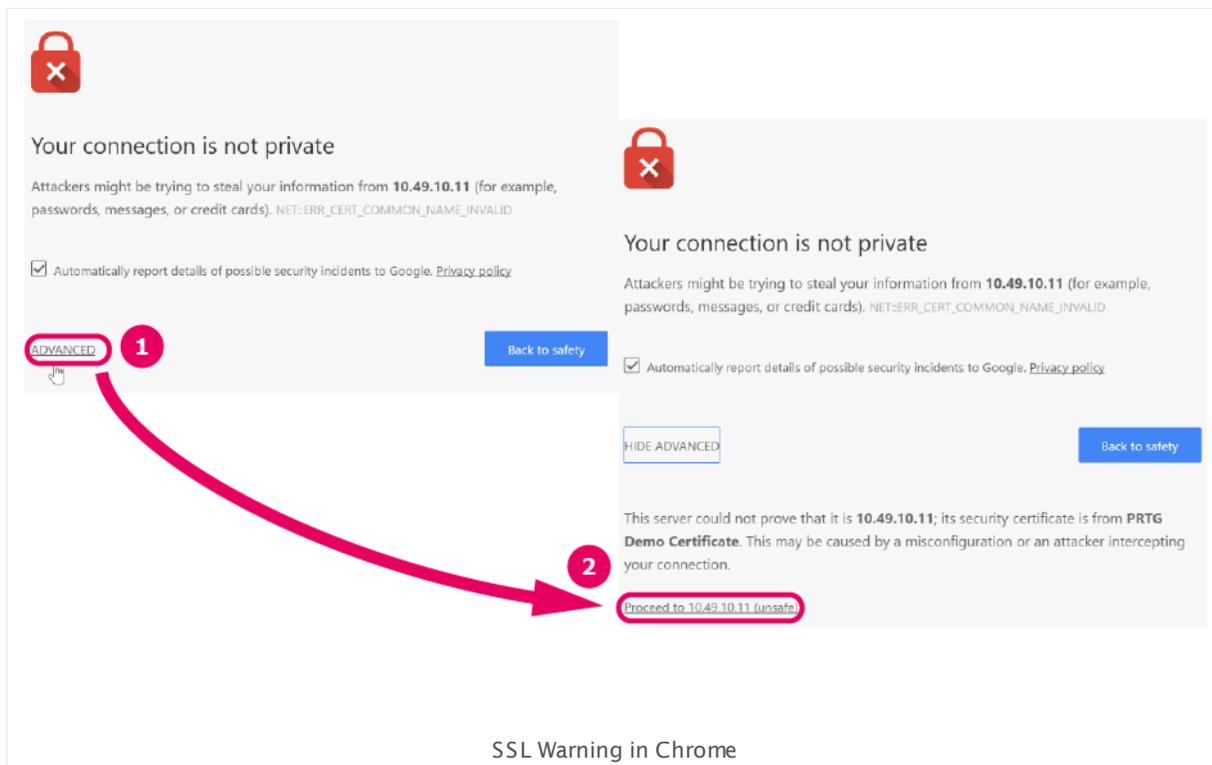

Every browser shows a slightly different certificate warning. The necessary steps are similar for every browser, with a few small differences:

- [Google Chrome](#)^[172]
- [Mozilla Firefox](#)^[173]
- [Internet Explorer](#)^[173]
- [Other](#)^[174]

You can avoid these browser warnings by [using your own trusted SSL certificate](#)^[376] with PRTG. For this purpose we provide the freeware tool [PRTG Certificate Importer](#)^[376].

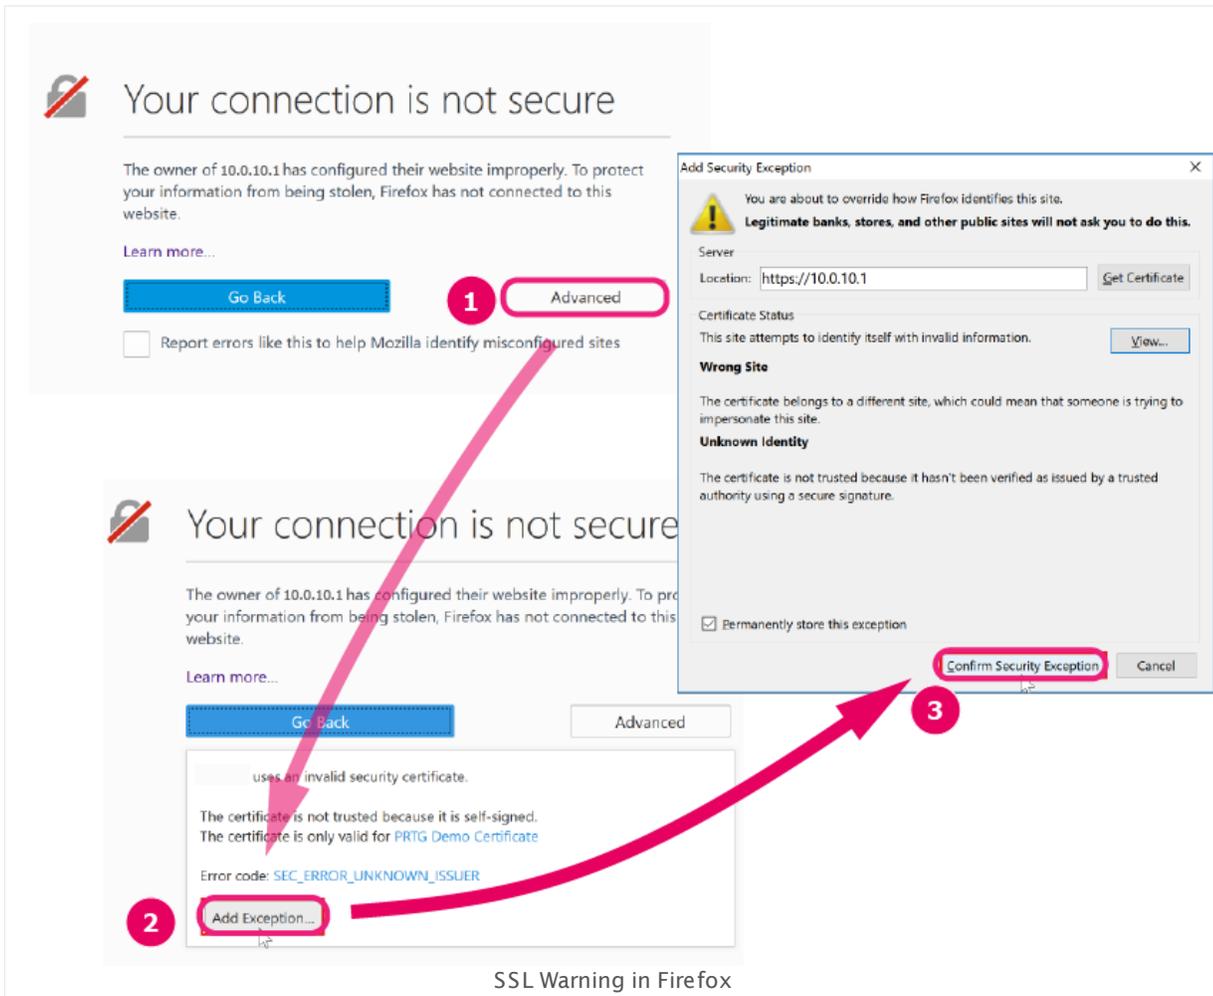

Google Chrome

In **Google Chrome**, click **Advanced** and then **Proceed to [yourPRTGserver] (unsafe)** every time you call the PRTG web interface.

Mozilla Firefox

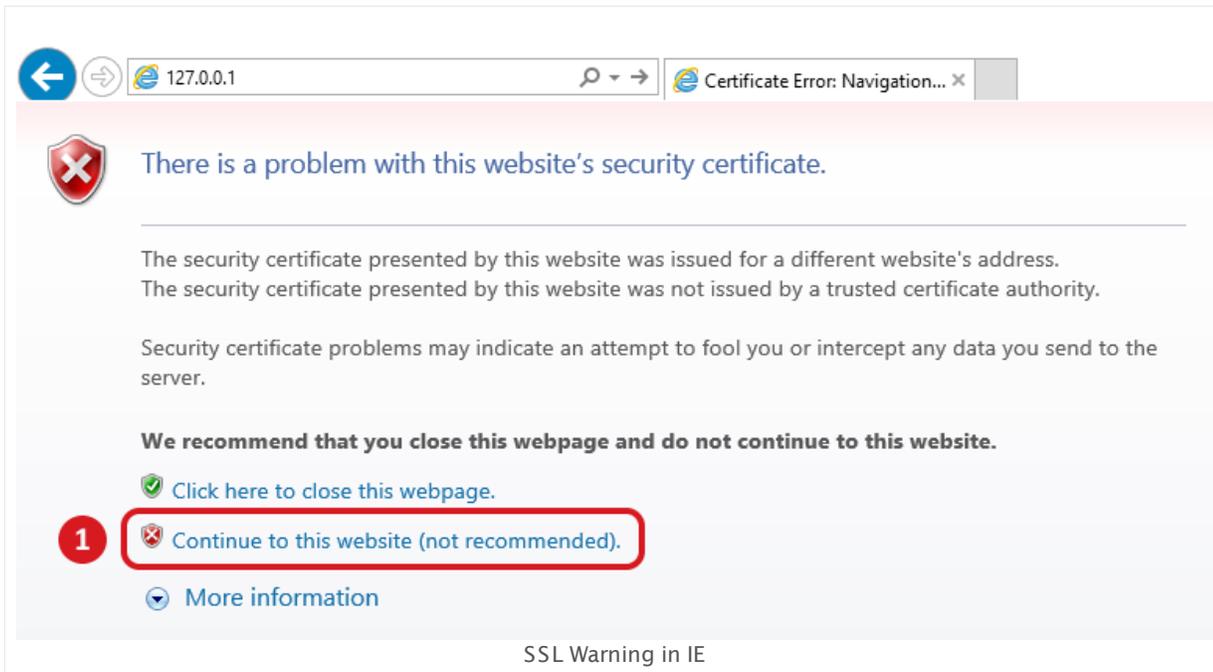

In **Mozilla Firefox**, click **Advanced** and then click the **Add Exception...** button. A window opens, leave the check mark for **Permanently store this exception** and finally click the **Confirm Security Exception** button.

You only have to go through this procedure once for every Firefox browser and PRTG core server.

Internet Explorer

In **Internet Explorer**, click **Continue to this website (not recommended)** every time you call the web interface.

Other

For other, not officially supported browsers, the procedure is similar.

Knowledge Base: Why can't I save my PRTG password in Google Chrome?

- <https://kb.paessler.com/en/topic/61982>

6.3 Welcome Page

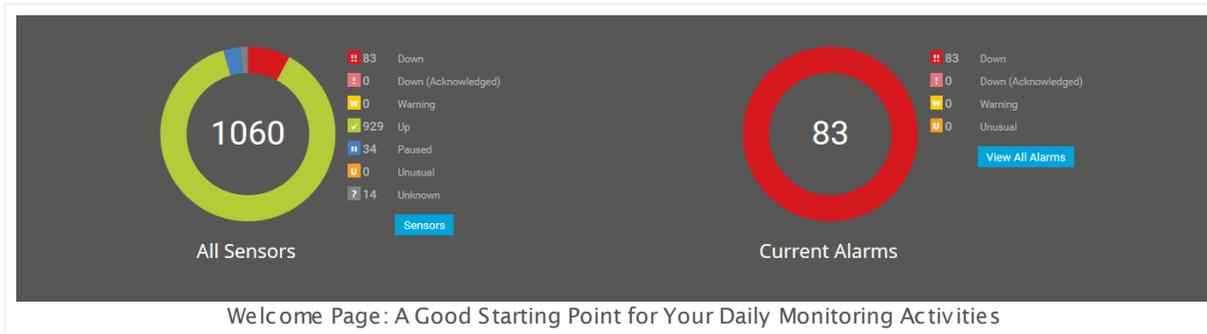

After completing the [Smart Setup](#)^[52], you will see PRTG's welcome page by default when you log in to the web interface. You can set another homepage in your [account settings](#)^[3304], section **Web Interface**.

i This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

The PRTG welcome page shows you various information about your PRTG installation at a glance, similar to a dashboard. The welcome page keeps you informed about all [Sensors](#)^[267] and current [Alarms](#)^[219]:

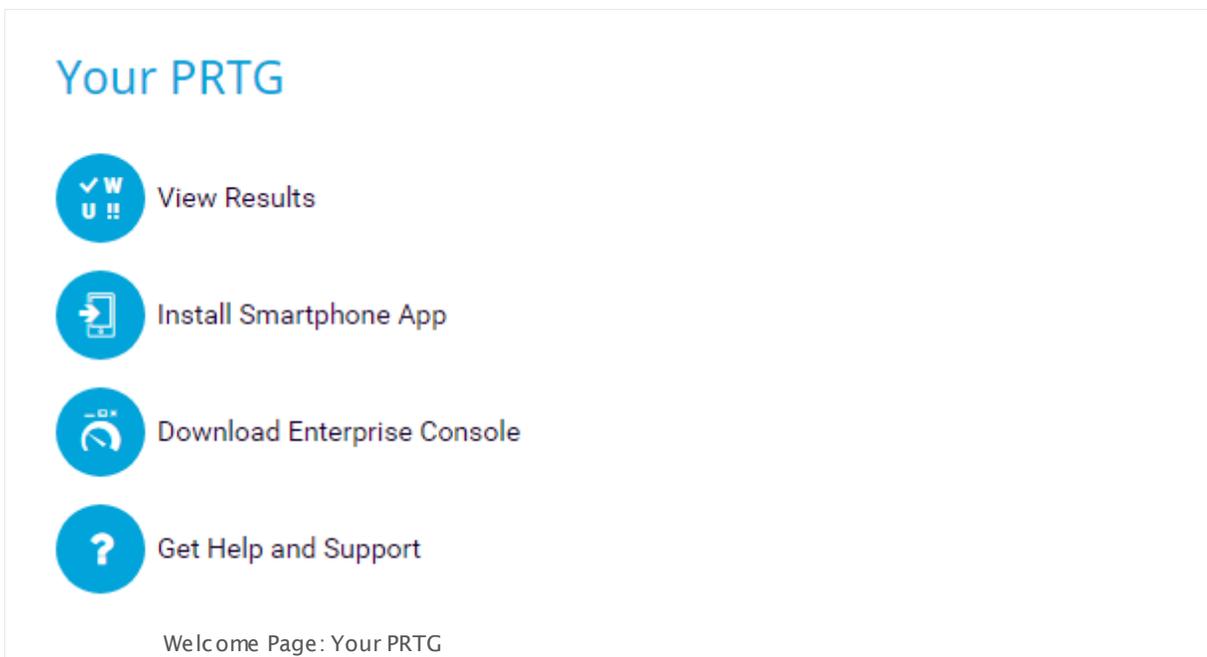

- **Sensors:** Open the [Top 10 Lists](#)^[267] for sensors.

- **View All Alarms:** Open a [list of alarms](#) in your PRTG installation.

You can also directly access several pages in the PRTG web interface from the welcome page:

- **View Results:** Open the [device tree](#) that shows your monitoring results.
- **Install Smart phone App:** Open the [download page for PRTG's mobile apps](#).
- **Download Enterprise Console:** Open the [download page for the Enterprise Console](#) in PRTG (PRTG on premises only).
- **Get Help and Support:** Open the PRTG help and support page from where you can access the PRTG user manual, the Knowledge Base, and video tutorials. You can also open [support tickets](#) and contact [our customer service](#) from this page.
- **Manage Subscription:** Open your PRTG hosted by Paessler dashboard and manage your subscriptions.

Other sections are:

- **Paessler Blog:** Shows recent information about PRTG and Paessler. Click the heading of an article to open it on paessler.com with your browser.

- **Yesterday's Activity:** Shows what your PRTG server did for you on the day before. Point with your mouse to the mini graph to show the number of sensor scans on a specific day. See also manual section [PRTG Status—System Status](#)^[3400], section **Activity History**.
- **License Status:** Shows the number of your remaining maintenance days for PRTG on premises and the number of sensors you can still add with your current license. Click **Get Maintenance** to open the Paessler shop and extend your maintenance for PRTG on premises installations. Click **Get More Sensors** to open the Paessler shop and upgrade your license. See also manual section [PRTG Status—License Status and Settings](#)^[3414].
 - ❗ The number of available sensors that is displayed here does not consider [paused sensors](#)^[245] for technical reasons. However, paused sensors do not count against the maximum number of sensors that your license allows. Add the number of your paused sensors to the displayed number to know exactly how many sensors are still available on your installation.
 - ❗ If you use a PRTG on premises license with an unlimited number of sensors, PRTG takes 10,000 sensors as starting point to calculate the number of available sensors, which is displayed here. Please consider the [system requirements](#)^[26] for a properly working PRTG setup and click **Recommended Setup** for more information.
- **Update Available:** Shows the version number of your PRTG on premises core server and the version number of the latest available PRTG version. You will see the label **NEW** if there is a newer version available. Click **Install Update** to open the PRTG [Auto-Update](#)^[3407] page.
- If your PRTG on premises installation is currently not SSL-secured, the welcome page will ask you to enable SSL encryption for the PRTG website. Click **Yes, Switch to SSL** to enable SSL encryption or **Don't Tell Me Again** to remove this note from the welcome page. See also manual section [System Administration—User Interface](#)^[3346].
- If you still use the default password of the PRTG System Administrator user (**prtgadmin**) on a PRTG on premises installation, the welcome page will ask you to set a secret password if your PRTG website is publicly accessible. Click **Change Default Password Now** to define a new password. See also manual section [System Administration—User Accounts](#)^[3377].
- In the **video section** you find informative and helpful videos about monitoring with PRTG. Click a video to open and play it on paessler.com.

The collected information about your PRTG installation makes the welcome page a good starting point for your daily monitoring activities. Of course, you can also set up your custom dashboards in PRTG. The [Maps](#)^[3276] feature of PRTG enables you to create dashboards exactly like you want.

6.3.1 Customer Service

If you have any questions about license purchase, upgrade, or maintenance extension, you can directly contact the Paessler **Customer Service** from the **Help and Support Center** in the PRTG web interface. We will readily assist you with quotes or information about licensing and maintenance, and guide you through the purchasing process. Our Customer Services team will also gladly send you the contact information of a knowledgeable PRTG partner in your region or research any technical specifications you might need beforehand.

 PRTG transmits your feedback or questions securely to Paessler via the PRTG Cloud. Please make sure your PRTG server has access to the internet and can reach the URL <https://api.prtgcloud.com:443> for successful transmission.

Ask a Question or Give Us Your Feedback

Provide the following information in this section of the **Contact Paessler Customer Service** form:

- **Your Name:** Enter your full name for contact information.
- **Your Email Address:** Enter an email address under which we can reach you.

- **Your Country:** Select the country in which you run PRTG so we can provide you contact information for a partner near you.
- **Your Phone Number:** Enter a phone number under which we can reach you.
- **How can we help?** Select the scope of your question.
- **Emotional State:** If you want to, you can indicate your current feelings about PRTG and your purchase process.
- **Describe your question in one sentence:** Provide short information that indicates the topic of your request.
- **Do you have any further comments?** Enter your comments here. This can be feedback or any questions for our customer service.

Click **Submit** to send your question or feedback to our customer service. Click **Cancel** to close the customer service contact form without sending it.

 If you have technical questions regarding your already existing PRTG setup, [contact our technical support](#).

6.4 General Layout

This manual section provides a general overview of the structure of the web interface of PRTG. Central focus is the **Devices** view, which you can select via the main menu bar. The **Devices** view presents the monitoring results at a glance—you will widely use it.

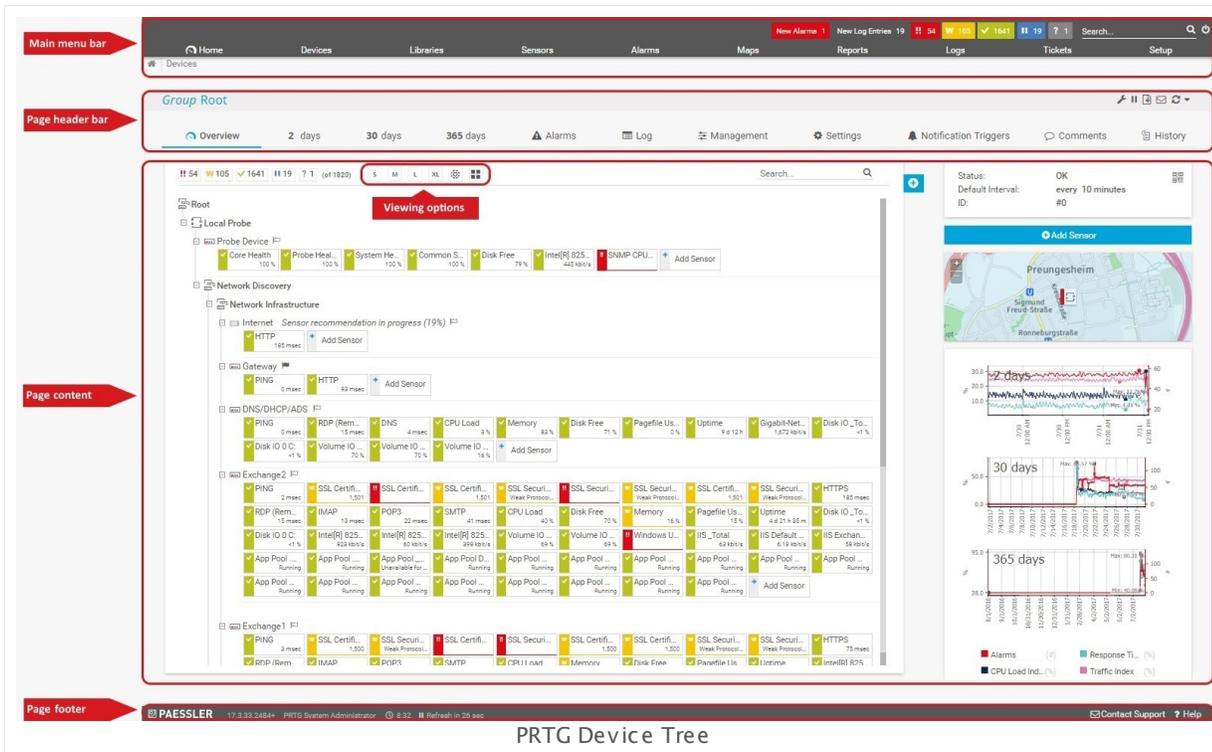

Welcome Page

When you log in to the PRTG web interface, by default you will see the [Welcome Page](#)^[175]. You can set another homepage in your [account settings](#)^[3304], section **Web Interface**.

Click **View Results** to open the device tree window.

Tree View Layout

Click **View Results** on the welcome screen to display the device tree window. This will be a good starting point for your everyday work with PRTG.

From top to bottom, the device tree screen has several areas that will be covered in further detail in this section. For a general overview of the device tree consider the table below.

Page area name	Description
Global Header Area ¹⁸⁵	This area contains the main menu at the very top, the global status bar, the path to the currently selected object, and a quick search box.
Page Header Bar ¹⁸⁵	This area contains the page heading with the name of the current object, several tabs with settings, monitoring data of the current object, and quick action buttons.
Page Content ¹⁸⁶	This area contains information about the current object and all other objects underneath in the tree hierarchy, the object's status bar, a quick search box, and the QR code that links to the current URL.
Viewing options ¹⁸⁷	These buttons are part of the page content. Here you can adjust how your device tree is displayed.
Page Footer	Shows information about the current version of PRTG, the logged in PRTG user account, and the current time (depending on the timezone settings ³³⁸⁰ for the currently logged in user). A timer counts down how much time remains until the next automatic page refresh. You can pause the refresh timer with the pause icon and resume with the play icon. If you open another page while the refresh timer is paused, the timer will resume automatically, starting with the defined Auto Refresh Interval that you can configure in your account settings ³³⁰⁷ .  Long table lists ²³⁷ that are set to display 1000 items at a time will be excluded from automatic refresh to ensure system performance.
Page Footer Icons	With these icons you have quick access to the PRTG Auto-Update ³⁴⁰⁷ page if a new version is available and to the contact support form ³⁴²⁴ . There is also a link to context sensitive help. When running PRTG in a cluster, you will also see a cluster related element. It shows the name of the node that you are logged in to and displays whether this is a master or a failover node. Click the bar to show the Cluster Status ³⁴¹² . In a failover node, you can review all data, but changes in the settings will not be saved. In order to change settings, please log in to the master node of your cluster.

Click an object to see its details page. In the page heading of the [page header bar](#) ¹⁸⁵ you always see the name of the object that you have currently selected.

When navigating the PRTG web interface, the following paths are available:

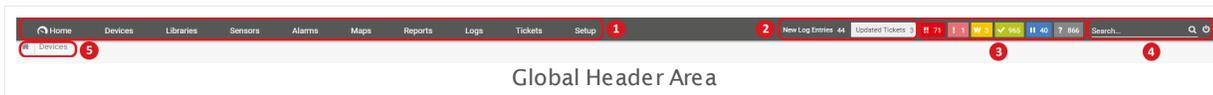

- The main menu provides access to all important aspects of the software.
- The quick search is often the fastest way to find a specific object (for example, a sensor or a device).

- Using the page tabs, you can switch between various sub-pages.
- Right-clicking objects will open a [context menu](#)^[247].
- When pausing over objects, the tool tip appears, and after further hovering a quick-access window ([Hover Popup](#)^[262]) will open.
- You can drill down into the object hierarchy of probes, groups, devices, and sensors in the object tree by merely clicking a sub-object of the currently displayed object (for example, a sensor on the device page).

These navigation paths offer complete access to the functionality of PRTG, often you will find multiple means of accessing information or navigating to a certain setting.

In the following, the different areas of the web interface are described.

Global Header Area

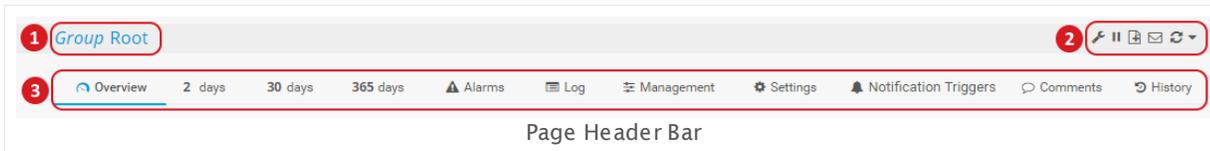

The header area of the web interface provides central, very condensed information about your installation and offers access to all content and every setting within PRTG. The following table lists the elements that the global header area is made up of.

i This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

Screen Number	Part	Description
1	Main Menu Bar	For starting to navigate through the web interface, the main menu is the best starting point. We recommend that you take a few minutes to familiarize yourself with the menu bar and its sub-items. For a detailed description see the Main Menu Structure ^[263] section.
2	New Alarms, New Log Entries, New Tickets	The information boxes show how many new alarms, new log entries, and updated tickets have occurred. Click the respective box to view the lists of Alarms ^[219] , Logs ^[228] , or Tickets ^[230] .
3	Global Sensor Status Symbols	This area shows the accumulated states of all sensors you have configured for monitoring, divided according to the different sensor states. Depending on each respective status, you will see colored boxes with numbers that symbolize the amount of sensors that are in the respective status. For example, you can see how many sensors are in Up , Down , or Warning status. Click a box to view a list of all sensors in the respective status. For a detailed description, see the Sensor States ^[195] section.
4	Search Bar, Logout	<p>Via the icons in the top-right corner you can start a search or log out.</p> <p>To search for a monitoring object, enter a name, parts of a name, an IP address, a DNS name, or a tag in the search box on the right and confirm with enter. PRTG will perform a string search in your entire monitoring setup, including groups, devices, sensors, libraries, maps, reports, tickets, and object comments.</p> <p>A page with the items that are related to the search term will open—even displaying online help articles.</p>
5	Breadcrumbs	Below the main menu, PRTG shows a path that retraces the steps back to the welcome screen (or your defined starting page). Use it to quickly jump back to where you came from. Breadcrumbs can also help you to orient yourself if you get lost. If you click a breadcrumb item, a dropdown menu opens that shows all objects on the same level. You can either search for an object, or select one directly. For example, you can use this to directly access all other sensors or a device, other devices within a group, and another group on the same probe. Other probes in your root group are also available.

Page Header Bar

The page header bar, below the global header area, consists of a number of elements shown in the table below.

Screen Number	Part	Description
1	Page Heading	This line displays the current object's type and name as page heading. In the screenshot above, it is a group that is called Root . Here you can define the object's priority by clicking on one of the five stars (not available for the Root group). For details, see section Priority and Favorites ^[242] .
2	Context Buttons	On the right side is a row of icons for several actions. Depending on the currently viewed page within PRTG, you can pause (and resume) the respective object. You can also add another object (for example, a sensor to a device), send a link to the current page per email, perform an immediate scan, open a related ticket, or show the corresponding object history page ^[229] . Click the down arrow to open the context menu for the currently displayed object for further options. For more information, see Context Menus ^[247] section.
3	Tabs	Via tabs you can navigate to the various sub-pages of an object, for example, to its monitoring data or settings. For more information, see sections Review Sensor Data ^[198] and Change Device and Sensor Settings ^[217] .

i This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

Depending on the selected object type, the page header bar shows additional information:

- All objects underneath the Root group show their [dependency](#)^[141].
- Groups and devices display the time elapsed since the last execution of the [auto-discovery](#)^[282] on the selected object.

Part 6: Ajax Web Interface—Basic Procedures | 4 General Layout

- Devices show their respective DNS/IP address as defined in the [device settings](#)^[402] and the time elapsed since the last execution of the [sensor recommendation](#)^[213] on this device.
- Sensors show additional monitoring statistics.

Page Content

The page content of the general layout varies dependent on the selected object. It shows information about the current object and all other objects underneath in the tree hierarchy. The deeper down in the hierarchy you select an object, the more detailed is the displayed information.

The screenshot displays the PRTG Network Monitor interface. On the left, a tree view shows the hierarchy: Root > Local Probe > Probe Device > Core Health (100%), Probe Health (100%), System Health (100%), Common S... (100%), Disk Free (79%), Intel[R] 825... (466 kb/s), and SNMP CPU... (red). Below this, 'Network Infrastructure' is expanded to show 'Internet F2' with HTTP (141 msec), 'Gateway gw' with PING (0 msec) and HTTP (54 msec), 'DNS/DHCP/ADS: dc1 F2' with PING (2 msec), RDP (Rem...) (10 msec), DNS (6 msec), CPU Load (2%), Memory (82%), Disk Free (71%), Pagefile Us... (5%), and Uptime (9 d 17 h), and 'Exchange F2' with a large grid of sensors including PING, SSL Certifi..., RDP (Rem...), IMAP, POP3, SMTP, CPU Load, Disk Free, Memory, Pagefile Us..., Uptime, Disk IO, Intel[R] 825..., and multiple App Pool sensors.

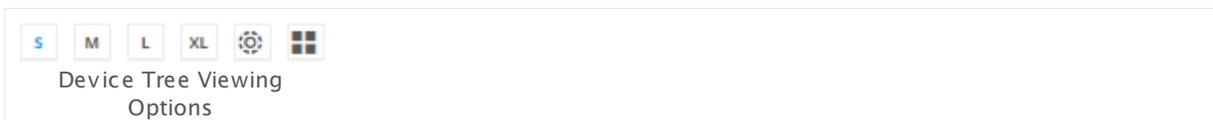

On the right, a detailed view of a sensor is shown. It includes a status box (Status: OK, Default Interval: every 10 minutes, ID: #0), a map of 'Preungesheim', and three time-series charts for 7 days, 30 days, and 365 days. A legend at the bottom identifies the data series: Alarms (red square), Response TL... (green square), CPU Load Ind... (blue square), and Traffic Index (pink square).

Page Content

1	Sensor Status Bar	<p>This element is visible when viewing a probe, a group (including Root), or a device. It is not available when the sensor details page is open. The sensor status bar shows the accumulated states of all sensors for the current object, divided into different sensor states. They show the number of sensors in the respective status.</p> <p>For example, you can see how many sensors are in Up, Down, or Warning state. For a detailed description of sensor states, see the Sensor States^[195] section. You can hide sensors that are in a certain state by removing the check mark in front of the respective status. To show them again, re-add the check mark.</p>
2	Viewing options	<p>This element is only visible when viewing a probe or a group. It is not available when you view device or sensor details. For a detailed description, see Switch Device Tree View^[187] below.</p>
3	Tree Search	<p>In the white search box to the right of the tree view selection, enter a key word to search the device tree for matching items. The tree will highlight matching devices and sensors by graying-out all others. This can help to gain a quick overview over sensors monitoring a specific part of your network. For example, you can enter the keyword "firewall" to highlight devices and sensors matching this name.</p>
4	Add Button	<p>Use this button to add new objects to your monitoring setup. For a detailed description, see Add Button^[192] below.</p>
5	Object Status, Scanning Interval, Object ID, QR Code	<p>This element displays the current status of the selected object, the time interval in which PRTG scans the current object, the ID of the current object, and the QR code for the current page. If you use a PRTG mobile app^[3494], you can scan the code to view the current object directly on your mobile device. Click the QR code to enlarge it for scanning.</p>

Switch Device Tree View

Wherever a probe or group is displayed, you can choose between a number of viewing options.

Switch Device Tree View—Classic Device Tree

Via the sizes in the page header bar, you can adjust how much information will be included next to each object. Using the various buttons, you can switch from a very condensed view (SM) to an extra spacious view (XL).

In the classic device tree view you can **collapse** devices, groups, and probes. Click the minus box left of the object name. The sensor states will then be summarized. The states of all sensors on this object will be displayed. Right next to the status, the amount of sensors in this status will be displayed, with the exception of the states **Down**, **Down (Partial)**, and **Down (Acknowledged)**. In the default settings, the sensors will be grouped together if there are more than ten sensors with the same status, otherwise they will be displayed individually.

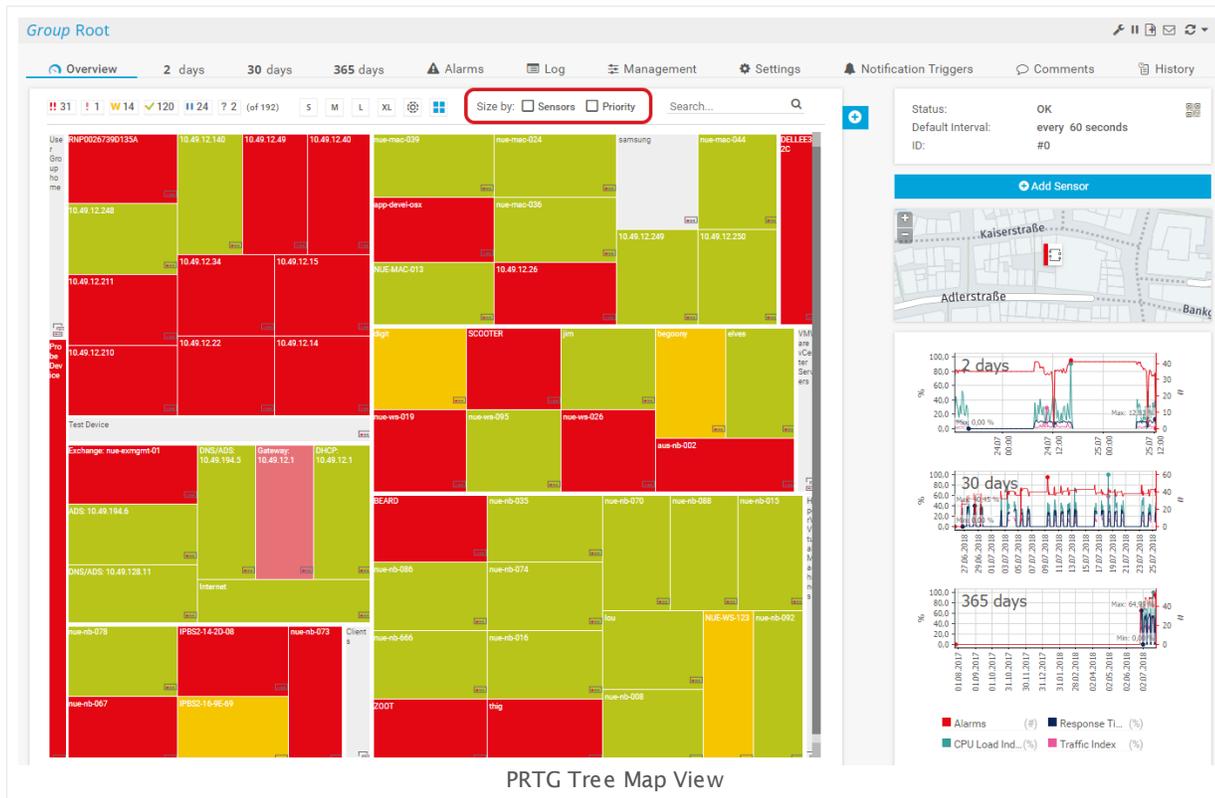

Switch Device Tree View—Extended Views

There are two additional options to the simple tree views that enable you to display the status of all sensors of your entire installation in a single overview. Choose one of the icons to change the view:

Tree Map View (6)

The tree map view displays all devices of your entire installation as tiles sorted into a square and arranged according to the groups they belong to. Each device dynamically changes color to reflect the overall status of the sensors on the device. You can also adjust the square size: either depending on a device's priority, or depending on the number of sensors on a device, or depending on both. To do this, click the **Size by: Sensors** and/or **Priority** setting in the page header bar (see the mark in the screenshot below).

Sunburst View (5)

The sunburst view displays your entire installation as a circle diagram. The groups are represented as inner circles, and all devices contained within a group are shown as 'cake slices' attached to the outside of a circle element.

The sunburst is interactive:

- You can click elements to open the details view of your monitoring objects.
- You can zoom in and out by using the plus + and minus - buttons or your mouse wheel.
- You can change the position of the sunburst on the overview tab with drag & drop.

Flag	Flag Color	Object Status	Meaning
	Red	Down	At least one sensor 'belonging to' this object shows a red Down status. Point to an object's name to view the total number of alarms concerning this object.
	Bright-Red	Down (Acknowledged)	At least one sensor belonging to this object is Down and the status has been acknowledged by a PRTG user via the Acknowledge Alarm function. All of this device's Down states must have been acknowledged—if at least one sensor is not acknowledged, this object will be displayed as Down .
	Yellow	Warning	At least one sensor belonging to this object shows a yellow Warning status. There is no sensor in a Down or Down (Acknowledged) status concerning this object.
	Orange	Unusual	At least one sensor belonging to this object shows an orange Unusual status. There is no sensor in a Down , Down (Acknowledged) , or Warning status concerning this object.
	Green	Up	All sensors belonging to this object are in a green Up status. There is no sensor in a Down , Down (Acknowledged) , Warning , Paused , or Unusual status concerning this object.
	Blue	Paused	All sensors belonging to this object show a blue Paused status. There is no sensor in a Down , Down (Acknowledged) , Warning , Unusual , or Up status concerning this object.
	Black (Grey)	Unknown	All sensors belonging to this object have an Unknown status. There is no sensor in a Down , Down (Acknowledged) , Warning , Unusual , Paused , or Up status concerning this object.

▪ **Size by Sensors / Size by Priority**

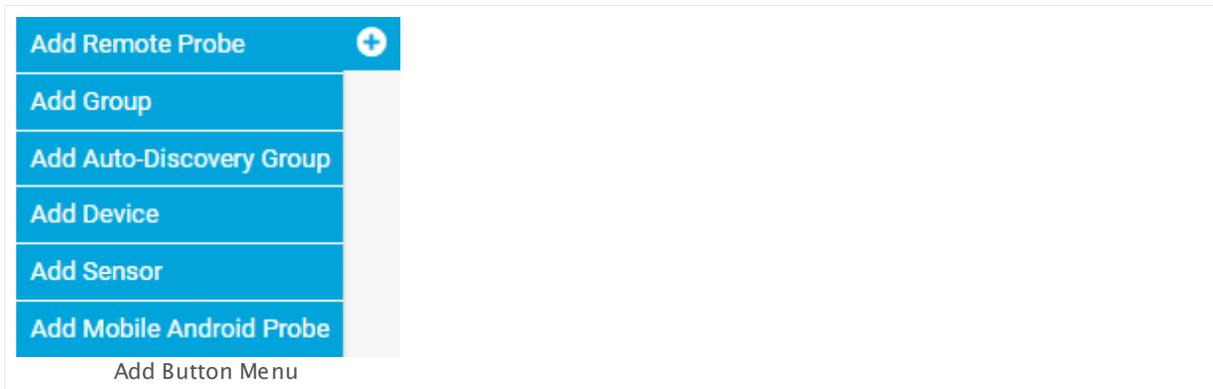

You can adjust the size of the different squares. They can be calculated by the amount of sensors running on a device or within a group, or by the sensors' priority (see [Priority and Favorites](#)^[242]), or both. Use the check boxes in the page header bar (see below) to change the view immediately, then use the setting that suits you best.

Size by: Sensors Priority
 Sorting Checkboxes

Add Button

Hover over  to add new objects to your monitoring setup. An assistant will appear, leading you through the necessary steps.

 The content of the PRTG context menu varies, depending on the menu item or tab you have selected.

See the following for more information:

- [Add Remote Probe](#)  3707
- [Add a Group](#)  302
- [Auto-Discovery—Creating an Auto-Discovery Group](#)  283
- [Add a Device](#)  311
- [Add a Sensor](#)  325
- [Add Mobile Android Probe](#)

Default Objects in the Device Tree

By default, a **Probe Device** is created in the device tree on the [local probe](#)  3742 or [hosted probe](#)  3743. It represents the probe system running with your PRTG installation. PRTG automatically monitors the system health of the core server and each probe to discover overloading situations that may distort monitoring results. To monitor the system status of the probe computer, PRTG automatically creates a few sensors:

- [Core Health Sensor](#)  652
- [Probe Health Sensor](#)  1590
- [System Health Sensor](#)  2669
- Some further device specific sensors for disk usage and bandwidth

In a cluster installation, PRTG also creates a **Cluster Probe Device** with a [Cluster Health Sensor](#)  638 that monitors the cluster's system health.

We recommend that you keep these sensors, but they all are removable.

6.5 Sensor States

In the PRTG device tree you usually create several sensors for each [device](#)^[402]. With sensors, you can monitor different aspects of your devices. Using a simple color code, they always show you what is going on in your network.

The color of a sensor always shows its current status. In the below table, you will find a list of states a sensor can show. This list also reflects the hierarchy of states whenever summarized sensor states are shown (in the [device tree](#)^[181], or on [geo maps](#)^[3211]): the higher a status is in the hierarchy, the higher will be its priority in displaying sensor states. For example, if all the sensors of a specific device are **Up**, but one of its sensors reaches a **Down** status, then the overall status of this device will be **Down** as well (for example, displayed red in the [Tree Map View](#)^[187]), because this status is higher up in the hierarchy.

i **Down** and **Down (Partial)** states are equal in the status hierarchy.

Sensor	Color	Status Name	Meaning
	Red	Down	<ol style="list-style-type: none"> 1. PRTG is unable to reach the device, or the sensor has changed to the error state. See the Sensor Warning and Down Behavior^[196] below for more information. <ul style="list-style-type: none"> i By design, a sensor does not record any data in its channels while it shows this status. 2. Another reason for this status can be an error limit that is set in the Sensor Channels Settings^[3160], or an error status due to a sensor Lookup^[3693]. <ul style="list-style-type: none"> i In this case, the sensor continues to record data in all sensor channels although the sensor shows an error.
	Green/Red	Down (Partial)	<p>In a cluster, at least one node reports this sensor as Down, while at least one other node reports the same sensor as Up.</p> <ul style="list-style-type: none"> i This status is not available for sensors on remote probes in a failover cluster^[130].
	Bright-Red	Down (Acknowledged)	<p>The sensor is Down and the status was acknowledged by a PRTG user, applying the Acknowledge Alarm function. This can be helpful to mark that an alarm has already been brought to attention. For acknowledged alarms no further notifications^[3216] are sent. To set this sensor status, right-click the sensor in Down status and from the context menu^[247], select Acknowledge Alarm... Then enter a comment and click OK.</p>

Sensor	Color	Status Name	Meaning
	Yellow	Warning	The sensor gives an error reading, but PRTG will try again. The sensor may soon change to a down status. See the Sensor Warning and Down Behavior ^[196] below for more information. Another reason for this status can be a warning limit set in a sensor's Sensor Channels Settings ^[3160] .
	Orange	Unusual	The sensor reports unusual values for this weekday and time of day. The unusual detection is based on the historic average data and can be configured or disabled in the system administration ^[3356] . You can also disable unusual detection for certain groups only (see Group Settings ^[399]).
	Green	Up	The last scan was okay and the sensor currently receives data.
	Blue	Paused	The sensor is currently paused (for a certain timespan, indefinitely, or triggered by a dependency ^[141]).
	Black (Gray)	Unknown	The sensor has not received any data yet or there is an error in (network) communication, likely on the probe system. If sensors show this status persistently, a PRTG restart may be necessary.  For extended troubleshooting, see this Knowledge Base article: What to check if sensors are black (gray)?

Sensor Warning and Down Behavior

The **Down** status symbolizes that something is wrong with a monitored device. There can be various reasons for a down status, for example, an interruption in the physical connection to the device, an internet connection outage, or a crashed server.

After a failed request, PRTG tries to re-contact the device before setting a sensor to **Down** status (this is true for almost all types of sensors):

1. If a request to a device fails for the first time, the sensor will change to **Warning** status. PRTG repeats the request and attempts to re-scan the device immediately.
2. If the second request also fails, the sensor changes to **Down** status by default until the device is reachable again. You can change this behavior in the [Scanning Interval](#)^[343] settings of any monitoring object. PRTG tries to reach the device with every scanning interval.

This procedure gives devices and services the chance to recover from a momentary overload and prevents false alarms. Still, you are informed promptly about any network issues.

 The behavior described above does **not** apply to **Warning** or **Down** states that are activated due to a warning or error limit set in the [Sensor Channels Settings](#)^[3160] or to channels using [lookups](#)^[3693].

6.6 Review Monitoring Data

Probe, group, device, and sensor pages have tabs that you can use to navigate between the different options. For example, you can view your network's status, view monitoring results, or change settings.

Overview

The **Overview** tab shows an overview of the currently selected object and its sensors. The pages share a common structure, but some elements differ, depending on the type of object.

- **Probes and Groups:** the tab shows a tree-like view with devices and sensors, a Geo Map, as well as summary graphs for different timespans of the current probe or group.
- **Devices:** the tab shows device details, a Geo Map, and summary graphs for different timespans, colored gauges for high priority sensors, as well as a table list of all sensors on this device, and a [table list](#) [237] with [Recommended Sensors](#) [213].
- **Sensors:** the tab shows sensor details, current status, colored gauges, sensor graphs for different timespans, a table with all sensor channels, as well as [similar sensors](#) [209], which show correlations in your network.

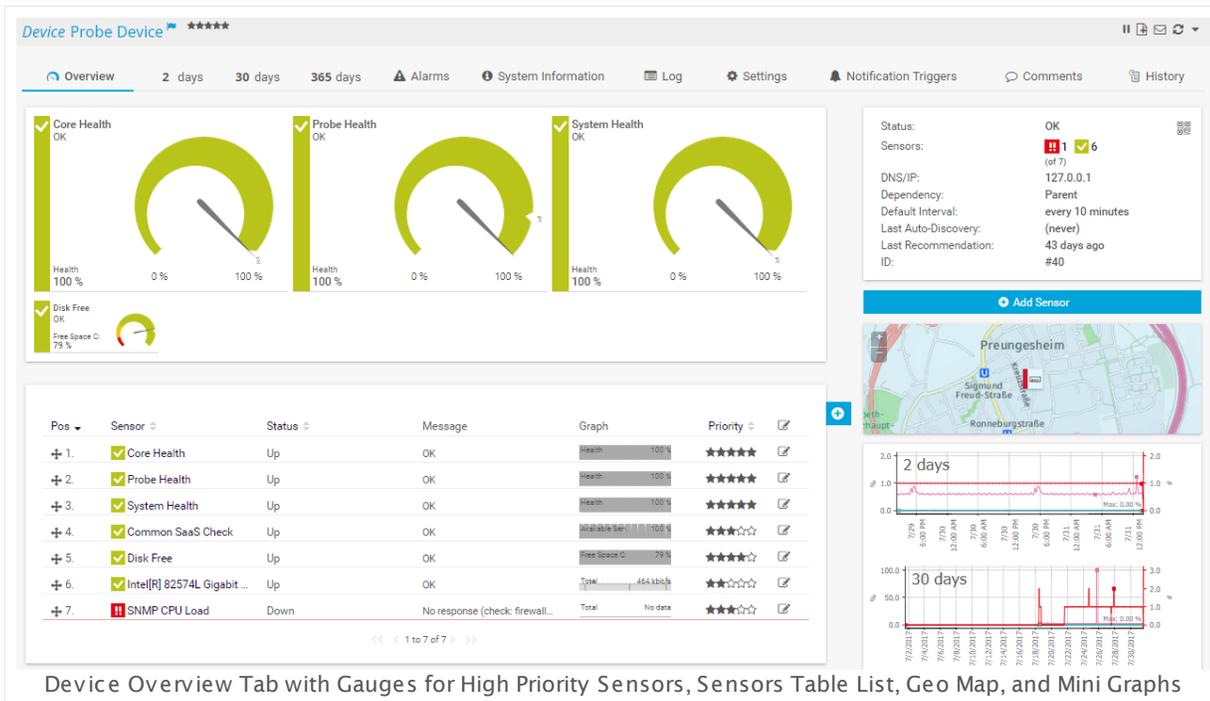

i You can turn off the sensor recommendation and disable the table list in [System Administration—Monitoring](#) [3369].

i Assign 4 star (***) or 5 star (****) priorities to sensors to display their gauges on your device overview pages. 5 star sensors are represented by larger gauges (upper row on the screenshot) rather than 4 star sensors (lower row on the screenshot).

Gauges represent sensor values on the **Overview** tab of devices and channel values on **Overview** tabs of sensors. They visualize the current value of a sensor or a channel, so you can use them as a quick status indicator.

- Red and yellow sections of gauges correspond to the error and warning limits of the [sensor channel settings](#) [3160].
- Device overview tabs only show gauges of high priority sensors, sensors with priorities of 3 stars (***) or less are omitted here.
- Sensor overview tabs show gauges of all sensor channels (except the **Downtime** channel), regardless of priority. The primary channel is displayed with the large gauge.
- Sensor channels that display binary values such as on/off or successful/failing due to their [lookup](#) [3693] configuration are visualized as **switches** not gauges. Switches only show red or green for their respective two states.

i For the gauge to remain legible, we recommend that you stay below 120 [lookup](#) [3693] values for primary channels, which belong to sensors with a 5 star priority. For sensors with a priority of 4 stars, the recommended limit is around 40 lookup values.

Toplists

Toplists are available for [xFlow and Packet Sniffer sensors](#)^[430] only. Toplist graphs are displayed right on the sensor overview page.

For more information, see the section [Toplists](#)^[3186].

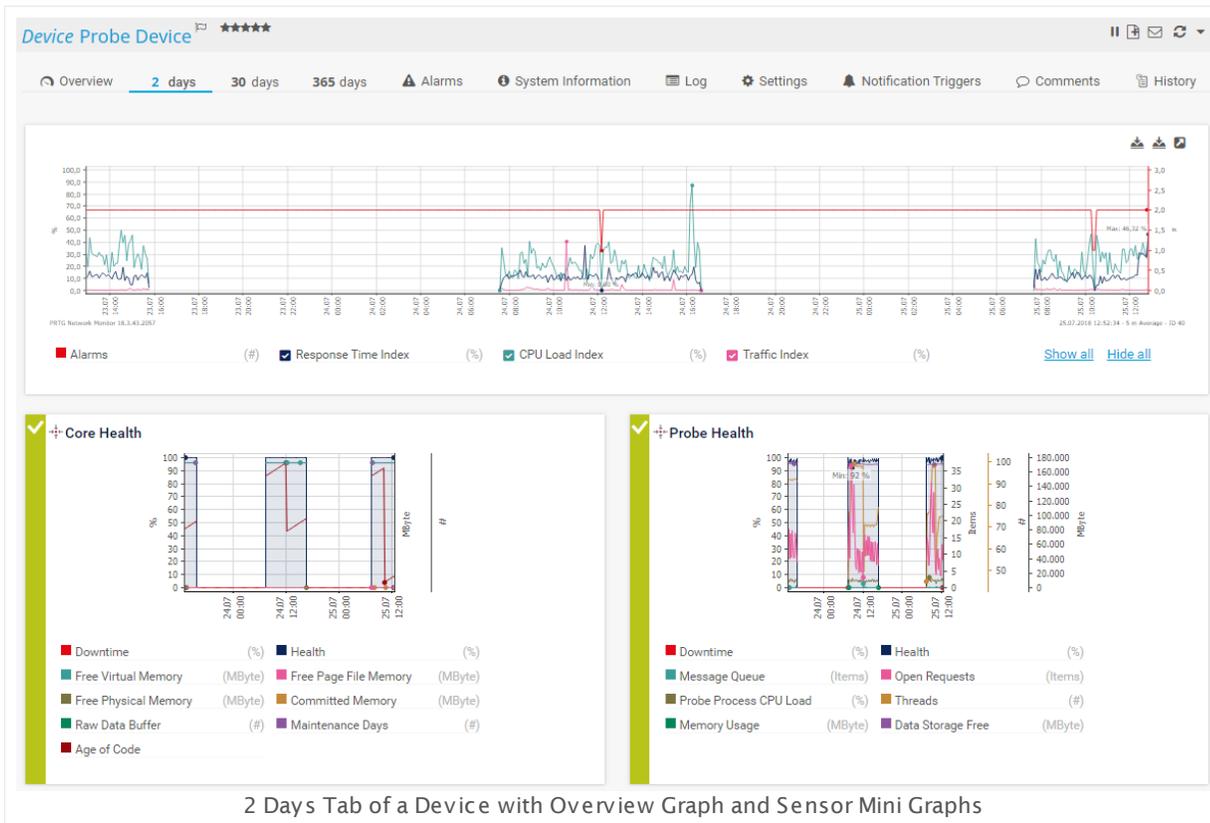

Live Data and Data By x Days

Select one of the tabs **Live Data** (available for sensors only), **2 days**, **30 days**, or **365 days** to display an object's monitoring data live (sensors only), or for different timespans and in more or less detail. The time that graph legends and data tables show depends on the [time zone settings](#)^[3380] for the currently logged in user.

The days mentioned here is the default setting. You can change the shown days of the different graphs under [System Administration—User Interface](#)^[3351].

Graphs label minimum and maximum values of a sensor's primary channel and minimum and maximum values of the **Response Time Index** of other objects. A maximum value of 100% will not be labeled.

Part 6: Ajax Web Interface—Basic Procedures | 6 Review Monitoring Data

Live Data and Data By x Days—Probes, Groups, and Devices

For probes, groups, and devices, each of the tabs shows a summary graph for the current object and mini graphs for all sensors on this object, as well as a data table for the current object. For performance reasons, PRTG never displays more than 50 mini graphs. Hover over a mini graph to display the graph legend.

Summary graphs show the number of alarms as well as three **index graphs**. These graphs indicate response time, CPU usage, and bandwidth usage for all sensors. Index graphs are similar to a stock index. The shown values are based on the readings of all sensors of this object. PRTG computes these values using statistics and by comparing the values to the highest and lowest readings ever recorded.

The three index graphs show overall (or global) trends in your network. If these values increase over a specific time frame, then CPU load, bandwidth load, or response time respectively have worsened during this time. For example, a **CPU Load Index** value of 90% means that the average CPU load for all CPU sensors of your current configuration is at 90% of the highest ever measured CPU usage value.

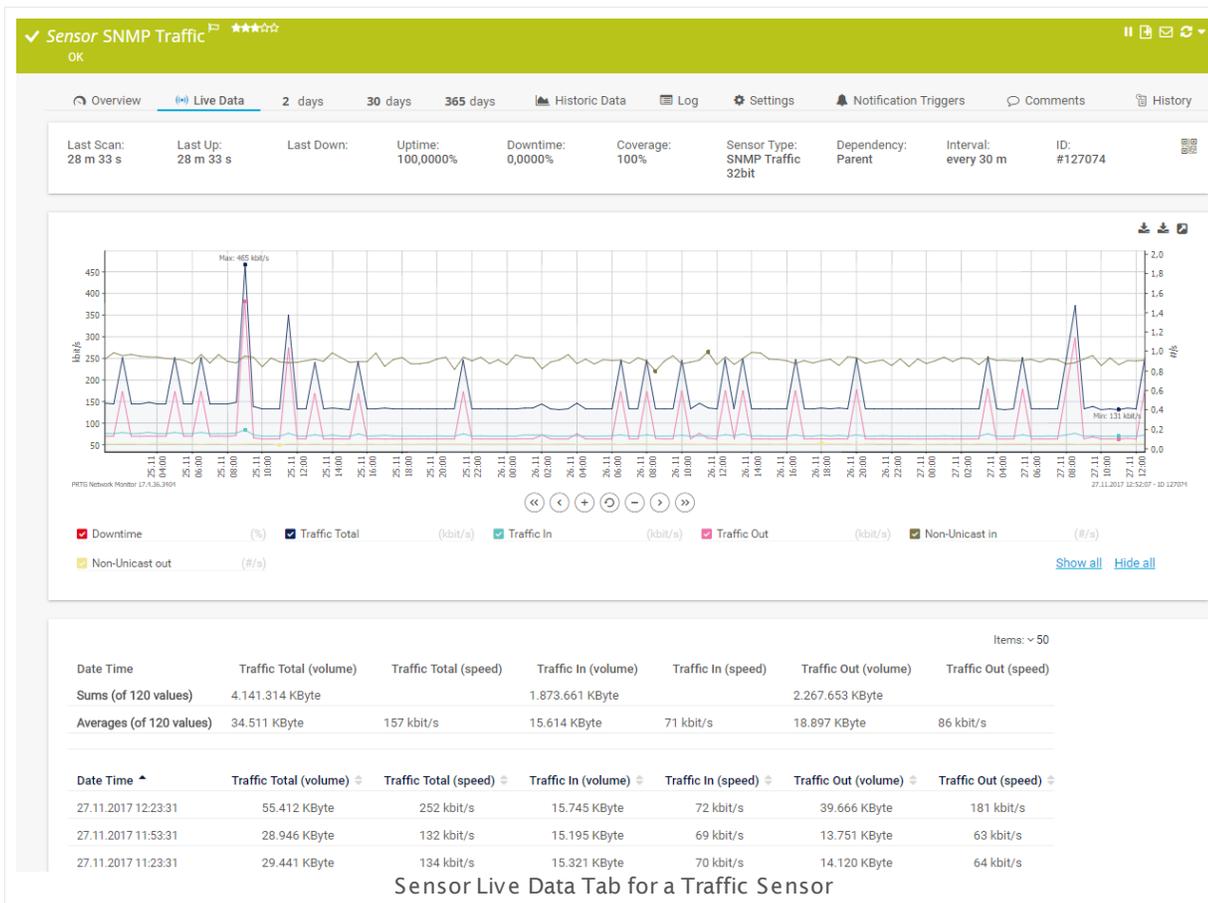

The following four channels are available in the summary graph:

- **Alarms:** Sums up the number of all down states of sensors on this object during the given time span. This graph provides you a bird's eye view of your network issues. It cannot be hidden.
- **Response Time Index:** Indicates the request times in your network.

- **CPU Load Index:** Indicates the CPU usage in your network.
- **Traffic Index:** Indicates the bandwidth usage in your network.

 For more details about the index graphs, see the Knowledge Base: [How does PRTG compute CPU Index, Traffic Index and Response Time Index?](#)

You can hide all channels individually except the "Alarms" channel. To do this, remove the check mark symbol in front of a channel name besides the graph, and the corresponding channel's line will disappear. You can also **Show all** or **Hide all** channels by clicking on the buttons below the channel names. The graph view will be reset immediately.

The screenshot displays the 'Sensor SNMP Traffic' interface. At the top, there's a green header with the sensor name and status. Below it, a navigation bar includes 'Overview', 'Live Data' (selected), and other options like '2 days', '30 days', '365 days', 'Historic Data', 'Log', 'Settings', 'Notification Triggers', 'Comments', and 'History'. A summary row provides key metrics: Last Scan (28 m 33 s), Last Up (28 m 33 s), Last Down, Uptime (100,000%), Downtime (0,000%), Coverage (100%), Sensor Type (SNMP Traffic 32bit), Dependency (Parent), Interval (every 30 m), and ID (#127074).

The main section features a line graph showing traffic over time. The y-axis represents traffic in kbit/s (0 to 450) and #/s (0.0 to 2.0). The x-axis shows dates from 25.11.2017 to 27.11.2017. A legend below the graph allows toggling various data series: Downtime (%), Traffic Total (kbit/s), Traffic In (kbit/s), Traffic Out (kbit/s), Non-Unicast in (#/s), and Non-Unicast out (#/s). There are 'Show all' and 'Hide all' buttons.

Below the graph is a table with columns for Date Time, Traffic Total (volume), Traffic Total (speed), Traffic In (volume), Traffic In (speed), Traffic Out (volume), and Traffic Out (speed). The table shows summary data for 'Sums (of 120 values)' and 'Averages (of 120 values)', followed by a list of individual data points for the last few minutes.

Sensor Live Data Tab for a Traffic Sensor

Live Data and Data By x Days—Sensors

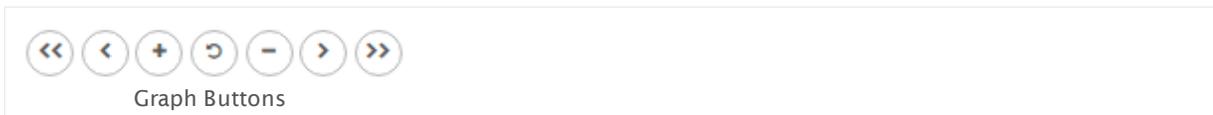

For sensors, each tab shows a graph and data table for the selected sensor. When viewing the data of a sensor running on a cluster probe, you can additionally select if you want to show the data of all nodes, or of one specific node only. Please use the **Select Cluster Member** bar below the tabs.

 Multi-node graphs are never displayed as filled graphs, but are displayed with lines only. However, historic data reports can have filled multi-node graphs.

While viewing a sensor graph you can hide single sensor channels individually. Simply remove the check mark symbol in front of a channel name below the graph, and the according channel's line will disappear. You can also **Show all** or **Hide all** channels by clicking on the buttons besides the channel names.

Live Data and Data By x Days—Interactive Graphs

The graphs on a sensor's historic data tabs and in "zoomed graphs in new windows" (see below) belonging to other monitoring objects are all interactive. You can zoom in and scroll along the time axis with the corresponding buttons.

The following actions are available for graphs:

- **<<** scrolls one graph window left and **>>** one graph window right. The scrolled time depends on the graph you select, for example, 2 days on a 2 days graph.
- **<** scrolls left and **>** right on the time axis. The scrolled time depends on the graph you select.
- **+** zooms into and **-** out of the graph. The displayed time depends on the graph selected. For example, you can zoom in a 30 days graph so that it shows data for 6 days.
- **x** resets the graph to the default view.

In the upper right corner of each graph, three small icons are located   :

-   **Download the graph (PNG or SVG):** Shows a PNG or SVG file of the graph in a new browser window. You can then save or copy it for later use.
-  **Zoom graph in new window:** Opens a larger version of the graph in a new browser window.

For each graph, you can also choose which specific channels (only on sensor pages) or indexes you want to see via the corresponding check boxes or the **Show all** and **Hide all** buttons.

 [Warning or error limits](#)^[3162] are only shown in graphs (highlighted in yellow or red) if you select exactly one channel with a limit.

Historic Data

The **Historic Data** tab is available for sensors only.

 For more information, section [Historic Data Reports](#)^[204].

Sensor Lists

Viewing lists of sensors is a great way to keep an eye on your network status because you can select which kind of sensors you would like to see. There are many different sensor list views available, such as a list of favorite sensors and top 10 lists, lists filtered by current sensor status, value, availability, tag or type, sensor cross reference, and many more.

Sensor lists are accessible via the main menu bar. Click the **Sensors** entry to show a table list of all sensors. In the [table list](#)^[237] displayed here, you can re-arrange the items by clicking the column's header items (see section [Working with Table Lists](#)^[237]). Hover over it to show other menu options.

 For detailed information about the available options, see the [Main Menu Structure](#)^[267] (**Sensors**) section.

Alarms

The **Alarms** tab is not available for sensors, but for probes, groups, and devices only.

 For more information, see the [Alarms](#)^[219] section.

System Information

The **System Information** tab is available for devices only.

 For more information, see section [System Information](#)^[222].

Log

The **Logs** tab shows past activities and events regarding the currently selected object.

 For more information, see the [Logs](#)^[228] section.

6.7 Historic Data Reports

For quick reviews of a sensor's monitoring data, use the historic data reports as an alternative to the comprehensive [Reports](#) ³²⁵² function. You can run and view a report of the historic data for each single sensor, on demand. Additionally, you can export this sensor data as XML or CSV files to your computer for further processing with third-party applications.

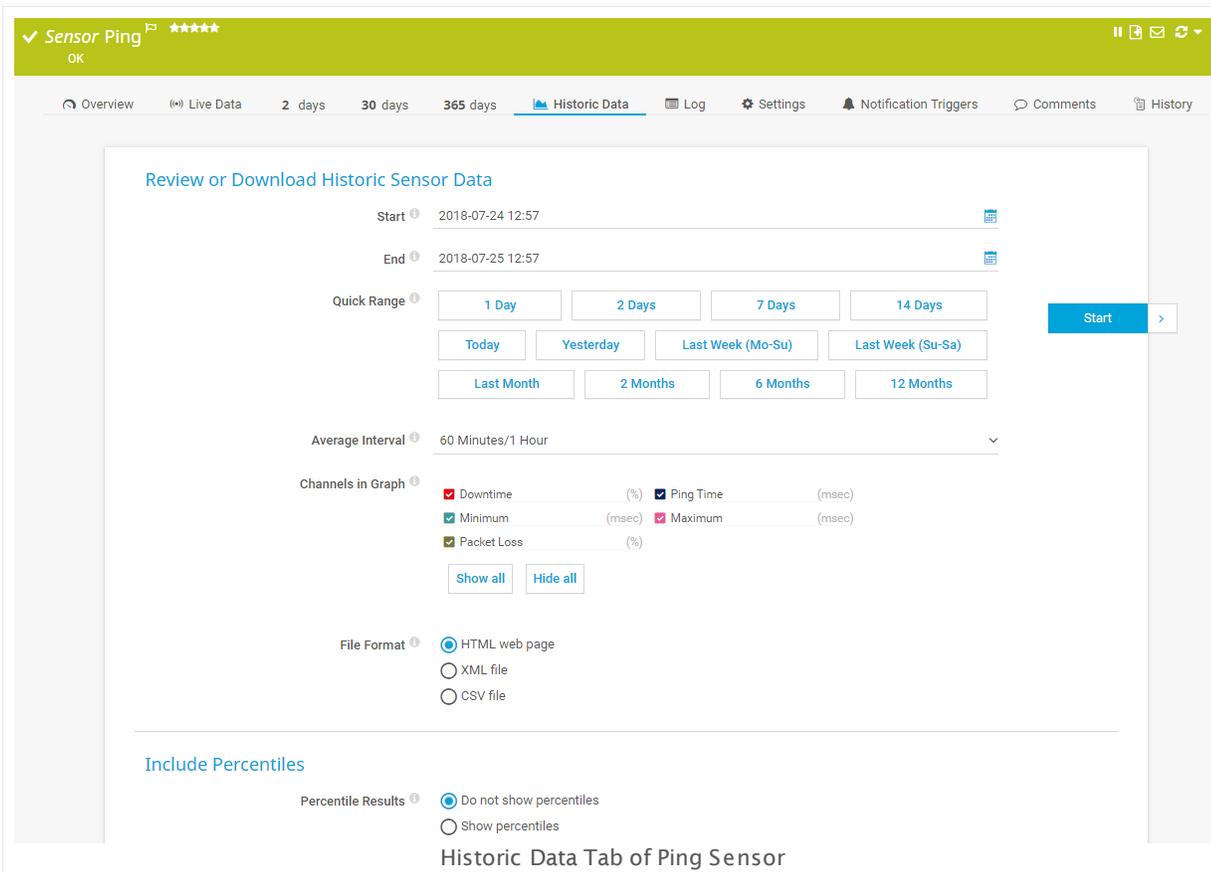

There are two ways to open PRTG historic data reports: either you click the **Historic Data** tab on a sensor's detail page, or you choose **Sensors | View Historic Data** from the [main menu](#) ²⁶⁷.

Historic Data (Sensor Tab)

Probe, group, device, and sensor pages have tabs that you can use to navigate between the different options. For example, you can view your network's status, view monitoring results, or change settings.

The **Historic Data** tab is available for sensors only (not for probes, groups, or devices). When you open the historic data tab of a sensor, there is no sensor selection available. If you want to select a different sensor for the report, select **Sensors | View Historic Data** from the main menu in the PRTG web interface.

Historic Monitoring Data (Sensors Main Menu)

When you open historic data reports via **Sensors | View Historic Data** in the main menu, PRTG will ask you to choose the sensor you want to create a report for with the [Object Selector](#)^[240].

Historic Monitoring Data Settings

SETTINGS	
Sensor	This field is only visible if you open the historic data function via the main menu. Select the sensor you want to create the report for: click the reading-glass symbol to open the object selector. For more information, see section Object Selector ^[240] .
Start	Specify the start date and time of the data you want to review. Use the date time picker to enter the date and time. i You cannot start the report generation if monitoring data has been purged ^[3373] after the defined start date. Please set the start for the report to a date where data is available.
End	Specify the end date and time of the data you want to review. Use the date time picker to enter the date and time.
Quick Range	In this section you can use several buttons for a faster selection of start and end dates. Click any of these links to change the Start and End values above. Choose between: <ul style="list-style-type: none"> ▪ 1 Day, 2 Days, 7 Days, or 14 Days: Set the date range to the respective day(s). The current time of the current day is the end date. ▪ Today, Yesterday, Last Week (Mo-Su), Last Week (Su-Sa), Last Month, 2 Months, 6 Months, 12 Months: Set the date range to the last matching period. It starts at 00:00 and ends at 00:00 of the particularly following day.
Average Interval	With this option, you can activate and configure averaging. Select an interval for which PRTG will calculate the average value. You can choose between No Interval (no averaging is performed and only raw data displayed), a few seconds, minutes, hours, or a whole day (24 Hours). A shorter interval results in a more detailed report for this sensor. The best settings for you may vary, depending on the scanning interval of the sensor, the selected date period, and the intended use for the report. It might be useful to try different settings and compare what the results look like.

SETTINGS

 See the section [Automatic Averaging](#)  below.

Channels in Graph

Select the channels that you want to include in the graph of the report. You can select or deselect individual channels with the respective check boxes, and select or deselect all channels with the buttons **Show all** or **Hide all**. PRTG will only show the data of selected channels in the graph of the report.

 The report table will always show the data of all channels.

Cluster Node

This field is only visible if the sensor is running on a cluster probe. Select the cluster node's data that PRTG will include in the report. Choose between:

- **All nodes:** Include the data of all cluster nodes in the report.
- **[Several specific nodes]:** Use a specific node's data for the report. The nodes you see are specific to your setup.

File Format

Select the output format for the report. Choose between:

- **HTML web page:** Display the result directly as HTML web page. This is also a good option to check results before exporting to another file format.
- **XML file:** Export the data as Extensible Markup Language (XML) file. Usually, your browser shows a download dialog when you use this option.
- **CSV file:** Export the data as Comma Separated Values (CSV) file, for example, for import into **Microsoft Excel**. Usually, your browser shows a download dialog when you use this option.

INCLUDE PERCENTILES

Percentile Results

Define if you want to include an additional [percentile calculation](#)  of your data in the report. Choose between:

- **Do not show percentiles:** PRTG does not use a percentile formula to calculate your monitoring results. It will show only the standard values.
- **Show percentiles:** PRTG adds a column to the result data tables that shows percentiles for every sensor channel.

INCLUDE PERCENTILES

i Percentiles are not available for all report templates. If a template does not support percentiles, they will simply not show up in the report, even when you enable this setting.

Likewise, percentiles are not available in a cluster setup if you choose the option **All Nodes** in the **Cluster Node** setting in the sensor section above.

Percentile Type	<p>This setting is only visible if you select Show percentiles above. Enter the percentile type you want PRTG to use for the calculation. If you choose, for example, to calculate the 95th percentile, enter "95" here and 5 % of peak values will be discarded.</p> <p>Please enter an integer value.</p>
Percentile Average Interval	<p>This setting is only visible if you select Show percentiles above. Enter a value to define the averaging interval on which PRTG bases the percentile calculation. The default value is 300 seconds (5 minutes). This means that PRTG takes 5 minute averages as basic values for the percentile calculation. Please enter an integer value.</p>
Percentile Mode	<p>This setting is only visible if you select Show percentiles above. Choose the mode for percentile calculation:</p> <ul style="list-style-type: none"> ▪ Discrete: PRTG takes discrete values to calculate percentile results. ▪ Continuous: PRTG interpolates between discrete values and bases the calculation on interpolated values.

Click **Start** to generate a historic data report.

i You cannot start the report generation if monitoring data has been [purged](#)³³⁷³ after the defined start date. Please set the start for the report to a date where data is available.

Remarks for Reports

- Any sensor graph in your report will only show channels that are enabled via the **Show in Graphs** option in the [Sensor Channels Settings](#)³¹⁶⁰.
- Reports show statistics for uptime (**Up** and **Down** in percent) and requests (**Good** and **Failed** in percent). Values between **5%** and **95%**, as well as **100%** and **0%**, are rounded to whole numbers without decimal places. Other values are shown with 3 decimal places.
- Due to rounding, the statistics in section **Sensor Status History** of the report might differ in a few seconds from the values in section **Uptime Stats**.
- Data reporting is limited to 5 requests per minute.
- Reports cannot show uptime or downtime data for the [Sensor Factory Sensor](#)¹⁷²⁰.

- Create reports that include an appropriate amount of data. Reports may not work as expected if too many sensors with short scanning intervals have to be processed. Adjust your report size and time span that the report covers if necessary.

Automatic Averaging

For performance reasons, PRTG automatically averages monitoring data when calculating data for large time spans. Data is then averaged regardless of the selected average interval.

TIME SPAN IN REPORT	MINIMUM LEVEL OF DETAIL (AVERAGE INTERVAL)
Up to 40 days	Any
40 to 500 days	60 minutes/1 hour or larger

Reports for time spans of more than 500 days are not possible. If you enter a longer time span, it will automatically be shortened to 365 days.

 Under certain circumstances, the resulting report may contain a time span that differs to the defined start and end date because of internal averaging processes. When averages are greater than 1 hour and they do not equal 24 hours and they are combined with certain time spans, it might happen that resulting datapoints are asynchronous to the time spans. Please especially consider this behavior when you use [API](#) calls to generate reports.

Knowledge Base: Why is there missing data in historical data reports?

- <https://kb.paessler.com/en/topic/61382>

6.8 Similar Sensors

With PRTG you can detect relationships between different components in your network. For example, you can detect extraordinarily high CPU load correlating with extraordinarily high traffic at a specific time of a day or week. This might give you a hint to further investigate that part of your network.

What is Similarity?

The similarity calculation is based on the values that are saved in the history of sensors. If measured values change in the same way, the **similar sensors analysis** will detect it and show you the sensors that it found similar data relations for. PRTG will show all sensors that reach 85 % to 100 % similarity.

We implemented the similar sensors analysis as a heuristic calculation designed to show interconnections and correlations in your network that maybe you were not even aware of. The analysis is completely automated and sensor type agnostic. It is based on mathematics and fuzzy logic and optimizes your sensor usage by tracking redundant monitoring of some aspects of your system.

Similar Sensors Analysis in PRTG

You can adjust the depth of similar sensors analysis or turn it off in [System Administration—Monitoring](#)^[335]. You can also enable or disable the similarity analysis for specific probes, groups, and devices and specify [inheritance](#)^[137] in the corresponding [object settings](#)^[217], section **Automatic Monitoring Analysis**.

There are two options to view similar sensors:

- The overview page of sensors contains a [similar sensors section](#)^[209]. PRTG lists channels there that show similarities to channels of the current sensor.
- In addition, you can call a [similar sensors overview page](#)^[211] via **Sensors | Similar Sensors Overview** from the [main menu](#)^[267].

To edit the list of the similar sensors results, use the [available filters](#)^[212].

Similar Sensors (Sensor Overview Tab)

Probe, group, device, and sensor pages have tabs that you can use to navigate between the different options. For example, you can view your network's status, view monitoring results, or change settings.

On the overview tab of a sensor, PRTG lists channels that show similarities to channels of the currently selected sensor. The table is empty if PRTG detects no similarities regarding the selected sensor.

- ❗ PRTG shows similar sensors here when channels have 85% similarity or more. The similar sensors analysis saves up to 15 entries per sensor.

Part 6: Ajax Web Interface—Basic Procedures | 8 Similar Sensors

The screenshot displays the 'Sensor SNMP Traffic' overview page. At the top, there are navigation tabs for Overview, Live Data, and historical data (2 days, 30 days, 365 days). A traffic gauge shows a total of 509 kbit/s. Below it is a table of channel statistics:

Channel	ID	Last Value (volume)	Last Value (speed)	Minimum	Maximum
Downtime	-4				
Traffic In	0	21,352 KByte	292 kbit/s	150 kbit/s	13,184 kbit/s
Traffic Out	1	15,923 KByte	217 kbit/s	84 kbit/s	1,824 kbit/s
Traffic Total	-1	37,275 KByte	509 kbit/s	84 kbit/s	15,007 kbit/s

The 'Similar Sensors' section, highlighted with a red box, lists three pairs of sensors with their similarity percentages:

- 100% similarity between '(011) Local Area Connection Traffic' and '(016) Local Area Connection-WFP LightWeight ...'
- 99% similarity between '(011) Local Area Connection Traffic' and '(015) Local Area Connection-QoS Packet Sched.'
- 85% similarity between '(011) Local Area Connection Traffic' and 'Intel[R] PRO_1000 MT Network Connection (To ...'

Below the similar sensors section are three graphs: 'Live Graph, 20 hours', '2 days', and '365 days', each showing traffic volume over time.

Similar Sensors Section on a Sensor's Overview Tab

The similar sensors section provides the following information:

SIMILAR SENSORS

- Similarity** Shows a measurement of similarity between two channels in percent.
- Channel** Shows a channel of the currently selected sensor.
- Similar Channel** Shows a channel of another sensor similar to a channel of the currently selected sensor (the one in the "Channel" column in the same row).

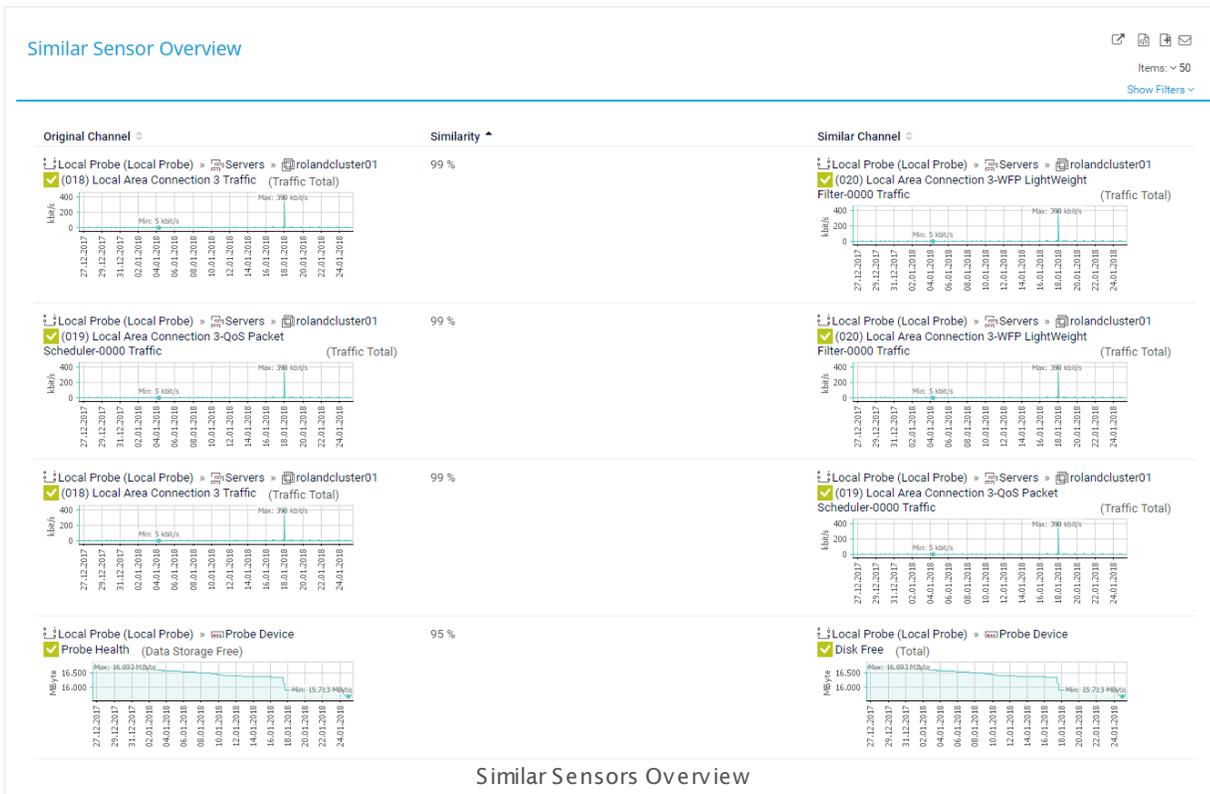

i PRTG does not show the similar sensors section when the analysis is off or when you have exceeded 1,000 sensors and selected the [automatic analysis depth option](#). You will see a notice in this case.

Similar Sensors Overview (Sensors Menu)

This page shows the results of the similar sensors analysis from the entire monitoring database. PRTG lists all channels with similarities to another one here. On the table top, you have several filter options to display similar sensors as you need it. Choose the object of interest, the degree of similarity, and if you want to display back references.

For more details, see also section [Working with Table Lists](#) ²³⁷.

PRTG shows similar sensors here when channels have at least 85% similarity. Furthermore, the analysis saves up to 15 entries per sensor.

You can sort the list by clicking the column headers. The similar sensors overview page provides the following information:

SIMILAR SENSORS OVERVIEW

Original Channel Shows channels that other channels are compared to. Click the column header to sort the list according to the order in the device tree in ascending or descending order.

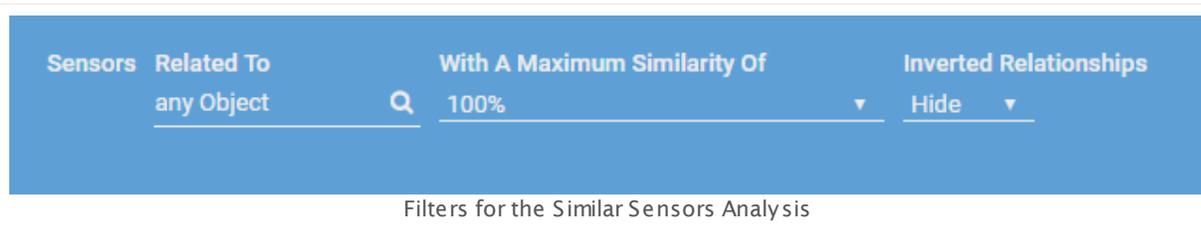

SIMILAR SENSORS OVERVIEW

Similarity	Shows a measurement of similarity between two channels in percent. Click the column header to sort the list according to the similarities in ascending or descending order.
Similar Channel	Shows a channel compared to the original channel. Click the column header to sort the list according to the order in the device tree in ascending or descending order.

i PRTG does not show the similar sensors overview option in the main menu if you turned off the analysis or if you have exceeded 1,000 sensors and selected the automatic analysis depth option.

Adjust the Similar Sensors Overview to Your Needs

You can use various filters to adjust the displayed results of the similar sensors analysis. Click **Show Filters** and edit the filters that will show up.

Filters for the Similar Sensors Analysis

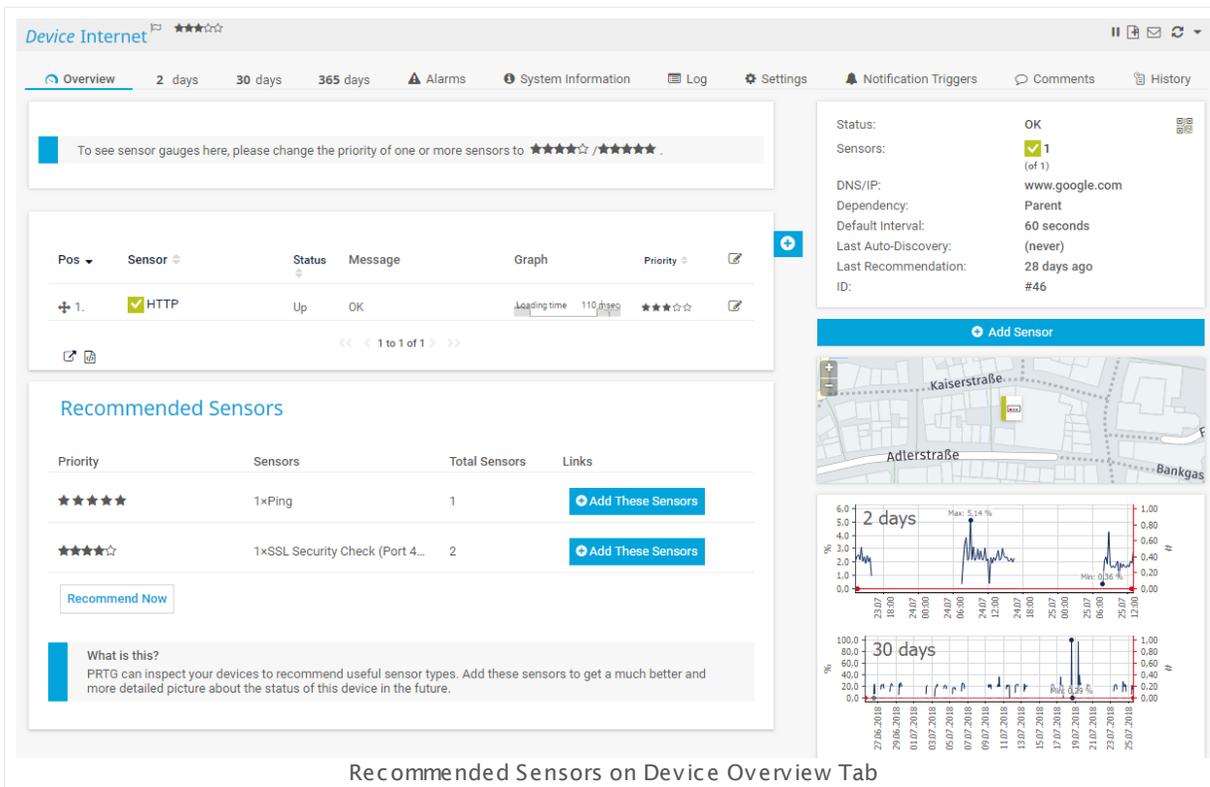

SIMILAR SENSORS FILTERS

Sensors Related To	Select the device, probe, or group that you want the similar sensors analysis to cover. This way, you can apply the analysis to the parts of your network that you are interested in.
With a Maximum Similarity of	Select a degree of similarity from 85 % to 100 %.
Inverted Relationships	<p>If you select Show, PRTG shows all similarity relationships, that is, A matches B and B matches A.</p> <p>If you select Hide, PRTG will show only A matches B relationships. This reduces the number of displayed similar sensors.</p>

6.9 Recommended Sensors

The **Recommended Sensors** function is one of the options that PRTG supports you in setting up a comprehensive monitoring. PRTG can explore any device and check which sensors you have already created. If it finds useful sensors that can [complete your monitoring](#)^[198] and are not yet created, you will find a list of recommended sensors for your specific device. By adding these sensors, you will not miss important monitoring data anymore!

 You cannot use this feature on the **Hosted Probe** of a PRTG hosted by Paessler instance. You can use this feature on [remote probes](#)^[370].

Recommended Sensors on Device Overview Tab

Get Sensor Recommendations

You want to know which sensors can complete the monitoring of your devices? By default, PRTG recommends sensors for any device that you add to PRTG and shows the suggested sensor types for it on the **Overview** tab of the device, as long as your installation contains less than 5,000 sensors in total. All you have to do is click the **Add These Sensors** button to enhance your monitoring experience.

If you want to manually start the detection engine for sensor recommendations on any desired device, follow the steps below.

You can see the [time passed since the last execution of the sensor recommendation in the page header bar](#)^[185] on the **Overview** tab of this device.

Step 1: Choose the Device

Open the [Overview](#)^[198] tab of the device that you want to analyze.

Probe, group, device, and sensor pages have tabs that you can use to navigate between the different options. For example, you can view your network's status, view monitoring results, or change settings.

Step 2: Recommend Now

To start the analysis of your device, click the **Recommend Now** button or choose the option **Recommend Now** in the [context menu](#)^[254].

i If you do not see the **Recommend Now** option, make sure that the sensor recommendation is enabled in the [System Administration—Monitoring](#)^[3359] settings. Probe devices do not offer this option.

Depending on the complexity of your device, it can take some time until you see the results of the analysis. Stay tuned!

Recommended Sensors

PRTG has started searching for sensors it can recommend for this device. You can see the search progress in the **Recommended Sensors** table. Please click **OK** to close this window.

OK

Recommended Sensors Investigation

PRTG runs the device analysis in the background with low priority to prevent potential performance issues. Consequently, the recommended sensors analysis can take more time than expected if PRTG needs resources to ensure gapless monitoring of your network in the first place. By default, the sensor recommendation engine starts automatically when you add a new device, when you do not have more than 5,000 sensors, or when the last analysis was executed more than 30 days ago. You can change these settings in the [System Administration—Monitoring](#)^[3359].

i To recommend [SNMP sensors](#)^[431] for a device, the detection engine uses the SNMP version that you defined in the [Credentials for SNMP Devices](#)^[411] section of the device settings.

Step 3: Get the Results

After analyzing your device, PRTG suggests a list of sensors that are useful for a more comprehensive monitoring.

Recommended Sensors

Priority	Sensors	Total Sensors	Links
★★★★★	1xPING	1	Add These Sensors
★★★★☆	1xSSL Security Check (Port 443), 1xSSL Certificate Sensor (Port ...	2	Add These Sensors

[Recommend Now](#)

What is this?
 PRTG can inspect your devices to recommend useful sensor types. Add these sensors to get a much better and more detailed picture about the status of this device in the future.

List of Recommended Sensors

The list of recommended sensors provides the following information:

RECOMMENDED SENSORS

Priority	Shows which priority ^[242] the suggested sensors will have when you add them. The recommended sensors table is sorted by priority, beginning with top priority (5***** stars) in the first row. ⓘ You can manually change the priority of a sensor after adding it.
Sensors	Shows the suggested sensors and the number of sensors from one type PRTG recommends for this device (for example, you might want to add a sensor from the type SNMP Traffic ^[240] multiple times because of several network interfaces).
Total Sensors	Shows the total number of suggested sensors per table row. These sensors have the same priority.
Links	Displays an Add These Sensors button for every table row. Click to automatically add the sensors listed in this table row to the device.

ⓘ The detection engine checks if a certain sensor type currently exists on your device and recommends that you add this sensor if it does not exist. If this sensor type already existed previously on the device but you have deleted it, PRTG will suggest this sensor type again. Please ignore the suggestion of this sensor type or follow [Step 4](#)^[215].

Step 4: Add Recommended Sensors

Click the **Add These Sensors** button in a table row to add all sensors in this row to the analyzed device.

i If you want to add **all** suggested sensors regardless of their priority, click every **Add These Sensors** button in the recommended sensors table. If you want to add only **some** of the sensors of a certain priority and not all of them, please click **Add These Sensors** first and then [delete](#)^[259] or [pause](#)^[245] the ones you do not need.

Settings for the Recommended Sensors Analysis

You can also adjust the recommended sensors detection. Go to [System Administration—Monitoring](#)^[339] to select whether

- you want PRTG to decide on the sensor recommendation (default), or
- you want the recommended sensors to always be displayed, or
- you want to turn off the recommended sensors function.

If you use the default setting, PRTG uses an intelligent assistant that takes care of your specific network monitoring situation. PRTG automatically counts the number of sensors you have and decides whether to start the recommended sensors detection or not. It will not start if your PRTG installation comprises 5,000 sensors or more to prevent performance issues. We recommend that you set this default option so you do not miss any important monitoring data about your network, without risking running into performance issues.

i Disable the recommended sensors feature if you encounter performance issues or if you do not want to display this information on device overview tabs.

More

Do you want to get more help with choosing and creating useful sensors? This is possible in PRTG with the [Auto-Discovery](#)^[282]. You can activate it when [adding a new device](#)^[313] to PRTG, [manually at any time](#)^[283], or choose if you want PRTG to [analyze a whole section](#)^[285] of your network, for example, devices covered by a certain IP range.

i The auto-discovery has a higher priority than the recommended sensors detection. If both are active, PRTG will queue the sensor recommendation and execute the auto-discovery first.

6.10 Object Settings

Probe, group, device, and sensor pages have tabs that you can use to navigate between the different options. For example, you can view your network's status, view monitoring results, or change settings.

Device Tree Management

The **Management** tab is available when viewing probes or groups. After clicking this tab you can move devices and sensors directly in the tree view. If moving is not possible, the web interface will automatically start a clone process.

 For more information, see the [Manage Device Tree](#) ³²⁹ section.

General Settings

In the **Settings** tab you can define all settings for the current object. The available options vary, depending on the kind of object you're changing. See the following sections for information about the respective object types:

- [Root Group Settings](#) ³³¹
- [Probe Settings](#) ³⁵¹
- [Group Settings](#) ³⁷⁵
- [Device Settings](#) ⁴⁰²
- [Sensor Settings](#) ⁴²⁸

 The available setting options are different for **each** sensor, but always the same for probes, groups, and devices. [Sensor Channels Settings](#) ³¹⁶⁰ are not reachable via tab but directly on a sensor's overview page via channel gauges and the channels table.

Notification Triggers Settings

In the **Notification Triggers** tab, notification triggers can be set for every object. When using these settings for a probe, group, or device, they will be inherited to all sensors on these objects. Available notification trigger options are the same for all objects.

 For more information, see [Sensor Notification Triggers Settings](#) ³¹⁷⁰ section.

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the name of the PRTG user who made the change, and a message. The history log retains the last 100 entries.

i On some pages, you can access the history of subordinate objects via the corresponding context button in the [page header bar](#)¹⁸⁵. This includes [System Administration](#)³³⁴³ and the overview pages of [User Accounts](#)³³⁷⁶, [User Groups](#)³³⁸³, [Reports](#)³²⁵², [Libraries](#)³²³⁵, and [Maps](#)³²⁷⁸. See the [Logs \(Main Menu\)](#)²²⁹ for details.

6.11 Alarms

The alarms list shows all sensors that are currently in a **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** status. Sensors in other states (for example, **Up**, **Paused**, or **Unknown**) do not appear here. This is useful for keeping track of all irregularities in your network.

In the [table list](#)²³⁷, you can re-sort the items by clicking the column's header items.

Sensors With Alarms Items: ~ 50

Alarms List

There are two ways to display the alarms list: either click the **Alarms** tab on the detail page of a probe, group, or device (not available for sensors), or click **Alarms** in the [main menu bar](#)²⁶³.

i By default, table lists with alarms are ordered by [priority](#)²⁴².

Alarms (Object Tab)

Probe, group, device, and sensor pages have tabs that you can use to navigate between the different options. For example, you can view your network's status, view monitoring results, or change settings.

On an object's detail view, click the **Alarms** tab to show a table list of all sensors **on this object** that currently show a **Down**, **Down (Partial)**, **Warning**, or **Unusual** status. You will see a subset of sensors in an alarm status for the current object only. This is a subset of the entries available via the **Alarms | All** option in the [main menu bar](#)^[270]. The tab is not available on a sensor's detail page.

Alarms (Main Menu)

Click **Alarms** in the [main menu bar](#)^[270] to show a table list of **all** sensors in your configuration that currently show a **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** status. You can also show these sensors as gauges. Click **Alarms** in the [main menu bar](#)^[263] and select another option to only show a subset of sensors in certain states. Choose between:

ALARMS	
All	Open a list of all sensors that are currently in Down , Down (Partial) , Down (Acknowledged) , Warning , or Unusual status ^[195] .
Show as Gauges	Open a page with the gauges of all sensors that are currently in Down , Down (Partial) , Down (Acknowledged) , Warning , or Unusual status. The size of the sensor gauges corresponds to their respective priority.
Errors Only	Open a list of all sensors that are currently in Down , Down (Partial) , or Down (Acknowledged) status.
Warnings Only	Open a list of all sensors that are currently in Warning status.
Unusuals Only	Open a list of all sensors that are currently in Unusual status.

Acknowledge Alarm

An acknowledged alarm shows up in the alarms list as "acknowledged" (see [Sensor States](#)^[195]) and will not [trigger](#)^[3170] any more [notifications](#)^[3216].

 If the alarm condition clears, the sensor usually returns to an **Up** status immediately with the next sensor scan.

To acknowledge an alarm, right-click a sensor entry and choose **Acknowledge Alarm...** from the context menu, enter a message and click the **OK** button. The message will appear in the last message value of the sensor. You can choose between: **Acknowledge Indefinitely...**, **acknowledge For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Until...**

If you choose **Until...** a dialog box appears:

ACKNOWLEDGE ALARM UNTIL

Selected Objects	Shows the sensor(s) that you want to acknowledge the alarm for. You can acknowledge alarms for more than one sensor using multi-edit ³¹⁹⁷ .
Message	Enter a text, for example, the reason why you acknowledge the alarm. Please enter a string or leave the field empty.
Until	Enter the date when the acknowledge status will end. Use the date time picker to enter the date and time.  If the alarm condition still persists after the specified date, the sensor will show a Down status again.

Only [users](#)³³⁷⁶ with write access rights may acknowledge alarms. You can give read-only users the right to acknowledge alarms, too. See section [User Accounts Settings](#)³³⁷⁷, section **Account Control**.

6.12 System Information

The **System Information** is a great feature to see at a glance what is going on on the systems you have in your network. You get

- basic system data of your device like bios serial number or MAC and IP addresses,
- all connected hardware types as well as their states and properties,
- the software you have installed, including version and vendor information,
- the users connected to your system and their domain,
- a list of all active or stopped Windows system services plus their properties, and
- a list of all processes running on your system, including their ID and start time.

Together with your everyday monitoring you will receive a really profound knowledge about your IT infrastructure from only one single source—your PRTG Network Monitor!

The screenshot shows the 'System Information' tab for a device named 'Device Probe Device'. The navigation bar includes 'Overview', '2 days', '30 days', '365 days', 'Alarms', 'System Information' (selected), 'Log', 'Settings', 'Notification Triggers', 'Comments', and 'History'. The main content area is titled 'System Information' and has a blue header with expandable sections: System, Hardware, Software, Users, Services, and Processes. Below this, there are two panels: 'System' (updated 22 h 52 m ago) and 'Hardware' (updated 22 h 52 m ago). The 'System' panel shows a table with columns 'Name' and 'Value', listing items like 'Bios Serial Number', 'IPAddress / Intel(R) 82574L Gigabit Network Connection', and 'Windows Version'. The 'Hardware' panel shows a table with columns 'Name', 'Class', 'Caption', and 'Properties', listing items like '\\.\PHYSICALDRIVE0 (Disk dr...', 'Intel(R) 82574L Gigabit Netw...', 'Intel(R) Xeon(R) CPU E5-2680...', 'Microsoft ISATAP Adapter', 'Microsoft Kernel Debug Netw...', 'Microsoft XPS Document Wri...', 'Physical Memory', and 'Physical Memory Array'.

System Information Tab on a Windows Device

System Information is available for all devices that you add to PRTG and run with an [officially supported Windows version](#)^[26]. You can also retrieve system information from Linux, Unix, or other devices that have Simple Network Management Protocol (SNMP) enabled.

i Some of the above listed system information may not be available depending on the request method you use (Windows Management Instrumentation (WMI) or Simple Network Management Protocol (SNMP)). To get all information available, activate both request methods (Windows Management Instrumentation (WMI) **and** Simple Network Management Protocol (SNMP)), as far as possible.

Find and Use System Information

Go to the overview page of a device and click the **System Information** tab to see available information.

Basically, it is not necessary to configure anything special to use the **System Information** feature, if you already monitor a network device with [WMI](#)^[433] and [SNMP sensors](#)^[431]. The **PRTG System Information** uses the same [technologies](#)^[3488]. So, you already meet the main prerequisites for retrieving system information for your device. The data will be displayed in the corresponding **System Information** table automatically and you can [analyze your system directly](#)^[225]. If you are not using Windows Management Instrumentation (WMI) or Simple Network Management Protocol (SNMP) sensors yet, see section [Prerequisites](#)^[223] below that shows in detail what you need to get system information.

 **System Information** is enabled by default. To retrieve the data, PRTG will automatically use **Credentials for Windows Systems** and **Credentials for SNMP Devices** as defined in the [device settings](#)^[402] or as [inherited](#)^[133] from a parent object like the **Root** group. Please consider this when you monitor devices outside the local network, especially when using **SNMP v1** or **v2c** that do not provide encryption.

 System Information is not supported by the [Enterprise Console](#)^[3430]. Please use the [PRTG web interface](#)^[166] to access the system information of a device.

 System Information for your devices only has informational purposes. We cannot guarantee that the data displayed in PRTG Network Monitor fully corresponds to the device parameters.

 You cannot use this feature on the **Hosted Probe** of a PRTG hosted by Paessler instance. You can use this feature on [remote probes](#)^[3709].

Prerequisites

Fulfill the following requirements to show all available system information data for a device. It is not necessary to meet every single prerequisite but then some tables will not show all data or may even remain empty. For example, if you do not configure SNMP on the target device, you will get less information for the **System** table.

- **Valid credentials** in the [device settings](#)^[402] (or [inherited](#)^[133]): Enter correct settings for the target device in the sections **Credentials for Windows Systems** and **Credentials for SNMP Devices**.
- **Remote Registry** Windows service: Enable the **Remote Registry** Windows service on the target computer, for example, via **services.msc**, and set the start type to **automatic**.
- **Remote Procedure Call (RPC)** Windows service: Enable the RPC Windows service on the target computer, for example, via **services.msc**, and set the start type to **automatic**.
- **WMI** on probe and target computer: Configure Windows Management Instrumentation (WMI) on the target computer and on the computer that runs the PRTG probe with the device. Especially configure the firewall of the target computer to allow WMI. For more details, see manual section [Monitoring via WMI](#)^[3507] and the Knowledge Base article [General Introduction to WMI and PRTG](#).

- **SNMP** on target computer: Configure Simple Network Management Protocol (SNMP) on the target computer. For more details, see manual section [Monitoring via SNMP](#)^[3489] and the Knowledge Base article [General Introduction to SNMP and PRTG](#).

Usually you will see data coming in after a few minutes, depending on the protocols you use (WMI takes longer than SNMP). A **System Information** table will show an error message, if PRTG cannot get data, for example, because of misconfiguration.

- For details about error messages, see this Knowledge Base article: [How can PRTG get data for System Information tables?](#)

Software
31 5 Ago

No Data Available

- *Error: Could not connect to the remote registry service of the target system. Make sure the service is running and the Windows credentials are correct. (code: PE255)*
- *Error: Could not connect to the remote registry service of the target system. Make sure the service is running and the Windows credentials are correct. (code: PE255)*
- *Error: SNMP No Response*

No Data Available: Check the Preconditions

System Information (Device Tab)

Probe, group, device, and sensor pages have tabs that you can use to navigate between the different options. For example, you can view your network's status, view monitoring results, or change settings.

Overview
2 days
30 days
365 days
Alarms
System Information
Log
Settings
Notifications
Comments
History

Tabs Bar on Device Level

On the details page of a device, click the **System Information** tab.

- If you do not see a **System Information** tab for your device, you need to enable **System Information** in section [Advanced Network Monitoring](#)^[425] in the device settings (or inherit it from an object higher in the [hierarchy](#)^[133]). **System Information** is enabled by default. If **System information** is disabled, the **System Information** tab will not be available for the device.

Analyze Your Systems

On the **System Information** page, PRTG displays a table for each system information category about this device: **System**, **Hardware**, **Software**, **Users**, **Services**, and **Processes**.

CATEGORY	SYSTEM INFORMATION	REQUEST METHOD
System	Shows information about the device like BIOS serial number, IP addresses, MAC addresses, and Windows version.	 WMI  SNMP
Hardware	Shows hardware that is connected to the device like disk drives, CD/DVD, video controllers, processors, network adapters, sound devices, printers, and memory. You can see Class and Caption of a hardware device. In the Properties column you get more information about the hardware (for example, the description).	 WMI  SNMP
Software	<p>Shows installed software and the Version number on the device. In the Properties column you get more information about the software (for example, the size).</p> <p> PRTG uses Uninstall registry keys to retrieve the list of installed software, so the displayed software might differ from the software that the target Windows system shows under Programs and Features.</p> <p> The System Information scan for software on the probe device uses the credentials the probe¹²⁶ runs with and ignores credentials from the Settings tab.</p>	 WMI  SNMP
Users	Shows the user accounts connected to the device and their Domain .	 WMI  SNMP
Services	Shows the available Windows services on the device. This table shows the State of the service (running, stopped) and the start type (Start mode automatic, manual, or disabled). In the Properties column you can get more information about a service (for example, the description).	 WMI  SNMP
Processes	Shows the processes that are currently running on the device as listed on the Processes tab of the Windows Task Manager. You can also see the Start Time (only WMI) and Process ID of a process.	 WMI  SNMP

Click the refresh button in the upper-right corner of a table to retrieve current information for this **System Information** category. The timestamp shows the time passed since the last table refresh.

31 S Ago 
Table Refresh

PRTG automatically retrieves data for all tables, including **System**, **Hardware**, and **Software**, once every 24 hours. The tables **Users**, **Services**, and **Processes** refresh each time you open the **System Information** tab. PRTG also updates all system information tables when the PRTG server is restarted, for example, after an update.

-  PRTG can perform up to 24 system information scans simultaneously so it may take some time until the tables are filled after a server restart.
-  You can sort each table by clicking the column headers. See [Working with Table Lists](#) ²³⁷ section for more information.
-  PRTG user accounts with read-only [access rights](#) ¹⁵⁸ to a device can view system information on this device but they cannot refresh tables manually.

Data Storage

PRTG stores data files with the retrieved system information in the corresponding **\System Information Database** subfolder of the [PRTG data folder](#) ³⁷³⁴.

-  If you delete a device in PRTG, the system information files of this device will remain in these folders unless you delete them manually.

PRTG uses the following subfolders for **System Information** data.

SYSTEM INFORMATION DATABASE: DATA FOLDERS

hardware	Data for the Hardware table
loggedonusers	Data for the Users table
processes	Data for the Processes table
services	Data for the Services table
software	Data for the Software table
system	Data for the System table

6.13 Logs

Logs show all past activities and events of your PRTG monitoring setup. This is useful for researching past user activities, system events, and, for example, to check whether messages were sent. In a typical setup, a huge amount of log data is produced. Because the activity of every single object is recorded, you can use this information to check if your setup works exactly as desired.

There are several filters available to make navigating the log entries easier. See the [Working with Table Lists](#) section for more information.

List with Log Entries

There are two options to open the logs list: Either you click the **Log** tab on the detail page of a probe, group, device, or sensor, or you choose the **Logs** item in the main menu.

Probe, group, device, and sensor pages have tabs that you can use to navigate between the different options. For example, you can view your network's status, view monitoring results, or change settings.

Click the **Log** tab to show a table list with all log information **on this object**. This is a more detailed log than the system log available via the **Logs | All** option in [main menu](#)^[273].

Logs (Main Menu)

Click **Logs** in the [main menu bar](#)^[273] to show a table list of all system log entries in your configuration. **Hover** over **Logs** and select another option to narrow down your log search. Choose between:

LOGS	
All	Open a table list ^[237] with log information for all objects in your configuration, newest first.
Status Changes >	Open a list with log information for certain status changes only. Hover over Status Changes to show other menu items. Follow the menu path to view log entries with a special value in the Status field only. Select between Up & Down (shows entries with either Up or Down in the Status field), Down, Warning, Unusual, Up, Paused/Resumed (shows entries with either Paused or Resumed in the Status field), or Acknowledged Alarms .
System Events >	Open a list with log information regarding certain system event types only. Hover over System Events to show other menu items. Select between the following event types: Probe Related, Cluster Related, Auto-Discovery, Notifications, or Status Messages .
Object History	<p>Open a list with log information about changes to the PRTG setup and deletions of subordinate system objects. The object history page has a tab-like interface. Using the tabs you can navigate through various sub-pages in order to view the changes to all related settings and deletions of objects. Select between the following tabs: My Account, System Administration, Notifications, Schedules, User Accounts, User Groups, Reports, Libraries, or Maps.</p> <p> You can open a specific tab directly with the context button History in the page header bar^[185] on the corresponding pages.</p>

More

Knowledge Base: The logs page in the PRTG web interface does not load. What can I do?

- <https://kb.paessler.com/en/topic/77329>

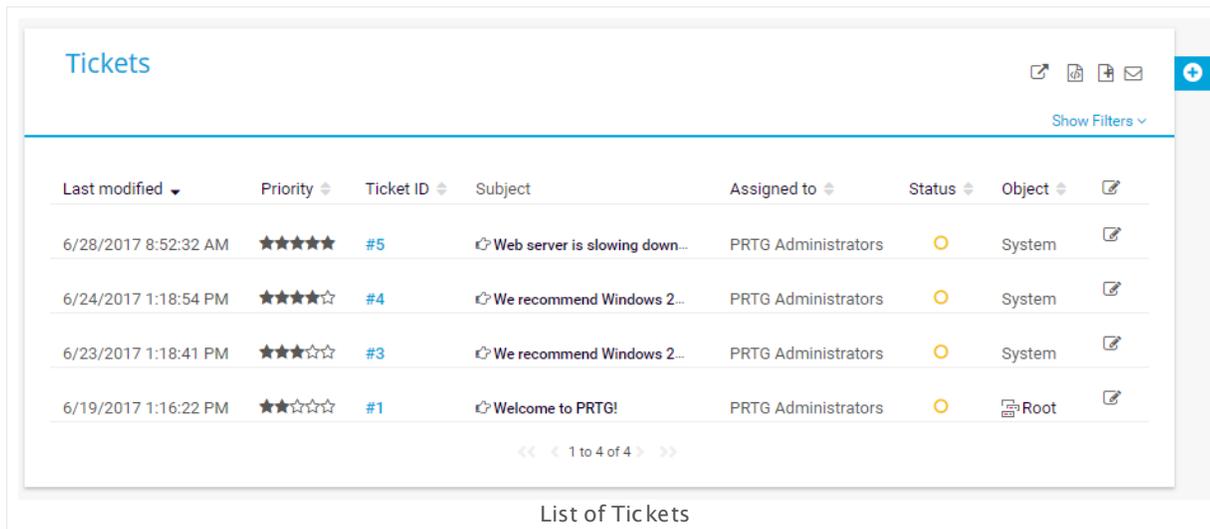

6.14 Tickets

PRTG Network Monitor includes its own ticket system. With tickets you can manage and maintain various issues that may appear while monitoring a network. A ticket in PRTG contains information about recent events in your PRTG installation that need a closer look by the administrator or another responsible person. You can see each ticket as a task for a particular PRTG user.

Each monitoring related task has a lifecycle in the ticket system. PRTG itself can create tickets, for example, when [Auto-Discovery](#)^[282] has finished, and PRTG users can create tickets as well for every kind of issue. In addition, you can set up notifications that open a ticket when something uncommon occurs in your network. The task comes to life when a ticket is created. Responsible PRTG users then take care of this issue. Once the issue has been resolved, the ticket can be closed and the lifecycle of the task ends.

Every ticket has a unique ID, a priority, and a status, and you can take several actions on each ticket. You should view every ticket and take a corresponding action. This way, you always keep an overview about each task and its history in your PRTG installation.

PRTG can also send an email to you whenever a ticket is assigned to you or if one of your tickets has been changed. See section [Tickets as Emails](#)^[234] for details and how to turn off emails about tickets.

Last modified	Priority	Ticket ID	Subject	Assigned to	Status	Object	
6/28/2017 8:52:32 AM	★★★★★	#5	Web server is slowing down...	PRTG Administrators	○	System	✎
6/24/2017 1:18:54 PM	★★★★☆	#4	We recommend Windows 2...	PRTG Administrators	○	System	✎
6/23/2017 1:18:41 PM	★★★☆☆	#3	We recommend Windows 2...	PRTG Administrators	○	System	✎
6/19/2017 1:16:22 PM	★★☆☆☆	#1	Welcome to PRTG!	PRTG Administrators	○	Root	✎

List of Tickets

i You can turn off the tickets system for particular user groups in [System Administration—User Groups](#)^[3383] except for the PRTG Administrators group. The users in the admin group will not receive new ToDo tickets (and notifications about changes) by default, only the PRTG System Administrator user. You cannot change this behavior. However, you can [turn off ticket emails](#)^[234] for every user account.

Types of Tickets

New tickets are created in the following cases:

- New devices or sensors have been created by the auto-discovery process.
 - ❗ In the corresponding ticket, only device templates will be listed that PRTG used to create sensors.
- A new probe connects to the core and must be acknowledged.
- A new cluster node connects to the cluster and must be acknowledged.
- A new version of the software is available.
- A new report is ready for review.
- In a few other situations, such as when the system runs out of disk space, for licensing issues, when an error occurs, etc.
- A [notification](#)  opened a ticket if set in the notification settings.
- A user opened a ticket.

Overall, there are three types of tickets:

- **User Tickets:** Tickets created by PRTG users, for example, to assign monitoring related tasks to a particular PRTG user (or user group)
- **ToDo Tickets:** Tickets created by PRTG to show important system information and in case of specific system events. They are assigned to the PRTG System Administrator user and cannot be turned off.
 - ❗ The **Related Object** of ToDo tickets is **System**.
- **Notification Tickets:** Tickets created via [Notifications](#)  in case of monitoring alerts

States of Tickets

Tickets can have three different states depending on the working process regarding the corresponding issue:

Sym bol	State	Description
	Open	New tickets will be open as long as the corresponding issue exists as described in the ticket.
	Resolved	The issue as described in the ticket does not persist any longer. Someone took care of it.
	Closed	Usually, the ticket has been resolved before, the solution to the issue has been checked for correctness, and the ticket does not require any other action.

Tickets (Main Menu)

 This option is only shown in the main menu bar if the user group of the current user is allowed to use the ticket system. You can turn off tickets for particular user groups in [System Administration—User Groups](#)³³⁸³. Users with **read-only** rights are always excluded from the ticket system and cannot see the tickets entry in the main menu bar.

You have several options to display a list of tickets that is filtered to your needs. In the [main menu bar](#)²⁶³, **hover** over **Tickets** to show all available filter options or **click** directly to show all open tickets assigned to the current user. You can also create a new ticket via the main menu. Available options are:

- **My Tickets**
Click to show all open tickets that are assigned to the current user. **Hover** over **My Tickets** show other menu items for filtering these tickets depending on their status:
 - **Open**
 - **Resolved**
 - **Closed**
 - **All**
- **All Tickets**
Click to show all open tickets of all PRTG users. **Hover** over **All Tickets** to show other menu items for filtering these tickets depending on their status:
 - **Open**
 - **Resolved**
 - **Closed**
 - **All**
- **ToDo Tickets**
Click to show all open tickets from the [type](#)²³⁰ **ToDo**. **Hover** over **ToDo Tickets** to show other menu items for filtering these tickets depending on their status:
 - **Open**
Click to show all open ToDo tickets. **Hover** over **Open** to show other menu items for filtering these tickets depending on their event type:
 - **Report Related**
 - **Auto-Discovery Related**
 - **Probe Related**
 - **System Errors**
 - **New Software Version**
 - **Resolved**
 - **Closed**

- **All**
- **Open Ticket**
 Hover over  and select **Add Ticket** from the menu. This will open the **Add Ticket** dialog. In the first step, select the object on which you want to focus in the ticket via the **Object Selector**^[240]. Click **OK**.
 You can leave this step out when using the **context menu**^[247] of this object in the device tree to open the ticket.

In step 2, provide the following information and confirm by clicking on **OK** to create a **User Ticket**:

- **Subject**: Enter a meaningful title for the ticket that indicates the topic of the issue.
- **Assigned to**: Select a user (or user group) who will be responsible for this issue from the dropdown list.
- **Priority**: Define a **priority**^[242] from one to five stars.
- **Comments**: Enter a text message. This message should describe the issue in detail.

After selecting the desired filter or opening a new user ticket, a corresponding list of tickets will appear. In this table list, you can re-sort the items by using the **respective options**^[237]. Additionally, you have several search options using the inline filter directly above the table. The following filters are available:

- **Ticket status**: all, open, resolved, closed
- **Ticket type**: User, ToDo, Notification
- **Concerned user(s)**: Show only tickets that are assigned to a specific user or user group. There are the following types:
 - **anyone**: no user filter is applied so all tickets on this PRTG server are shown
 - **me**: show tickets that are assigned to you (the user who is currently logged in)
 - **Groups**: show tickets that are assigned to a specific user group only
 - **Users**: show tickets that are assigned to a specific user only
 - **Disallowed**: users or user groups that do not have access rights to the selected object are displayed under **Disallowed**. This for your information only; you cannot select them!
- **Relationship to a monitoring object**: Choose groups, probes, devices, or sensors with the **Object Selector**^[240].
 ToDo tickets are related to **System**.
- **Time span** to view tickets by last edit of a ticket: Use the date time picker to enter the date and time.

Click on the subject of a ticket to open the ticket's detail page. There you can find all related information, as well as conduct several actions.

ToDo Ticket #68 ★☆☆☆☆ 📄 ✉

Software update is available

Status: open Assigned to: PRTG Administrators Related Object: System Type: ToDo (New Software Version) ID: #68 [✎ Edit](#) [👤 Assign](#) [✔ Resolve](#) [🗑 Close](#)

Last Update

Opened by PRTG System Administrator+ Assigned to PRTG Administrators 28.08.2017 08:44:34

[28.08.2017 08:44:34] Version 17.3.34.2739 has been downloaded and is ready for installation. Please visit Setup|Autoupdate to initiate the installation.

An Open ToDo Ticket with Instructions

Actions

For best experience with PRTG, check every ticket and select appropriate actions.

i Only members of user groups that have the corresponding [access rights](#)¹⁵⁹ can view and edit tickets that are related to a certain monitoring object.

The following actions are available when viewing the tickets list or a specific ticket:

- **Edit**: Opens a dialog where you can change the subject and the priority of the ticket, as well as assign the ticket to another user. Furthermore, you can add a text message to this ticket. Confirm your changes by clicking **OK**.
- **Assign**: Opens a dialog where you can give the ticket to another user. Select a user (or user group) via the dropdown menu. Furthermore, you can add a text message to this ticket. Confirm your assignment by clicking **Save**.
- **Resolve**: Opens a dialog where you can resolve the ticket by clicking **Save**. The status **resolved** indicates that the issue as described in this ticket does not persist. Furthermore, you can add a text message to this ticket that indicates, for example, what has been done concerning the issue.
- **Close**: Opens a dialog where you can close the ticket by clicking **Save**. Usually, this ticket has been resolved before and the correct solution of the issue has been checked. Furthermore, you can add a text message to this ticket.
- **Reopen**: Opens a dialog where you can reopen a ticket after it has been resolved or closed. Do so, for example, if the solution of the issue turned out to be incorrect. Furthermore, you can add a text message to this ticket that indicates, for example, why you have opened the ticket again. Confirm reopening and assignment by clicking **Save**.

Tickets as Emails

You can receive all tickets that are assigned to you or to your user group as emails. You will also be notified via email each time this ticket is edited. This way, you will always be informed about new notifications (if set), important system information (if PRTG System Administrator), or within the communication with other PRTG users. You can turn off the setting **Tickets as Emails** in [System Administration—User Accounts](#)³³⁷⁶. If you disable emails for tickets for a user account, this particular user will not receive any ticket emails anymore.

i If you have defined to get tickets as emails and you are PRTG System Administrator, you will receive emails for ToDo tickets as well, although ToDo tickets are considered to be opened by the PRTG System Administrator.

6.15 Working with Table Lists

Throughout the web interface you often see table lists of items, for example, sensor or device lists. Table lists are also available on the overview pages of [Libraries](#), [Maps](#), [Reports](#), [Notifications](#), and [Schedules](#), as well as in [Logs](#) and [Tickets](#). All these provide common functionality. Depending on the type of content in the list, tables show various information in their columns for each object.

On certain overview pages, like for [sensors](#), [tickets](#), and [similar sensors](#), there is also an in-line filter available directly above the table. The filter options depend on the current page.

Ping Sensors Items: ~ 50
Show Filters v

Sensor	Probe Group Device	Status	Last Value	Message	Graph	Priority	Fav.	
✓ PING		Up	0 msec	OK		★★★★★	🔖	
✓ PING		Up	0 msec	OK		★★★★★	🔖	
✓ PING		Up	1 msec	OK		★★★★★	🔖	
✓ PING		Up	0 msec	OK		★★★★★	🔖	
✓ PING		Up	0 msec	OK		★★★★★	🔖	
✓ PING		Up	1 msec	OK		★★★★★	🔖	
✓ PING		Up	1 msec	OK		★★★★★	🔖	
✓ PING		Up	0 msec	OK		★★★★★	🔖	
✓ PING		Up	0 msec	OK		★★★★★	🔖	
✓ PING		Up	1 msec	OK		★★★★★	🔖	
✓ PING		Up	0 msec	OK		★★★★★	🔖	
✓ PING		Up	0 msec	OK		★★★★★	🔖	
✓ PING		Up	1 msec	OK		★★★★★	🔖	

Example of a Table List

FEATURE	DISPLAY	WHAT IT DOES
Paging		The content of a table is displayed over several pages. Click the arrow symbols at the end of a list to view other pages, or to jump to the beginning or the end of the list.
New Window		Click the window symbol at the beginning of a list to open the table in a new window.
Date Range		Use the date and time picker to show table list entries within a specific time span. Click the first date field for the start date and the second field for the end date. A calendar dialog opens where you can select date and time. Click the Done button to apply the selected date and time.
Select Range		When viewing log lists (not available in other lists), click Select Range in the upper-right corner of the list to select the time span you want to show log entries for. Choose between Today , Yesterday , and several other time spans. Choose Unlimited to disable this filter again.
Items		Click Items at the beginning of the list to select how many rows are shown on each page. Choose between 50 , 100 , 500 , and 1000 .
Sorting		Click the column headers to sort lists by the respective column. You select all words with arrows next to them for sorting, for example, by Status , Last Value , Priority , and more. The available options vary depending on the type of list.
Show XML		Click the XML option at the beginning of a list to download the current page in XML format. Your browser will usually show a download dialog.
Filtering		Use the filter options to show specific objects in the list. Enter one or more Tags into the field Tagged With to filter the list for corresponding objects. You can use the add (+) and remove (X) signs to categorize tags as "must have this tag" or "must not have this tag".

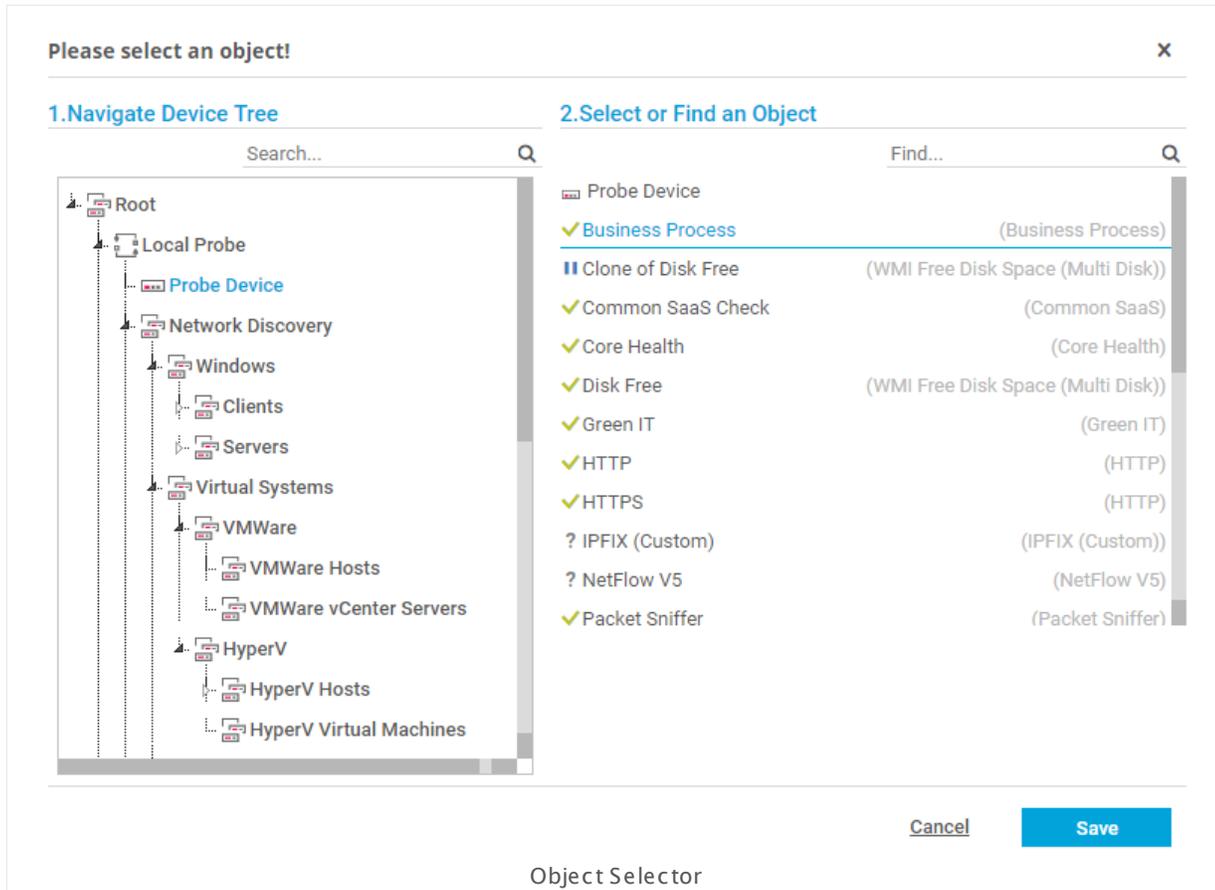

Click the entry below **Related to** to choose an object from the device tree with the **Object Selector** to show corresponding objects.

Related Topics

- [Multi-Edit Lists](#) 

6.16 Object Selector

For some functions, the object selector is shown. It enables you to browse all objects in your configuration and select an object in two steps.

Step 1: Navigate Device Tree

On the left-hand side, you see a device tree specific to your setup that you can browse by clicking the corresponding nodes. Click a device to view its sensors on the right-hand side.

You can directly browse for objects in the device tree by entering a probe name, group name, or device name into the **Search...** field above the device tree navigation. You can also use a substring only. The resulting objects will be displayed immediately without any manual confirmation.

Step 2: Select an Object

If you have selected a device on the left-hand side, you will see the sensors on this device here, on the right-hand side. Also, the sensor type is shown. **Hover** over a sensor on the right side to view its parent device and group.

You can also directly search and find sensors by entering the sensor name, group name, device name, or tag into the **Find...** box above the sensor list.

Select an object and click the **Save** button.

6.17 Priority and Favorites

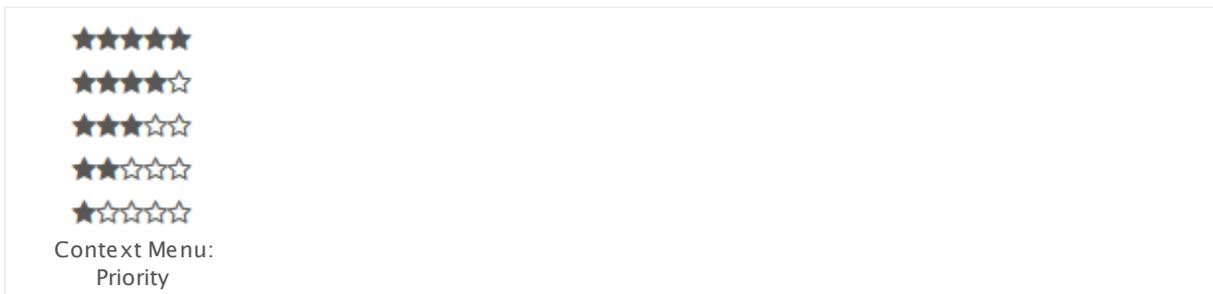

You can set priorities for all your monitoring objects and also categorize devices or sensors as favorites. Both settings affect how your objects are displayed.

- ⓘ Settings for priority and favorites are stored for the entire installation. They are not user specific.

Priority for All Objects

The priority setting affects the order in which your objects are displayed when you view table lists. PRTG lists objects with a higher priority first, others underneath, depending on their own priority. Furthermore, [device overview pages display gauges](#)^[198] for sensors with a high priority.

To change priority settings, **right-click** an object to open the [context menu](#)^[247] and select **Priority/Favorite**. You can choose between 5 stars ********* (top priority) and one star ***** (lowest priority). By default, all objects are set to medium priority (3 stars *****)**. In the page header bar and in lists, you can set a priority directly with one click on a star, for example, for sensors on a device overview page.

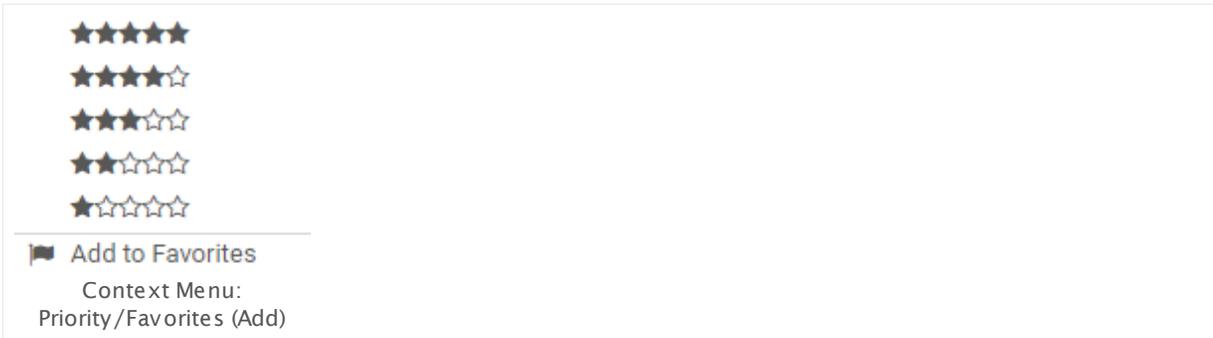

- ⓘ Select 4 or 5 stars for particular sensors to activate their gauges on device overview pages.
- ⓘ Select 5 stars for a map to show it as an entry in the [main menu bar](#)^[263] under **Home**.

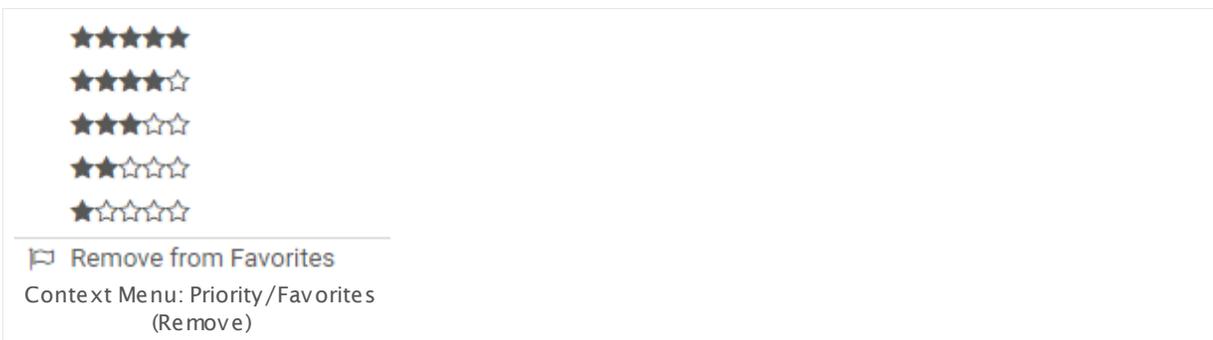

Favorites for Devices and Sensors

To call a list of all your favorite devices or sensors, select **Devices | Favorite Devices** or **Sensors | Favorite Sensors** from the main menu. These lists are sorted by priority as well.

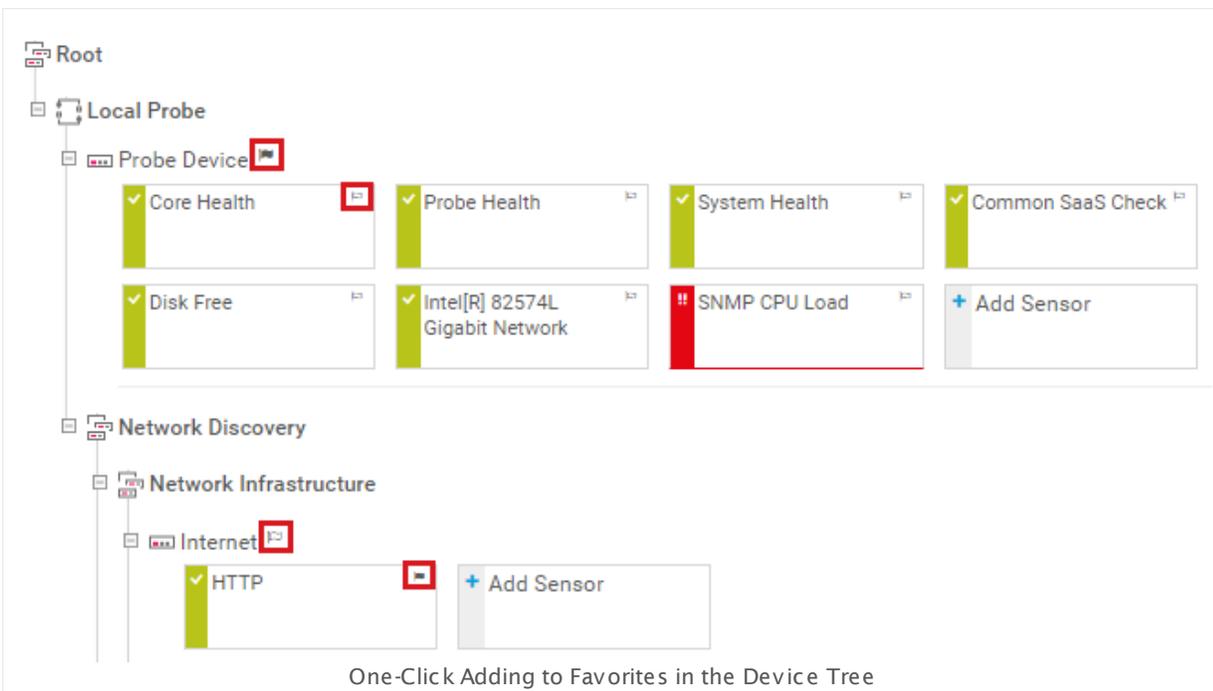

You can mark any device or sensor as favorite to add it to the favorite list. Right-click it to open the [context menu](#)^[247]. Select **Priority/Favorite | Add to Favorites**. A small black flag symbol will be added next to the object's name.

To remove an object from the favorites list, select **Priority/Favorite | Remove from Favorites** from the [context menu](#)^[247].

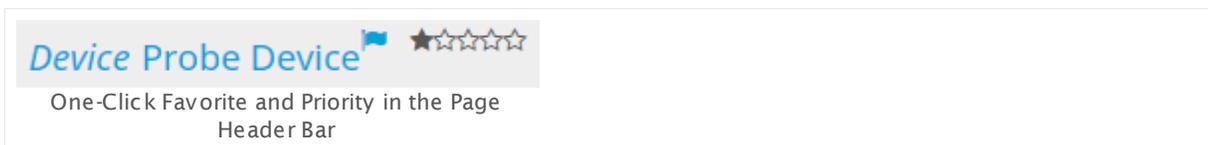

There is also the option to add a device or sensor to favorites with one click in the device tree. Just click the small flag symbol to the right of the respective object name. If the flag is black, the specific object is already a favorite; clicking the flag again will remove it from favorites and the flag will turn gray again.

Priority and Favorites in the Page Header Bar

You can add any device or sensor to favorites on its details page by clicking the small flag symbol in the [page header bar](#)¹⁸⁵. If the flag is blue, the selected object is already a favorite. Clicking the flag again will remove it from favorites and the flag will turn gray again. It is also possible to set the priority of the object by clicking one of the five stars in the page header; five stars ********* means top priority, one star ***** is the lowest priority.

6.18 Pause

If you want to pause monitoring, you have several possibilities to do so in PRTG. You can pause monitoring for a single sensor, an entire device, group, or even probe.

i While a sensor is paused, it will not collect any monitoring data, will not change its [status](#)^[195], and will not trigger any [notifications](#)^[143]. An object will keep its pause status also after a restart of PRTG.

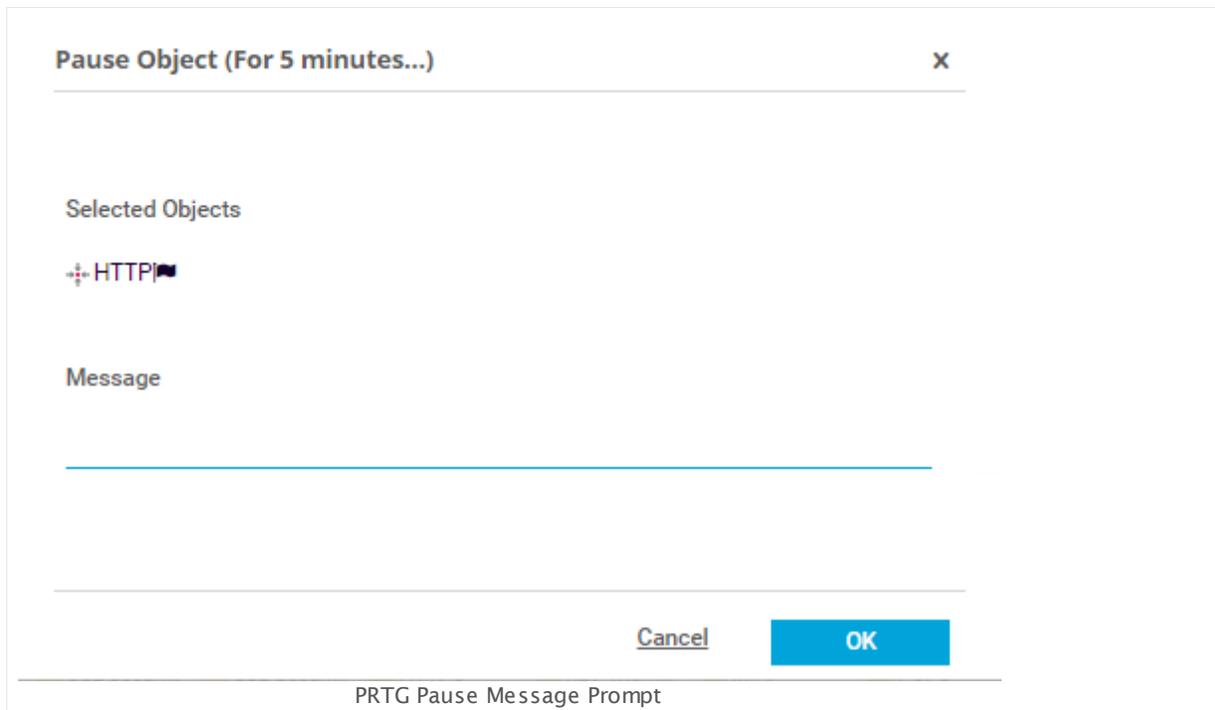

Pause by Intention—Manually or by Schedule

Navigate to the desired object in the device tree and select **Pause** from the [context menu](#)^[247].

You can choose **Pause Indefinitely**, or select a time after which monitoring will resume automatically, such as **5 or 15 minutes**, **1 or 3 hours**, **1 day**, or **Until** a certain date. You can also set up a one-time maintenance window to pause sensors automatically at a specified time.

i When selecting the **Pause** symbol from an object's [hover popup](#)^[262] or while using [multi-edit](#)^[3197], the object(s) will be paused indefinitely until resumed.

When selecting a pause option, you are prompted to enter a message. It will be shown in the status message of the object as long as it is paused. Confirm with **OK** to pause the object or click **Cancel** to not pause it.

The screenshot shows a dialog box titled "Pause Object (For 5 minutes...)" with a close button (X) in the top right corner. Below the title bar, there is a section labeled "Selected Objects" which contains a single entry: "HTTP" with a small icon to its left. Below this, there is a section labeled "Message" with a large, empty text input field. At the bottom of the dialog, there are two buttons: "Cancel" and "OK". The "OK" button is highlighted in blue. Below the dialog box, the text "PRTG Pause Message Prompt" is visible.

i Monitoring for objects can also be paused by applying a schedule (see [Account Settings —Schedules](#)^[3338]) in the [Object Settings](#)^[217]. If you pause a master object by schedule or manually, you do not trigger a status change by [dependency](#)^[141]. See this Knowledge Base article [Why will dependent objects not go into paused status automatically when I pause the master object?](#)

Pause by Hierarchy

If you pause monitoring for a given object in the [device tree](#)^[181], all child objects underneath will be paused as well. For example, if you pause a group, all sensors on all devices in this group will also be paused. Once an object is paused, you can resume monitoring at any time by selecting **Resume** from the [context menu](#)^[247]. However, you cannot resume monitoring for single child objects that are paused by a parent object, only for the object you originally set to pause.

Pause by Dependency

There is a way you can make PRTG pause objects automatically. If you have a master object, for example, a master Ping sensor for a device, PRTG can pause all dependent sensors on the device automatically in case the master object is down. See [Dependencies](#)^[141] for more information and mind this Knowledge Base article [Why will dependent objects not go into paused status automatically when I pause the master object?](#)

6.19 Context Menus

Right-click on an object to view a context menu with many options for direct access to monitoring data and functions. You can also access many of the functionalities via the [main menu](#)^[263] or the [hover popup](#)^[262] window. However, using the context menu is the easier way in most cases.

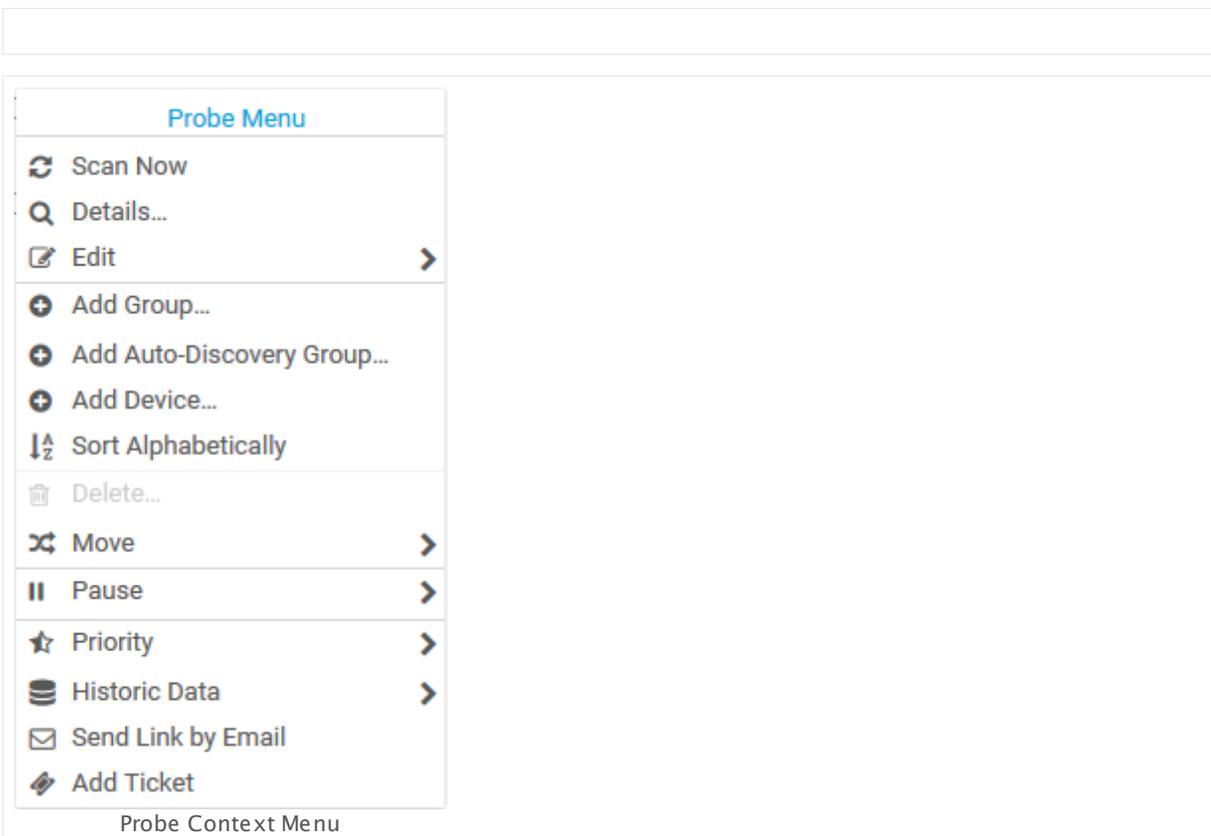

i To view your browser's context menu, hold down the **Ctrl** key (Chrome) or the **Shift** key (Firefox) while right-clicking. You will then see the menu of your browser instead of the PRTG menu. This is not possible with Internet Explorer.

The content of the PRTG context menu varies, depending on the type of object you have selected. See the following subsections for an overview of the available options.

- [Probe Context Menu](#)^[247]
- [Group Context Menu](#)^[251]
- [Device Context Menu](#)^[254]
- [Sensor Context Menu](#)^[259]

Probe Context Menu

The **Probe Menu** contains actions for your [local probe, hosted probe, remote probes, or mini probes](#)^[134].

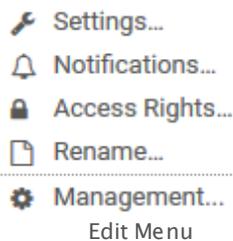

PROBE MENU

Scan Now Perform an immediate scan for the selected probe. This queries the data for all devices and sensors underneath in the [object hierarchy](#) ^[133].

Details... Show the [overview tab](#) ^[198] of the selected probe.

Edit > **Hover** over **Edit** to show the **Edit** menu.

The following actions are available:

- **Settings...**
Open the [Probe Settings](#) ^[351] tab of this probe.
- **Notifications...**
Open the [Notification Triggers](#) ^[326] tab of this probe.
- **Access Rights...**
Open an assistant to edit [User Access Rights](#) ^[158] for this probe.
- **Rename...**
Open an assistant to edit the name of this probe.
- **Management...**
Open the [Management](#) ^[329] tab of this probe.

Add Group... Open an assistant that guides you through the process of adding a new group to the selected probe.

 For detailed instructions, see [Add a Group](#) ^[302].

Add Auto-Discovery Group... Open an assistant that guides you through the process of adding a new auto-discovery group to the selected probe. PRTG creates a new group and runs an auto-discovery in your network to add devices and sensors automatically. For more information, see section [Using the Auto-Discovery](#) ^[282].

 This option is not available on the **Hosted Probe** of a PRTG hosted by Paessler instance.

PROBE MENU

Add Device... Open an assistant that guides you through adding a new device to the selected probe.

 For detailed instructions, see [Add a Device](#)³¹¹.

Sort Alphabetically Sort direct children (groups and devices) of the selected probe in alphabetical order.

 The ordering is stored in the monitoring configuration and cannot be revoked.

Delete... Delete the selected probe. PRTG will ask for confirmation before anything is actually deleted.

Move > **Hover** over **Move** to open the **Move** menu.

The following actions are available:

- **Top:** Move the probe to the top of the root group.
- **Up:** Move the probe one entry up under the root group.
- **Down:** Move the probe one entry down under the root group.
- **Bottom:** Move the probe to the bottom of the root group.
- **Management...:** Open the [Management](#)³²⁹ tab of the probe.

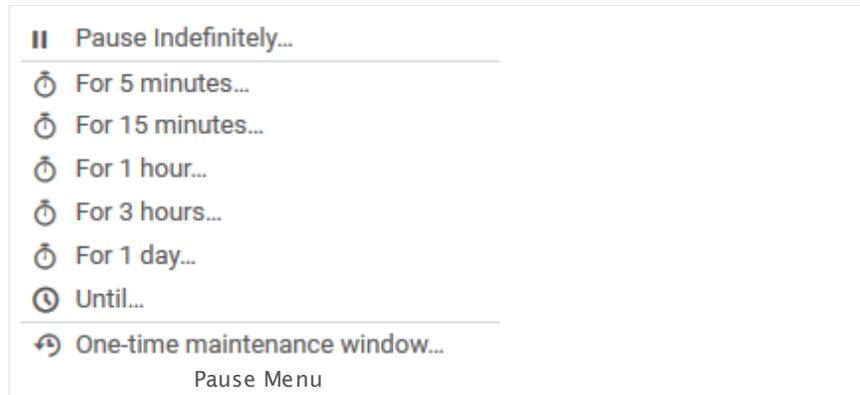

Pause > **Hover** over **Pause** to open the **Pause** menu.

—or—

Resume

If the probe is already in paused or in "simulate error" status, **Resume** appears. **Click** to restart monitoring on this probe.

PROBE MENU

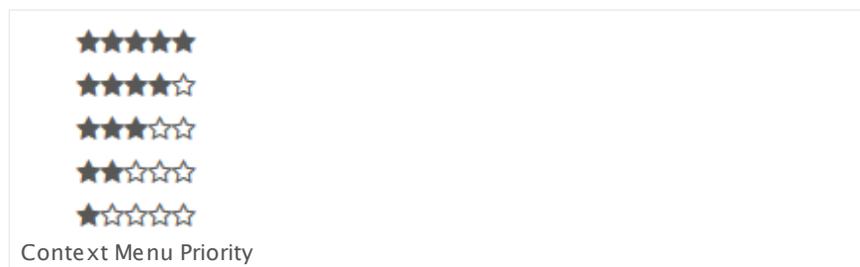

You can pause and resume monitoring on the selected probe. The monitoring for all sensors in the [object hierarchy](#)¹³³ underneath will be paused or resumed.

You can choose between: **Pause Indefinitely...**, pause **For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Pause Until...**. If you choose **Pause Until...**, an assistant appears where you can define a date. Use the date time picker to enter the date and time. PRTG will resume monitoring after this date.

You can directly add a **One-time maintenance window** to pause monitoring during a planned downtime. In the appearing assistant, define the start and end date of the maintenance window for this probe. Use the date time picker to enter the date and time.

Priority >

Hover over **Priority** to open the **Priority** menu.

Define the priority of the selected probe.

 For details, see [Priority and Favorites](#)²⁴².

Historic Data >

Hover over **Historic Data** to open the **Historic Data** menu.

PROBE MENU

-  Last 2 days...
 -  Last 30 days...
 -  Last 365 days...
 -  Create Report...
- Context Menu Historic
Data

The following actions are available:

- Open [the historic data report tabs for the specified interval](#)^[200]: **Last 2 days...**, **Last 30 days...**, or **Last 365 days...**
 - **Create Report...**: Open an assistant to add a new report to PRTG.
-  For details, see [Reports Step by Step](#)^[3257].

Send Link by Email

Send the link to the selected probe by email. **Click** to create a new email using your system's standard email client. It contains a direct link to the [overview tab](#)^[198] of the selected probe.

Add Ticket

Open the **Add Ticket** dialog.

 For details, see the section [Tickets](#)^[233].

Group Context Menu

The **Group Menu** contains actions for your [groups](#)^[134].

 The context menu of the **Root** group is special and differs from the other groups' menu.

GROUP MENU

Scan Now

Perform an immediate scan for the selected group. This queries the data for all devices and sensors underneath in the [object hierarchy](#)^[133].

Details...

Show the [overview tab](#)^[198] of the selected group.

Edit >

Hover over **Edit** to show the **Edit** menu. The following actions are available:

GROUP MENU

- **Settings...**
Open the [Group Settings](#)^[375] tab of this group.
- **Notifications...**
Open the [Notification Triggers](#)^[3216] tab of this group.
- **Access Rights...**
Open an assistant to edit [User Access Rights](#)^[158] for this group.
- **Rename...**
Open an assistant to edit the name of this group.
- **Management...**
Open the [Management](#)^[329] tab of this group.

Add Group... Open an assistant that guides you through the process of adding a new group to the selected group.

 For detailed instructions, see [Add a Group](#)^[302].

Add Auto-Discovery Group... Open an assistant that guides you through the process of adding a new auto-discovery group to the selected group. PRTG creates a new group and runs an auto-discovery in your network to add devices and sensors automatically. For more information, please see section [Using the Auto-Discovery](#)^[282].

 This option is not available on the **Hosted Probe** of a PRTG hosted by Paessler instance.

Add Device... Open an assistant that guides you through adding a new device to the selected group.

 For detailed instructions, see [Add a Device](#)^[311].

Auto-Discovery This option is only available for auto-discovery groups. These are groups with automatic device identification or sensor creation [enabled](#)^[376]. Hover over **Auto-Discovery** to show its menu. The following actions are available:

- **Run Auto-Discovery:** Start an automatic search immediately to automatically add new sensors to the selected device. The search runs in the background and uses the option you set in the **Sensor Management** [section of the group settings](#)^[376]. If found, you see new devices with sensors after a few minutes (if found). For more information, please see [Auto-Discovery](#)^[283] (**Run Auto-Discovery Now**).

GROUP MENU

- **Run Auto-Discovery with Template:** Open an [assistant](#)^[285] to start an automatic search with a desired device template. This is the **Sensor Management** option **Automatic sensor creation using specific device template(s)**. Other automatic device identification options are not available. The option you set in the **Sensor Management** [section of the group settings](#)^[376] will not apply.

 This option is not available on the **Hosted Probe** of a PRTG hosted by Paessler instance.

Sort Alphabetically

Sort direct children (groups and devices) of the selected group in alphabetical order.

 The ordering is stored in the monitoring configuration and cannot be revoked.

Delete...

Delete the selected group. PRTG will ask for confirmation before anything is actually deleted.

Clone...

Open an assistant that guides you through cloning the selected group.

 For detailed instructions, see [Clone Object](#)^[3193].

Move >

Hover over **Move** to open the **Move** menu. The following actions are available:

- **Top:** Move the group to the top of the mother node (here usually a probe or another group).
- **Up:** Move the group one entry up under the mother node.
- **Down:** Move the group one entry down under the mother node.
- **Bottom:** Move the group to the bottom of the mother node.
- **To Other Group...:** Move the group to another group to become a sub-group.
- **Management...:** Open the [Management](#)^[329] tab of the group.

Pause >

Hover over **Pause** to open the **Pause** menu.

—or—

If the group is already in paused or in "simulate error" status, **Resume** appears. **Click** to restart monitoring on this group.

Resume

You can pause and resume monitoring on the selected group. The monitoring for all sensors in the [object hierarchy](#)^[133] underneath will be paused or resumed.

GROUP MENU

You can choose between: **Pause Indefinitely...**, pause **For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Pause Until...**. If you choose **Pause Until...**, an assistant appears where you can define a date. Use the date time picker to enter the date and time. PRTG will resume monitoring after this date.

You can directly add a **One-time maintenance window** to pause monitoring during a planned downtime. In the appearing assistant, define the start and end date of the maintenance window for this group. Use the date time picker to enter the date and time.

Priority >

Hover over **Priority** to open the **Priority** menu. Define the priority of the selected group.

 For details, see [Priority and Favorites](#)^[242].

Historic Data >

Hover over **Historic Data** to open the **Historic Data** menu. The following actions are available:

- Open [the historic data report tabs for the specified interval](#)^[200]: **Last 2 days...**, **Last 30 days...**, or **Last 365 days...**
- **Create Report...**: Open an assistant to add a new report to PRTG.

 For details, see [Reports Step by Step](#)^[3257].

Send Link by Email

Send the link to the selected group by email. **Click** to create a new email using your system's standard email client. It contains a direct link to the [overview tab](#)^[198] of the selected group.

Add Ticket

Open the **Add Ticket** dialog.

 For details, see section [Tickets](#)^[233].

Device Context Menu

The **Device Menu** contains actions for your [devices](#)^[135].

DEVICE MENU

Scan Now

Perform an immediate scan for the selected device. This queries the data for all sensors underneath in the [object hierarchy](#)^[133].

DEVICE MENU

Details...	Show the overview tab ^[198] of the selected device.
Edit >	<p>Hover over Edit to show the Edit menu. The following actions are available:</p> <ul style="list-style-type: none"> ▪ Settings... Open the Device Settings^[402] tab of this device. ▪ Notifications... Open the Notification Triggers^[3216] tab of this device. ▪ Access Rights... Open an assistant to edit User Access Rights^[156] for this device. ▪ Rename... Open an assistant to edit the name of this device. You can also select another device icon.
Add Sensor...	<p>Open an assistant that guides you through adding a new sensor to the selected device.</p> <p> For detailed instructions, see Add a Sensor^[325].</p>
Auto-Discovery	<p>Hover over Auto-Discovery to show the Auto-Discovery menu. The following actions are available:</p> <ul style="list-style-type: none"> ▪ Run Auto-Discovery: Start an automatic search immediately to automatically add new sensors to the selected device. The search runs in the background and uses the option you set in the Sensor Management section of the device settings^[402]. If found, you see new sensors on this device after a few minutes. For more information, please see Auto-Discovery^[283] (Run Auto-Discovery Now). <ul style="list-style-type: none"> ① If you have set the option Manual (no auto-discovery) in the device settings section^[404] Sensor Management and start the auto-discovery from the context menu, PRTG will run it using the standard device identification and change the device setting to Automatic device identification (standard, recommended). Please note that the Enterprise Console^[3473] behaves differently in this case. ▪ Run Auto-Discovery with Template: Open an assistant^[285] to start an automatic search with a desired device template. This is the Sensor Management option Automatic sensor creation using specific device template(s). Other automatic device identification options are not available. The option you set in the Sensor Management section of the device settings^[404] will not apply.

DEVICE MENU

Create Device Template...

Open an assistant that guides you through creating a new device template. The template is then available in [auto-discovery](#) .

 For detailed instructions, see [Create Device Template](#) .

Recommend Now

Start an analysis to get sensor recommendations for this device. When PRTG has finished the inspection of the device, you see the sensor recommendations in a table list on the [device overview tab](#)  where you can add the according sensor types directly.

 This option is only available if the [recommendation engine is enabled](#) .

Sort Alphabetically

Sort the sensors on the selected device in alphabetical order.

 The ordering is stored in the monitoring configuration and cannot be revoked.

Delete...

Delete the selected device. PRTG will ask for confirmation before anything is actually deleted.

Clone...

Open an assistant that guides you through cloning the selected device.

 For detailed instructions, see [Clone Object](#) .

Move >

Hover over **Move** to open the **Move** menu. The following actions are available:

- **Top:** Move the device to the top of the mother node (here usually a probe or group).
- **Up:** Move the device one entry up under the mother node.
- **Down:** Move the device one entry down under the mother node.
- **Bottom:** Move the device to the bottom of the mother node.
- **To Other Group...:** Move the device to another group.

Pause >

Hover over **Pause** to open the **Pause** menu.

—or—

If the device is already in paused or "simulate error" status, **Resume** appears. **Click** to restart monitoring on this device.

Resume

You can pause and resume monitoring on the selected device. The monitoring for all sensors on this device will be paused or resumed.

DEVICE MENU

You can choose between: **Pause Indefinitely...**, pause **For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Pause Until...**. If you choose **Pause Until...**, an assistant appears where you can define a date. Use the date time picker to enter the date and time. PRTG will resume monitoring after this date.

You can directly add a **One-time maintenance window** to pause monitoring during a planned downtime. In the appearing assistant, define the start and end date of the maintenance window for this device. Use the date time picker to enter the date and time.

Priority/Favorite ›

Hover over **Priority/Favorite** to open the **Priority/Favorite** menu. Define the priority of the selected device, or add to or remove it from the favorite devices list.

 For details, see [Priority and Favorites](#) ^[242].

Historic Data ›

Hover over **Historic Data** to open the **Historic Data** menu. The following actions are available:

- Open [the historic data report tabs for the specified interval](#) ^[200]: **Last 2 days...**, **Last 30 days...**, or **Last 365 days...**
- **Create Report...**: Open an assistant to add a new report to PRTG.

 For details, see [Reports Step by Step](#) ^[3257].

Device Tools ›

Hover over **Device Tools** to open the **Device Tools** menu.

 This option is not available on the **Hosted Probe** of a PRTG hosted by Paessler instance.

-  [Go To Service URL...](#)

-  [New window with HTTP...](#)
-  [New window with HTTPS...](#)
-  [New window with FTP...](#)

-  [Remote Desktop...](#)
- [Traceroute...](#)
- [Install Remote Probe...](#)
- Context Menu Device Tools

The following actions are available:

DEVICE MENU

- **Go To Service URL...**
Open the [service page](#) that you have defined in the [Device Settings](#)^[402]. If there is no service URL available for this device, you can enter an address in the appearing assistant.
 - **New window with HTTP...**
Open a new browser window with Hypertext Transfer Protocol (HTTP) and the IP address / DNS name of the device.
 - **New window with HTTPS...**
Open a new browser window with Hypertext Transfer Protocol Secure (HTTPS) and the IP address / DNS name of the device.
 - **New window with FTP...**
Open a new browser window with File Transfer Protocol (FTP) and the IP address / DNS name of the device.
 - **Remote Desktop...**
Download an [.rdp](#) file. When you execute this file, a remote desktop will start with the IP address / DNS name of the device.
 In Firefox you have to use [mstsc.exe \(Microsoft Terminal Service\)](#) to open the file.
 - **Traceroute...**
Start a traceroute on the selected device. PRTG will display the route and measure transit delays of packets across the IP network.
 - **Install Remote Probe...**
Open an assistant to install a **Remote Probe** of PRTG on this device. For more details, see [Remote Probe Quick Install](#)^[3713].
 This option is only available on devices on local probes.
-  This option is not available in PRTG hosted by Paessler.

Find Duplicates... Search in your PRTG configuration for devices with the same IP address or DNS name as the selected device. A window with the results will appear, either showing existing duplicates or a message indicating that there are no duplicates.

Send Link by Email Send the link to the selected device by email. [Click](#) to create a new email using your system's standard email client. It contains a direct link to the [overview tab](#)^[198] of the selected device.

Add Ticket Open the **New Ticket** dialog.
 For details, see section [Tickets](#)^[233].

Sensor Context Menu

The **Sensor Menu** contains actions for your [sensors](#)^[135].

SENSOR MENU	
Scan Now	Perform an immediate scan for the selected sensor.
Details...	Show the overview tab ^[198] of the selected sensor.
Edit >	<p>Hover over Edit to show the Edit menu. The following actions are available:</p> <ul style="list-style-type: none"> ▪ Settings... Open the Sensor Settings^[428] tab of this sensor. ▪ Notifications... Open the Notification Triggers^[3216] tab of this sensor. ▪ Access Rights... Open an assistant to edit User Access Rights^[158] for this sensor. ▪ Rename... Open an assistant to edit the name of this sensor.
Acknowledge Alarm >	<p>This option is available only in the sensor menu when you select a sensor in a Down or Down (Partial) status^[195].</p> <p>You can acknowledge an alarm for the selected sensor. An acknowledged alarm will show up in the alarms list as "acknowledged" (see Sensor States^[195]) and will not trigger^[3170] any more notifications^[3216].</p> <p>You can choose between: Acknowledge Indefinitely..., acknowledge For 5 Minutes..., For 15 Minutes..., For 1 Hour..., For 3 Hours..., For 1 Day..., or Until... If you choose Until... an assistant appears where you can define a date. Use the date time picker to enter the date and time. If the alarm condition still exists after this date, the sensor will show a Down status again.</p> <p>i If the alarm condition clears, the sensor usually returns into an Up status immediately with the next sensor scan. For details about acknowledging an alarm, see Alarms^[220] section.</p>
Delete...	Delete the selected sensor. PRTG will ask for confirmation before anything is actually deleted.
Clone...	Open an assistant that guides you through cloning the selected sensor.

SENSOR MENU

 For detailed instructions, see [Clone Object](#) ^[3193].

Move ›

Hover over **Move** to open the **Move** menu. The following actions are available:

- **Top:** Move the sensor to the top of the device on which it runs.
- **Up:** Move the sensor one entry up on the device.
- **Down:** Move the sensor one entry down on the device.
- **Bottom:** Move the sensor to the bottom of the device.

Pause ›

Hover over **Pause** to open the **Pause** menu.

—or—

Resume

If the sensor is already in [paused status](#) ^[195] or in **Simulate Error Status**, **Resume** appears. **Click Resume** to restart monitoring on this sensor.

You can pause and resume monitoring of the selected sensor. Choose between: **Pause Indefinitely...**, pause **For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Pause Until...**. If you choose **Pause Until...**, an assistant appears where you can define a date. Use the date time picker to enter the date and time. PRTG will resume monitoring after this date.

You can directly add a **One-time maintenance window** to pause monitoring during a planned downtime. In the appearing assistant, define the start and end date of the maintenance window for this sensor. Use the date time picker to enter the date and time. Inheritance of the **Schedules, Dependencies, and Maintenance Window** setting from a parent device, group, or probe will be suspended for this timeframe and set again afterwards.

Simulate Error Status

Set the selected sensor to a [Down status](#) ^[195]. Like for the paused status, **Resume** will appear in the context menu if a the selected sensor is already in a simulated error status.

 "Simulate error status" does not work for sensors that run on a PRTG Mini Probe.

Priority/Favorite ›

Hover over **Priority/Favorite** to open the **Priority/Favorite** menu. Define the priority of the selected sensor, or add or remove it from the favorite devices list.

 For details, see [Priority and Favorites](#) ^[242].

Historic Data ›

Hover over **Historic Data** to open the **Historic Data** menu. The following actions are available:

SENSOR MENU

- Open the [historic data tab for the specified interval](#)²⁰¹: **Live Data...**, **Last 2 days...**, **Last 30 days...**, or **Last 365 days...**
- **View Historic Data**: Open the [Historic Data](#)²⁰⁴ tab of this sensor.
- **Create Report...**: Open an assistant to add a new report to PRTG.

 For details, see [Reports Step by Step](#)³²⁵⁷.

Send Link by Email

Send the link to the selected sensor by email. **Click** to create a new email using your system's standard email client. It contains a direct link to the [overview tab](#)¹⁹⁸ of the selected sensor.

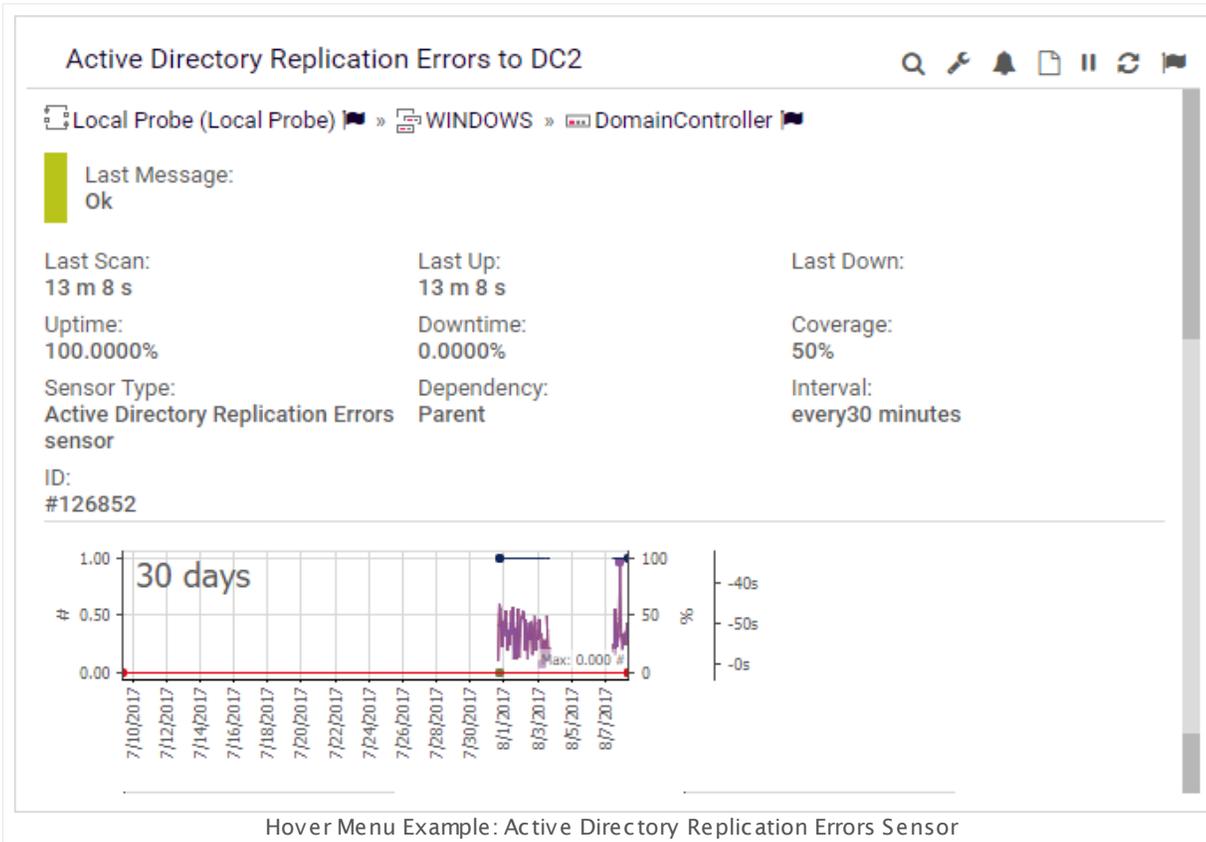

Add Ticket

Open the **Add Ticket** dialog.

 For details, see section [Tickets](#)²³³.

6.20 Hover Popup

Whenever you rest the mouse pointer for a second over an object's icon in the [device tree](#)^[181], a hover popup window will appear, showing details about this object. It contains information from the object's [overview tab](#)^[198], as well as several graphs. The exact information provided depends on the kind of object you are hovering over.

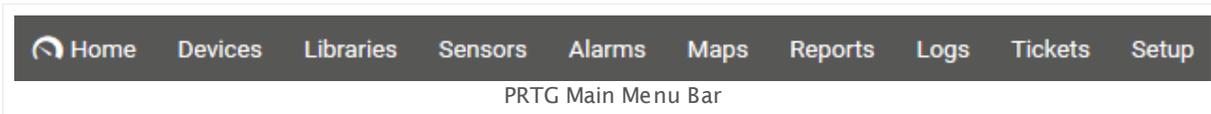

- ❗ The hover popup only appears if your browser is the currently focused window on your desktop. It disappears with every (automatic) page refresh.

Menu Icons

At the top of the hover popup window, several icons are shown that enable you to view or edit the current object. These are the most important options from this object's [context menu](#)^[247], which is shown when right-clicking it.

6.21 Main Menu Structure

You can access all functions of PRTG using the main menu. In this section, you find descriptions about the most important menu items. Often, you can either **click** an item directly, or **hover** over it to show more items.

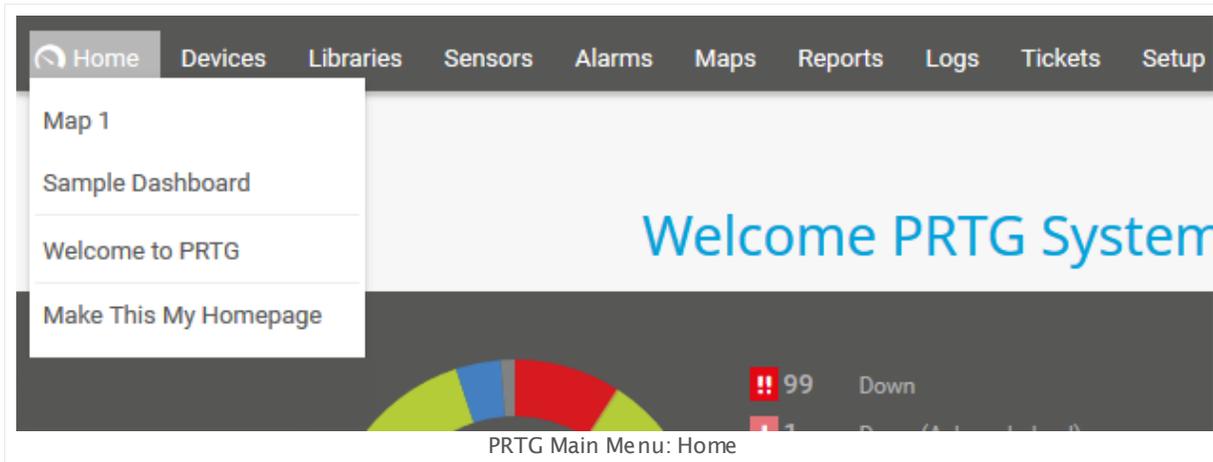

i This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

The following menu items are available:

- [Home](#) ²⁶³
- [Devices](#) ²⁶⁵
- [Libraries](#) ²⁶⁷
- [Sensors](#) ²⁶⁷
- [Alarms](#) ²⁷⁰
- [Maps](#) ²⁷¹
- [Reports](#) ²⁷²
- [Logs](#) ²⁷³
- [Tickets](#) ²⁷⁴
- [Setup](#) ²⁷⁵
- [Search Box](#) ²⁷⁷
- [Logout \(Off Symbol\)](#) ²⁷⁸

Home

Click to open the user's homepage. The default setting is the [PRTG welcome page](#) ¹⁸¹. You can change the homepage in the user [account settings](#) ³³⁰⁴. Point to **Home** to show other menu items.

HOME

Sample Dashboard

Open a preconfigured dashboard to view monitoring data in another layout. Dashboards provide different preset overviews with the status of your sensors. This dashboard is one of the default [Maps](#) that PRTG creates automatically with a new installation.

i The **Home** menu shows maps that have a 5***** [priority](#). To show a desired map here, give it 5 stars on the [maps overview page](#). You can include up to 10 map entries in the menu. For details, see section [Maps in Home Menu](#).

i You can change the appearance of the default dashboard with the [Map Designer](#). To not show the sample dashboard in the menu, define a [priority](#) lower than 5***** for this map.

☁ This option is not available in PRTG hosted by Paessler.

Switch Cluster Node >

This option is only available if PRTG runs in [Clustering](#) mode. Show available cluster nodes. **Hover** over **Switch Cluster Node** to show other menu items. Follow the menu path (it is specific to your setup) to select another cluster node. The current Master node is shown in bold letters. Click on a node's name to leave the current node and connect to the other, showing the same page there.

☁ This option is not available in PRTG hosted by Paessler.

Welcome to PRTG

Open the [Welcome Page](#) that shows the Paessler news feed and various information about your PRTG installation, and it provides quick links to major sections of the web interface.

i This is the default homepage of the PRTG web interface.

HOME

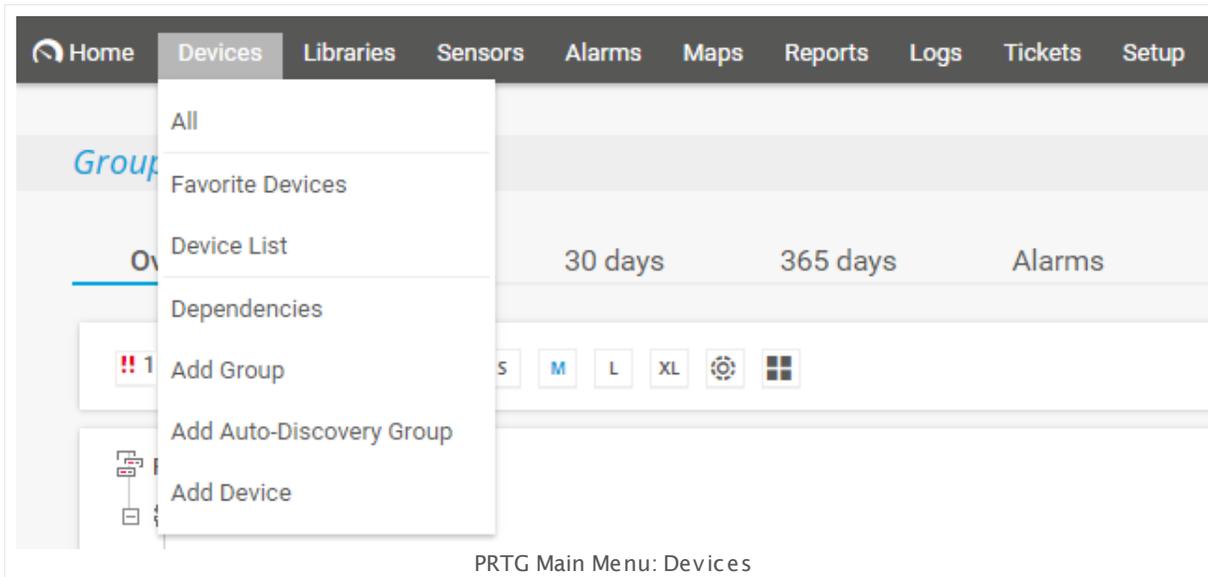

Make This My Homepage

Change the page that is loaded when you click **Home** in the main menu. Select this command on any page to set its URL as the current user's homepage. This setting is user sensitive. The default homepage is [/welcome.htm](#).

You can change this setting any time by clicking this command again, or by changing the **Homepage URL** in the [My Account](#) ^{330d} settings.

Devices

Click to show a group view of all your devices, starting with the **Root** group, which contains all other groups of your setup. **Hover** over **Devices** to show other menu items.

DEVICES

All

Open the **Overview** tab of the [Root](#) ^{133d} group that shows a group view of all your devices (the device tree).

Favorite Devices

Open a table list of all devices marked as [Favorite](#) ^{242d}. **Click** the **Print QR-Codes** button to show a printable list of the QR codes of all your favorite devices.

i To mark any device as a favorite device, select **Priority/ Favorite | Add to Favorites** from its context menu or click the small flag on a device's details page.

DEVICES

Device List

Open a list view of all devices in your setup. **Click** to show a table list of all devices in your setup.

 In the [table list](#)^[237] that appears, you can re-sort the items by clicking the column's header items.

Dependencies

Open an overview list of the [Dependencies](#)^[141] configured for the objects in your setup. You can select dependencies and define master dependencies in the **Schedules, Dependencies, and Maintenance Windows** [settings of a monitoring object](#)^[217] (not available for the **Root** group).

Add Group

Start an assistant that guides you through the process of adding a new group to your setup.

 For more information, see section [Create Objects Manually](#)^[301].

 You can create new groups much faster by choosing **Add Group...** from a probe's or group's context menu.

Add Auto-Discovery Group

Start an assistant that guides you through the process of adding a new auto-discovery group to your setup. PRTG will create a new group and run an auto-discovery in your network to add devices and sensors for these devices automatically.

 For more information, see section [Using the Auto-Discovery](#)^[282].

 You can create new groups much faster by choosing **Add Auto-Discovery Group...** from a probe's or group's context menu.

 This option is not available on the **Hosted Probe** of a PRTG hosted by Paessler instance.

Add Device

Start an assistant that guides you through the process of adding a new device to an existing group. During the process, you can choose if PRTG will run an auto-discover for the new device to add sensors automatically.

 For more information, see section [Create Objects Manually](#)^[301].

 You can create new devices much faster by choosing **Add Device...** from a group's context menu.

Libraries

Click to open the **Libraries** overview list where you can view or add custom views of your network status and monitoring data. Hover over **Libraries** to show other menu items.

For more information, see [Libraries](#) section.

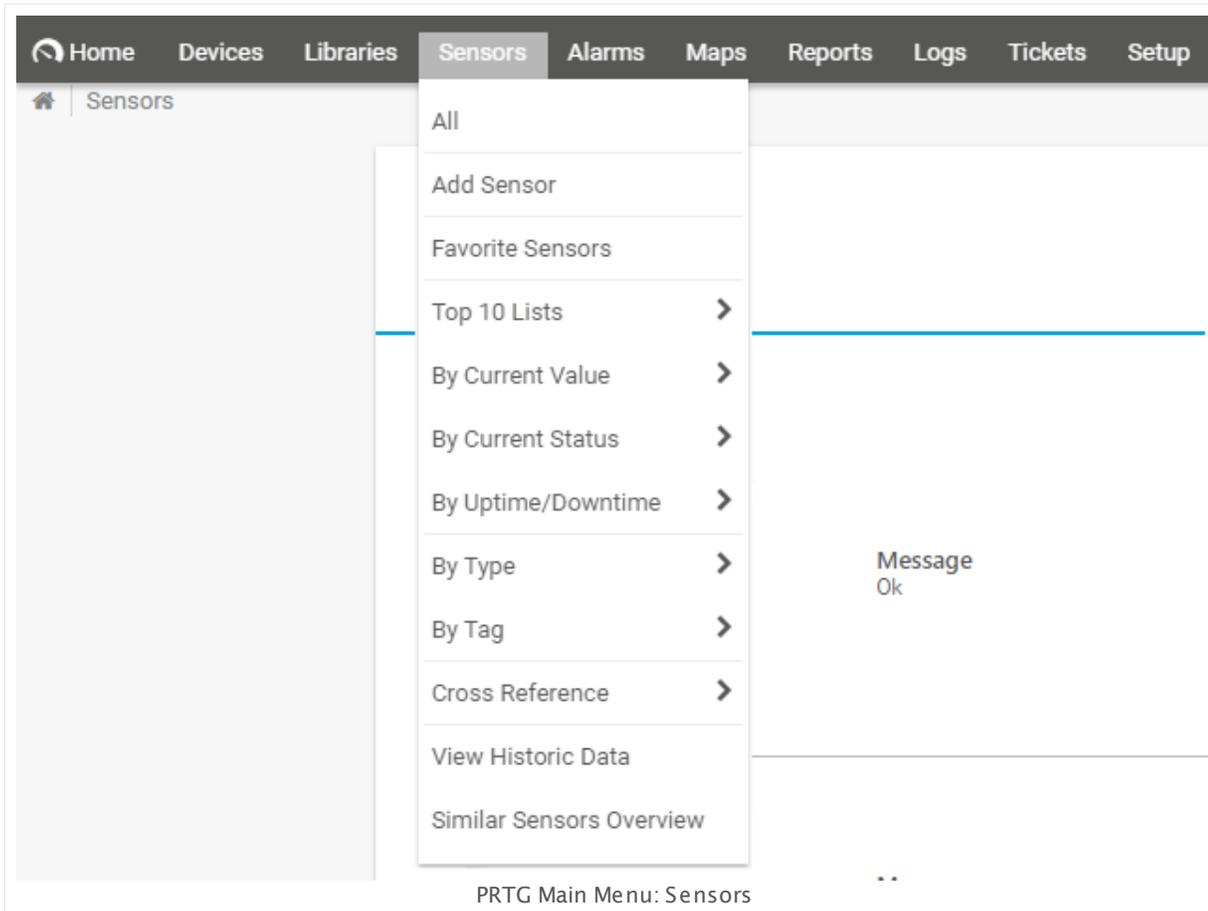

LIBRARIES

All	Open the Libraries overview list where you can view or add custom device tree views of your network status and monitoring data.
Add Library	Open an assistant to create a new library.
Select Library >	Open an existing library. Hover over Select Library to show more options. Follow the alphabetical menu path (it is specific to your setup) to view your libraries. Click a library to open it.

Sensors

Click to show a table list of all [sensors](#). In the [table list](#) that appears, you can re-sort the items by clicking the column's header items and you can filter the list by related object and tag with the inline filter directly above the table. Hover over **Sensors** in the main menu bar to show other menu items.

- The column **Last Value** shows only the last value of the sensor's **primary channel**.
- For most sensor lists, you can use [Multi-Edit](#) to change the settings of more than one sensor at once.

SENSORS

All

Open a [table list](#)^[237] of all [sensors](#)^[135]. In the table list appearing, you can re-sort the items by clicking the column's header items.

- ⓘ The column **Last Value** shows only the last value of the sensor's **primary channel**.

Add Sensor

Start an assistant that guides you through the process of adding a new sensor to an existing device. For more information, see section [Add a Sensor](#)^[325]. During the process, you can also choose to create a new device via the [Add a Device](#)^[317] assistant (that you can also open from the ["Devices" menu](#)^[265] directly).

Favorite Sensors

Open a table list of all sensors that you marked as [Favorite](#)^[242].

- ⓘ To mark any sensor as a favorite sensor, select **Priority/ Favorite | Add to Favorites** from its context menu or click the small flag on a device's details page.

SENSORS

Top 10 Lists >

Open a dashboard view with different top 10 lists that show best or worst uptime, Ping, bandwidth usage, website response times, CPU usage, disk usage, memory usage, and system uptime. **Click** to show top 10 lists for all sensors. **Hover** over **Top 10 Lists** to show other menu items. Follow the menu path (it is specific to your setup) to view top 10 lists for a specific probe or group only.

 The shown sensors are selected by default tags.

By Current Value >

Open a list of sensors filtered by value. **Hover** over **By Current Value** to show other menu items. Follow the menu path to view [table lists](#)^[237] of **Fastest Value** or **Slowest Value** sensors for

- Ping
- Port
- Webpages
- IMAP/POP3/SMTP
- FTP

as well as a list of sensors with **Highest Value** or **Lowest Value** regarding

- Bandwidth
- CPU
- Disk
- Memory

 The shown sensors are selected by default tags.

By Current Status >

Open a list of sensors filtered by status. **Hover** over **By Current Status** to show other menu items. Follow the menu path to view [table lists](#)^[237] of all sensors in a certain status.

 For more information about sensor states, see [Sensor States](#)^[195] section.

By Uptime/Downtime >

Open a list of sensors filtered by different parameters. **Hover** over **By Uptime/Downtime** to show other menu items. Follow the menu path to view [table lists](#)^[237] of all sensors sorted by

- Best Uptime (%)
- Highest Uptime (Time)
- Worst Downtime (%)
- Highest Downtime (Time)

SENSORS

By Type ›

Open a list of sensors filtered by [sensor type](#)^[429]. **Hover** over **By Type** to show other menu items. Follow the alphabetical menu path (it is specific to your setup) to view a sensor [table list](#)^[237] containing only sensors of one specific sensor type.

By Tag ›

Open a list of sensors filtered by [tag](#)^[139]. **Hover** over **By Tag** to show other menu items. Follow the alphabetical menu path (it is specific to your setup) to see available tags. Select a tag to view a [table list](#)^[237] containing only sensors marked with this tag.

 If you have more than 1000 tags, no tags are shown here. See [Tags](#)^[140] section for more information.

Cross Reference ›

Open the sensor cross reference to show information about all sensors including [priority and favorite status](#)^[242], [scanning interval](#)^[345], [access rights](#)^[158], [notification trigger settings](#)^[217], [schedule](#)^[142], and [dependency](#)^[141]. **Click** to show a sensor cross reference for all sensors. **Hover** over **Cross Reference** to show other menu items. Follow the menu path (it is specific to your setup) to view cross reference information for sensors by type or tag.

View Historic Data

Open an assistant for a quick generation of sensor data reports.

 For more information, see [Historic Data Reports](#)^[204] section.

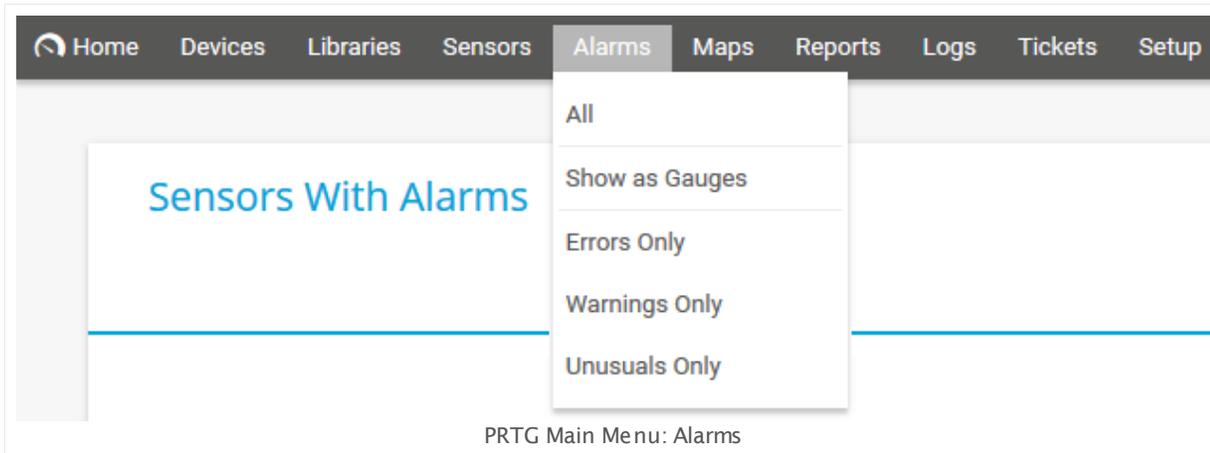

Similar Sensors Overview

Open an overview page with a list of similar sensors.

 For more information, see [Similar Sensors](#)^[209] section.

Alarms

Click to show all sensors that currently show a **Down**, **Down (Partial)**, **Warning**, or **Unusual** status. In the [table list](#)^[237] that appears, you can re-sort the items by clicking the column's header items. If you select **Show as Gauges**, this command displays the [sensor gauges](#)^[198] in a size corresponding to their priority. **Hover** over **Alarms** to show other menu items.

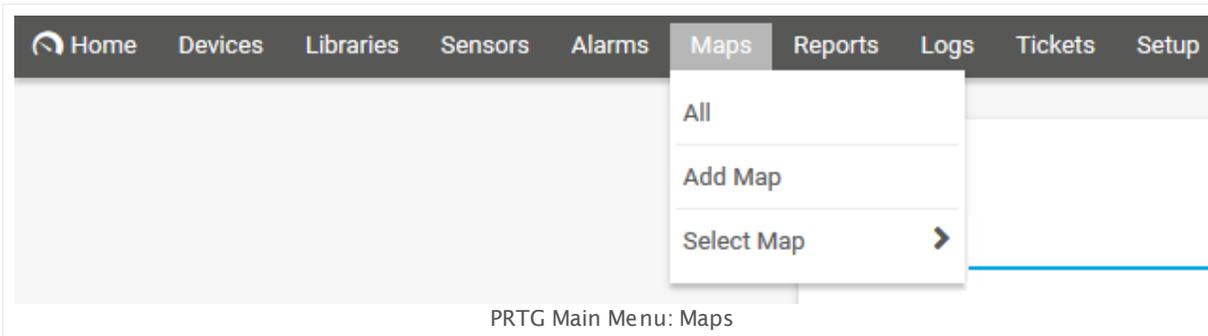

ALARMS

All	Open a list of all sensors that are currently in Down, Down (Partial), Down (Acknowledged), Warning, or Unusual status ¹⁹⁵ .
Show as Gauges	Open a page with the gauges of all sensors that are currently in Down, Down (Partial), Down (Acknowledged), Warning, or Unusual status. The size of the sensor gauges corresponds to their respective priority.
Errors Only	Open a list of all sensors that are currently in Down, Down (Partial), or Down (Acknowledged) status.
Warnings Only	Open a list of all sensors that are currently in Warning status.
Unusuals Only	Open a list of all sensors that are currently in Unusual status.

Maps

Click to open the **Maps** overview page where you can view or add custom views of your network status and monitoring data. **Hover** over **Maps** to show other menu items.

 For more information, see [Maps](#) ³²⁷⁶ section.

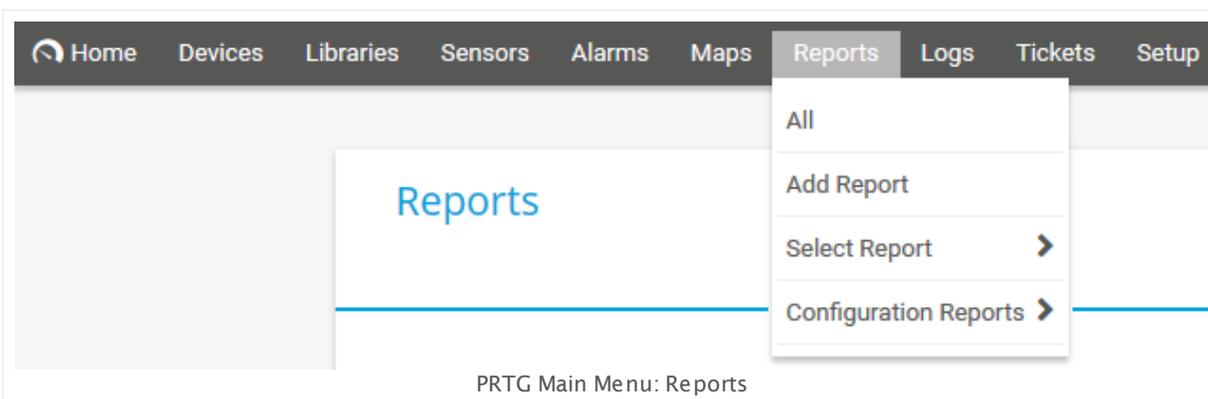

MAPS

- All** Open the **Maps** overview page where you can view or add custom views of your network's status and monitoring data.
- Add Map** Open an assistant to directly [add](#) a new map.
- Select Map >** Open an existing map. **Hover** over **Select Map** to show other menu items. Follow the menu path (it is specific to your setup) to select a map.

Reports

Click to open the **Reports** overview page where you can view or add reports of your monitoring data. **Hover** over **Reports** to show other menu items.

 For more information, see [Reports](#) section.

REPORTS

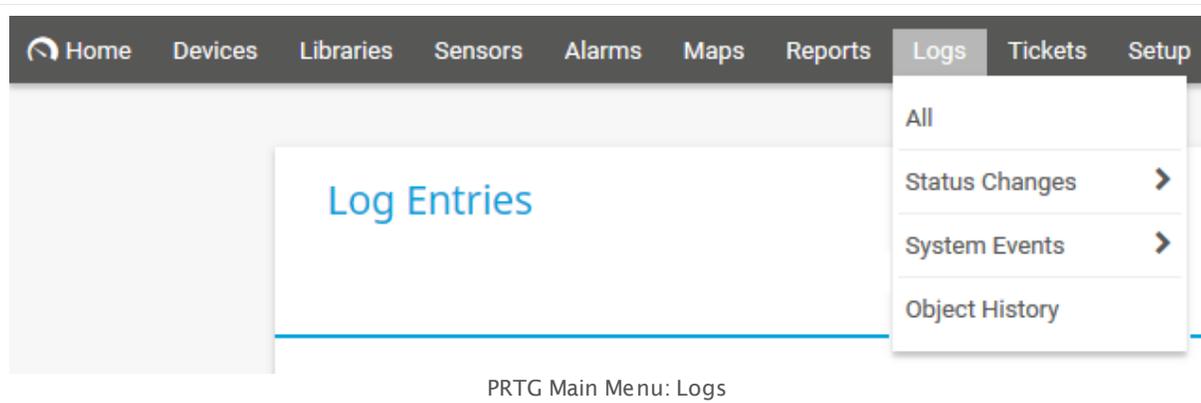

All	Open the Reports overview page where you can view or add reports of your monitoring data.
Add Report	Open an assistant to directly add a new report.
Select Report ›	Open an existing report. Point to Select Report to show other menu items. Follow the menu path (it is specific to your setup) to select a report.
Configuration Reports ›	Create reports for maps, reports, users & user groups, and system configuration to document changes to the configuration. Point to Reports Configuration Reports to see the available configuration reports .

Logs

Click to show log information for all objects in your configuration, newest first. In the [table list](#) appearing, you can filter the items by using the [respective options](#). **Hover** over **Logs** to show other menu items.

For more information, see [Logs](#) section.

Logs for monitoring objects (for example, sensors) are available as long as you define **Logfile Records** in the **Historic Data Purging** settings under [System Administration—Core & Probes](#).

LOGS

All	Open a table list with log information for all objects in your configuration, newest first.
-----	---

LOGS

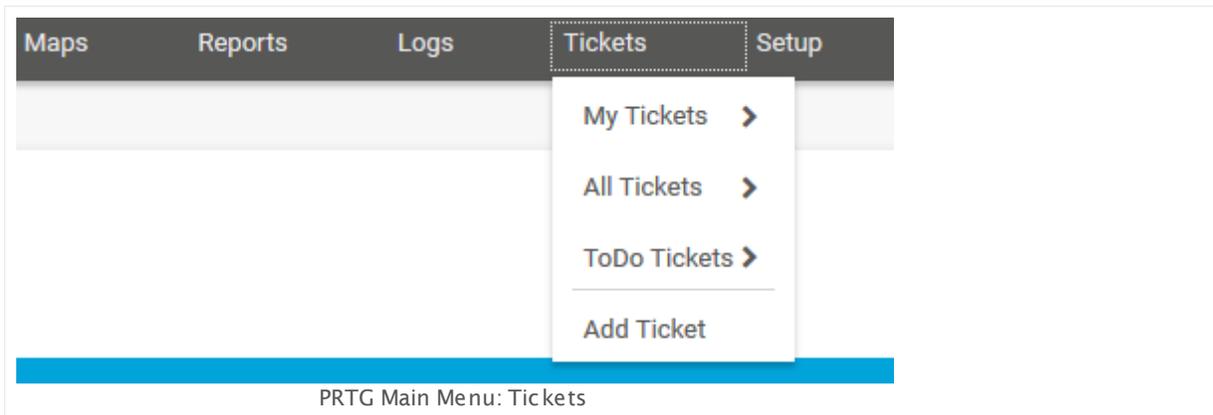

- Status Changes** › Open a list with log information for certain status changes only. **Hover** over **Status Changes** to show other menu items. Follow the menu path to view log entries with a special value in the **Status** field only. Select between **Up & Down** (shows entries with either **Up** or **Down** in the **Status** field), **Down, Warning, Unusual, Up, Paused/Resumed** (shows entries with either **Paused** or **Resumed** in the **Status** field), or **Acknowledged Alarms**.
- System Events** › Open a list with log information regarding certain system event types only. **Hover** over **System Events** to show other menu items. Select between the following event types: **Probe Related, Cluster Related, Auto-Discovery, Notifications, or Status Messages**.
- Object History** Open a list with log information about changes to the PRTG setup and deletions of subordinate system objects. The object history page has a tab-like interface. Using the tabs you can navigate through various sub-pages in order to view the changes to all related settings and deletions of objects. Select between the following tabs: **My Account, System Administration, Notifications, Schedules, User Accounts, User Groups, Reports, Libraries, or Maps**.
-  You can open a specific tab directly with the context button **History** in the [page header bar](#)¹⁸⁵ on the corresponding pages.

Tickets

Click to show all open tickets that are assigned to the current user. In the [table list](#)²³⁷ that appears, you can re-sort the items by clicking the column's header items, and you can filter the list with the inline filter directly above the table. **Hover** over **Tickets** to show other menu items.

Tickets show important system information or action steps to take for the administrator. For best experience with PRTG, check every ticket and conduct appropriate actions.

 For more information, see section [Tickets](#)²³⁰.

You have several options to display a list of tickets, which is filtered to your needs. You can also create a new ticket via the main menu.

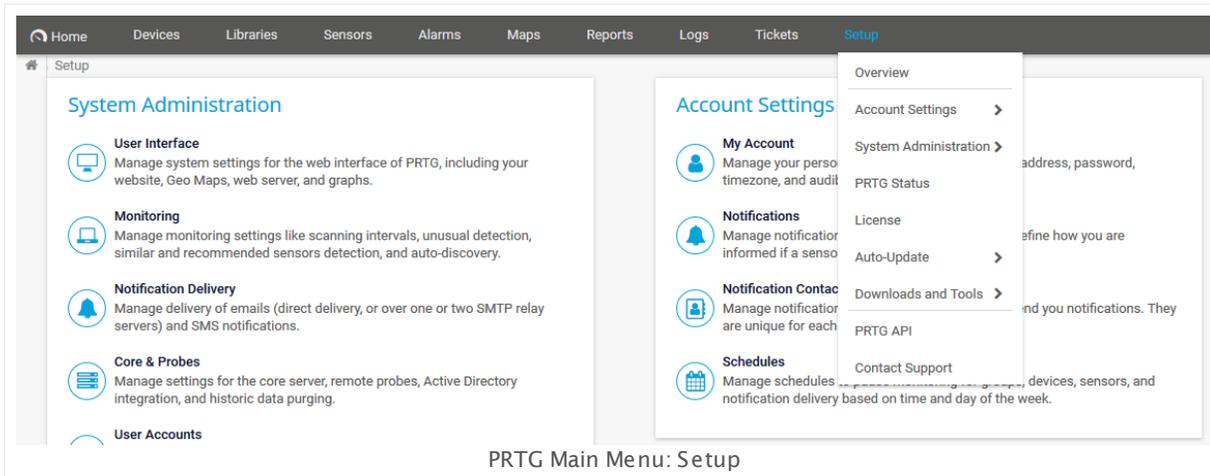

TICKETS	
My Tickets ›	Open a list of all open tickets that are assigned to the current user. Hover over My Tickets to show other menu items for filtering these tickets depending on their status.
All Tickets ›	Open a list of all open tickets of all PRTG users. Hover over All Tickets to show other menu items for filtering these tickets depending on their status.
ToDo Tickets ›	Open a list of open tickets from the type ToDo . Hover over ToDo Tickets to show other menu items for filtering these tickets depending on their status.
Add Ticket	Open the Add Ticket dialog. Provide the needed information and confirm by clicking OK to create a User Ticket .
	 For more information about available options, refer to section Tickets ²³⁰ .

Setup

Click to show the setup page. **Hover** over **Setup** to show other menu items.

 For more information, see [Setup](#) ³³⁰² section.

Part 6: Ajax Web Interface—Basic Procedures | 21 Main Menu Structure

PRTG Main Menu: Setup

SETUP

Overview

Open the [setup page](#) ³³⁰².

Account Settings >

Open the [My Account](#) ³³⁰⁴ settings. **Hover** over **Account Settings** to show and open the tabs of account settings directly. Choose from:

- [My Account](#) ³³⁰⁴
- [Notification Templates](#) ³³¹¹
- [Notification Contacts](#) ³³³⁴
- [Schedules](#) ³³³⁸

System Administration >

Open the [System Administration](#) ³³⁴³ settings. **Hover** over **System Administration** to show and open the tabs of the system administration settings directly. Choose from:

- [Manage Subscriptions](#) ⁷¹ (PRTG hosted by Paessler only)
- [User Interface](#) ³³⁴³
- [Monitoring](#) ³³⁵⁵
- [Notification Delivery](#) ³³⁶¹
- [Core & Probes](#) ³³⁶⁶
- [Cluster](#) ³³⁹⁴ (PRTG on premises only)
- [User Accounts](#) ³³⁷⁶
- [User Groups](#) ³³⁸³
- [Administrative Tools](#) ³³⁸⁸

SETUP

PRTG Status

Open the [PRTG Status—System Status](#)³³⁹⁶ page. When running a cluster, **hover** over **PRTG Status** to show other menu items. Choose from:

- [System Status](#)³³⁹⁶
- [Cluster Status](#)³⁴¹²

License

Open the [license activation status](#)³⁴¹⁴ page.

 This option is not available in PRTG hosted by Paessler.

Auto-Update ›

Open information about the [Software Auto-Update](#)³⁴⁰⁷ status of your PRTG installation. On this page, you can also download and install available updates. **Hover** over **Auto-Update** to show other menu items. Choose from:

- [Status](#)³⁴⁰⁷ to view the update status and to manually check for the latest update.
- [Settings](#)³⁴⁰⁹ to define your update settings.

 This option is not available in PRTG hosted by Paessler.

Downloads and Tools›

Open the [downloads page](#)³⁴²⁰ of PRTG for additional downloads and tools. Choose from:

- [Client App for Windows \(Enterprise Console\)](#)³⁴²⁰  (PRTG on premises only)
- [Client Apps for Mobile Devices](#)³⁴²⁰
- [Remote Probe Installer](#)³⁴²⁰
- [PRTG Tools](#)³⁴²⁰

PRTG API

Open the [Application Programming Interface \(API\) Definition](#)³⁶⁰⁶ for your installation.

Contact Support

Open the [Contact Paessler Support / Send Your Feedback to Paessler](#)³⁴²⁴ form.

Search (Reading-glass Symbol)

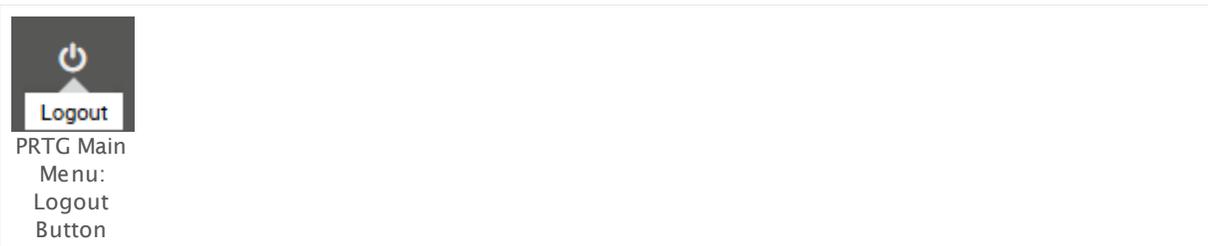

Search... 

PRTG Main Menu: Search Box

Click the **Search** box to find objects in your monitoring setup. Enter your search term, and start the search with the enter key. PRTG will perform a string search in your entire monitoring setup, including groups, devices, sensors, libraries, maps, reports, tickets, and object comments, as well as in the PRTG user manual. You will see all search results on a new page.

i You can only search for names that are actually displayed. For example, to search for a specific user, use their display name. The login name or email address of a user account will not be used.

Logout (Off Symbol)

Log out the current user and return to the [login screen](#)¹⁶⁸.

Context Menu

Additionally, there are [Context Menus](#)²⁴⁷ available for all objects. Right-click an object to open it.

Part 7

Ajax Web Interface—Device and Sensor Setup

7 Ajax Web Interface—Device and Sensor Setup

The PRTG web interface is the feature complete access to PRTG Network Monitor via the web. Use the PRTG web interface as default interface to setup your monitoring and bring it to perfection.

Configure devices and sensors, set up notifications, review monitoring results, create reports, visualize your monitoring on dashboards, and use many more PRTG features to complete your monitoring.

The PRTG web interface is based on Asynchronous Java Script and XML (AJAX) and designed to optimally adjust to your systems by its **responsive design**. It shows all object setting dialogs as pop-up layers, so you never lose the current context. The web interface adjusts to the size of your screen, so you always get information displayed in an optimized way.

While you are [logged in](#)¹⁶⁸, the PRTG web interface continuously refreshes the data on the screen via AJAX calls and you always are up to date on the current monitoring results. You can [set](#)³³⁷⁶ the refresh interval and method individually.

Thanks to **Single Page Application (SPA)** technology, your system will stay highly performant because only single page elements are refreshed when necessary.

The following sections introduce device and sensor setup in the Ajax Graphical User Interface (GUI).

Ajax Web Interface—Device and Sensor Setup—Topics

- [Auto-Discovery](#)²⁸²
- [Create Objects Manually](#)³⁰¹
- [Manage Device Tree](#)³²⁹

7.1 Auto-Discovery

The PRTG auto-discovery is a great way to automatically create a sophisticated and concise set of sensors for your complete network. It is mainly suitable for LAN discovery because it involves a lot of SNMP and WMI.

-  PRTG already runs a quick initial auto-discovery as soon as you finish the installation of PRTG to automatically show you several available devices in your network.

How Auto-Discovery Works

The PRTG auto-discovery process has three stages:

- **Step 1**
Scanning a network segment for devices using Ping (for groups only).
- **Step 2**
Assessing the device type for all devices discovered in step 1 (using SNMP, WMI, and other protocols).
- **Step 3a**
Creating sensor sets that match the discovered device types of step 2. This is done based on built-in device templates with recommended sensors for many device types.

Step 3b (optional)

Creating sensor sets using device templates that PRTG users created (see [Create Device Template](#)³²⁰³ section).

You can use the auto-discovery on group level for a range of IP addresses, or for individual devices that you have created manually. You can run the auto-discovery just once, on demand via the context menu, or scheduled every hour, day, or week. Running the auto-discovery daily or weekly on group level automatically creates new devices when they are connected to the network and adds according sensors.

-  PRTG will create a notifying [ticket](#)²³⁰¹ when at least one new device or sensor has been discovered. You will also receive a ticket in case of an error. By default, PRTG sends tickets as email as well. You can change this behavior in your user account settings, section [Ticket System](#)³³⁰⁹.

Restrictions

Please be aware of the following restrictions of the auto-discovery:

- PRTG cannot discover devices that cannot be pinged, because step 1 uses pings. If, for example, a firewall blocks echo requests, PRTG cannot discover a device behind it.
- Please define authentication settings for **Windows Systems, Linux (SSH/WBEM) Systems, VMware/XEN Servers, SNMP Devices, Database Management Systems, and Amazon CloudWatch** to fully benefit from the power of this feature. We recommend that you define these settings in the [Root group](#)³³¹¹.
- If a device has more than one IP address, it may show up more than once in the discovery results, even though PRTG tries to identify these situations.

- Auto-discovery on group level will not create new sensors on devices that already exist in PRTG but only on newly discovered devices. If you want to automatically add sensors to an existing device, please run the auto-discovery on this device.
 - Using frequent auto-discoveries of large network segments can lead to performance issues. Because of this we recommend that you only schedule regular auto-discoveries where necessary. For detailed information, see this Knowledge Base article: [Why can automatic auto-discoveries evoke performance issues?](#)
 - PRTG automatically adds suitable device icons to discovered devices. PRTG uses a device's MAC address for this purpose, which it determines via **ARP (Address Resolution Protocol)**. This only works via IPv4 and not with IPv6. Usually, ARP works only in the local network unless your router supports ARP and you configure it accordingly.
 - If you use [Multi-Edit](#)³¹⁹⁷ to automatically create sensors using specific device template(s), the auto-discovery is not automatically started. To manually start the auto-discovery, right-click the individual devices and select **Auto-Discovery | Run Auto-Discovery**.
- i** HTTP sensors indicate the access type to the target device with their names (**HTTP**, **HTTP (8080)**, and **HTTPS**). This approach helps to distinguish HTTP sensors if the auto-discovery adds more than one instance to a device.

Run Auto-Discovery Now

You can run an auto-discovery at any time for a group or a device. To do so, **right-click** the object to analyze and select **Run Auto-Discovery** from the [context menu](#)²⁴⁷. PRTG immediately starts searching for new objects that can be added to the device tree. If you use it for an auto-discovery group (not available on hosted probes), PRTG will add devices with according sensors, if found. If you use it for a device, PRTG will add new sensors, if found. You can always see in the corresponding [page header bar](#)¹⁸⁵ when PRTG ran the last auto-discovery on a selected group or device.

- i** The auto-discovery will also re-add devices or sensors you have manually deleted. If you do not want this, please create objects [manually](#)³⁰¹ only.

Creating an Auto-Discovery Group

There are several ways to start auto-discovery:

- Select **Devices | Add Auto-Discovery Group** from the [main menu bar](#)²⁶³. To start an automatic detection of devices and sensors in your network an assistant will appear, leading you through two steps.
- For faster setup, you can select **Add Auto-Discovery Group...** in the [context menu](#)²⁴⁷ of a probe or group to which you want to add the new group. This will skip step 1 and lead you directly to step 2.

 You cannot use this feature on the **Hosted Probe** of a PRTG hosted by Paessler instance. You can use this feature on [remote probes](#)³⁷⁰⁹.

- i** This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

Add Auto-Discovery Group to Group Local Probe
✕

Create a group of monitoring objects that you want to explore with the help of PRTG's auto-discovery. Specify your group settings, the sensor management, a discovery schedule, the IP range for discovery, and the credentials for Windows, Linux, VMware/Xen, and SNMP, if necessary.

Add Auto-Discovery Group Dialog

- **Step 1**
Choose a probe or group you want to add the new group to. Click **Continue**.
- **Step 2**
Add auto-discovery settings as described below.

Add Auto-Discovery Group Settings

GROUP NAME AND TAGS

- Group Name** Enter a meaningful name to identify the group. The name will be shown by default in the devices tree and in all alarms.
- Tags** Enter one or more tags. Confirm each tag by hitting the space, comma, or enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case sensitive. Tags are automatically [inherited](#) 139.

GROUP TYPE

- Sensor Management** Select the method for automatic network discovery. Choose between:
- **Automatic device identification (standard, recommended):** Detect mainly based on Ping, SNMP, and WMI. This option works fine for most installations.
 - **Automatic device identification (detailed, may create many sensors):** Detect in a more detailed way and create more sensors. This option uses all standard device templates for auto-discovery. It is suitable for small network segments and whenever you want to monitor the maximum number of sensors available.
 - **Automatic sensor creation using specific device template(s):** Manually define the device templates used for auto-discovery. From the list below, select one or more templates.

- Device Template(s)** This option is only visible if you enable using specific device templates above. Choose one or more templates by adding a check mark in front of the respective template name. You can also select and deselect all items by using the check box in the table head. PRTG will use the selected templates for auto-discovery on the current device. Choose from:
- **ADSL**
 - **Amazon Cloudwatch**
 - **Buffalo TeraStation NAS**
 - **Cisco ASA VPN**
 - **Cisco Device (Generic)**

- **Dell EqualLogic**
- **Dell MDI Disk**
- **DNS Server**
- **Environment Jacarta**
- **Environment Poseidon**
- **FTP Server**
- **Generic Device (PING only)**
- **Generic Device (SNMP-enabled)**
- **Generic Device (SNMP-enabled, Detailed)**
- **HTTP Web Server**
- **Hyper V Host Server**
- **IPMI enabled devices**
- **Juniper NS Device**
- **Linux/UNIX Device (SNMP or SSH enabled)**
- **Mail Server (Generic)**
- **Mail Server (MS Exchange)**
- **Microsoft SharePoint 2010**
- **NAS LenovoEMC**
- **NAS QNAP**
- **NAS Synology**
- **NetApp**
- **NTP Server**
- **Printer (HP)**
- **Printer Generic**
- **RDP Server**
- **RMON compatible device**
- **Server (Compaq/HP agents)**
- **Server (Dell)**
- **Server Cisco UCS**
- **Server IBM**
- **SonicWall**
- **SSL Security Check**
- **Switch (Cisco Catalyst)**

- **Switch (Cisco IOS Based)**
- **Switch (HP Procurve)**
- **UNIX/Linux Device**
- **UPS Health (APC)**
- **UPS Health (Generic)**
- **UPS Health (Liebert)**
- **VMware ESX / vCenter Server**
- **Webserver**
- **Windows (Detailed via WMI)**
- **Windows (via Remote PowerShell)**
- **Windows (via WMI)**
- **Windows IIS (via SNMP)**
- **XEN Hosts**
- **XEN Virtual Machines**

Once the auto-discovery is finished, PRTG will create a new [ticket](#) [230] and list the device templates that it used to create new sensors. The ticket will not show templates that were not applied.

Discovery Schedule

Define when PRTG will run the auto-discovery. Choose between:

- **Once:** Perform auto-discovery only once. PRTG will add new devices and sensors once. If you select this option, you have to [start the auto-discovery manually](#) [283], it will not run automatically.
 - **Hourly:** Perform auto-discovery for new devices and sensors every 60 minutes.
 - ⓘ Please use this option with caution! Frequently executed auto-discoveries might cause performance issues, especially when large network segments are scanned every hour.
 - **Daily:** Perform auto-discovery for new devices and sensors every 24 hours. The first auto-discovery will run immediately, all other discoveries will start at the time defined in the **Auto-Discovery Settings** section of the [System Administration—Monitoring](#) [336] settings.
 - **Weekly:** Perform auto-discovery for new devices and sensors every 7 days. The first auto-discovery will run immediately, all other discoveries will start at the time defined in the **Auto-Discovery Settings** section of the [System Administration—Monitoring](#) [336] settings.
- ⓘ The **Discovery Schedule** will be set to **Once** on all devices created by the scheduled auto-discovery for performance reasons.

IP Selection Method	<p>Define how you want to define the IP range for auto-discovery. Choose between:</p> <ul style="list-style-type: none"> ▪ Class C base IP with start/end (IPv4): Define an IPv4 class C address range. ▪ List of individual IPs and DNS names (IPv4): Enter a list of individual IPv4 addresses or DNS names. ▪ IP and subnet (IPv4): Enter an IPv4 address and subnet mask. ▪ IP with octet range (IPv4): Enter an IPv4 address range for every IP octet individually. With this, you can define very customizable IP ranges. ▪ List of individual IPs and DNS names (IPv6): Enter a list of individual IPv6 addresses or DNS names. ▪ Use computers from the active directory (maximum 1000 computers): Search in the active directory for computers to perform auto-discovery. <ul style="list-style-type: none"> ❗ Define your active directory domain in advance in the system administration. See System Administration—Core & Probes³³⁷². <p>❗ Only subnets with up to 65,536 IP addresses can be discovered! If you define a range with a higher number of addresses, discovery will stop before it is completed.</p>
IPv4 Base	<p>This field is only visible if you select Class C network detection above. Enter a class C network as IP base for the auto-discovery. Enter the first three octets of an IPv4 IP address, for example, 192.168.0</p>
IPv4 Range Start	<p>This field is only visible if you select Class C network detection above. Enter the IP octet of the class C network specified above from which PRTG will start the auto-discovery. This will complete the IP base above to an IPv4 address. For example, enter 1 to discover from 192.168.0.1.</p>
IPv4 Range End	<p>This field is only visible if you select Class C network detection above. Enter the IP octet of the class C network specified above at which PRTG will stop the auto-discovery. This will complete the IP base above to an IPv4 address. For example, enter 254 to discover up to 192.168.0.254.</p>
IPv4/DNS Name List IPv6/DNS Name List	<p>This field is only visible if you select the IP list option above. Enter a list of IP addresses or DNS names that the auto-discovery will scan. Enter each address in a separate line.</p>

IPv4 and Subnet (IPv4)	<p>This field is only visible if you select the IP and subnet option above. Enter an expression in the format address/subnet, for example, 192.168.3.0/255.255.255.0. You can also use the short form like 192.168.3.0/24 in this example. PRTG will scan the complete host range (without network and broadcast address) defined by the IP address and the subnet mask.</p>
IP with Octet Range	<p>This field is only visible if you select the octet range option above. Enter an expression in the format a1.a2.a3.a4, where a1, a2, a3, and a4 are each a number between 0-255, or a range with two numbers and a hyphen like 1-127. All permutations of all ranges are calculated. For example, 10.0.1-10.1-100 results in 1,000 addresses that PRTG will scan during auto-discovery.</p>
Organizational Unit	<p>This field is only visible if you select active directory above. Enter an organizational unit (OU) to restrict the active directory search to computers that are part of this OU. Just enter the name of the OU without any other term (so without "OU" in front). If you leave this field empty, there will not be any restriction.</p> <p> Make sure that the OU contains a host. If the OU is empty, you will receive an error message.</p> <p>If you have sub-OUs, consider the correct syntax in the format Y,OU=X: OUs that are part of another OU have to be listed together with their parent(s). Enter the sub-OU followed by ,OU= and the name of the parent OU.</p> <p>Examples:</p> <ul style="list-style-type: none"> ▪ Assuming that the organizational unit 'Y' is part of the OU named 'X'. Then the syntax would be Y,OU=X ▪ For three OUs 'X', 'Y' part of 'X', and 'Z' part of 'Y', the syntax would be Z,OU=Y,OU=X <p> The order is important, sub-OUs have to be listed left of their particular parents!</p>
Name Resolution	<p>Define how to monitor newly discovered devices. This affects only new devices. The setting for existing devices will remain unchanged. Depending on your selection the IP Address/DNS Name field of an added device^[402] shows the DNS name or IP address that PRTG uses to access the target device. Choose between:</p> <ul style="list-style-type: none"> ▪ Use DNS names (recommended): Monitor newly discovered devices via their DNS names (if available). ▪ Use IP addresses: Monitor newly discovered devices via their IP addresses. <p>We recommend that you use the default value.</p> <p> This setting does not affect how PRTG shows the devices in the device tree.</p>

Device Rescan

Define if you want to add devices that already exist in your PRTG installation also to the currently selected group. Choose between:

- **Skip auto-discovery for known devices/IPs (recommended):** Do not re-scan known devices or IP addresses, only add devices with new IPs or DNS names when auto-discovering. PRTG will not add devices that are already included elsewhere in your configuration, for example, in other groups.
- **Perform auto-discovery for known devices/IPs:** Re-scan devices with known IP addresses with every auto-discovery. This option will add devices that already exist in other groups also to this group and runs the auto-discovery on the newly added devices.
 - ❗ The auto-discovery will not run on devices that already exist in this group. If you want to run the auto-discovery for an existing device, you have to start the auto-discovery on this device.

We recommend that you use the default value.

- ❗ In certain cases, the IP resolution may not work and might result in a device not being added if it has the same local IP address as in another LAN.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

If you have not set credentials yet, set them now before starting the auto-discovery to fully exploit the power of this feature!

CREDENTIALS FOR WINDOWS SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Domain or Computer Name

Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, enter the computer name here. If you want to use a Windows domain user account (recommended), enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Do **not** leave this field empty.

CREDENTIALS FOR WINDOWS SYSTEMS

User	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	<p>Define the authentication method to use for login. Choose between:</p> <ul style="list-style-type: none"> ▪ Login via Password: Provide a password for login. Enter below. ▪ Login via Private Key: Provide a private key for authentication. <ul style="list-style-type: none">  PRTG can only handle keys in OpenSSH format that are not encrypted. You cannot use password-protected keys here. In the text field, paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, see Monitoring via SSH³⁵¹⁰.
Password	This field is only visible if you select password login above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Private Key	<p>This field is only visible if you select private key login above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges.</p> <p> If you do not insert a private key for the first time, but change the private key, you need to restart your PRTG core server service³³⁸⁸ in order for the private key change to take effect! For details, see Monitoring via SSH³⁵¹⁰.</p>
For WBEM Use Protocol	<p>Define the protocol to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> ▪ HTTP: Use an unencrypted connection for WBEM. ▪ HTTPS: Use an SSL-encrypted connection for WBEM.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

For WBEM Use Port	<p>Define the port to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> ▪ Set automatically (port 5988 or 5989): Use one of the standard ports, depending on whether you choose unencrypted or encrypted connection above. ▪ Set manually: Use a custom port. Define below.
WBEM Port	<p>This setting is only visible if you enable manual port selection above. Enter the WBEM port number.</p>
SSH Port	<p>Enter the port number to use for SSH connections.</p> <p> By default, PRTG uses this setting automatically for all SSH sensors⁴³⁴, unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Define the rights that you want to use to execute the command on the target system. Choose between:</p> <ul style="list-style-type: none"> ▪ Run the command as the user connecting (default): Use the rights of the user who establishes the SSH connection, as defined above. ▪ Run the command as another user using 'sudo' (with password): Use the rights of another user with a password required for sudo to run commands on the target device, for example, as root user. ▪ Run the command as another user using 'sudo' (without password): Use the rights of another user without a password required for sudo to run commands on the target device, for example, as root user. ▪ Run the command as another user using 'su': Use the rights of another user with su to run commands on the target device.
Target User	<p>This field is only visible if you choose sudo or su above. Enter a username to run the specified command as a user other than root. If you leave this field empty, you will run the command as root. Ensure you set the Linux password even if you use a public or private key for authentication. This is not necessary if the user is allowed to execute the command without a password.</p>
Password Target User	<p>This field is only visible if you choose to run the commands using su or sudo with password above. Enter the password for the specified target user.</p>

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

SSH Engine

Select the method you want to use to [access data with SSH sensors](#)³⁵¹⁰. We strongly recommend that you keep the default engine! For now, you still can use the legacy mode to ensure compatibility with your target systems. Choose between:

- **Default (recommended):** This is the default monitoring method for SSH sensors. It provides best performance and security.
- **Compatibility Mode (deprecated):** Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

 You can also individually select the SSH engine for each SSH sensor in the sensor settings.

CREDENTIALS FOR VMWARE/XENSERVER

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User

Enter a login name for access to VMware and Xen servers. Usually, you will use credentials with administrator privileges.

Password

Enter a password for access to VMware and Xen servers. Usually, you will use credentials with administrator privileges.

 Single Sign-On (SSO) passwords for vSphere do not support special characters. See the manual sections for VMware sensors for details.

VMware Protocol

Define the protocol used for the connection to VMware and XenServer. Choose between:

- **HTTPS (recommended):** Use an SSL-encrypted connection to VMware and XenServers.
- **HTTP:** Use an unencrypted connection to VMware and XenServers.

Session Pool

Define if you want to use session pooling for VMware sensors. Choose between:

CREDENTIALS FOR VMWARE/XENSERVER

- **Reuse session for for multiple scans (recommended):** Select this option to use session pooling. With session pooling, a VMware sensor uses the same session as created in advance to query data and needs not to log in and out for each sensor scan. We recommend that you choose this option because it reduces network load and log entries on the target device, resulting in better performance.
- **Create a new session for each scan:** If you select this option and disable session pooling, a VMware sensor has to log in and out for each sensor scan. We recommend that you use the session pooling option above for better performance.

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

The settings you define in this section apply to the following sensor types:

- [ADO SQL v2 Sensor](#)⁴⁶³
- [Microsoft SQL v2 Sensor](#)¹²⁶⁷
- [MySQL v2 Sensor](#)¹²⁸⁴
- [Oracle SQL v2 Sensor](#)¹⁴⁵⁷
- [PostgreSQL Sensor](#)¹⁵⁷⁴

Port for Databases

Define which ports PRTG will use for connections to the monitored databases. Choose between:

- **Set automatically (default port, recommended):** PRTG automatically determines the type of the monitored database and uses the corresponding default port to connect. See below for a list of default ports.
- **Define one custom port valid for all database sensors:** Choose this option if your database management systems do not use the default ports. Define the port for database connections manually below. If you choose this option, PRTG will use the custom port for all database sensors.

If you choose the automatic port selection, PRTG uses the following default ports:

- **Microsoft SQL:** 1433

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

- **MySQL:** 3306
- **Oracle SQL:** 1521
- **PostgreSQL:** 5432

Custom Database Port	<p>Enter the number of the port that PRTG will use for database connections. Please enter an integer value.</p> <p> All database sensors on this device will use this port to connect.</p>
Authentication Mode	<p>Select the authentication method for the connection to the SQL database. Choose between:</p> <ul style="list-style-type: none">▪ Windows authentication with impersonation: If you select this option, PRTG uses the Windows credentials as defined in the particular device settings^[407] for the database connection.  The user whose credentials are used needs to have permissions to log on to the system on which the PRTG probe with a database sensor runs. This is required for the impersonation.▪ SQL server authentication: Choose this option if you want to use explicit credentials for database connections.
User	<p>This field is only visible if you select SQL server authentication above. Enter the username for the database connection.</p>
Password	<p>This field is only visible if you select SQL server authentication above. Enter the password for the database connection.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than this value defines, the sensor cancels the request and triggers an error message. The maximum timeout value is 300 seconds (5 minutes).</p>

CREDENTIALS FOR AMAZON CLOUDWATCH

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

CREDENTIALS FOR AMAZON CLOUDWATCH

Access Key	Enter your Amazon Web Services (AWS) access key. Please see the corresponding Amazon CloudWatch sensor ^[435] documentation to learn more about the rights that are required for querying AWS CloudWatch metrics.
Secret Key	Enter your Amazon Web Services (AWS) secret key. Please see the corresponding Amazon CloudWatch sensor ^[435] documentation to learn more about the rights that are required for querying AWS CloudWatch metrics.

CREDENTIALS FOR SNMP DEVICES

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

SNMP Version	<p>Select the SNMP version for the device connection. Choose between:</p> <ul style="list-style-type: none"> ▪ v1: Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices. <ul style="list-style-type: none"> ❗ SNMP v1 does not support 64-bit counters. This may result in invalid data when monitoring traffic via SNMP. ▪ v2c (recommended): Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters. ▪ v3: Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption. <ul style="list-style-type: none"> ❗ When using SNMP v3 you can only monitor a limited number of sensors per second due to internal limitations. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds limits you to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased Interval Delay or Open Requests with the Probe Health Sensor^[159], distribute the load over multiple probes^[370]. SNMP v1 and v2 do not have this limitation.
Community String	This setting is only visible if you select SNMP version v1 or v2c above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.

CREDENTIALS FOR SNMP DEVICES

Authentication Type	<p>This setting is only visible if you select SNMP version v3 above. Choose between:</p> <ul style="list-style-type: none">▪ MD5: Use Message-Digest Algorithm 5 (MD5) for authentication.▪ SHA: Use Secure Hash Algorithm (SHA) for authentication. <p>The type you choose must match the authentication type of your device.</p> <p>i If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field Password empty. In this case, SNMP_SEC_LEVEL_NOAUTH is used and authentication deactivated entirely.</p>
User	<p>This setting is only visible if you select SNMP version v3 above. Enter a username for secure authentication. This value must match the username of your device.</p>
Password	<p>This setting is only visible if you select SNMP version v3 above. Enter a password for secure authentication. This value must match the password of your device.</p>
Encryption Type	<p>This setting is only visible if you select SNMP version v3 above. Select an encryption type. Choose between:</p> <ul style="list-style-type: none">▪ DES: Use Data Encryption Standard (DES) as encryption algorithm.▪ AES: Use Advanced Encryption Standard (AES) as encryption algorithm. <p>i AES 192 and AES 256 are not supported by Net-SNMP. They lack RFC specification.</p> <p>i The type that you choose must match the encryption type of your device.</p>
Data Encryption Key	<p>This setting is only visible if you select SNMP version v3 above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device.</p> <p>i If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.</p>

CREDENTIALS FOR SNMP DEVICES

Context Name	This setting is only visible if you select SNMP version v3 above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port for the SNMP communication. We recommend that you use the default value.
SNMP Timeout (Sec.)	Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered. The maximum timeout value is 300 seconds (5 minutes).

PROXY SETTINGS FOR HTTP SENSORS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

HTTP Proxy Settings	<p>The proxy settings determine how a sensor connects to a given URL. You can enter data for an HTTP proxy server that sensors will use when connecting via HTTP or HTTPS.</p> <ul style="list-style-type: none">  This setting affects monitoring only and determines the behavior of HTTP sensors. To change proxy settings for the core server, see System Administration—Core & Probes^[336].  The SSL Certificate Sensor^[263] and the SSL Security Check Sensor^[264] do not support HTTP proxies, but you can configure connections via SOCKS proxies in their sensor settings.
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	<p>If the proxy requires authentication, enter the username for the proxy login.</p> <ul style="list-style-type: none">  Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login.

PROXY SETTINGS FOR HTTP SENSORS

-  Only basic authentication is available! Please enter a string or leave the field empty.

ACCESS RIGHTS

User Group Access Define which user group(s) will have access to the object that you are editing. A table with user groups and rights is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists.
- **Read:** Users in this group can see the object and review its settings.
- **Write:** Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings.
- **Full:** Users in this group can see the object, as well as review and edit its settings as well as edit access rights.

You can create new user groups in the [System Administration—User Groups](#) settings.

Save your settings. If you leave the current page, all changes to the settings will be lost!

Auto-Discovery in Progress

While auto-discovery is running you may experience a lower system performance as usual, because PRTG works in the background to discover your network. Depending on the IP ranges defined (up to 65,536 addresses), the discovery may run up to several days before it is complete. You can review the status of the discovery process as follows:

- In the device tree, behind the group or device name, you will see a percentage value showing the progress of auto-discovery.
- During auto-discovery, the web interface will display a box in the lower-right corner that shows the number of active auto-discovery tasks.
- To stop a running auto-discovery, right-click the group or device, and select **Pause | For 5 minutes...** from the [context menu](#). PRTG will [pause](#) monitoring for 5 minutes and stop auto-discovery tasks.

Disable Initial Auto-Discovery

To disable the initial auto-discovery for a fresh PRTG installation, simply run the installer in command prompt and add `/NoInitialAutoDisco=1` as parameter. This may be useful for performance reasons or if you prefer to manually add devices and sensors to your installation.

7.2 Create Objects Manually

We recommend that you use the [auto-discovery](#)^[282] function to create a basic monitoring setup for your network. Afterwards, you can manually create devices that could not be discovered, or [arrange](#)^[319] detected devices in groups.

The procedure depends on the kind of object you want to add. Choose between:

- [Add a Group](#)^[302]
- [Add a Device](#)^[311]
- [Add a Sensor](#)^[325]

Add a Remote Probe

 See section [Multiple Probes and Remote Probes](#)^[370] for more information.

7.2.1 Add a Group

 This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

There are several ways to add a group manually:

- Select **Devices | Add Group** from the main menu. An assistant will appear, leading you through two steps.
- Hover over  and select **Add Group** from the menu. An assistant will appear, leading you through two steps.
- For faster setup, you can select **Add Group...** in the [context menu](#)^[247] of a probe or group to which you want to add the new group. This will skip step 1 and lead you directly to step 2.
- **Step 1**
Choose a probe or group you want to add the new group to. Click **Continue**.

Add Group to Group Local Probe ✕

Define Group Settings

Choose a name for the group and—if desired—the Windows, Linux, VMware, and SNMP credential settings. These will be inherited to all devices in this group.

Help: [Add a Group](#)

Add a New Group

In PRTG your network devices are organized into groups. You can define as many groups as you like and you can create multiple levels of sub-groups.

Add Group Assistant Step 2

- **Step 2**
Add group settings as described below.

Add Group Settings

GROUP NAME AND TAGS

Group Name	Enter a meaningful name to identify the group. The name will be shown by default in the devices tree and in all alarms.
Tags	Enter one or more tags. Confirm each tag by hitting the space, comma, or enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case sensitive. Tags are automatically inherited ¹³⁹ .

CREDENTIALS FOR WINDOWS SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) ¹³⁷ for more information.

Domain or Computer Name	Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, enter the computer name here. If you want to use a Windows domain user account (recommended), enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Do not leave this field empty.
User	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) ¹³⁷ for more information.

User	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
------	--

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

Login	<p>Define the authentication method to use for login. Choose between:</p> <ul style="list-style-type: none"> ▪ Login via Password: Provide a password for login. Enter below. ▪ Login via Private Key: Provide a private key for authentication. <ul style="list-style-type: none"> ❗ PRTG can only handle keys in OpenSSH format that are not encrypted. You cannot use password-protected keys here. In the text field, paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, see Monitoring via SSH³⁵¹⁰.
Password	<p>This field is only visible if you select password login above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.</p>
Private Key	<p>This field is only visible if you select private key login above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges.</p> <p>❗ If you do not insert a private key for the first time, but change the private key, you need to restart your PRTG core server service³³⁸⁸ in order for the private key change to take effect! For details, see Monitoring via SSH³⁵¹⁰.</p>
For WBEM Use Protocol	<p>Define the protocol to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> ▪ HTTP: Use an unencrypted connection for WBEM. ▪ HTTPS: Use an SSL-encrypted connection for WBEM.
For WBEM Use Port	<p>Define the port to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> ▪ Set automatically (port 5988 or 5989): Use one of the standard ports, depending on whether you choose unencrypted or encrypted connection above. ▪ Set manually: Use a custom port. Define below.
WBEM Port	<p>This setting is only visible if you enable manual port selection above. Enter the WBEM port number.</p>
SSH Port	<p>Enter the port number to use for SSH connections.</p> <p>❗ By default, PRTG uses this setting automatically for all SSH sensors⁴³⁴, unless you define a different port number in the sensor settings.</p>

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

SSH Rights Elevation	<p>Define the rights that you want to use to execute the command on the target system. Choose between:</p> <ul style="list-style-type: none">▪ Run the command as the user connecting (default): Use the rights of the user who establishes the SSH connection, as defined above.▪ Run the command as another user using 'sudo' (with password): Use the rights of another user with a password required for sudo to run commands on the target device, for example, as root user.▪ Run the command as another user using 'sudo' (without password): Use the rights of another user without a password required for sudo to run commands on the target device, for example, as root user.▪ Run the command as another user using 'su': Use the rights of another user with su to run commands on the target device.
Target User	<p>This field is only visible if you choose sudo or su above. Enter a username to run the specified command as a user other than root. If you leave this field empty, you will run the command as root. Ensure you set the Linux password even if you use a public or private key for authentication. This is not necessary if the user is allowed to execute the command without a password.</p>
Password Target User	<p>This field is only visible if you choose to run the commands using su or sudo with password above. Enter the password for the specified target user.</p>
SSH Engine	<p>Select the method you want to use to access data with SSH sensors. We strongly recommend that you keep the default engine! For now, you still can use the legacy mode to ensure compatibility with your target systems. Choose between:</p> <ul style="list-style-type: none">▪ Default (recommended): This is the default monitoring method for SSH sensors. It provides best performance and security.▪ Compatibility Mode (deprecated): Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine. <p> You can also individually select the SSH engine for each SSH sensor in the sensor settings.</p>

CREDENTIALS FOR VMWARE/XENSERVER

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User	Enter a login name for access to VMware and Xen servers. Usually, you will use credentials with administrator privileges.
Password	Enter a password for access to VMware and Xen servers. Usually, you will use credentials with administrator privileges.  Single Sign-On (SSO) passwords for vSphere do not support special characters. See the manual sections for VMware sensors for details.
VMware Protocol	Define the protocol used for the connection to VMware and XenServer. Choose between: <ul style="list-style-type: none">▪ HTTPS (recommended): Use an SSL-encrypted connection to VMware and XenServers.▪ HTTP: Use an unencrypted connection to VMware and XenServers.
Session Pool	Define if you want to use session pooling for VMware sensors. Choose between: <ul style="list-style-type: none">▪ Reuse session for for multiple scans (recommended): Select this option to use session pooling. With session pooling, a VMware sensor uses the same session as created in advance to query data and needs not to log in and out for each sensor scan. We recommend that you choose this option because it reduces network load and log entries on the target device, resulting in better performance.▪ Create a new session for each scan: If you select this option and disable session pooling, a VMware sensor has to log in and out for each sensor scan. We recommend that you use the session pooling option above for better performance.

CREDENTIALS FOR SNMP DEVICES

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

SNMP Version	Select the SNMP version for the device connection. Choose between:
--------------	--

CREDENTIALS FOR SNMP DEVICES

- **v1:** Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices.

i SNMP v1 does not support 64-bit counters. This may result in invalid data when monitoring traffic via SNMP.

- **v2c (recommended):** Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters.

- **v3:** Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption.

i When using SNMP v3 you can only monitor a limited number of sensors per second due to internal limitations. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds limits you to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased **Interval Delay** or **Open Requests** with the **Probe Health Sensor**, distribute the load over **multiple probes**. SNMP v1 and v2 do not have this limitation.

Community String	This setting is only visible if you select SNMP version v1 or v2c above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.
Authentication Type	<p>This setting is only visible if you select SNMP version v3 above. Choose between:</p> <ul style="list-style-type: none"> ▪ MD5: Use Message-Digest Algorithm 5 (MD5) for authentication. ▪ SHA: Use Secure Hash Algorithm (SHA) for authentication. <p>The type you choose must match the authentication type of your device.</p> <p>i If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field Password empty. In this case, SNMP_SEC_LEVEL_NOAUTH is used and authentication deactivated entirely.</p>
User	This setting is only visible if you select SNMP version v3 above. Enter a username for secure authentication. This value must match the username of your device.

CREDENTIALS FOR SNMP DEVICES

Password	This setting is only visible if you select SNMP version v3 above. Enter a password for secure authentication. This value must match the password of your device.
Encryption Type	<p>This setting is only visible if you select SNMP version v3 above. Select an encryption type. Choose between:</p> <ul style="list-style-type: none">▪ DES: Use Data Encryption Standard (DES) as encryption algorithm.▪ AES: Use Advanced Encryption Standard (AES) as encryption algorithm. <p> AES 192 and AES 256 are not supported by Net-SNMP. They lack RFC specification.</p> <p> The type that you choose must match the encryption type of your device.</p>
Data Encryption Key	<p>This setting is only visible if you select SNMP version v3 above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device.</p> <p> If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.</p>
Context Name	This setting is only visible if you select SNMP version v3 above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port for the SNMP communication. We recommend that you use the default value.
SNMP Timeout (Sec.)	Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered. The maximum timeout value is 300 seconds (5 minutes).

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object that you are editing. A table with user groups and rights is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists.
- **Read:** Users in this group can see the object and review its settings.
- **Write:** Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings.
- **Full:** Users in this group can see the object, as well as review and edit its settings as well as edit access rights.

You can create new user groups in the [System Administration—User Groups](#) settings.

Save your settings. If you leave the current page, all changes to the settings will be lost!

7.2.2 Add a Device

 This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

There are several ways to add a device manually:

- Select **Devices | Add Device** from the main menu. An assistant will appear, leading you through two steps.
- Hover over  and select **Add Device** from the menu. An assistant will appear, leading you through two steps.
- For faster setup, you can select **Add Device...** in the [context menu](#)²⁴⁷ of a group to which you want to add the new device. This will skip step 1 and lead you directly to step 2.
- **Step 1**
Choose a group you want to add the new device to. Click **OK**.

Add Device Assistant Step 2

- **Step 2**
 Add device settings as described below.

Add Device Settings

DEVICE NAME AND ADDRESS

Device Name	Enter a meaningful name to identify the device. The name will be shown by default in the device tree and in all alarms.
IP Version	Define which IP protocol PRTG will use to connect to this device. The setting is valid for all sensors created on this device. Choose between: <ul style="list-style-type: none">▪ Connect using IPv4: Use IP version 4 for all requests to this device.▪ Connect using IPv6: Use IP version 6 for all requests to this device.
IP Address/DNS Name	Enter the IP address (either v4 or v6, depending on your selection above) or DNS name for the device. Most sensors created on this device will inherit this setting and they will try to connect to this address for monitoring.  There are some sensor types that still have their own setting for IP address/DNS name. Those sensors will use their own settings.
Tags	Enter one or more tags; confirm each tag by hitting the space, comma, or enter key. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. Tags are automatically inherited ¹³⁹ .
Device Icon	Choose a device icon from the list. It will be shown in the device tree.

DEVICE TYPE

Sensor Management	Select which type of auto-discovery you would like to perform for this device. Choose between: <ul style="list-style-type: none">▪ Manual (no auto-discovery): Select this if you want to only create sensors manually.▪ Automatic device identification (standard, recommended): Use a small set of auto-discovery templates. This will scan your LAN and usually create a set of standard sensors on your device.
-------------------	--

DEVICE TYPE

- **Automatic device identification (detailed, may create many sensors):** Use an extended set of auto-discovery templates. This will scan your LAN and usually create many sensors on your device.
- **Automatic sensor creation using specific device template (s):** Use specific auto-discovery templates only. Please select templates below. This will scan your LAN and add sensors defined in the template.

Discovery Schedule

This option is only visible if you select one of the auto-discovery options above. Define when the auto-discovery will run. Choose between:

- **Once:** Perform auto-discovery only once. For existing devices, this will initiate a one-time sensor update for the current device. If you select this option, you have to [start the auto-discovery manually](#)^[283], it will not run automatically.
- **Hourly:** Perform auto-discovery for new sensors every hour.
- **Daily:** Perform auto-discovery for new sensors every day.
- **Weekly:** Perform auto-discovery for new sensors every week.

Device Template(s)

This option is only visible if using specific device templates (last option) is enabled above. Choose one or more templates by adding a check mark in front of the respective template name. You can also select and deselect all items by using the check box in the table head. These will be used for auto-discovery on the current device. Choose from:

- **ADSL**
- **Amazon Cloudwatch**
- **Buffalo TeraStation NAS**
- **Cisco ASA VPN**
- **Cisco Device (Generic)**
- **Dell EqualLogic**
- **Dell MDI Disk**
- **DNS Server**
- **Environment Jakarta**
- **Environment Poseidon**
- **FTP Server**
- **Generic Device (PING only)**

DEVICE TYPE

- **Generic Device (SNMP-enabled)**
- **Generic Device (SNMP-enabled, Detailed)**
- **HTTP Web Server**
- **Hyper V Host Server**
- **IPMI enabled devices**
- **Juniper NS Device**
- **Linux/UNIX Device (SNMP or SSH enabled)**
- **Mail Server (Generic)**
- **Mail Server (MS Exchange)**
- **Microsoft SharePoint 2010**
- **NAS LenovoEMC**

- **UPS Health (Generic)**

DEVICE TYPE

- **UPS Health (Liebert)**
- **VMware ESX / vCenter Server**
- **Webserver**
- **Windows (Detailed via WMI)**
- **Windows (via Remote PowerShell)**
- **Windows (via WMI)**
- **Windows IIS (via SNMP)**
- **XEN Hosts**
- **XEN Virtual Machines**

Once the auto-discovery is finished, PRTG will create a new [ticket](#) ^[230] and list the device templates that were actually used to create new sensors. Templates that were not applied will not be shown in the ticket.

CREDENTIALS FOR WINDOWS SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) ^[137] for more information.

Domain or Computer Name	Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, enter the computer name here. If you want to use a Windows domain user account (recommended), enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Do not leave this field empty.
User	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	<p>Define the authentication method to use for login. Choose between:</p> <ul style="list-style-type: none"> ▪ Login via Password: Provide a password for login. Enter below. ▪ Login via Private Key: Provide a private key for authentication. <ul style="list-style-type: none">  PRTG can only handle keys in OpenSSH format that are not encrypted. You cannot use password-protected keys here. In the text field, paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, see Monitoring via SSH³⁵¹⁰.
Password	This field is only visible if you select password login above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Private Key	<p>This field is only visible if you select private key login above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges.</p> <p> If you do not insert a private key for the first time, but change the private key, you need to restart your PRTG core server service³³⁸⁸ in order for the private key change to take effect! For details, see Monitoring via SSH³⁵¹⁰.</p>
For WBEM Use Protocol	<p>Define the protocol to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> ▪ HTTP: Use an unencrypted connection for WBEM. ▪ HTTPS: Use an SSL-encrypted connection for WBEM.
For WBEM Use Port	<p>Define the port to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> ▪ Set automatically (port 5988 or 5989): Use one of the standard ports, depending on whether you choose unencrypted or encrypted connection above. ▪ Set manually: Use a custom port. Define below.
WBEM Port	This setting is only visible if you enable manual port selection above. Enter the WBEM port number.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

SSH Port	<p>Enter the port number to use for SSH connections.</p> <p> By default, PRTG uses this setting automatically for all SSH sensors ⁴³⁴, unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Define the rights that you want to use to execute the command on the target system. Choose between:</p> <ul style="list-style-type: none">▪ Run the command as the user connecting (default): Use the rights of the user who establishes the SSH connection, as defined above.▪ Run the command as another user using 'sudo' (with password): Use the rights of another user with a password required for sudo to run commands on the target device, for example, as root user.▪ Run the command as another user using 'sudo' (without password): Use the rights of another user without a password required for sudo to run commands on the target device, for example, as root user.▪ Run the command as another user using 'su': Use the rights of another user with su to run commands on the target device.
Target User	<p>This field is only visible if you choose sudo or su above. Enter a username to run the specified command as a user other than root. If you leave this field empty, you will run the command as root. Ensure you set the Linux password even if you use a public or private key for authentication. This is not necessary if the user is allowed to execute the command without a password.</p>
Password Target User	<p>This field is only visible if you choose to run the commands using su or sudo with password above. Enter the password for the specified target user.</p>
SSH Engine	<p>Select the method you want to use to access data with SSH sensors ³⁵¹⁰. We strongly recommend that you keep the default engine! For now, you still can use the legacy mode to ensure compatibility with your target systems. Choose between:</p> <ul style="list-style-type: none">▪ Default (recommended): This is the default monitoring method for SSH sensors. It provides best performance and security.▪ Compatibility Mode (deprecated): Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

-  You can also individually select the SSH engine for each SSH sensor in the sensor settings.

CREDENTIALS FOR VMWARE/XENSERVER

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User	Enter a login name for access to VMware and Xen servers. Usually, you will use credentials with administrator privileges.
Password	Enter a password for access to VMware and Xen servers. Usually, you will use credentials with administrator privileges.  Single Sign-On (SSO) passwords for vSphere do not support special characters. See the manual sections for VMware sensors for details.
VMware Protocol	Define the protocol used for the connection to VMware and XenServer. Choose between: <ul style="list-style-type: none">▪ HTTPS (recommended): Use an SSL-encrypted connection to VMware and XenServers.▪ HTTP: Use an unencrypted connection to VMware and XenServers.
Session Pool	Define if you want to use session pooling for VMware sensors. Choose between: <ul style="list-style-type: none">▪ Reuse session for for multiple scans (recommended): Select this option to use session pooling. With session pooling, a VMware sensor uses the same session as created in advance to query data and needs not to log in and out for each sensor scan. We recommend that you choose this option because it reduces network load and log entries on the target device, resulting in better performance.▪ Create a new session for each scan: If you select this option and disable session pooling, a VMware sensor has to log in and out for each sensor scan. We recommend that you use the session pooling option above for better performance.

CREDENTIALS FOR SNMP DEVICES

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

SNMP Version	<p>Select the SNMP version for the device connection. Choose between:</p> <ul style="list-style-type: none"> ▪ v1: Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices. <ul style="list-style-type: none">  SNMP v1 does not support 64-bit counters. This may result in invalid data when monitoring traffic via SNMP. ▪ v2c (recommended): Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters. ▪ v3: Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption. <ul style="list-style-type: none">  When using SNMP v3 you can only monitor a limited number of sensors per second due to internal limitations. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds limits you to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased Interval Delay or Open Requests with the Probe Health Sensor¹⁵⁹⁰, distribute the load over multiple probes³⁷⁰⁹. SNMP v1 and v2 do not have this limitation.
Community String	<p>This setting is only visible if you select SNMP version v1 or v2c above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.</p>
Authentication Type	<p>This setting is only visible if you select SNMP version v3 above. Choose between:</p> <ul style="list-style-type: none"> ▪ MD5: Use Message-Digest Algorithm 5 (MD5) for authentication. ▪ SHA: Use Secure Hash Algorithm (SHA) for authentication. <p>The type you choose must match the authentication type of your device.</p> <ul style="list-style-type: none">  If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field Password empty. In this case, SNMP_SEC_LEVEL_NOAUTH is used and authentication deactivated entirely.

CREDENTIALS FOR SNMP DEVICES

User	This setting is only visible if you select SNMP version v3 above. Enter a username for secure authentication. This value must match the username of your device.
Password	This setting is only visible if you select SNMP version v3 above. Enter a password for secure authentication. This value must match the password of your device.
Encryption Type	<p>This setting is only visible if you select SNMP version v3 above. Select an encryption type. Choose between:</p> <ul style="list-style-type: none">▪ DES: Use Data Encryption Standard (DES) as encryption algorithm.▪ AES: Use Advanced Encryption Standard (AES) as encryption algorithm. <p> AES 192 and AES 256 are not supported by Net-SNMP. They lack RFC specification.</p> <p> The type that you choose must match the encryption type of your device.</p>
Data Encryption Key	<p>This setting is only visible if you select SNMP version v3 above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device.</p> <p> If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.</p>
Context Name	This setting is only visible if you select SNMP version v3 above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port for the SNMP communication. We recommend that you use the default value.
SNMP Timeout (Sec.)	Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered. The maximum timeout value is 300 seconds (5 minutes).

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) ¹³⁷ for more information.

The settings you define in this section apply to the following sensor types:

- [ADO SQL v2 Sensor](#) ⁴⁶³
- [Microsoft SQL v2 Sensor](#) ¹²⁶⁷
- [MySQL v2 Sensor](#) ¹²⁸⁴
- [Oracle SQL v2 Sensor](#) ¹⁴⁵⁷
- [PostgreSQL Sensor](#) ¹⁵⁷⁴

Port for Databases Define which ports PRTG will use for connections to the monitored databases. Choose between:

- **Set automatically (default port, recommended):** PRTG automatically determines the type of the monitored database and uses the corresponding default port to connect. See below for a list of default ports.
- **Define one custom port valid for all database sensors:** Choose this option if your database management systems do not use the default ports. Define the port for database connections manually below. If you choose this option, PRTG will use the custom port for all database sensors.

If you choose the automatic port selection, PRTG uses the following default ports:

- **Microsoft SQL:** 1433
- **MySQL:** 3306
- **Oracle SQL:** 1521
- **PostgreSQL:** 5432

Custom Database Port Enter the number of the port that PRTG will use for database connections. Please enter an integer value.

 All database sensors on this device will use this port to connect.

Authentication Mode Select the authentication method for the connection to the SQL database. Choose between:

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

- **Windows authentication with impersonation:** If you select this option, PRTG uses the Windows credentials as defined in the particular [device settings](#)^[407] for the database connection.
 - ❗ The user whose credentials are used needs to have permissions to log on to the system on which the PRTG probe with a database sensor runs. This is required for the impersonation.
- **SQL server authentication:** Choose this option if you want to use explicit credentials for database connections.

User	This field is only visible if you select SQL server authentication above. Enter the username for the database connection.
Password	This field is only visible if you select SQL server authentication above. Enter the password for the database connection.
Timeout (Sec.)	Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than this value defines, the sensor cancels the request and triggers an error message. The maximum timeout value is 300 seconds (5 minutes).

CREDENTIALS FOR AMAZON CLOUDWATCH

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Access Key	Enter your Amazon Web Services (AWS) access key. Please see the corresponding Amazon CloudWatch sensor ^[435] documentation to learn more about the rights that are required for querying AWS CloudWatch metrics.
Secret Key	Enter your Amazon Web Services (AWS) secret key. Please see the corresponding Amazon CloudWatch sensor ^[435] documentation to learn more about the rights that are required for querying AWS CloudWatch metrics.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Save your settings. If you leave the current page, all changes to the settings will be lost!

7.2.3 Add a Sensor

 This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

There are several ways to add a sensor manually:

- Select **Sensors | Add Sensor** from the main menu. An assistant will appear, leading you through two steps.
- Hover over  and select **Add Sensor** from the menu. An assistant will appear, leading you through two steps.
- For faster setup, you can select **Add Sensor...** in the [context menu](#)²⁴⁷ of a device to which you want to add the new sensor. This will skip step 1 and lead you directly to [step 2](#)³²⁷.
- You can also click the **Add Sensor** button at the end of a device's sensor list on the device tree screen or above the Geo Map on the right.

Step 1 - Select Device

Add Sensor

< Cancel sensor creation

Choose a Device to Add the New Sensor to

Create a new device

Add sensor to an existing device

Select a Group from the List

Select a device from the list. Tip: You can create new sensors much faster by right clicking a device and choosing Add Sensor from the context menu. Continue >

Search...

- Root
 - Local Probe
 - Probe Device
 - Network Discovery
 - Network Infrastructure
 - Internet
 - Gateway
 - DHCP
 - Exchange
 - ADS
 - DNS/ADS
 - DNS
 - Windows
 - Clients
 - nue-ph

This field is required.

Add Sensor Dialog

- Select **Add sensor to an existing device** (default setting).
- Choose the device you want to add the new sensor to.
- Click **Continue**.

The add sensor assistant appears.

Step 2 - Choose Sensor Type

The add sensor assistant helps you choose the correct sensor (see screenshot above).

- Narrow down the sensor types:
 - Choose appropriate criteria to filter the shown sensor types. **A**
 - Enter (parts of) the name into the search box. **B**
 - Go through the detailed list of sensors matching the selected device. **C**
 - If you cannot find a suitable sensor, search for custom sensors in our PRTG Script World. Just click **Looking For More Sensor Types?** below the list of sensor types. See section [List of Available Sensor Types—Script World Sensors](#) ^[450].
- Choose which sensor best monitors the parameters you require.
- Click the sensor box to select this sensor.

The sensor settings dialog opens.

- Enter suitable sensor settings.

-  PRTG suggests sensor types to create on the selected device. This recommendation is automatically calculated based on the current user's sensor usage and shows the ten most commonly used sensor types (if enough sensor types are already in use).
-  If you are unsure which sensor type will provide the information you require, then we recommend that you use the filter categories to progressively narrow down your choices.

You can either:

- Select the type of parameter you want to monitor via **Monitor What?**. 
 - Specify the type of target system you want to monitor and see what sensors are available for this type of hardware in **Target System Type?**. 
 - Choose the technology that you want to use for monitoring (for example SNMP or WMI) in **Technology Used?**. 
-  Please also consider whether a sensor's performance impact is high or low by checking the bar in the lower left corner of the sensor box. For further information, see this Knowledge Base article: [How to Speed Up PRTG](#) (especially section 4 - Sensor Type and Monitoring Considerations)
- Confirm by clicking **Create**.

PRTG will now create the sensor. The device tree opens.

-  For more information about a sensor type, see the manual section of the respective sensor (directly accessible via the question mark (?) symbol in the top-right corner). You can also go to the [List of Available Sensor Types](#) ⁴²⁹ section to find a comprehensive overview of sensor types.

More

Knowledge Base: How can I change the number of entries in most used sensor types?

- <https://kb.paessler.com/en/topic/59788>

Knowledge Base: How to Speed Up PRTG (especially section 4 - Sensor Type and Monitoring Considerations)

- <https://kb.paessler.com/en/topic/2733>

7.3 Manage Device Tree

While viewing the device tree (or parts of it), click the **Management** tab to enter a different tree view that shows your devices and sensors in a less colorful way. While in this view, you can move monitoring objects using **drag&drop** in your browser window. You can also view and edit object settings by selecting the object. Changes take effect immediately. When done, leave the **Management** tab.

To arrange objects in the tree, you have the following options:

Drag&Drop a Sensor

You can either move a sensor within the same device, or clone a sensor to another device.

- Within the same device, drag any sensor and drop it to the place where you want to have it. A shadow will show the future position. When dropping, the sensor will be **moved** to this position and existing sensors will be lined up after it. This is a very easy way to reposition your sensors.
- Drag any sensor from one device and drop it on another to **clone** a sensor. This will create the same sensor type, with the same settings, on the new device, while maintaining the original sensor. A shade will show the future position.
 - ❶ Cloned sensors are put to **Pause** status initially to give you the chance to change any settings before monitoring begins. Please check the [settings](#)^[217] and [resume](#)^[245] monitoring.
- ❶ You cannot clone **fixed** objects, such as the root group, a probe device, or PRTG system internal sensors.
- ❶ To **clone** entire groups or devices, please use the [Clone Object](#)^[3193] functionality accessible via the objects' [Context Menu](#)^[247].

Drag&Drop a Group or Device

You can change a group's or device's position by using drag&drop.

- Within the same probe or group, drag any group or device and move it up or down in the device tree. A small red arrow will appear, showing the future position. When dropping, the group or device will be moved to this position and existing probes, groups, and devices will be lined up underneath. This is a very easy way to reposition your groups or devices.
- Drag any group or device from one probe or group and drop it on another probe or group. A small red arrow will appear, showing the future position. When dropping, the group or device will be moved to the new probe or group. Existing groups and devices will be lined up underneath. This is a very easy way to change the probe a group or device is part of, or to add groups or devices to other groups.
- ❶ You cannot move the **Local Probe**, **Hosted Probe** and **Remote Probes**.

Multi-Edit Object Properties

You can use Multi-Edit for object settings:

- Hold down the **Ctrl** key and select multiple groups, devices, or sensors (one of a kind).
- In the appearing dialog, select the settings you want to edit, change the according values, and click **Save**. The changes will be applied to all selected objects.

The dialog is the same as described in the [Multi-Edit](#)³¹⁹⁹ (Edit Settings) section.

Related Topics

For other ways to arrange objects, see

- [Arrange Objects](#)³¹⁹¹
- [Create Device Template](#)³²⁰³
- [Clone Object](#)³¹⁹³

7.4 Root Group Settings

On the **Root** group's overview page, click the **Settings** tab to change settings.

The Root Group is Special

The **Root** group is the highest instance in the object hierarchy of your PRTG setup and parent to all other objects. Therefore, all objects inherit settings from the **Root** group. If you define important settings on this high level, work will be easier later on. So, before you create your own sensors, it is a good idea to review the **Root** group's settings to ensure they suit your network. There are already reasonable presets made with installation.

i If necessary, you can override every setting for every single child object later. To do so, simply disable the respective **Inherit** option of an object.

Root Group Settings

The following settings are available in the **Settings** tab. As you may not need all of these, just regard the settings you really need and ignore the others. All settings you define here can easily be inherited to all other objects in your setup.

i This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

BASIC GROUP SETTINGS

Group Name	Enter a meaningful name to identify the group. The name will be shown by default in the devices tree and in all alarms.
Status	Define if monitoring for this group is started or paused. Choose between: <ul style="list-style-type: none">▪ Started: Monitor this group.▪ Paused: Pause monitoring for this group. All sensors on all devices in this group will be paused until this setting is changed again.

LOCATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Location (for Geo Maps)

When you want to use [Geo Maps](#)^[3211], enter a location in the first line. Geographical maps will display objects (devices, groups) then with a flag, showing the current status using a color code similar to the [sensor status icons](#)^[195] (green - yellow - orange - red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, PRTG will parse latitude and longitude automatically, for example: **49.452778 11.077778** or **enter 49.452778 any 11.077778 text**

A minus sign (-) in the first line will hide an object from geo maps. In this case you can enter location information in line two and following.

You can define a specific label for each location: enter a string denoting the label in the first line and provide geo coordinates in the second line. This geo marker will show then the object with the label in the PRTG geo map.

 The preview map will always have a road map layout regardless of the map layout you set in [User Interface](#)^[3346].

CREDENTIALS FOR WINDOWS SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Domain or Computer Name

Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, enter the computer name here. If you want to use a Windows domain user account (recommended), enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Do **not** leave this field empty.

User

Enter the username for Windows access. Usually, you will use credentials with administrator privileges.

Password

Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	<p>Define the authentication method to use for login. Choose between:</p> <ul style="list-style-type: none"> ▪ Login via Password: Provide a password for login. Enter below. ▪ Login via Private Key: Provide a private key for authentication. <ul style="list-style-type: none">  PRTG can only handle keys in OpenSSH format that are not encrypted. You cannot use password-protected keys here. In the text field, paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, see Monitoring via SSH³⁵¹⁰.
Password	This field is only visible if you select password login above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Private Key	<p>This field is only visible if you select private key login above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges.</p> <p> If you do not insert a private key for the first time, but change the private key, you need to restart your PRTG core server service³³⁸⁸ in order for the private key change to take effect! For details, see Monitoring via SSH³⁵¹⁰.</p>
For WBEM Use Protocol	<p>Define the protocol to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> ▪ HTTP: Use an unencrypted connection for WBEM. ▪ HTTPS: Use an SSL-encrypted connection for WBEM.
For WBEM Use Port	<p>Define the port to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> ▪ Set automatically (port 5988 or 5989): Use one of the standard ports, depending on whether you choose unencrypted or encrypted connection above. ▪ Set manually: Use a custom port. Define below.
WBEM Port	This setting is only visible if you enable manual port selection above. Enter the WBEM port number.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

SSH Port	<p>Enter the port number to use for SSH connections.</p> <p> By default, PRTG uses this setting automatically for all SSH sensors ⁴³⁴, unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Define the rights that you want to use to execute the command on the target system. Choose between:</p> <ul style="list-style-type: none">▪ Run the command as the user connecting (default): Use the rights of the user who establishes the SSH connection, as defined above.▪ Run the command as another user using 'sudo' (with password): Use the rights of another user with a password required for sudo to run commands on the target device, for example, as root user.▪ Run the command as another user using 'sudo' (without password): Use the rights of another user without a password required for sudo to run commands on the target device, for example, as root user.▪ Run the command as another user using 'su': Use the rights of another user with su to run commands on the target device.
Target User	<p>This field is only visible if you choose sudo or su above. Enter a username to run the specified command as a user other than root. If you leave this field empty, you will run the command as root. Ensure you set the Linux password even if you use a public or private key for authentication. This is not necessary if the user is allowed to execute the command without a password.</p>
Password Target User	<p>This field is only visible if you choose to run the commands using su or sudo with password above. Enter the password for the specified target user.</p>
SSH Engine	<p>Select the method you want to use to access data with SSH sensors ³⁵¹⁰. We strongly recommend that you keep the default engine! For now, you still can use the legacy mode to ensure compatibility with your target systems. Choose between:</p> <ul style="list-style-type: none">▪ Default (recommended): This is the default monitoring method for SSH sensors. It provides best performance and security.▪ Compatibility Mode (deprecated): Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

-  You can also individually select the SSH engine for each SSH sensor in the sensor settings.

CREDENTIALS FOR VMWARE/XENSERVER

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User	Enter a login name for access to VMware and Xen servers. Usually, you will use credentials with administrator privileges.
Password	Enter a password for access to VMware and Xen servers. Usually, you will use credentials with administrator privileges.  Single Sign-On (SSO) passwords for vSphere do not support special characters. See the manual sections for VMware sensors for details.
VMware Protocol	Define the protocol used for the connection to VMware and XenServer. Choose between: <ul style="list-style-type: none">▪ HTTPS (recommended): Use an SSL-encrypted connection to VMware and XenServers.▪ HTTP: Use an unencrypted connection to VMware and XenServers.
Session Pool	Define if you want to use session pooling for VMware sensors. Choose between: <ul style="list-style-type: none">▪ Reuse session for for multiple scans (recommended): Select this option to use session pooling. With session pooling, a VMware sensor uses the same session as created in advance to query data and needs not to log in and out for each sensor scan. We recommend that you choose this option because it reduces network load and log entries on the target device, resulting in better performance.▪ Create a new session for each scan: If you select this option and disable session pooling, a VMware sensor has to log in and out for each sensor scan. We recommend that you use the session pooling option above for better performance.

CREDENTIALS FOR SNMP DEVICES

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

SNMP Version	<p>Select the SNMP version for the device connection. Choose between:</p> <ul style="list-style-type: none"> ▪ v1: Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices. <ul style="list-style-type: none">  SNMP v1 does not support 64-bit counters. This may result in invalid data when monitoring traffic via SNMP. ▪ v2c (recommended): Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters. ▪ v3: Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption. <ul style="list-style-type: none">  When using SNMP v3 you can only monitor a limited number of sensors per second due to internal limitations. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds limits you to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased Interval Delay or Open Requests with the Probe Health Sensor¹⁵⁹⁰, distribute the load over multiple probes³⁷⁰⁹. SNMP v1 and v2 do not have this limitation.
Community String	<p>This setting is only visible if you select SNMP version v1 or v2c above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.</p>
Authentication Type	<p>This setting is only visible if you select SNMP version v3 above. Choose between:</p> <ul style="list-style-type: none"> ▪ MD5: Use Message-Digest Algorithm 5 (MD5) for authentication. ▪ SHA: Use Secure Hash Algorithm (SHA) for authentication. <p>The type you choose must match the authentication type of your device.</p> <p> If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field Password empty. In this case, SNMP_SEC_LEVEL_NOAUTH is used and authentication deactivated entirely.</p>

CREDENTIALS FOR SNMP DEVICES

User	This setting is only visible if you select SNMP version v3 above. Enter a username for secure authentication. This value must match the username of your device.
Password	This setting is only visible if you select SNMP version v3 above. Enter a password for secure authentication. This value must match the password of your device.
Encryption Type	<p>This setting is only visible if you select SNMP version v3 above. Select an encryption type. Choose between:</p> <ul style="list-style-type: none">▪ DES: Use Data Encryption Standard (DES) as encryption algorithm.▪ AES: Use Advanced Encryption Standard (AES) as encryption algorithm. <p> AES 192 and AES 256 are not supported by Net-SNMP. They lack RFC specification.</p> <p> The type that you choose must match the encryption type of your device.</p>
Data Encryption Key	<p>This setting is only visible if you select SNMP version v3 above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device.</p> <p> If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.</p>
Context Name	This setting is only visible if you select SNMP version v3 above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port for the SNMP communication. We recommend that you use the default value.
SNMP Timeout (Sec.)	Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered. The maximum timeout value is 300 seconds (5 minutes).

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)  for more information.

The settings you define in this section apply to the following sensor types:

- [ADO SQL v2 Sensor](#) 
- [Microsoft SQL v2 Sensor](#) 
- [MySQL v2 Sensor](#) 
- [Oracle SQL v2 Sensor](#) 
- [PostgreSQL Sensor](#) 

Port for Databases Define which ports PRTG will use for connections to the monitored databases. Choose between:

- **Set automatically (default port, recommended):** PRTG automatically determines the type of the monitored database and uses the corresponding default port to connect. See below for a list of default ports.
- **Define one custom port valid for all database sensors:** Choose this option if your database management systems do not use the default ports. Define the port for database connections manually below. If you choose this option, PRTG will use the custom port for all database sensors.

If you choose the automatic port selection, PRTG uses the following default ports:

- **Microsoft SQL:** 1433
- **MySQL:** 3306
- **Oracle SQL:** 1521
- **PostgreSQL:** 5432

Custom Database Port Enter the number of the port that PRTG will use for database connections. Please enter an integer value.

 All database sensors on this device will use this port to connect.

Authentication Mode Select the authentication method for the connection to the SQL database. Choose between:

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

- **Windows authentication with impersonation:** If you select this option, PRTG uses the Windows credentials as defined in the particular [device settings](#)^[407] for the database connection.
 - ❗ The user whose credentials are used needs to have permissions to log on to the system on which the PRTG probe with a database sensor runs. This is required for the impersonation.
- **SQL server authentication:** Choose this option if you want to use explicit credentials for database connections.

User	This field is only visible if you select SQL server authentication above. Enter the username for the database connection.
Password	This field is only visible if you select SQL server authentication above. Enter the password for the database connection.
Timeout (Sec.)	Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than this value defines, the sensor cancels the request and triggers an error message. The maximum timeout value is 300 seconds (5 minutes).

CREDENTIALS FOR AMAZON CLOUDWATCH

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Access Key	Enter your Amazon Web Services (AWS) access key. Please see the corresponding Amazon CloudWatch sensor ^[435] documentation to learn more about the rights that are required for querying AWS CloudWatch metrics.
Secret Key	Enter your Amazon Web Services (AWS) secret key. Please see the corresponding Amazon CloudWatch sensor ^[435] documentation to learn more about the rights that are required for querying AWS CloudWatch metrics.

WINDOWS COMPATIBILITY OPTIONS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

When experiencing problems while monitoring via Windows sensors, you can set some compatibility options for troubleshooting.

Preferred Data Source	<p>Define the method Windows sensors will use to query data. This setting is valid only for hybrid sensors offering performance counter and Windows Management Instrumentation (WMI) technology. The setting will be ignored for all other sensors! Choose between:</p> <ul style="list-style-type: none"> ▪ Performance Counters and fallback to WMI: Try to query data via performance counters. If this is not possible, establish a connection via WMI. ▪ Performance Counters only: Query data via performance counters only. If this is not possible, a sensor will return no data. ▪ WMI only (recommended): Query data via WMI only. If this is not possible, a sensor will return no data. In current PRTG versions, this is our recommendation to achieve best performance and stability.
Timeout Method	<p>Specify the time the sensor will wait for the return of its WMI query before aborting it with an error message. Choose between:</p> <ul style="list-style-type: none"> ▪ Use 1.5x scanning interval (recommended): Use a default of one and a half times the scanning interval set for the sensor (see below in this settings). ▪ Set manually: Enter a timeout value manually. <p>We recommend that you use the default value. Only if you experience ongoing timeout errors, try increasing the timeout value.</p>
Timeout Value (Sec.)	<p>This field is only visible if the manual timeout method is selected above. Enter the time the sensor will wait for the return of its WMI query before aborting with an error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).</p>

SNMP COMPATIBILITY OPTIONS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

SNMP COMPATIBILITY OPTIONS

When experiencing problems while monitoring via Simple Network Management Protocol (SNMP) sensors, you can set some compatibility options for troubleshooting.

SNMP Delay (ms)	Add a time in milliseconds that will be waited between two SNMP requests. This can help increase device compatibility. Please enter an integer value. We recommend that you use the default value. If you experience SNMP connection failures, please increase it. You can define a delay between 0 and 100 , higher delays are not supported and will be discarded.
Failed Requests	<p>Define if an SNMP sensor will try again after a request fails.</p> <ul style="list-style-type: none">▪ Retry (recommended): Try again if an SNMP request fails. This can help prevent false error messages due to temporary timeout failures.▪ Do not retry: Do not retry if an SNMP request fails. With this setting enabled an SNMP sensor will be set to error status earlier.
Overflow Values	<p>Define how PRTG will handle overflow values. Some devices do not handle internal buffer overflows correctly. This can cause false peaks.</p> <ul style="list-style-type: none">▪ Ignore overflow values: Ignore overflow values and do not include them in the monitoring data.▪ Handle overflow values as valid results: Regard all overflow values as regular data and include them in the monitoring data. <p>We recommend that you use the default value.</p> <p> If you experience problems because of strange peaks in your data graphs, change this option. Peaks might indicate that the monitored device resets counters without an overflow. PRTG interprets such a behavior as overflow that results in data peaks. Choose the option Ignore overflow values in this case. For more details, see this Knowledge Base article: What is the Overflow Values setting in the SNMP Compatibility Options?</p>
Zero Values	<p>Define how PRTG will handle zero values. Some devices send incorrect zero values. This can cause false peaks.</p> <ul style="list-style-type: none">▪ Ignore zero values for delta sensors (recommended): Ignore zero values and do not include them in the monitoring data.▪ Handle zero values as valid results for delta sensors: Regard all zero values as regular data and include them in the monitoring data. <p>We recommend that you use the default value. If you experience problems, change this option.</p>

SNMP COMPATIBILITY OPTIONS

- 32-bit/64-bit Counters** Define which kind of traffic counters PRTG will search for on a device.
- **Use 64-bit counters if available (recommended):** The interface scan will use 64-bit traffic counters, if available. This can avoid buffer overflows in the devices.
 - **Use 32-bit counters only:** The interface scan will always use 32-bit traffic counters, even if 64-bit counters are available. This can lead to more reliable monitoring for some devices.

We recommend that you use the default value. If you experience problems, change this option.

- Request Mode** Define which kind of request method PRTG uses for SNMP sensors.
- **Use multi get (recommended):** Bundle multiple SNMP requests into one request.
 - **Use single get:** Use one request for each SNMP value. This can increase compatibility with older devices.

We recommend that you use the default value. If you experience problems, change this option.

 PRTG uses **paging** for SNMP requests. This means that if a sensor has to query more than 20 OIDs, it will automatically poll the OIDs in packages of 20 OIDs each per request.

- Port Name Template** Define how the name of SNMP sensors created on a device will be put together. Enter a template using several variables. When adding new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID usually several fields are available with interface descriptions. They are different for every device and OID. PRTG will use the information in these fields to name the sensors. If a field is empty or not available, an empty string is added to the name. As default, **([port]) [ifalias]** is set as port name template, which will create a name such as **(001) Ethernet1**, for example. You can use any field names available at a certain OID of your device, among which are:
- **[port]:** The port number of the monitored interface.
 - **[ifalias]:** The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling.
 - **[ifname]:** The textual name of the monitored interface as assigned by the local device.
 - **[ifdescr]:** A textual string containing information about the monitored device or interface, for example, manufacturer, product name, version.

SNMP COMPATIBILITY OPTIONS

- **[ifspeed]**: An estimate of the monitored interface's current bandwidth (KBit/s).
- **[ifsensor]**: The type of the sensor, this is **SNMP Traffic** or **SNMP RMON**. This is useful to differentiate between your [SNMP Traffic](#) ²⁴⁶⁷ and [SNMP RMON](#) ²⁴⁰⁵ sensors.

Combine them as you like to obtain suitable sensor names.

 For more information about SNMP sensor names, see this Knowledge Base article: [How can I change the defaults for names automatically generated for new SNMP sensors?](#)

Port Name Update

Define how PRTG will react if you change port names in your physical device (for example, a switch or router). Choose between:

- **Keep port names (use this if you edit the names in PRTG)**: Do not automatically adjust sensor names. This is the best option if you want to change names in PRTG manually.
- **Automatic sensor name update if name changes in device**: If PRTG detects changes of port names in your physical device, it will try to automatically adjust sensor names accordingly.

 For more information about automatic updates of names, see this Knowledge Base article: [Automatically update port name and number for SNMP Traffic sensors when the device changes them](#)

Port Identification

Define which field will be used for SNMP interface identification. Choose between:

- **Automatic (recommended)**: Tries the ifAlias field first to identify an SNMP interface and then ifDescr.
 -  ifName will not be tried automatically.
- **Use ifAlias**: For most devices ifAlias is the best field to get unique interface names.
- **Use ifDescr**: Use this option if the port order of your device changes after a reboot, and there is no ifAlias field available. For example, this is the best option for Cisco ASA devices.
 -  When using this option it is important that your device returns unique interface names in the ifDescr field.
- **Use ifName**: You can also use this option if there is no unique ifAlias available.
 -  When using this option, it is important that your device returns unique interface names in the ifName field.

SNMP COMPATIBILITY OPTIONS

- **No Port Update:** Use this option to disable automatic port identification.

Start Interface Index For [SNMP Traffic sensors](#)²⁴⁶⁷, define at which index PRTG will start to query the interface range during sensor creation. Use **0** for automatic mode. We recommend that you use the default value.

End Interface Index For [SNMP Traffic sensors](#)²⁴⁶⁷, define at which index PRTG will stop to query the interface range during sensor creation. Use **0** for automatic mode. We recommend that you use the default value.

PROXY SETTINGS FOR HTTP SENSORS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

HTTP Proxy Settings The proxy settings determine how a sensor connects to a given URL. You can enter data for an HTTP proxy server that sensors will use when connecting via HTTP or HTTPS.

-  This setting affects monitoring only and determines the behavior of HTTP sensors. To change proxy settings for the core server, see [System Administration—Core & Probes](#)³³⁶⁸.
-  The [SSL Certificate Sensor](#)²⁶³⁵ and the [SSL Security Check Sensor](#)²⁶⁴⁶ do not support HTTP proxies, but you can configure connections via SOCKS proxies in their sensor settings.

Name Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.

Port Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.

User If the proxy requires authentication, enter the username for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

Password If the proxy requires authentication, enter the password for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

- | | |
|-------------------------|--|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ^[336] on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> |

SCANNING INTERVAL

- ⓘ If a channel uses [lookup](#)^[3693] values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Schedule Select a schedule from the list. Schedules can be used to pause monitoring for a certain time span (days, hours) throughout the week. You can create new schedules and edit existing ones in the [account settings](#)^[331].

- ⓘ Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Maintenance Window Specify if you want to set-up a one-time maintenance window. During a maintenance window, this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

- ⓘ To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency settings are available only in [Probe Settings](#)^[351], [Group Settings](#)^[375], [Device Settings](#)^[402], and [Sensor Settings](#)^[428].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

ADVANCED NETWORK ANALYSIS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Unusual Detection Define if you want to benefit from [unusual detection](#)^[336] for sensors. You can configure the behavior of unusual detection (or disable it completely) in the [system settings](#)^[336]. Choose between:

- **Enabled:** Activate unusual detection for this object and, by default, for all objects underneath in the [hierarchy](#)^[133] of the device tree. Sensors affected by this setting will turn to orange color ([unusual sensor status](#)^[195]) if PRTG detects unusual activity.
- **Disabled:** Do not activate unusual detection. PRTG will ignore unusual values for sensors affected by this setting. These sensors will not show an unusual sensor status.

Similar Sensors Detection Define if you want to activate [Similar Sensors](#)^[209] analysis. You can configure the depth of analysis of similar sensors detection (or disable it completely) in the [system settings](#)^[336]. Choose between:

- **Enabled:** Activate similar sensors detection for this object and, by default, for all objects underneath in the [hierarchy](#)^[133] of the device tree. PRTG considers all sensors affected by this setting during similarity analysis.

ADVANCED NETWORK ANALYSIS

- System Information
- **Disabled:** Do not activate similar sensors detection. PRTG will not consider sensors affected by this setting during similarity analysis.
- Define if you want to retrieve and show [System Information](#)^[222] for your devices. Choose between:
- **Enabled:** Activate the system information feature for this object and, by default, for all objects underneath in the [hierarchy](#)^[133] of the device tree.
 - **Disabled:** Do not activate system information.
-  **System Information** is enabled by default. To retrieve the data, PRTG will automatically use **Credentials for Windows Systems** and **Credentials for SNMP Devices** as defined in the [device settings](#)^[402] or as [inherited](#)^[133] from a parent object like the **Root** group. Please consider this when you monitor devices outside the local network, especially when using **SNMP v1** or **v2c** that do not provide encryption.
-  This setting is not available on the **Hosted Probe** of a PRTG hosted by Paessler instance.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Notifications

The status or the data of a sensor can trigger notifications. Using this mechanism, you can configure external alerting tailored to your needs. In an object's detail page, click the **Notifications** tab to change sensor notification triggers. The defined triggers will be inherited down to sensor level. For detailed information, see [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see [Object Settings](#)^[217] section.

7.5 Probe Settings

On a probe's overview page, click the **Settings** tab to change settings.

Add Remote Probe

You can add additional remote probes to your setup to extend your monitoring to networks that are not directly reachable by your PRTG core installation or cluster.

 See section [Add Remote Probe](#)^[3707] for more details.

Probe Settings

The following settings are available in the **Settings** tab of every probe. Because you may not need all of these for every probe, just regard the settings you really need, ignoring the others.

We recommend that you define as many settings as possible in the **Root**^[331] group, so you can inherit them to all other objects further down in the [device tree hierarchy](#)^[133].

 This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

BASIC PROBE SETTINGS

Probe Name	Enter a meaningful name to identify the probe. The name will be shown by default in the devices tree and in all alarms.
Tags	Enter one or more Tags ^[139] . Confirm each tag by hitting the space, comma, or enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case sensitive.  It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).
Status	Choose if monitoring for this probe is started or paused. <ul style="list-style-type: none"> ▪ Started: Monitor this probe. ▪ Paused: Pause monitoring for this probe. All sensors on all devices on this probe will be paused until this setting is changed again.

BASIC PROBE SETTINGS

Priority Select a priority for the probe. This setting determines where the probe will be placed in list views. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

LOCATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Location (for Geo Maps) When you want to use [Geo Maps](#)³²¹, enter a location in the first line. Geographical maps will display objects (devices, groups) then with a flag, showing the current status using a color code similar to the [sensor status icons](#)¹⁹⁵ (green - yellow - orange - red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, PRTG will parse latitude and longitude automatically, for example: **49.452778 11.077778** or **enter 49.452778 any 11.077778 text**

A minus sign (-) in the first line will hide an object from geo maps. In this case you can enter location information in line two and following.

You can define a specific label for each location: enter a string denoting the label in the first line and provide geo coordinates in the second line. This geo marker will show then the object with the label in the PRTG geo map.

 The preview map will always have a road map layout regardless of the map layout you set in [User Interface](#)^{334b}.

CREDENTIALS FOR WINDOWS SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Domain or Computer Name	Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, enter the computer name here. If you want to use a Windows domain user account (recommended), enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Do not leave this field empty.
User	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	Define the authentication method to use for login. Choose between: <ul style="list-style-type: none"> ▪ Login via Password: Provide a password for login. Enter below. ▪ Login via Private Key: Provide a private key for authentication.  PRTG can only handle keys in OpenSSH format that are not encrypted. You cannot use password-protected keys here. In the text field, paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, see Monitoring via SSH³⁵¹⁰.
Password	This field is only visible if you select password login above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

Private Key	<p>This field is only visible if you select private key login above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges.</p> <p>i If you do not insert a private key for the first time, but change the private key, you need to restart your PRTG core server service³³⁸⁸ in order for the private key change to take effect! For details, see Monitoring via SSH³⁵¹⁰.</p>
For WBEM Use Protocol	<p>Define the protocol to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> ▪ HTTP: Use an unencrypted connection for WBEM. ▪ HTTPS: Use an SSL-encrypted connection for WBEM.
For WBEM Use Port	<p>Define the port to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> ▪ Set automatically (port 5988 or 5989): Use one of the standard ports, depending on whether you choose unencrypted or encrypted connection above. ▪ Set manually: Use a custom port. Define below.
WBEM Port	<p>This setting is only visible if you enable manual port selection above. Enter the WBEM port number.</p>
SSH Port	<p>Enter the port number to use for SSH connections.</p> <p>i By default, PRTG uses this setting automatically for all SSH sensors⁴³⁴, unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Define the rights that you want to use to execute the command on the target system. Choose between:</p> <ul style="list-style-type: none"> ▪ Run the command as the user connecting (default): Use the rights of the user who establishes the SSH connection, as defined above. ▪ Run the command as another user using 'sudo' (with password): Use the rights of another user with a password required for sudo to run commands on the target device, for example, as root user. ▪ Run the command as another user using 'sudo' (without password): Use the rights of another user without a password required for sudo to run commands on the target device, for example, as root user.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

- **Run the command as another user using 'su':** Use the rights of another user with **su** to run commands on the target device.

Target User This field is only visible if you choose **sudo** or **su** above. Enter a username to run the specified command as a user other than **root**. If you leave this field empty, you will run the command as **root**. Ensure you set the Linux password even if you use a public or private key for authentication. This is not necessary if the user is allowed to execute the command without a password.

Password Target User This field is only visible if you choose to run the commands using **su** or **sudo** with password above. Enter the password for the specified target user.

SSH Engine Select the method you want to use to [access data with SSH sensors](#)³⁵¹⁰. We strongly recommend that you keep the default engine! For now, you still can use the legacy mode to ensure compatibility with your target systems. Choose between:

- **Default (recommended):** This is the default monitoring method for SSH sensors. It provides best performance and security.
- **Compatibility Mode (deprecated):** Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

 You can also individually select the SSH engine for each SSH sensor in the sensor settings.

CREDENTIALS FOR VMWARE/XENSERVER

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷¹ for more information.

User Enter a login name for access to VMware and Xen servers. Usually, you will use credentials with administrator privileges.

Password Enter a password for access to VMware and Xen servers. Usually, you will use credentials with administrator privileges.

-  Single Sign-On (SSO) passwords for vSphere do not support special characters. See the manual sections for VMware sensors for details.

CREDENTIALS FOR VMWARE/XENSERVER

VMware Protocol	<p>Define the protocol used for the connection to VMware and XenServer. Choose between:</p> <ul style="list-style-type: none">▪ HTTPS (recommended): Use an SSL-encrypted connection to VMware and XenServers.▪ HTTP: Use an unencrypted connection to VMware and XenServers.
Session Pool	<p>Define if you want to use session pooling for VMware sensors. Choose between:</p> <ul style="list-style-type: none">▪ Reuse session for for multiple scans (recommended): Select this option to use session pooling. With session pooling, a VMware sensor uses the same session as created in advance to query data and needs not to log in and out for each sensor scan. We recommend that you choose this option because it reduces network load and log entries on the target device, resulting in better performance.▪ Create a new session for each scan: If you select this option and disable session pooling, a VMware sensor has to log in and out for each sensor scan. We recommend that you use the session pooling option above for better performance.

CREDENTIALS FOR SNMP DEVICES

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

SNMP Version	<p>Select the SNMP version for the device connection. Choose between:</p> <ul style="list-style-type: none">▪ v1: Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices.  SNMP v1 does not support 64-bit counters. This may result in invalid data when monitoring traffic via SNMP.▪ v2c (recommended): Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters.▪ v3: Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption.
--------------	--

CREDENTIALS FOR SNMP DEVICES

i When using SNMP v3 you can only monitor a limited number of sensors per second due to internal limitations. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds limits you to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased **Interval Delay** or **Open Requests** with the **Probe Health Sensor**, distribute the load over **multiple probes**. SNMP v1 and v2 do not have this limitation.

Community String This setting is only visible if you select SNMP version **v1** or **v2c** above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.

Authentication Type This setting is only visible if you select SNMP version **v3** above. Choose between:

- **MD5:** Use **Message-Digest Algorithm 5** (MD5) for authentication.
- **SHA:** Use **Secure Hash Algorithm** (SHA) for authentication.

The type you choose must match the authentication type of your device.

i If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field **Password** empty. In this case, **SNMP_SEC_LEVEL_NOAUTH** is used and authentication deactivated entirely.

User This setting is only visible if you select SNMP version **v3** above. Enter a username for secure authentication. This value must match the username of your device.

Password This setting is only visible if you select SNMP version **v3** above. Enter a password for secure authentication. This value must match the password of your device.

Encryption Type This setting is only visible if you select SNMP version **v3** above. Select an encryption type. Choose between:

- **DES:** Use **Data Encryption Standard** (DES) as encryption algorithm.
- **AES:** Use **Advanced Encryption Standard** (AES) as encryption algorithm.

i AES 192 and AES 256 are not supported by Net-SNMP. They lack RFC specification.

CREDENTIALS FOR SNMP DEVICES

 The type that you choose must match the encryption type of your device.

Data Encryption Key

This setting is only visible if you select SNMP version **v3** above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device.

 If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.

Context Name

This setting is only visible if you select SNMP version **v3** above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.

SNMP Port

Enter the port for the SNMP communication. We recommend that you use the default value.

SNMP Timeout (Sec.)

Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered. The maximum timeout value is **300** seconds (5 minutes).

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

The settings you define in this section apply to the following sensor types:

- [ADO SQL v2 Sensor](#)^[463]
- [Microsoft SQL v2 Sensor](#)^[1267]
- [MySQL v2 Sensor](#)^[1284]
- [Oracle SQL v2 Sensor](#)^[1457]
- [PostgreSQL Sensor](#)^[1574]

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

Port for Databases	<p>Define which ports PRTG will use for connections to the monitored databases. Choose between:</p> <ul style="list-style-type: none"> ▪ Set automatically (default port, recommended): PRTG automatically determines the type of the monitored database and uses the corresponding default port to connect. See below for a list of default ports. ▪ Define one custom port valid for all database sensors: Choose this option if your database management systems do not use the default ports. Define the port for database connections manually below. If you choose this option, PRTG will use the custom port for all database sensors. <p>If you choose the automatic port selection, PRTG uses the following default ports:</p> <ul style="list-style-type: none"> ▪ Microsoft SQL: 1433 ▪ MySQL: 3306 ▪ Oracle SQL: 1521 ▪ PostgreSQL: 5432
Custom Database Port	<p>Enter the number of the port that PRTG will use for database connections. Please enter an integer value.</p> <p> All database sensors on this device will use this port to connect.</p>
Authentication Mode	<p>Select the authentication method for the connection to the SQL database. Choose between:</p> <ul style="list-style-type: none"> ▪ Windows authentication with impersonation: If you select this option, PRTG uses the Windows credentials as defined in the particular device settings^[407] for the database connection. <ul style="list-style-type: none">  The user whose credentials are used needs to have permissions to log on to the system on which the PRTG probe with a database sensor runs. This is required for the impersonation. ▪ SQL server authentication: Choose this option if you want to use explicit credentials for database connections.
User	<p>This field is only visible if you select SQL server authentication above. Enter the username for the database connection.</p>
Password	<p>This field is only visible if you select SQL server authentication above. Enter the password for the database connection.</p>

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

Timeout (Sec.) Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than this value defines, the sensor cancels the request and triggers an error message. The maximum timeout value is **300** seconds (5 minutes).

CREDENTIALS FOR AMAZON CLOUDWATCH

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Access Key Enter your Amazon Web Services (AWS) access key. Please see the corresponding [Amazon CloudWatch sensor](#)^[435] documentation to learn more about the rights that are required for querying AWS CloudWatch metrics.

Secret Key Enter your Amazon Web Services (AWS) secret key. Please see the corresponding [Amazon CloudWatch sensor](#)^[435] documentation to learn more about the rights that are required for querying AWS CloudWatch metrics.

WINDOWS COMPATIBILITY OPTIONS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

When experiencing problems while monitoring via Windows sensors, you can set some compatibility options for troubleshooting.

Preferred Data Source Define the method Windows sensors will use to query data. This setting is valid only for hybrid sensors offering performance counter and Windows Management Instrumentation (WMI) technology. The setting will be ignored for all other sensors! Choose between:

- **Performance Counters and fallback to WMI:** Try to query data via performance counters. If this is not possible, establish a connection via WMI.
- **Performance Counters only:** Query data via performance counters only. If this is not possible, a sensor will return no data.

WINDOWS COMPATIBILITY OPTIONS

- **WMI only (recommended):** Query data via WMI only. If this is not possible, a sensor will return no data. In current PRTG versions, this is our recommendation to achieve best performance and stability.

Timeout Method Specify the time the sensor will wait for the return of its WMI query before aborting it with an error message. Choose between:

- **Use 1.5x scanning interval (recommended):** Use a default of one and a half times the scanning interval set for the sensor (see below in this settings).
- **Set manually:** Enter a timeout value manually.

We recommend that you use the default value. Only if you experience ongoing timeout errors, try increasing the timeout value.

Timeout Value (Sec.) This field is only visible if the manual timeout method is selected above. Enter the time the sensor will wait for the return of its WMI query before aborting with an error message. Please enter an integer value. The maximum value is **900** seconds (15 minutes).

SNMP COMPATIBILITY OPTIONS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

When experiencing problems while monitoring via Simple Network Management Protocol (SNMP) sensors, you can set some compatibility options for troubleshooting.

SNMP Delay (ms) Add a time in milliseconds that will be waited between two SNMP requests. This can help increase device compatibility. Please enter an integer value. We recommend that you use the default value. If you experience SNMP connection failures, please increase it. You can define a delay between **0** and **100**, higher delays are not supported and will be discarded.

Failed Requests Define if an SNMP sensor will try again after a request fails.

- **Retry (recommended):** Try again if an SNMP request fails. This can help prevent false error messages due to temporary timeout failures.

SNMP COMPATIBILITY OPTIONS

	<ul style="list-style-type: none">▪ Do not retry: Do not retry if an SNMP request fails. With this setting enabled an SNMP sensor will be set to error status earlier.
Overflow Values	<p>Define how PRTG will handle overflow values. Some devices do not handle internal buffer overflows correctly. This can cause false peaks.</p> <ul style="list-style-type: none">▪ Ignore overflow values: Ignore overflow values and do not include them in the monitoring data.▪ Handle overflow values as valid results: Regard all overflow values as regular data and include them in the monitoring data. <p>We recommend that you use the default value.</p> <p> If you experience problems because of strange peaks in your data graphs, change this option. Peaks might indicate that the monitored device resets counters without an overflow. PRTG interprets such a behavior as overflow that results in data peaks. Choose the option Ignore overflow values in this case. For more details, see this Knowledge Base article: What is the Overflow Values setting in the SNMP Compatibility Options?</p>
Zero Values	<p>Define how PRTG will handle zero values. Some devices send incorrect zero values. This can cause false peaks.</p> <ul style="list-style-type: none">▪ Ignore zero values for delta sensors (recommended): Ignore zero values and do not include them in the monitoring data.▪ Handle zero values as valid results for delta sensors: Regard all zero values as regular data and include them in the monitoring data. <p>We recommend that you use the default value. If you experience problems, change this option.</p>
32-bit/64-bit Counters	<p>Define which kind of traffic counters PRTG will search for on a device.</p> <ul style="list-style-type: none">▪ Use 64-bit counters if available (recommended): The interface scan will use 64-bit traffic counters, if available. This can avoid buffer overflows in the devices.▪ Use 32-bit counters only: The interface scan will always use 32-bit traffic counters, even if 64-bit counters are available. This can lead to more reliable monitoring for some devices. <p>We recommend that you use the default value. If you experience problems, change this option.</p>
Request Mode	<p>Define which kind of request method PRTG uses for SNMP sensors.</p>

SNMP COMPATIBILITY OPTIONS

- **Use multi get (recommended):** Bundle multiple SNMP requests into one request.
- **Use single get:** Use one request for each SNMP value. This can increase compatibility with older devices.

We recommend that you use the default value. If you experience problems, change this option.

 PRTG uses **paging** for SNMP requests. This means that if a sensor has to query more than 20 OIDs, it will automatically poll the OIDs in packages of 20 OIDs each per request.

Port Name Template

Define how the name of SNMP sensors created on a device will be put together. Enter a template using several variables. When adding new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID usually several fields are available with interface descriptions. They are different for every device and OID. PRTG will use the information in these fields to name the sensors. If a field is empty or not available, an empty string is added to the name. As default, **[port] [ifalias]** is set as port name template, which will create a name such as **(001) Ethernet1**, for example. You can use any field names available at a certain OID of your device, among which are:

- **[port]:** The port number of the monitored interface.
- **[ifalias]:** The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling.
- **[ifname]:** The textual name of the monitored interface as assigned by the local device.
- **[ifdescr]:** A textual string containing information about the monitored device or interface, for example, manufacturer, product name, version.
- **[ifspeed]:** An estimate of the monitored interface's current bandwidth (KBit/s).
- **[ifsensor]:** The type of the sensor, this is **SNMP Traffic** or **SNMP RMON**. This is useful to differentiate between your **SNMP Traffic** [2467] and **SNMP RMON** [2405] sensors.

Combine them as you like to obtain suitable sensor names.

 For more information about SNMP sensor names, see this Knowledge Base article: [How can I change the defaults for names automatically generated for new SNMP sensors?](#)

Port Name Update

Define how PRTG will react if you change port names in your physical device (for example, a switch or router). Choose between:

SNMP COMPATIBILITY OPTIONS

- **Keep port names (use this if you edit the names in PRTG):** Do not automatically adjust sensor names. This is the best option if you want to change names in PRTG manually.
- **Automatic sensor name update if name changes in device:** If PRTG detects changes of port names in your physical device, it will try to automatically adjust sensor names accordingly.

 For more information about automatic updates of names, see this Knowledge Base article: [Automatically update port name and number for SNMP Traffic sensors when the device changes them](#)

Port Identification

Define which field will be used for SNMP interface identification. Choose between:

- **Automatic (recommended):** Tries the ifAlias field first to identify an SNMP interface and then ifDescr.
 -  ifName will not be tried automatically.
- **Use ifAlias:** For most devices ifAlias is the best field to get unique interface names.
- **Use ifDescr:** Use this option if the port order of your device changes after a reboot, and there is no ifAlias field available. For example, this is the best option for Cisco ASA devices.
 -  When using this option it is important that your device returns unique interface names in the ifDescr field.
- **Use ifName:** You can also use this option if there is no unique ifAlias available.
 -  When using this option, it is important that your device returns unique interface names in the ifName field.
- **No Port Update:** Use this option to disable automatic port identification.

Start Interface Index

For [SNMP Traffic sensors](#)²⁴⁶⁷, define at which index PRTG will start to query the interface range during sensor creation. Use 0 for automatic mode. We recommend that you use the default value.

End Interface Index

For [SNMP Traffic sensors](#)²⁴⁶⁷, define at which index PRTG will stop to query the interface range during sensor creation. Use 0 for automatic mode. We recommend that you use the default value.

PROXY SETTINGS FOR HTTP SENSORS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

HTTP Proxy Settings The proxy settings determine how a sensor connects to a given URL. You can enter data for an HTTP proxy server that sensors will use when connecting via HTTP or HTTPS.

-  This setting affects monitoring only and determines the behavior of HTTP sensors. To change proxy settings for the core server, see [System Administration—Core & Probes](#)³³⁶⁸.
-  The [SSL Certificate Sensor](#)²⁶³⁵ and the [SSL Security Check Sensor](#)²⁶⁴⁶ do not support HTTP proxies, but you can configure connections via SOCKS proxies in their sensor settings.

Name Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.

Port Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.

User If the proxy requires authentication, enter the username for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

Password If the proxy requires authentication, enter the password for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

CLUSTER USAGE

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Distribution This box is only visible if you run a PRTG cluster. Sometimes you want to exclude a certain node from monitoring the sensors running on this probe, group, or device, for example, if a device is not reachable from every node configured in your cluster. In the list of cluster nodes, please select the nodes that will **not** be included in sensor scans. By default, this setting is [inherited](#)¹³⁷ to all objects underneath.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to pause monitoring for a certain time span (days, hours) throughout the week. You can create new schedules and edit existing ones in the [account settings](#)³³¹.

 Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Maintenance Window Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

 To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current object if its parent object is in a Down status, or if it is paused by another dependency. ▪ Select object: Pause the current object if its parent object is in a Down status, or if it is paused by another dependency. Additionally, pause the current object if a specific other object in the device tree is in a Down status, or if it is paused by another dependency. Select below. <p> You do not trigger a status change by dependency if you manually pause a master object or if you pause it by schedule.</p> <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects should be paused. You can check all dependencies^[323] in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the object selector ^[240] to choose an object on which the current object will be dependent on.
Dependency Delay (Sec.)	<p>This field is only visible if you select another object than the parent as dependency type. Define a time span in seconds for dependency delay.</p> <p>After the master object for this dependency comes back to an Up status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

ADVANCED NETWORK ANALYSIS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Unusual Detection Define if you want to benefit from [unusual detection](#)^[336] for sensors. You can configure the behavior of unusual detection (or disable it completely) in the [system settings](#)^[336]. Choose between:

- **Enabled:** Activate unusual detection for this object and, by default, for all objects underneath in the [hierarchy](#)^[133] of the device tree. Sensors affected by this setting will turn to orange color ([unusual sensor status](#)^[195]) if PRTG detects unusual activity.
- **Disabled:** Do not activate unusual detection. PRTG will ignore unusual values for sensors affected by this setting. These sensors will not show an unusual sensor status.

Similar Sensors Detection Define if you want to activate [Similar Sensors](#)^[209] analysis. You can configure the depth of analysis of similar sensors detection (or disable it completely) in the [system settings](#)^[336]. Choose between:

- **Enabled:** Activate similar sensors detection for this object and, by default, for all objects underneath in the [hierarchy](#)^[133] of the device tree. PRTG considers all sensors affected by this setting during similarity analysis.

ADVANCED NETWORK ANALYSIS

System Information

- **Disabled:** Do not activate similar sensors detection. PRTG will not consider sensors affected by this setting during similarity analysis.

Define if you want to retrieve and show [System Information](#)^[222] for your devices. Choose between:

- **Enabled:** Activate the system information feature for this object and, by default, for all objects underneath in the [hierarchy](#)^[133] of the device tree.
- **Disabled:** Do not activate system information.

 **System Information** is enabled by default. To retrieve the data, PRTG will automatically use **Credentials for Windows Systems** and **Credentials for SNMP Devices** as defined in the [device settings](#)^[402] or as [inherited](#)^[133] from a parent object like the **Root** group. Please consider this when you monitor devices outside the local network, especially when using **SNMP v1** or **v2c** that do not provide encryption.

 This setting is not available on the **Hosted Probe** of a PRTG hosted by Paessler instance.

PROBE SETTINGS FOR MONITORING

Define the IP address used for outgoing monitoring requests.

- If there is more than one IP on the current system available, you can specify the IP address that PRTG will use for outgoing monitoring requests of certain sensor types.
- This setting will be used for sensors using the following connection types: HTTP, DNS, FTP, IMAP, POP3, Port, Remote Desktop, SMTP, and SNMP.
- The setting is valid for all monitoring requests sent from this PRTG probe.
- This setting is useful for devices that expect a certain IP address when queried.
- Default setting is **auto**. PRTG will select an IP address automatically.

 This feature does not support all sensor types for technical reasons.

 If you change this setting, some sensors might stop working. For example, sensors might show a **Down** status if the selected IP address is blocked on the way to or directly on the monitored device.

PROBE SETTINGS FOR MONITORING

Outgoing IPv4 Define the IP address for outgoing requests using the IPv4 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**.

Outgoing IPv6 Define the IP address for outgoing requests using the IPv6 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**.

 For details about the basic concept of IPv6 in PRTG, see the [IPv6](#) section.

Cluster Connectivity This box is only visible if you run a PRTG cluster. Define if this probe connects to all cluster nodes, including the failover nodes, or only to the primary master node. Choose between:

- **Probe sends data only to primary master node:** The probe connects only to the primary master node. You are not able to review monitoring data on failover nodes. Consider choosing this option if you have bandwidth limitations in your network or if the probe cannot access your failover node(s).
- **Probe sends data to all cluster nodes:** This is the default option. The probe connects to all nodes in your cluster and sends monitoring data to the failover node(s) in addition to the primary master. The probe is visible on all your nodes as soon as it connects automatically to the correct IP addresses and ports of the failover nodes. If your master node fails, you can still see monitoring data of this probe.

 PRTG will not notify you if a remote probe is disconnected from a cluster node. Please check explicitly on a cluster node if your remote probes are connected (for example, via the device tree in the PRTG web interface on a cluster node).

SCHEDULED RESTART SETTINGS

 This setting is not available on the **Hosted Probe** of a PRTG hosted by Paessler instance.

Restart Options For best performance, we recommend that you regularly restart the Windows servers on which PRTG is running. To do this automatically for PRTG, you can schedule an automatic restart. Choose between the following options:

SCHEDULED RESTART SETTINGS

- **No scheduled reboot or service restart:** Do not perform any scheduled restart of services automatically. We recommend a manual restart every few weeks. You can initiate a restart of your PRTG core server and probes under [System Administration—Administrative Tools](#) in the PRTG web interface.
- **Scheduled restart of PRTG services:** Restart all PRTG services on the system where this probe runs on. If you choose this option on the local probe, the PRTG core server will restart as well. Define a schedule below.
- **Scheduled system reboot (recommended):** We recommend this setting, although it is not set by default. Enter a schedule below. We recommend that you restart Windows servers once a month for best performance.

Restart Schedule

You can only see this setting if you selected a schedule option above. Choose how often you want to restart PRTG services or the Windows server:

- **Once per week:** Select a day of the week and a time below.
- **Once per month (recommended):** Select a day of the month and a time below.

Specify Day

You can only see this setting if you selected a schedule option above. Select a specific day of the week (**Monday** to **Sunday**) or month (**1st** to **30th** or **Last**). If you select **Last**, the restart will always be executed on the last day of the month, regardless of how many days the month has.

 If you select a date that does not exist in every month (for example, the 30th day in February), PRTG will automatically initiate the restart on the last day of this month.

Specify Hour

You can only see this setting if you selected a schedule option above. Select the time of day when PRTG will perform the restart.

 You will get a Windows warning message 10 minutes before the restart to inform you if you are a currently logged in user. The actual restart time can differ up to 30 minutes from the settings you enter here.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Notifications

The status or the data of a sensor can trigger notifications. Using this mechanism, you can configure external alerting tailored to your needs. In an object's detail page, click the **Notifications** tab to change sensor notification triggers. The defined triggers will be inherited down to sensor level. For detailed information, see [Sensor Notification Triggers Settings](#) ³¹⁷⁰ section.

Others

For more general information about settings, see [Object Settings](#) ²¹⁷¹ section.

7.6 Group Settings

On a group's overview page, click the **Settings** tab to change settings.

Add Group

The **Add Group** dialog appears when adding a new group to a parent group. It only shows the setting fields that are imperative for creating the group. Therefore, you will not see all setting fields in this dialog. For example, the **Group Status** option is not available in this step.

You can change all settings in the group's **Settings** tab later.

Group Settings

The following settings are available in the **Settings** tab of every group. As you may not need all of these for every group, just regard the settings you really need, ignoring the others.

i This documentation does not refer to the setting of the special **Root** group. The settings available there differ from those described here.

We recommend that you define as many settings as possible in the **Root** group, so you can inherit them to all other objects further down in the [device tree hierarchy](#).

i This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

BASIC GROUP SETTINGS

Group Name	Enter a meaningful name to identify the group. The name will be shown by default in the devices tree and in all alarms.
Status	Choose if monitoring for this group is started or paused. We recommend that you use the default value. You can add additional tags to it, if you like. <ul style="list-style-type: none"> ▪ Started: Monitor this group. ▪ Paused: Pause monitoring for this group. All sensors on all devices in this group will be paused until this setting is changed again.
Parent Tags	Shows Tags that this group inherits from its parent probe . This setting is shown for your information only and cannot be changed here.

BASIC GROUP SETTINGS

Tags Enter one or more [Tags](#)¹³⁹. Confirm each tag by hitting the space, comma, or enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case sensitive.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the group. This setting determines where the group will be placed in list views. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

GROUP TYPE

Sensor Management Select which type of auto-discovery you would like to perform for this group. Choose between:

- **Manual (no auto-discovery):** Do not auto-discover any sensors, only add sensors manually.
- **Automatic device identification (standard, recommended):** Use a small set of auto-discovery templates. This will scan your LAN and usually create a set of standard sensors on your device.
- **Automatic device identification (detailed, may create many sensors):** Use an extended set of auto-discovery templates. This will scan your LAN and usually create many sensors on your device.
- **Automatic sensor creation using specific device templates:** Use specific auto-discovery templates only. Select templates below. This will scan your LAN and add sensors defined in the template.

Device Template(s) This option is only visible if you enable using specific device templates above. Choose one or more templates by adding a check mark in front of the respective template name. You can also select and deselect all items by using the check box in the table head. PRTG will use the selected templates for auto-discovery on the current device. Choose from:

- **ADSL**
- **Amazon Cloudwatch**

- **Buffalo TeraStation NAS**
- **Cisco ASA VPN**
- **Cisco Device (Generic)**
- **Dell EqualLogic**
- **Dell MDI Disk**
- **DNS Server**
- **Environment Jakarta**
- **Environment Poseidon**
- **FTP Server**
- **Generic Device (PING only)**
- **Generic Device (SNMP-enabled)**
- **Generic Device (SNMP-enabled, Detailed)**
- **HTTP Web Server**
- **Hyper V Host Server**
- **IPMI enabled devices**
- **Juniper NS Device**
- **Linux/UNIX Device (SNMP or SSH enabled)**
- **Mail Server (Generic)**
- **Mail Server (MS Exchange)**
- **Microsoft SharePoint 2010**
- **NAS LenovoEMC**
- **NAS QNAP**
- **NAS Synology**
- **NetApp**
- **NTP Server**
- **Printer (HP)**
- **Printer Generic**
- **RDP Server**
- **RMON compatible device**
- **Server (Compaq/HP agents)**
- **Server (Dell)**
- **Server Cisco UCS**
- **Server IBM**

- SonicWall
- SSL Security Check
- Switch (Cisco Catalyst)
- Switch (Cisco IOS Based)
- Switch (HP Procurve)
- UNIX/Linux Device
- UPS Health (APC)
- UPS Health (Generic)
- UPS Health (Liebert)
- VMware ESX / vCenter Server
- Webserver
- Windows (Detailed via WMI)
- Windows (via Remote PowerShell)
- Windows (via WMI)
- Windows IIS (via SNMP)
- XEN Hosts
- XEN Virtual Machines

Once the auto-discovery is finished, PRTG will create a new [ticket](#) ^[230] and list the device templates that it used to create new sensors. The ticket will not show templates that were not applied.

Discovery Schedule

Define when PRTG will run the auto-discovery. Choose between:

- **Once:** Perform auto-discovery only once. PRTG will add new devices and sensors once. If you select this option, you have to [start the auto-discovery manually](#) ^[283], it will not run automatically.
- **Hourly:** Perform auto-discovery for new devices and sensors every 60 minutes.
 - ⓘ Please use this option with caution! Frequently executed auto-discoveries might cause performance issues, especially when large network segments are scanned every hour.
- **Daily:** Perform auto-discovery for new devices and sensors every 24 hours. The first auto-discovery will run immediately, all other discoveries will start at the time defined in the **Auto-Discovery Settings** section of the [System Administration—Monitoring](#) ^[330] settings.

	<ul style="list-style-type: none"> ▪ Weekly: Perform auto-discovery for new devices and sensors every 7 days. The first auto-discovery will run immediately, all other discoveries will start at the time defined in the Auto-Discovery Settings section of the System Administration—Monitoring settings. <p>i The Discovery Schedule will be set to Once on all devices created by the scheduled auto-discovery for performance reasons.</p>
IP Selection Method	<p>Define how you want to define the IP range for auto-discovery. Choose between:</p> <ul style="list-style-type: none"> ▪ Class C base IP with start/end (IPv4): Define an IPv4 class C address range. ▪ List of individual IPs and DNS names (IPv4): Enter a list of individual IPv4 addresses or DNS names. ▪ IP and subnet (IPv4): Enter an IPv4 address and subnet mask. ▪ IP with octet range (IPv4): Enter an IPv4 address range for every IP octet individually. With this, you can define very customizable IP ranges. ▪ List of individual IPs and DNS names (IPv6): Enter a list of individual IPv6 addresses or DNS names. ▪ Use computers from the active directory (maximum 1000 computers): Search in the active directory for computers to perform auto-discovery. <ul style="list-style-type: none"> i Define your active directory domain in advance in the system administration. See System Administration—Core & Probes. <p>i Only subnets with up to 65,536 IP addresses can be discovered! If you define a range with a higher number of addresses, discovery will stop before it is completed.</p>
IPv4 Base	<p>This field is only visible if you select Class C network detection above. Enter a class C network as IP base for the auto-discovery. Enter the first three octets of an IPv4 IP address, for example, 192.168.0</p>
IPv4 Range Start	<p>This field is only visible if you select Class C network detection above. Enter the IP octet of the class C network specified above from which PRTG will start the auto-discovery. This will complete the IP base above to an IPv4 address. For example, enter 1 to discover from 192.168.0.1.</p>
IPv4 Range End	<p>This field is only visible if you select Class C network detection above. Enter the IP octet of the class C network specified above at which PRTG will stop the auto-discovery. This will complete the IP base above to an IPv4 address. For example, enter 254 to discover up to 192.168.0.254.</p>

IPv4/DNS Name List IPv6/DNS Name List	This field is only visible if you select the IP list option above. Enter a list of IP addresses or DNS names that the auto-discovery will scan. Enter each address in a separate line.
IPv4 and Subnet (IPv4)	This field is only visible if you select the IP and subnet option above. Enter an expression in the format address/subnet , for example, 192.168.3.0/255.255.255.0 . You can also use the short form like 192.168.3.0/24 in this example. PRTG will scan the complete host range (without network and broadcast address) defined by the IP address and the subnet mask.
IP with Octet Range	This field is only visible if you select the octet range option above. Enter an expression in the format a1.a2.a3.a4 , where a1 , a2 , a3 , and a4 are each a number between 0-255, or a range with two numbers and a hyphen like 1-127 . All permutations of all ranges are calculated. For example, 10.0.1-10.1-100 results in 1,000 addresses that PRTG will scan during auto-discovery.
Organizational Unit	<p>This field is only visible if you select active directory above. Enter an organizational unit (OU) to restrict the active directory search to computers that are part of this OU. Just enter the name of the OU without any other term (so without "OU" in front). If you leave this field empty, there will not be any restriction.</p> <p> Make sure that the OU contains a host. If the OU is empty, you will receive an error message.</p> <p>If you have sub-OUs, consider the correct syntax in the format Y,OU=X: OUs that are part of another OU have to be listed together with their parent(s). Enter the sub-OU followed by ,OU= and the name of the parent OU.</p> <p>Examples:</p> <ul style="list-style-type: none"> ▪ Assuming that the organizational unit 'Y' is part of the OU named 'X'. Then the syntax would be Y,OU=X ▪ For three OUs 'X', 'Y' part of 'X', and 'Z' part of 'Y', the syntax would be Z,OU=Y,OU=X <p> The order is important, sub-OUs have to be listed left of their particular parents!</p>
Name Resolution	<p>Define how to monitor newly discovered devices. This affects only new devices. The setting for existing devices will remain unchanged. Depending on your selection the IP Address/DNS Name field of an added device^[402] shows the DNS name or IP address that PRTG uses to access the target device. Choose between:</p> <ul style="list-style-type: none"> ▪ Use DNS names (recommended): Monitor newly discovered devices via their DNS names (if available). ▪ Use IP addresses: Monitor newly discovered devices via their IP addresses.

We recommend that you use the default value.

-  This setting does not affect how PRTG shows the devices in the device tree.

Device Rescan

Define if you want to add devices that already exist in your PRTG installation also to the currently selected group. Choose between:

- **Skip auto-discovery for known devices/IPs (recommended):** Do not re-scan known devices or IP addresses, only add devices with new IPs or DNS names when auto-discovering. PRTG will not add devices that are already included elsewhere in your configuration, for example, in other groups.
- **Perform auto-discovery for known devices/IPs:** Re-scan devices with known IP addresses with every auto-discovery. This option will add devices that already exist in other groups also to this group and runs the auto-discovery on the newly added devices.
 -  The auto-discovery will not run on devices that already exist in this group. If you want to run the auto-discovery for an existing device, you have to start the auto-discovery on this device.

We recommend that you use the default value.

-  In certain cases, the IP resolution may not work and might result in a device not being added if it has the same local IP address as in another LAN.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

LOCATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

LOCATION

Location (for Geo Maps)

When you want to use [Geo Maps](#)³²¹¹, enter a location in the first line. Geographical maps will display objects (devices, groups) then with a flag, showing the current status using a color code similar to the [sensor status icons](#)¹⁹⁵¹ (green - yellow - orange - red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, PRTG will parse latitude and longitude automatically, for example: **49.452778 11.077778** or **enter 49.452778 any 11.077778 text**

A minus sign (-) in the first line will hide an object from geo maps. In this case you can enter location information in line two and following.

You can define a specific label for each location: enter a string denoting the label in the first line and provide geo coordinates in the second line. This geo marker will show then the object with the label in the PRTG geo map.

 The preview map will always have a road map layout regardless of the map layout you set in [User Interface](#)³³⁴⁶.

CREDENTIALS FOR WINDOWS SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷¹ for more information.

Domain or Computer Name

Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, enter the computer name here. If you want to use a Windows domain user account (recommended), enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Do **not** leave this field empty.

User

Enter the username for Windows access. Usually, you will use credentials with administrator privileges.

Password

Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	<p>Define the authentication method to use for login. Choose between:</p> <ul style="list-style-type: none"> ▪ Login via Password: Provide a password for login. Enter below. ▪ Login via Private Key: Provide a private key for authentication. <ul style="list-style-type: none">  PRTG can only handle keys in OpenSSH format that are not encrypted. You cannot use password-protected keys here. In the text field, paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, see Monitoring via SSH³⁵¹⁰.
Password	This field is only visible if you select password login above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Private Key	<p>This field is only visible if you select private key login above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges.</p> <p> If you do not insert a private key for the first time, but change the private key, you need to restart your PRTG core server service³³⁸⁸ in order for the private key change to take effect! For details, see Monitoring via SSH³⁵¹⁰.</p>
For WBEM Use Protocol	<p>Define the protocol to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> ▪ HTTP: Use an unencrypted connection for WBEM. ▪ HTTPS: Use an SSL-encrypted connection for WBEM.
For WBEM Use Port	<p>Define the port to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between:</p> <ul style="list-style-type: none"> ▪ Set automatically (port 5988 or 5989): Use one of the standard ports, depending on whether you choose unencrypted or encrypted connection above. ▪ Set manually: Use a custom port. Define below.
WBEM Port	This setting is only visible if you enable manual port selection above. Enter the WBEM port number.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

SSH Port	<p>Enter the port number to use for SSH connections.</p> <p> By default, PRTG uses this setting automatically for all SSH sensors ⁴³⁴, unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Define the rights that you want to use to execute the command on the target system. Choose between:</p> <ul style="list-style-type: none">▪ Run the command as the user connecting (default): Use the rights of the user who establishes the SSH connection, as defined above.▪ Run the command as another user using 'sudo' (with password): Use the rights of another user with a password required for sudo to run commands on the target device, for example, as root user.▪ Run the command as another user using 'sudo' (without password): Use the rights of another user without a password required for sudo to run commands on the target device, for example, as root user.▪ Run the command as another user using 'su': Use the rights of another user with su to run commands on the target device.
Target User	<p>This field is only visible if you choose sudo or su above. Enter a username to run the specified command as a user other than root. If you leave this field empty, you will run the command as root. Ensure you set the Linux password even if you use a public or private key for authentication. This is not necessary if the user is allowed to execute the command without a password.</p>
Password Target User	<p>This field is only visible if you choose to run the commands using su or sudo with password above. Enter the password for the specified target user.</p>
SSH Engine	<p>Select the method you want to use to access data with SSH sensors ³⁵¹⁰. We strongly recommend that you keep the default engine! For now, you still can use the legacy mode to ensure compatibility with your target systems. Choose between:</p> <ul style="list-style-type: none">▪ Default (recommended): This is the default monitoring method for SSH sensors. It provides best performance and security.▪ Compatibility Mode (deprecated): Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

-  You can also individually select the SSH engine for each SSH sensor in the sensor settings.

CREDENTIALS FOR VMWARE/XENSERVER

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User	Enter a login name for access to VMware and Xen servers. Usually, you will use credentials with administrator privileges.
Password	Enter a password for access to VMware and Xen servers. Usually, you will use credentials with administrator privileges.  Single Sign-On (SSO) passwords for vSphere do not support special characters. See the manual sections for VMware sensors for details.
VMware Protocol	Define the protocol used for the connection to VMware and XenServer. Choose between: <ul style="list-style-type: none">▪ HTTPS (recommended): Use an SSL-encrypted connection to VMware and XenServers.▪ HTTP: Use an unencrypted connection to VMware and XenServers.
Session Pool	Define if you want to use session pooling for VMware sensors. Choose between: <ul style="list-style-type: none">▪ Reuse session for for multiple scans (recommended): Select this option to use session pooling. With session pooling, a VMware sensor uses the same session as created in advance to query data and needs not to log in and out for each sensor scan. We recommend that you choose this option because it reduces network load and log entries on the target device, resulting in better performance.▪ Create a new session for each scan: If you select this option and disable session pooling, a VMware sensor has to log in and out for each sensor scan. We recommend that you use the session pooling option above for better performance.

CREDENTIALS FOR SNMP DEVICES

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

SNMP Version	<p>Select the SNMP version for the device connection. Choose between:</p> <ul style="list-style-type: none"> ▪ v1: Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices. <ul style="list-style-type: none">  SNMP v1 does not support 64-bit counters. This may result in invalid data when monitoring traffic via SNMP. ▪ v2c (recommended): Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters. ▪ v3: Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption. <ul style="list-style-type: none">  When using SNMP v3 you can only monitor a limited number of sensors per second due to internal limitations. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds limits you to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased Interval Delay or Open Requests with the Probe Health Sensor¹⁵⁰⁰, distribute the load over multiple probes³⁷⁰⁹. SNMP v1 and v2 do not have this limitation.
Community String	<p>This setting is only visible if you select SNMP version v1 or v2c above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.</p>
Authentication Type	<p>This setting is only visible if you select SNMP version v3 above. Choose between:</p> <ul style="list-style-type: none"> ▪ MD5: Use Message-Digest Algorithm 5 (MD5) for authentication. ▪ SHA: Use Secure Hash Algorithm (SHA) for authentication. <p>The type you choose must match the authentication type of your device.</p> <ul style="list-style-type: none">  If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field Password empty. In this case, SNMP_SEC_LEVEL_NOAUTH is used and authentication deactivated entirely.

CREDENTIALS FOR SNMP DEVICES

User	This setting is only visible if you select SNMP version v3 above. Enter a username for secure authentication. This value must match the username of your device.
Password	This setting is only visible if you select SNMP version v3 above. Enter a password for secure authentication. This value must match the password of your device.
Encryption Type	<p>This setting is only visible if you select SNMP version v3 above. Select an encryption type. Choose between:</p> <ul style="list-style-type: none">▪ DES: Use Data Encryption Standard (DES) as encryption algorithm.▪ AES: Use Advanced Encryption Standard (AES) as encryption algorithm. <p> AES 192 and AES 256 are not supported by Net-SNMP. They lack RFC specification.</p> <p> The type that you choose must match the encryption type of your device.</p>
Data Encryption Key	<p>This setting is only visible if you select SNMP version v3 above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device.</p> <p> If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.</p>
Context Name	This setting is only visible if you select SNMP version v3 above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port for the SNMP communication. We recommend that you use the default value.
SNMP Timeout (Sec.)	Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered. The maximum timeout value is 300 seconds (5 minutes).

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

The settings you define in this section apply to the following sensor types:

- [ADO SQL v2 Sensor](#)⁴⁶³
- [Microsoft SQL v2 Sensor](#)¹²⁶⁷
- [MySQL v2 Sensor](#)¹²⁸⁴
- [Oracle SQL v2 Sensor](#)¹⁴⁵⁷
- [PostgreSQL Sensor](#)¹⁵⁷⁴

Port for Databases Define which ports PRTG will use for connections to the monitored databases. Choose between:

- **Set automatically (default port, recommended):** PRTG automatically determines the type of the monitored database and uses the corresponding default port to connect. See below for a list of default ports.
- **Define one custom port valid for all database sensors:** Choose this option if your database management systems do not use the default ports. Define the port for database connections manually below. If you choose this option, PRTG will use the custom port for all database sensors.

If you choose the automatic port selection, PRTG uses the following default ports:

- **Microsoft SQL:** 1433
- **MySQL:** 3306
- **Oracle SQL:** 1521
- **PostgreSQL:** 5432

Custom Database Port Enter the number of the port that PRTG will use for database connections. Please enter an integer value.

 All database sensors on this device will use this port to connect.

Authentication Mode Select the authentication method for the connection to the SQL database. Choose between:

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

- **Windows authentication with impersonation:** If you select this option, PRTG uses the Windows credentials as defined in the particular [device settings](#)^[407] for the database connection.
 - ❗ The user whose credentials are used needs to have permissions to log on to the system on which the PRTG probe with a database sensor runs. This is required for the impersonation.
- **SQL server authentication:** Choose this option if you want to use explicit credentials for database connections.

User	This field is only visible if you select SQL server authentication above. Enter the username for the database connection.
Password	This field is only visible if you select SQL server authentication above. Enter the password for the database connection.
Timeout (Sec.)	Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than this value defines, the sensor cancels the request and triggers an error message. The maximum timeout value is 300 seconds (5 minutes).

CREDENTIALS FOR AMAZON CLOUDWATCH

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Access Key	Enter your Amazon Web Services (AWS) access key. Please see the corresponding Amazon CloudWatch sensor ^[435] documentation to learn more about the rights that are required for querying AWS CloudWatch metrics.
Secret Key	Enter your Amazon Web Services (AWS) secret key. Please see the corresponding Amazon CloudWatch sensor ^[435] documentation to learn more about the rights that are required for querying AWS CloudWatch metrics.

WINDOWS COMPATIBILITY OPTIONS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

When experiencing problems while monitoring via Windows sensors, you can set some compatibility options for troubleshooting.

Preferred Data Source	<p>Define the method Windows sensors will use to query data. This setting is valid only for hybrid sensors offering performance counter and Windows Management Instrumentation (WMI) technology. The setting will be ignored for all other sensors! Choose between:</p> <ul style="list-style-type: none"> ▪ Performance Counters and fallback to WMI: Try to query data via performance counters. If this is not possible, establish a connection via WMI. ▪ Performance Counters only: Query data via performance counters only. If this is not possible, a sensor will return no data. ▪ WMI only (recommended): Query data via WMI only. If this is not possible, a sensor will return no data. In current PRTG versions, this is our recommendation to achieve best performance and stability.
Timeout Method	<p>Specify the time the sensor will wait for the return of its WMI query before aborting it with an error message. Choose between:</p> <ul style="list-style-type: none"> ▪ Use 1.5x scanning interval (recommended): Use a default of one and a half times the scanning interval set for the sensor (see below in this settings). ▪ Set manually: Enter a timeout value manually. <p>We recommend that you use the default value. Only if you experience ongoing timeout errors, try increasing the timeout value.</p>
Timeout Value (Sec.)	<p>This field is only visible if the manual timeout method is selected above. Enter the time the sensor will wait for the return of its WMI query before aborting with an error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).</p>

SNMP COMPATIBILITY OPTIONS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

SNMP COMPATIBILITY OPTIONS

When experiencing problems while monitoring via Simple Network Management Protocol (SNMP) sensors, you can set some compatibility options for troubleshooting.

SNMP Delay (ms)	Add a time in milliseconds that will be waited between two SNMP requests. This can help increase device compatibility. Please enter an integer value. We recommend that you use the default value. If you experience SNMP connection failures, please increase it. You can define a delay between 0 and 100 , higher delays are not supported and will be discarded.
Failed Requests	Define if an SNMP sensor will try again after a request fails. <ul style="list-style-type: none">▪ Retry (recommended): Try again if an SNMP request fails. This can help prevent false error messages due to temporary timeout failures.▪ Do not retry: Do not retry if an SNMP request fails. With this setting enabled an SNMP sensor will be set to error status earlier.
Overflow Values	Define how PRTG will handle overflow values. Some devices do not handle internal buffer overflows correctly. This can cause false peaks. <ul style="list-style-type: none">▪ Ignore overflow values: Ignore overflow values and do not include them in the monitoring data.▪ Handle overflow values as valid results: Regard all overflow values as regular data and include them in the monitoring data. We recommend that you use the default value. <p> If you experience problems because of strange peaks in your data graphs, change this option. Peaks might indicate that the monitored device resets counters without an overflow. PRTG interprets such a behavior as overflow that results in data peaks. Choose the option Ignore overflow values in this case. For more details, see this Knowledge Base article: What is the Overflow Values setting in the SNMP Compatibility Options?</p>
Zero Values	Define how PRTG will handle zero values. Some devices send incorrect zero values. This can cause false peaks. <ul style="list-style-type: none">▪ Ignore zero values for delta sensors (recommended): Ignore zero values and do not include them in the monitoring data.▪ Handle zero values as valid results for delta sensors: Regard all zero values as regular data and include them in the monitoring data. We recommend that you use the default value. If you experience problems, change this option.

SNMP COMPATIBILITY OPTIONS

- 32-bit/64-bit Counters** Define which kind of traffic counters PRTG will search for on a device.
- **Use 64-bit counters if available (recommended):** The interface scan will use 64-bit traffic counters, if available. This can avoid buffer overflows in the devices.
 - **Use 32-bit counters only:** The interface scan will always use 32-bit traffic counters, even if 64-bit counters are available. This can lead to more reliable monitoring for some devices.

We recommend that you use the default value. If you experience problems, change this option.

- Request Mode** Define which kind of request method PRTG uses for SNMP sensors.
- **Use multi get (recommended):** Bundle multiple SNMP requests into one request.
 - **Use single get:** Use one request for each SNMP value. This can increase compatibility with older devices.

We recommend that you use the default value. If you experience problems, change this option.

 PRTG uses **paging** for SNMP requests. This means that if a sensor has to query more than 20 OIDs, it will automatically poll the OIDs in packages of 20 OIDs each per request.

- Port Name Template** Define how the name of SNMP sensors created on a device will be put together. Enter a template using several variables. When adding new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID usually several fields are available with interface descriptions. They are different for every device and OID. PRTG will use the information in these fields to name the sensors. If a field is empty or not available, an empty string is added to the name. As default, **([port]) [ifalias]** is set as port name template, which will create a name such as **(001) Ethernet1**, for example. You can use any field names available at a certain OID of your device, among which are:
- **[port]:** The port number of the monitored interface.
 - **[ifalias]:** The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling.
 - **[ifname]:** The textual name of the monitored interface as assigned by the local device.
 - **[ifdescr]:** A textual string containing information about the monitored device or interface, for example, manufacturer, product name, version.

SNMP COMPATIBILITY OPTIONS

- **[ifspeed]**: An estimate of the monitored interface's current bandwidth (KBit/s).
- **[ifsensor]**: The type of the sensor, this is **SNMP Traffic** or **SNMP RMON**. This is useful to differentiate between your [SNMP Traffic](#) ²⁴⁶⁷ and [SNMP RMON](#) ²⁴⁰⁵ sensors.

Combine them as you like to obtain suitable sensor names.

 For more information about SNMP sensor names, see this Knowledge Base article: [How can I change the defaults for names automatically generated for new SNMP sensors?](#)

Port Name Update

Define how PRTG will react if you change port names in your physical device (for example, a switch or router). Choose between:

- **Keep port names (use this if you edit the names in PRTG)**: Do not automatically adjust sensor names. This is the best option if you want to change names in PRTG manually.
- **Automatic sensor name update if name changes in device**: If PRTG detects changes of port names in your physical device, it will try to automatically adjust sensor names accordingly.

 For more information about automatic updates of names, see this Knowledge Base article: [Automatically update port name and number for SNMP Traffic sensors when the device changes them](#)

Port Identification

Define which field will be used for SNMP interface identification. Choose between:

- **Automatic (recommended)**: Tries the ifAlias field first to identify an SNMP interface and then ifDescr.
 -  ifName will not be tried automatically.
- **Use ifAlias**: For most devices ifAlias is the best field to get unique interface names.
- **Use ifDescr**: Use this option if the port order of your device changes after a reboot, and there is no ifAlias field available. For example, this is the best option for Cisco ASA devices.
 -  When using this option it is important that your device returns unique interface names in the ifDescr field.
- **Use ifName**: You can also use this option if there is no unique ifAlias available.
 -  When using this option, it is important that your device returns unique interface names in the ifName field.

SNMP COMPATIBILITY OPTIONS

- **No Port Update:** Use this option to disable automatic port identification.

Start Interface Index For [SNMP Traffic sensors](#)²⁴⁶⁷, define at which index PRTG will start to query the interface range during sensor creation. Use **0** for automatic mode. We recommend that you use the default value.

End Interface Index For [SNMP Traffic sensors](#)²⁴⁶⁷, define at which index PRTG will stop to query the interface range during sensor creation. Use **0** for automatic mode. We recommend that you use the default value.

PROXY SETTINGS FOR HTTP SENSORS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

HTTP Proxy Settings The proxy settings determine how a sensor connects to a given URL. You can enter data for an HTTP proxy server that sensors will use when connecting via HTTP or HTTPS.

-  This setting affects monitoring only and determines the behavior of HTTP sensors. To change proxy settings for the core server, see [System Administration—Core & Probes](#)³³⁶⁸.
-  The [SSL Certificate Sensor](#)²⁶³⁵ and the [SSL Security Check Sensor](#)²⁶⁴⁶ do not support HTTP proxies, but you can configure connections via SOCKS proxies in their sensor settings.

Name Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.

Port Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.

User If the proxy requires authentication, enter the username for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

Password If the proxy requires authentication, enter the password for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

- | | |
|-------------------------|--|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ^[336] on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> |

SCANNING INTERVAL

- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

CLUSTER USAGE

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Distribution This box is only visible if you run a PRTG cluster. Sometimes you want to exclude a certain node from monitoring the sensors running on this probe, group, or device, for example, if a device is not reachable from every node configured in your cluster. In the list of cluster nodes, please select the nodes that will **not** be included in sensor scans. By default, this setting is [inherited](#)¹³⁷ to all objects underneath.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to pause monitoring for a certain time span (days, hours) throughout the week. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Maintenance Window Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current object if its parent object is in a Down status, or if it is paused by another dependency. ▪ Select object: Pause the current object if its parent object is in a Down status, or if it is paused by another dependency. Additionally, pause the current object if a specific other object in the device tree is in a Down status, or if it is paused by another dependency. Select below. <p>i You do not trigger a status change by dependency if you manually pause a master object or if you pause it by schedule.</p> <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects should be paused. You can check all dependencies^[3209] in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the object selector ^[240] to choose an object on which the current object will be dependent on.
Dependency Delay (Sec.)	<p>This field is only visible if you select another object than the parent as dependency type. Define a time span in seconds for dependency delay.</p> <p>After the master object for this dependency comes back to an Up status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

ADVANCED NETWORK ANALYSIS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Unusual Detection Define if you want to benefit from [unusual detection](#)^[336] for sensors. You can configure the behavior of unusual detection (or disable it completely) in the [system settings](#)^[336]. Choose between:

- **Enabled:** Activate unusual detection for this object and, by default, for all objects underneath in the [hierarchy](#)^[133] of the device tree. Sensors affected by this setting will turn to orange color ([unusual sensor status](#)^[195]) if PRTG detects unusual activity.
- **Disabled:** Do not activate unusual detection. PRTG will ignore unusual values for sensors affected by this setting. These sensors will not show an unusual sensor status.

Similar Sensors Detection Define if you want to activate [Similar Sensors](#)^[209] analysis. You can configure the depth of analysis of similar sensors detection (or disable it completely) in the [system settings](#)^[336]. Choose between:

- **Enabled:** Activate similar sensors detection for this object and, by default, for all objects underneath in the [hierarchy](#)^[133] of the device tree. PRTG considers all sensors affected by this setting during similarity analysis.

ADVANCED NETWORK ANALYSIS

- **Disabled:** Do not activate similar sensors detection. PRTG will not consider sensors affected by this setting during similarity analysis.
- System Information Define if you want to retrieve and show [System Information](#)^[222] for your devices. Choose between:
- **Enabled:** Activate the system information feature for this object and, by default, for all objects underneath in the [hierarchy](#)^[133] of the device tree.
 - **Disabled:** Do not activate system information.
-  **System Information** is enabled by default. To retrieve the data, PRTG will automatically use **Credentials for Windows Systems** and **Credentials for SNMP Devices** as defined in the [device settings](#)^[402] or as [inherited](#)^[133] from a parent object like the **Root** group. Please consider this when you monitor devices outside the local network, especially when using **SNMP v1** or **v2c** that do not provide encryption.
-  This setting is not available on the **Hosted Probe** of a PRTG hosted by Paessler instance.

NUMBER OF SENSORS LIMITATION

- Sensor Limit This setting allows the administrator to set a limit for the maximum number of sensors in this group. Subgroups are also included in this limitation. If the amount of sensors exceeds the limitation, surplus sensors will be [paused](#)^[245]. This is of special interest for a Managed Service Provider (MSP). Choose between:
- **Allow unlimited number of sensors:** Do not limit the number of sensors for this group. Any number of sensors can be added to this group and its subgroups.
 - **Limit number of sensors in this group:** Enable a limitation for the number of sensors in this group. Only a defined number of sensors can monitor in this group and its subgroups.
- Maximum Number of Sensors This field is only visible if you enable limitation above. Define how many sensors are allowed in this group and its subgroups. Sensors that exceed this group sensor limit will be paused. Please enter an integer value.

NUMBER OF SENSORS LIMITATION

- ❗ Sensors in [paused status](#)^[195] count for this group limit as well (for example, manually paused sensors, sensors paused by dependency or schedule), but not for the number of available sensors in your license.
- ❗ Manually paused sensors will override the sensor message "exceeds group sensor limit".

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Notifications

The status or the data of a sensor can trigger notifications. Using this mechanism, you can configure external alerting tailored to your needs. In an object's detail page, click the **Notifications** tab to change sensor notification triggers. The defined triggers will be inherited down to sensor level. For detailed information, see [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see [Object Settings](#)^[2171] section.

7.7 Device Settings

On the details page of a device, click the **Settings** tab to change settings.

Add Device

The **Add Device** dialog appears when you add a new device to a group. It only shows the setting fields that are imperative for creating the device in PRTG. Because of this, you will not see all setting fields in this dialog. For example, the **Device Status** option is not available in this step.

 You can change all settings in the **Settings** tab of the device later.

Device Settings

The following settings are available in the **Settings** tab of every device. Because you do not need all of these for every device, depending on the device type, just define the settings you really need and ignore the others.

We recommend that you define as many settings as possible in the [Root](#) ³³¹ group, so you can inherit them to all other objects further down in the [device tree hierarchy](#) ¹³³.

For device settings, there is also multi-edit available. This enables you to change the properties of many devices at a time.

 For more details, see [Multi-Edit Lists](#) ³¹⁹⁷ section.

 This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

BASIC DEVICE SETTINGS

Device Name	Enter a meaningful name to identify the device. PRTG shows this name by default in the device tree ¹⁸¹ and in all Alarms ²¹⁹ and Notifications ³²¹⁶ .
Status	Define the activity status of the device. Choose between: <ul style="list-style-type: none"> ▪ Started: Monitor this device. ▪ Paused: Pause monitoring for this device. All sensors on it are in status ¹⁹⁵ Paused until you change this setting again.

BASIC DEVICE SETTINGS

IP Version	<p>Define which IP protocol PRTG will use to connect to this device. The setting is valid for all sensors created on this device. Choose between:</p> <ul style="list-style-type: none"> ▪ IPv4 device: Use IP version 4 for all requests to this device. ▪ IPv6 device: Use IP version 6 for all requests to this device.
IP Address/DNS Name	<p>Enter the IP address (either v4 or v6, depending on your selection above) or DNS name for the device. Most sensors you create on this device will inherit this setting and try connecting to this address for monitoring.</p> <p> Some sensor types have their own setting for IP address/DNS name to which they connect.</p>
Parent Tags	<p>Shows Tags^[139] that this device inherits^[140] from its parent group and probe^[133]. This setting is shown for your information only and cannot be changed here.</p>
Tags	<p>Enter one or more Tags^[139]. Confirm each tag by with the space, comma, or enter key. Sensors on this device inherit these tags. You can use tags to group sensors and tag-filtered views, for example, in Libraries^[325]. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags, if you like.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority^[242] for the device. This setting determines the order in which your devices are displayed when you view table lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).</p>

ADDITIONAL DEVICE INFORMATION

Device Icon	Choose a device icon from the list. PRTG shows it in the device tree.
-------------	---

ADDITIONAL DEVICE INFORMATION

 For information on how to add your custom icons to PRTG on premises instances, see this article in the Knowledge Base: [How can I add my own device icons for use in the PRTG web interface?](#)

Service URL

Specify a URL you would like to open directly when you select **Device Tools | Go To Service URL** from the [context menu](#)^[254] of the device. For example, you can configure this option to call the address <http://www.example.com/service.html>. Enter a valid URL or leave the field empty.

DEVICE TYPE

Sensor Management

Select which type of auto-discovery you would like to perform for this device. Choose between:

- **Manual (no auto-discovery):** Select this if you want to only create sensors manually.
- **Automatic device identification (standard, recommended):** Use a small set of auto-discovery templates. This will scan your LAN and usually create a set of standard sensors on your device.
- **Automatic device identification (detailed, may create many sensors):** Use an extended set of auto-discovery templates. This will scan your LAN and usually create many sensors on your device.
- **Automatic sensor creation using specific device template (s):** Use specific auto-discovery templates only. Please select templates below. This will scan your LAN and add sensors defined in the template.

Discovery Schedule

This option is only visible if you select one of the auto-discovery options above. Define when the auto-discovery will run. Choose between:

- **Once:** Perform auto-discovery only once. For existing devices, this will initiate a one-time sensor update for the current device. If you select this option, you have to [start the auto-discovery manually](#)^[283], it will not run automatically.
- **Hourly:** Perform auto-discovery for new sensors every hour.
- **Daily:** Perform auto-discovery for new sensors every day.
- **Weekly:** Perform auto-discovery for new sensors every week.

DEVICE TYPE

Device Template(s) This option is only visible if using specific device templates (last option) is enabled above. Choose one or more templates by adding a check mark in front of the respective template name. You can also select and deselect all items by using the check box in the table head. These will be used for auto-discovery on the current device. Choose from:

- **ADSL**
- **Amazon Cloudwatch**
- **Buffalo TeraStation NAS**
- **Cisco ASA VPN**
- **Cisco Device (Generic)**
- **Dell EqualLogic**
- **Dell MDI Disk**
- **DNS Server**
- **Environment Jakarta**
- **Environment Poseidon**
- **FTP Server**
- **Generic Device (PING only)**
- **Generic Device (SNMP-enabled)**
- **Generic Device (SNMP-enabled, Detailed)**
- **HTTP Web Server**
- **Hyper V Host Server**
- **IPMI enabled devices**
- **Juniper NS Device**
- **Linux/UNIX Device (SNMP or SSH enabled)**
- **Mail Server (Generic)**
- **Mail Server (MS Exchange)**
- **Microsoft SharePoint 2010**
- **NAS LenovoEMC**
- **NAS QNAP**
- **NAS Synology**
- **NetApp**
- **NTP Server**

DEVICE TYPE

- **Printer (HP)**
- **Printer Generic**
- **RDP Server**
- **RMON compatible device**
- **Server (Compaq/HP agents)**
- **Server (Dell)**
- **Server Cisco UCS**
- **Server IBM**
- **SonicWall**
- **SSL Security Check**
- **Switch (Cisco Catalyst)**
- **Switch (Cisco IOS Based)**
- **Switch (HP Procurve)**
- **UNIX/Linux Device**
- **UPS Health (APC)**
- **UPS Health (Generic)**
- **UPS Health (Liebert)**
- **VMware ESX / vCenter Server**
- **Webserver**
- **Windows (Detailed via WMI)**
- **Windows (via Remote PowerShell)**
- **Windows (via WMI)**
- **Windows IIS (via SNMP)**
- **XEN Hosts**
- **XEN Virtual Machines**

Once the auto-discovery is finished, PRTG will create a new [ticket](#) ^[230] and list the device templates that were actually used to create new sensors. Templates that were not applied will not be shown in the ticket.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

LOCATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Location (for Geo Maps)

When you want to use [Geo Maps](#)³²¹, enter a location in the first line. Geographical maps will display objects (devices, groups) then with a flag, showing the current status using a color code similar to the [sensor status icons](#)¹⁹⁵ (green - yellow - orange - red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, PRTG will parse latitude and longitude automatically, for example: **49.452778 11.077778** or **enter 49.452778 any 11.077778 text**

A minus sign (-) in the first line will hide an object from geo maps. In this case you can enter location information in line two and following.

You can define a specific label for each location: enter a string denoting the label in the first line and provide geo coordinates in the second line. This geo marker will show then the object with the label in the PRTG geo map.

 The preview map will always have a road map layout regardless of the map layout you set in [User Interface](#)³³⁴⁶.

CREDENTIALS FOR WINDOWS SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

CREDENTIALS FOR WINDOWS SYSTEMS

Domain or Computer Name	Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, enter the computer name here. If you want to use a Windows domain user account (recommended), enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Do not leave this field empty.
User	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	<p>Define the authentication method to use for login. Choose between:</p> <ul style="list-style-type: none"> ▪ Login via Password: Provide a password for login. Enter below. ▪ Login via Private Key: Provide a private key for authentication.  PRTG can only handle keys in OpenSSH format that are not encrypted. You cannot use password-protected keys here. In the text field, paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, see Monitoring via SSH³⁵¹⁰.
Password	This field is only visible if you select password login above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Private Key	This field is only visible if you select private key login above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

i If you do not insert a private key for the first time, but **change** the private key, you need to [restart your PRTG core server service](#)³³⁸⁸ in order for the private key change to take effect! For details, see [Monitoring via SSH](#)³⁵¹⁰.

For WBEM Use Protocol	Define the protocol to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between: <ul style="list-style-type: none"> ▪ HTTP: Use an unencrypted connection for WBEM. ▪ HTTPS: Use an SSL-encrypted connection for WBEM.
For WBEM Use Port	Define the port to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between: <ul style="list-style-type: none"> ▪ Set automatically (port 5988 or 5989): Use one of the standard ports, depending on whether you choose unencrypted or encrypted connection above. ▪ Set manually: Use a custom port. Define below.
WBEM Port	This setting is only visible if you enable manual port selection above. Enter the WBEM port number.
SSH Port	Enter the port number to use for SSH connections. <p>i By default, PRTG uses this setting automatically for all SSH sensors⁴³⁴, unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	Define the rights that you want to use to execute the command on the target system. Choose between: <ul style="list-style-type: none"> ▪ Run the command as the user connecting (default): Use the rights of the user who establishes the SSH connection, as defined above. ▪ Run the command as another user using 'sudo' (with password): Use the rights of another user with a password required for sudo to run commands on the target device, for example, as root user. ▪ Run the command as another user using 'sudo' (without password): Use the rights of another user without a password required for sudo to run commands on the target device, for example, as root user. ▪ Run the command as another user using 'su': Use the rights of another user with su to run commands on the target device.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

Target User	This field is only visible if you choose sudo or su above. Enter a username to run the specified command as a user other than root . If you leave this field empty, you will run the command as root . Ensure you set the Linux password even if you use a public or private key for authentication. This is not necessary if the user is allowed to execute the command without a password.
Password Target User	This field is only visible if you choose to run the commands using su or sudo with password above. Enter the password for the specified target user.
SSH Engine	<p>Select the method you want to use to access data with SSH sensors³⁵¹⁰. We strongly recommend that you keep the default engine! For now, you still can use the legacy mode to ensure compatibility with your target systems. Choose between:</p> <ul style="list-style-type: none"> ▪ Default (recommended): This is the default monitoring method for SSH sensors. It provides best performance and security. ▪ Compatibility Mode (deprecated): Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine. <p> You can also individually select the SSH engine for each SSH sensor in the sensor settings.</p>

CREDENTIALS FOR VMWARE/XENSERVER

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User	Enter a login name for access to VMware and Xen servers. Usually, you will use credentials with administrator privileges.
Password	<p>Enter a password for access to VMware and Xen servers. Usually, you will use credentials with administrator privileges.</p> <p> Single Sign-On (SSO) passwords for vSphere do not support special characters. See the manual sections for VMware sensors for details.</p>
VMware Protocol	Define the protocol used for the connection to VMware and XenServer. Choose between:

CREDENTIALS FOR VMWARE/XENSERVICES

- **HTTPS (recommended):** Use an SSL-encrypted connection to VMware and XenServers.
- **HTTP:** Use an unencrypted connection to VMware and XenServers.

Session Pool

Define if you want to use session pooling for VMware sensors. Choose between:

- **Reuse session for for multiple scans (recommended):** Select this option to use session pooling. With session pooling, a VMware sensor uses the same session as created in advance to query data and needs not to log in and out for each sensor scan. We recommend that you choose this option because it reduces network load and log entries on the target device, resulting in better performance.
- **Create a new session for each scan:** If you select this option and disable session pooling, a VMware sensor has to log in and out for each sensor scan. We recommend that you use the session pooling option above for better performance.

CREDENTIALS FOR SNMP DEVICES

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

SNMP Version

Select the SNMP version for the device connection. Choose between:

- **v1:** Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices.
 -  **SNMP v1 does not support 64-bit counters.**
This may result in invalid data when monitoring traffic via SNMP.
- **v2c (recommended):** Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters.
- **v3:** Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption.

CREDENTIALS FOR SNMP DEVICES

i When using SNMP v3 you can only monitor a limited number of sensors per second due to internal limitations. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds limits you to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased **Interval Delay** or **Open Requests** with the **Probe Health Sensor**, distribute the load over **multiple probes**. SNMP v1 and v2 do not have this limitation.

Community String This setting is only visible if you select SNMP version **v1** or **v2c** above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.

Authentication Type This setting is only visible if you select SNMP version **v3** above. Choose between:

- **MD5**: Use **Message-Digest Algorithm 5** (MD5) for authentication.
- **SHA**: Use **Secure Hash Algorithm** (SHA) for authentication.

The type you choose must match the authentication type of your device.

i If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field **Password** empty. In this case, **SNMP_SEC_LEVEL_NOAUTH** is used and authentication deactivated entirely.

User This setting is only visible if you select SNMP version **v3** above. Enter a username for secure authentication. This value must match the username of your device.

Password This setting is only visible if you select SNMP version **v3** above. Enter a password for secure authentication. This value must match the password of your device.

Encryption Type This setting is only visible if you select SNMP version **v3** above. Select an encryption type. Choose between:

- **DES**: Use **Data Encryption Standard** (DES) as encryption algorithm.
- **AES**: Use **Advanced Encryption Standard** (AES) as encryption algorithm.

i AES 192 and AES 256 are not supported by Net-SNMP. They lack RFC specification.

CREDENTIALS FOR SNMP DEVICES

 The type that you choose must match the encryption type of your device.

Data Encryption Key

This setting is only visible if you select SNMP version **v3** above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device.

 If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.

Context Name

This setting is only visible if you select SNMP version **v3** above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.

SNMP Port

Enter the port for the SNMP communication. We recommend that you use the default value.

SNMP Timeout (Sec.)

Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered. The maximum timeout value is **300** seconds (5 minutes).

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

The settings you define in this section apply to the following sensor types:

- [ADO SQL v2 Sensor](#)⁴⁶³
- [Microsoft SQL v2 Sensor](#)¹²⁶⁷
- [MySQL v2 Sensor](#)¹²⁸⁴
- [Oracle SQL v2 Sensor](#)¹⁴⁵⁷
- [PostgreSQL Sensor](#)¹⁵⁷⁴

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

Port for Databases	<p>Define which ports PRTG will use for connections to the monitored databases. Choose between:</p> <ul style="list-style-type: none"> ▪ Set automatically (default port, recommended): PRTG automatically determines the type of the monitored database and uses the corresponding default port to connect. See below for a list of default ports. ▪ Define one custom port valid for all database sensors: Choose this option if your database management systems do not use the default ports. Define the port for database connections manually below. If you choose this option, PRTG will use the custom port for all database sensors. <p>If you choose the automatic port selection, PRTG uses the following default ports:</p> <ul style="list-style-type: none"> ▪ Microsoft SQL: 1433 ▪ MySQL: 3306 ▪ Oracle SQL: 1521 ▪ PostgreSQL: 5432
Custom Database Port	<p>Enter the number of the port that PRTG will use for database connections. Please enter an integer value.</p> <p> All database sensors on this device will use this port to connect.</p>
Authentication Mode	<p>Select the authentication method for the connection to the SQL database. Choose between:</p> <ul style="list-style-type: none"> ▪ Windows authentication with impersonation: If you select this option, PRTG uses the Windows credentials as defined in the particular device settings^[407] for the database connection. <ul style="list-style-type: none">  The user whose credentials are used needs to have permissions to log on to the system on which the PRTG probe with a database sensor runs. This is required for the impersonation. ▪ SQL server authentication: Choose this option if you want to use explicit credentials for database connections.
User	<p>This field is only visible if you select SQL server authentication above. Enter the username for the database connection.</p>
Password	<p>This field is only visible if you select SQL server authentication above. Enter the password for the database connection.</p>

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

Timeout (Sec.) Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than this value defines, the sensor cancels the request and triggers an error message. The maximum timeout value is **300** seconds (5 minutes).

CREDENTIALS FOR AMAZON CLOUDWATCH

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Access Key Enter your Amazon Web Services (AWS) access key. Please see the corresponding [Amazon CloudWatch sensor](#)^[435] documentation to learn more about the rights that are required for querying AWS CloudWatch metrics.

Secret Key Enter your Amazon Web Services (AWS) secret key. Please see the corresponding [Amazon CloudWatch sensor](#)^[435] documentation to learn more about the rights that are required for querying AWS CloudWatch metrics.

WINDOWS COMPATIBILITY OPTIONS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

When experiencing problems while monitoring via Windows sensors, you can set some compatibility options for troubleshooting.

Preferred Data Source Define the method Windows sensors will use to query data. This setting is valid only for hybrid sensors offering performance counter and Windows Management Instrumentation (WMI) technology. The setting will be ignored for all other sensors! Choose between:

- **Performance Counters and fallback to WMI:** Try to query data via performance counters. If this is not possible, establish a connection via WMI.
- **Performance Counters only:** Query data via performance counters only. If this is not possible, a sensor will return no data.

WINDOWS COMPATIBILITY OPTIONS

	<ul style="list-style-type: none"> ▪ WMI only (recommended): Query data via WMI only. If this is not possible, a sensor will return no data. In current PRTG versions, this is our recommendation to achieve best performance and stability.
Timeout Method	<p>Specify the time the sensor will wait for the return of its WMI query before aborting it with an error message. Choose between:</p> <ul style="list-style-type: none"> ▪ Use 1.5x scanning interval (recommended): Use a default of one and a half times the scanning interval set for the sensor (see below in this settings). ▪ Set manually: Enter a timeout value manually. <p>We recommend that you use the default value. Only if you experience ongoing timeout errors, try increasing the timeout value.</p>
Timeout Value (Sec.)	<p>This field is only visible if the manual timeout method is selected above. Enter the time the sensor will wait for the return of its WMI query before aborting with an error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).</p>

SNMP COMPATIBILITY OPTIONS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

When experiencing problems while monitoring via Simple Network Management Protocol (SNMP) sensors, you can set some compatibility options for troubleshooting.

SNMP Delay (ms)	<p>Add a time in milliseconds that will be waited between two SNMP requests. This can help increase device compatibility. Please enter an integer value. We recommend that you use the default value. If you experience SNMP connection failures, please increase it. You can define a delay between 0 and 100, higher delays are not supported and will be discarded.</p>
Failed Requests	<p>Define if an SNMP sensor will try again after a request fails.</p> <ul style="list-style-type: none"> ▪ Retry (recommended): Try again if an SNMP request fails. This can help prevent false error messages due to temporary timeout failures.

SNMP COMPATIBILITY OPTIONS

	<ul style="list-style-type: none">▪ Do not retry: Do not retry if an SNMP request fails. With this setting enabled an SNMP sensor will be set to error status earlier.
Overflow Values	<p>Define how PRTG will handle overflow values. Some devices do not handle internal buffer overflows correctly. This can cause false peaks.</p> <ul style="list-style-type: none">▪ Ignore overflow values: Ignore overflow values and do not include them in the monitoring data.▪ Handle overflow values as valid results: Regard all overflow values as regular data and include them in the monitoring data. <p>We recommend that you use the default value.</p> <p> If you experience problems because of strange peaks in your data graphs, change this option. Peaks might indicate that the monitored device resets counters without an overflow. PRTG interprets such a behavior as overflow that results in data peaks. Choose the option Ignore overflow values in this case. For more details, see this Knowledge Base article: What is the Overflow Values setting in the SNMP Compatibility Options?</p>
Zero Values	<p>Define how PRTG will handle zero values. Some devices send incorrect zero values. This can cause false peaks.</p> <ul style="list-style-type: none">▪ Ignore zero values for delta sensors (recommended): Ignore zero values and do not include them in the monitoring data.▪ Handle zero values as valid results for delta sensors: Regard all zero values as regular data and include them in the monitoring data. <p>We recommend that you use the default value. If you experience problems, change this option.</p>
32-bit/64-bit Counters	<p>Define which kind of traffic counters PRTG will search for on a device.</p> <ul style="list-style-type: none">▪ Use 64-bit counters if available (recommended): The interface scan will use 64-bit traffic counters, if available. This can avoid buffer overflows in the devices.▪ Use 32-bit counters only: The interface scan will always use 32-bit traffic counters, even if 64-bit counters are available. This can lead to more reliable monitoring for some devices. <p>We recommend that you use the default value. If you experience problems, change this option.</p>
Request Mode	<p>Define which kind of request method PRTG uses for SNMP sensors.</p>

SNMP COMPATIBILITY OPTIONS

- **Use multi get (recommended):** Bundle multiple SNMP requests into one request.
- **Use single get:** Use one request for each SNMP value. This can increase compatibility with older devices.

We recommend that you use the default value. If you experience problems, change this option.

 PRTG uses **paging** for SNMP requests. This means that if a sensor has to query more than 20 OIDs, it will automatically poll the OIDs in packages of 20 OIDs each per request.

Port Name Template

Define how the name of SNMP sensors created on a device will be put together. Enter a template using several variables. When adding new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID usually several fields are available with interface descriptions. They are different for every device and OID. PRTG will use the information in these fields to name the sensors. If a field is empty or not available, an empty string is added to the name. As default, **[port] [ifalias]** is set as port name template, which will create a name such as **(001) Ethernet1**, for example. You can use any field names available at a certain OID of your device, among which are:

- **[port]:** The port number of the monitored interface.
- **[ifalias]:** The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling.
- **[ifname]:** The textual name of the monitored interface as assigned by the local device.
- **[ifdescr]:** A textual string containing information about the monitored device or interface, for example, manufacturer, product name, version.
- **[ifspeed]:** An estimate of the monitored interface's current bandwidth (KBit/s).
- **[ifsensor]:** The type of the sensor, this is **SNMP Traffic** or **SNMP RMON**. This is useful to differentiate between your **SNMP Traffic** [2467] and **SNMP RMON** [2405] sensors.

Combine them as you like to obtain suitable sensor names.

 For more information about SNMP sensor names, see this Knowledge Base article: [How can I change the defaults for names automatically generated for new SNMP sensors?](#)

Port Name Update

Define how PRTG will react if you change port names in your physical device (for example, a switch or router). Choose between:

SNMP COMPATIBILITY OPTIONS

- **Keep port names (use this if you edit the names in PRTG):** Do not automatically adjust sensor names. This is the best option if you want to change names in PRTG manually.
- **Automatic sensor name update if name changes in device:** If PRTG detects changes of port names in your physical device, it will try to automatically adjust sensor names accordingly.

 For more information about automatic updates of names, see this Knowledge Base article: [Automatically update port name and number for SNMP Traffic sensors when the device changes them](#)

Port Identification

Define which field will be used for SNMP interface identification. Choose between:

- **Automatic (recommended):** Tries the ifAlias field first to identify an SNMP interface and then ifDescr.
 -  ifName will not be tried automatically.
- **Use ifAlias:** For most devices ifAlias is the best field to get unique interface names.
- **Use ifDescr:** Use this option if the port order of your device changes after a reboot, and there is no ifAlias field available. For example, this is the best option for Cisco ASA devices.
 -  When using this option it is important that your device returns unique interface names in the ifDescr field.
- **Use ifName:** You can also use this option if there is no unique ifAlias available.
 -  When using this option, it is important that your device returns unique interface names in the ifName field.
- **No Port Update:** Use this option to disable automatic port identification.

Start Interface Index

For [SNMP Traffic sensors](#)²⁴⁶⁷, define at which index PRTG will start to query the interface range during sensor creation. Use 0 for automatic mode. We recommend that you use the default value.

End Interface Index

For [SNMP Traffic sensors](#)²⁴⁶⁷, define at which index PRTG will stop to query the interface range during sensor creation. Use 0 for automatic mode. We recommend that you use the default value.

PROXY SETTINGS FOR HTTP SENSORS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

HTTP Proxy Settings The proxy settings determine how a sensor connects to a given URL. You can enter data for an HTTP proxy server that sensors will use when connecting via HTTP or HTTPS.

-  This setting affects monitoring only and determines the behavior of HTTP sensors. To change proxy settings for the core server, see [System Administration—Core & Probes](#)^[3368].
-  The [SSL Certificate Sensor](#)^[2635] and the [SSL Security Check Sensor](#)^[2646] do not support HTTP proxies, but you can configure connections via SOCKS proxies in their sensor settings.

Name Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.

Port Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.

User If the proxy requires authentication, enter the username for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

Password If the proxy requires authentication, enter the password for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)^[3355] on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

CLUSTER USAGE

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Distribution This box is only visible if you run a PRTG cluster. Sometimes you want to exclude a certain node from monitoring the sensors running on this probe, group, or device, for example, if a device is not reachable from every node configured in your cluster. In the list of cluster nodes, please select the nodes that will **not** be included in sensor scans. By default, this setting is [inherited](#)¹³⁷ to all objects underneath.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to pause monitoring for a certain time span (days, hours) throughout the week. You can create new schedules and edit existing ones in the [account settings](#)³³¹.

 Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Maintenance Window Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

 To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current object if its parent object is in a Down status, or if it is paused by another dependency. ▪ Select object: Pause the current object if its parent object is in a Down status, or if it is paused by another dependency. Additionally, pause the current object if a specific other object in the device tree is in a Down status, or if it is paused by another dependency. Select below. <p> You do not trigger a status change by dependency if you manually pause a master object or if you pause it by schedule.</p> <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects should be paused. You can check all dependencies^[323] in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the object selector ^[240] to choose an object on which the current object will be dependent on.
Dependency Delay (Sec.)	<p>This field is only visible if you select another object than the parent as dependency type. Define a time span in seconds for dependency delay.</p> <p>After the master object for this dependency comes back to an Up status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

ADVANCED NETWORK ANALYSIS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Unusual Detection Define if you want to benefit from [unusual detection](#)^[336] for sensors. You can configure the behavior of unusual detection (or disable it completely) in the [system settings](#)^[336]. Choose between:

- **Enabled:** Activate unusual detection for this object and, by default, for all objects underneath in the [hierarchy](#)^[133] of the device tree. Sensors affected by this setting will turn to orange color ([unusual sensor status](#)^[195]) if PRTG detects unusual activity.
- **Disabled:** Do not activate unusual detection. PRTG will ignore unusual values for sensors affected by this setting. These sensors will not show an unusual sensor status.

Similar Sensors Detection Define if you want to activate [Similar Sensors](#)^[209] analysis. You can configure the depth of analysis of similar sensors detection (or disable it completely) in the [system settings](#)^[336]. Choose between:

- **Enabled:** Activate similar sensors detection for this object and, by default, for all objects underneath in the [hierarchy](#)^[133] of the device tree. PRTG considers all sensors affected by this setting during similarity analysis.

ADVANCED NETWORK ANALYSIS

- **Disabled:** Do not activate similar sensors detection. PRTG will not consider sensors affected by this setting during similarity analysis.
- System Information Define if you want to retrieve and show [System Information](#)^[222] for your devices. Choose between:
- **Enabled:** Activate the system information feature for this object and, by default, for all objects underneath in the [hierarchy](#)^[133] of the device tree.
 - **Disabled:** Do not activate system information.
-  **System Information** is enabled by default. To retrieve the data, PRTG will automatically use **Credentials for Windows Systems** and **Credentials for SNMP Devices** as defined in the [device settings](#)^[402] or as [inherited](#)^[133] from a parent object like the **Root** group. Please consider this when you monitor devices outside the local network, especially when using **SNMP v1** or **v2c** that do not provide encryption.
-  This setting is not available on the **Hosted Probe** of a PRTG hosted by Paessler instance.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Notifications

The status or the data of a sensor can trigger notifications. Using this mechanism, you can configure external alerting tailored to your needs. In an object's detail page, click the **Notifications** tab to change sensor notification triggers. The defined triggers will be inherited down to sensor level. For detailed information, see [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see [Object Settings](#)^[217] section.

7.8 Sensor Settings

There are more than 200 different sensor types available. In the **Add Sensor** dialog, all sensors are categorized into groups to help you quickly find what you need. Once you are familiar with the interface, you will probably enter the first letters of a sensor type's name into the **Search** field in the upper-left corner and get to a sensor even faster.

Available Sensor Types

There is a dedicated manual section for every sensor type with details about the available settings.

 For more information, see the [List of Available Sensors](#)^[429].

 For sensor settings, there is also multi-edit available. This enables you to change properties of many sensors at a time. For more details, see section [Multi-Edit Lists](#)^[3197].

To detect unexpected correlations between your network components, PRTG provides a [Similar Sensors](#)^[209] analysis.

Sensor Settings Overview

For information about sensor settings, see the following sections:

- [Sensor Settings—List of Available Sensor Types](#)^{[428][429]}
- [Additional Sensor Types \(Custom Sensors\)](#)^[3155]
- [Sensor Channels Settings](#)^[3160]
- [Sensor Notification Triggers Settings](#)^[3170]

7.8.1 List of Available Sensor Types

This chapter lists all available sensors, arranged both by different categories and in alphabetical order.

i In the [Add a Sensor](#)^[325] assistant, PRTG offers you various options to easily filter for fitting sensor types.

Script World Sensors

In addition to the built-in sensors, you can create your own sensors. Just write a script or a program and use it with a [custom sensor](#)⁴⁵². There are already many free, useful scripts, plugins, and add-ons for PRTG in the [PRTG Script World](#). You can directly open the Script World from the [Add Sensor](#)³²⁵ dialog in the PRTG web interface.

7.8.2 Active Directory Replication Errors Sensor

The Active Directory Replication Errors sensor checks a Windows Domain Controller (DC) for replication errors.

It can show the following:

- Number of consecutive sync failures
- If the source is deleted
- If the scheduled sync is disabled
- Time of the last sync attempt
- Result of the last sync
- Time of the last sync success
- Number of modified consecutive sync failures
- Number of pending replication operations

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Active Directory Replication Errors Sensor

Sensor in Other Languages

Dutch: **Active Directory Replicatie Fouten**, French: **Erreurs de répliation Active Directory**, German: **Active Directory Replikationsfehler**, Japanese: **AD ? ? ? ? ? ? ? ? ? ? ? ?**, Portuguese: **Erros de replicação do Active Directory**, Russian: **Ошибки репликации Active Directory**, Simplified Chinese: **? ? ? ? ? ? ? ?**, Spanish: **Errores de replicación de Active Directory**

Remarks

- The device you add the sensor to must be a Domain Controller (DC).
 - [Requires](#)^[455] valid Windows domain credentials in the [settings of the parent device](#)^[407].
 - [Requires](#)^[455] the probe system to be part of the domain whose Active Directory you monitor.
 - [Requires](#)^[454] .NET 4.5 or later on the probe system. If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
 - We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
 - This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
 - This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Requirement: Member of Windows Domain

This sensor only works if the computer running the PRTG probe is part of the domain whose Active Directory you want to monitor. The probe runs either on the local system (on every node, if on a cluster probe), or on another system as [remote probe](#)^[3709]. If this requirement is not met, the sensor will not work. You have to add the sensor to a device that represents your Domain Controller (DC) in PRTG.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the [parent device's](#)^[407] **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

 If you use local credentials, please make sure that the same Windows user accounts (with the same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the replications you want to monitor. PRTG creates one sensor for each replication neighbor you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Replication Neighbor	Select the replication neighbor whose replication you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
----------------------	--

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Replication Neighbor	Shows the replication neighbor whose replication this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
----------------------	---

DEBUG OPTIONS

- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result:** Do not store the sensor result.
 - **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).
- Stack Unit** This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ^[335] on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: Which .NET version does PRTG require?

- <https://kb.paessler.com/en/topic/60543>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.3 ADO SQL v2 Sensor

The ADO SQL v2 sensor monitors a database using an ActiveX Data Objects (ADO) connection and executes a Structured Query Language (SQL) query. It can monitor any data source that is available via OLE DB (Object Linking and Embedding, Database) or ODBC (Open Database Connectivity).

It can show the following:

- Execution time of the whole request (including connection buildup, query execution, transaction handling, disconnection)
- Execution time of the given query
- Number of rows that were addressed by the query (including **select** statements if you process data tables)
- It can also process the data table and show defined values in individual channels.

Remarks

- [Requires](#) ¹²⁶⁸ .NET 4.5 or later on the probe system.
- Define credentials, custom port (if required), and timeout in settings section [Credentials for Database Management Systems](#) ⁴¹³ of the parent device, or in the settings of a group or probe above.
- Your SQL query must be stored in a file on the system of the probe the sensor is created on. If you use it on a remote probe, store the file on the system running the remote probe. In a cluster setup, copy the file to every cluster node.

- PRTG Manual: [Monitoring Databases](#)^[3534] (includes an [example](#)^[3535] for channel value selection)
 - Knowledge Base: [How to setup the SQL v2 sensors in PRTG? Is there a guide?](#)
 - Knowledge Base: [How can I monitor strings from an SQL database and show a sensor status depending on it?](#)
 - Knowledge Base: [How can I monitor error tables in SQL databases?](#)
 - Knowledge Base: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)
 - Save the SQL script with the query into the `\Custom Sensors\sql\adosql` subfolder of your PRTG installation. See manual section [Data Storage](#)^[3731] for more information about how to find this path.
 - If you use an ODBC connection, you have to define the ODBC connection in the **Windows ODBC Connection Manager** first. If it is a 64-bit Windows, you need to define the ODBC connection as an ODBC 32-bit connection.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DATABASE SPECIFIC

Connection String	<p>Enter the string that the sensor will use to connect to the database. For example, a connection string can look like this:</p> <pre>Provider=SQLOLEDB.1;Data Source=10.0.0.200\SQLEXPRESS;User ID=user;Password=userpass;Initial Catalog=Northwind</pre> <p>i For ODBC connections, you need to enter MSDASQL as provider, for example <code>Provider=MSDASQL;DSN=_my_odbc_sqlserver.</code></p> <p>i You can use the placeholders %dbloginuser and %dbloginpassword here. PRTG will replace them with the Credentials for Database Management Systems^[413] of the parent device.</p>
-------------------	--

DATA

SQL Query File

Select an SQL script file that includes a valid SQL statement to execute on the server. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

The script will be executed with every scanning interval. The list contains SQL scripts from the database management system specific `\Custom Sensors\sql` subfolder of your PRTG installation. Store your script there. If used on a remote probe, the file must be stored on the system running the remote probe. If used on a cluster probe, you must store the file on all servers running a cluster node!

 For more information on how to find this path, see section [Data Storage](#). By default, there is the demo script **Demo Serveruptime.sql** available that you can use to monitor the uptime of the target server.

For example, a correct expression in the file could be: **SELECT AVG (UnitPrice) FROM Products**. If you want to use transactions, separate the individual steps with semicolons ";".

 Please be aware that with each request, the full result set will be transferred, so use filters and limits in your query.

 See also this Knowledge Base article: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)

SQL Variables

You can use the following variables in your query file to have them replaced by an input parameter. This is useful if you have various SQL sensors with queries that differ in only one parameter.

- Microsoft SQL, MySQL, PostgreSQL: **@prt g**
- Oracle SQL: **:prt g**
- ADO SQL: **?** (question mark)

@prt g, **:prt g**, and **?** behave like common SQL variables, so consider the general rules for SQL variables. For example, you cannot use a variable for a table in the FROM statement of a query.

Example for variables usage: **SELECT * FROM Table WHERE @prt g**

Use Input Parameter

Define if you want to pass a parameter to your SQL query file. This will replace the variables **@prt g** (Microsoft SQL, MySQL, PostgreSQL), or **:prt g** (Oracle SQL), or **?** (ADO SQL) in the SQL query, considering the general rules for SQL variables. Choose between:

DATA

- **Don't use input parameter (default):** Execute the SQL query file without using variables.
- **Use input parameter:** Execute an SQL query file that contains a variable. Provide the parameter you want to use in the query below.

Input Parameter

This field is only visible if you choose **Use input parameter** above. Enter the parameter you want to pass to the SQL query file. This parameter will replace the variable `@prtg` or `:prtg` or `?` in the SQL query, considering the general rules for SQL variables.

You can also use PRTG placeholders for custom sensors (command line parameters) as input parameter, for example, `%sensorid` or `%deviceid`. For details, see section [Custom Sensors](#).

 Provide strings as they are and do not surround them with quotation marks. PRTG will correctly insert string parameters into the query automatically.

Use Transaction

Define if you want to use transactions and if they will affect the database content. Choose between:

- **Don't use transaction (default):** No transactions will be executed.
- **Use transaction and always rollback:** Choose this option to ensure that no data in the database will be changed by the query. In the SQL query file, separate the single steps of the transaction with semicolons.
- **Use transaction and commit on success:** Choose this option to perform changes on the database with the query. The changes will only apply if all execution steps succeed without any errors. In the SQL query file, separate the single steps of the transaction with semicolons.

Data Processing

Define if you want to process data from the database. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

- **Just execute the query:** If you select this option, the sensor will only show information about the number of affected rows and the execution time of the query. Affected rows are rows that were changed somehow with the query (for example, created, deleted, edited).
- **Count table rows:** Choose this option if you perform a **SELECT** statement and want to monitor how many rows of the data table this statement returns.

DATA

- **Process data table:** Select this option to read and analyze the queried data table. If you select this option, the sensor will count rows with **SELECT** statements as well.

Handle DBNull in Channel Values as

This setting is only visible if you select **Process data table** above. Define the sensor behavior if **DBNull** is returned by the query. Choose between:

- **Error:** The sensor will show a **Down** status if **DBNull** is reported.
- **Number 0:** The sensor will recognize the result **DBNull** as a valid value and interpret it as the number **0**.

Select Channel Value by

This setting is only visible if you select **Process data table** above. Define how the desired cell in the database table will be selected. This is necessary to configure the cells that will be used in the sensor channels. Choose between:

- **Column number:** The channel value will be determined by using the value in row 0 of the column whose number you specify below.
- **Column name:** The channel value will be determined by using the value in row 0 of the column whose name you specify below.
- **Row number:** The channel value will be determined by using the value in column 0 of the row whose number you specify below.
- **Key value pair:** The channel value will be determined by searching in column 0 for the key you specify below and returning the value in column 1 of the same row where the key value was found.

The option you choose here also defines the method to optionally determine a value for the sensor message. For details, see setting **Use Data Table Value in Sensor Message** below.

 See manual section [Monitoring Databases](#)  for an [example](#)  for channel value selection.

Sensor Channel #x

This setting is only visible if you select **Process data table** above. You can define up to 10 different channels for the data processing of this sensor. You have to define at least one data channel if you process the data table, so you will see all available settings for **Channel #1** without enabling it manually. For all other possible channels, choose between:

- **Disable:** This channel will not be added to the sensor.
- **Enable:** This channel will be added to the sensor. Define the settings as described above.

DATA

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Channel #x Name This setting is only visible if you select **Process data table** above. Enter a unique name for the channel. Please enter a string. Channels will be generated dynamically with this name as identifier. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Channel #x Column Number This setting is only visible if you select **Column number** above. Provide the number of the column that will be used to determine the channel value in row 0. Please enter an integer value.

Sensor Channel #x Column Name This setting is only visible if you select **Column number** above. Provide the name of the column that will be used to determine the channel value in row 0. Please enter a string.

Sensor Channel #x Row Number This setting is only visible if you select **Row number** above. Provide the number of the row that will be used to determine the channel value in column 0. Please enter an integer value.

Sensor Channel #x Key This setting is only visible if you select **Key value pair** above. Provide the key to search for in column 0 of the data table. The value in column 1 of the same row where the key value was found will be used to determine the channel value. Please enter a string.

Sensor Channel #x Mode This setting is only visible if you select **Process data table** above. Define how to display the determined value in the channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

- **Absolute (recommended):** Shows the value as the sensor retrieves it from the data table.
- **Difference:** The sensor calculates and shows the difference between the last and the current value returned from the data table. This mode is not compatible with the unit **Value Lookup**.

Sensor Channel #x Unit This setting is only visible if you select **Process data table** above. Define the unit of the channel value. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

- BytesBandwidth

DATA

- BytesMemory
- BytesDisk
- Temperature
- Percent
- TimeResponse
- TimeSeconds
- TimeHours
- Count
- CPU
- BytesFile
- SpeedDisk
- SpeedNet
- Custom
- Value Lookup

 For more information about the available units, see section [Custom Sensors](#).

 To use [lookups](#) with this channel, choose **Value Lookup** and select your lookup file below. Do not use **Custom** for using lookups with this sensor!

 Using the unit **Value Lookup** is not possible when you choose the **Difference** mode. You will not be able to create the sensor in this case.

Sensor Channel #x
Custom Unit

This setting is only visible if you select **Custom** above. Define a unit for the channel value. Please enter a string.

Sensor Channel #x
Value Lookup

This settings is only visible if you select **Value Lookup** above. Select a [lookup](#) file that you want to use with this channel.

Use Data Table Value in
Sensor Message

This setting is only visible if you select **Process data table** above. Define if the sensor message will show a value from the data table. Choose between:

- **Disable:** Do not use a custom sensor message.
- **Enable:** Define a custom sensor message with a defined value of the data table. Define the value selection below.

The method to determine a value for the sensor message is defined in setting **Select Channel Value by** above.

DATA

Sensor Message Column Number	<p>This setting is only visible if you select Column number and Use Data Table Value in Sensor Message above. Enter the number of a column. The sensor message will show the value in row 0 of this column. Please enter an integer value.</p> <p> Columns and rows start with index 0.</p>
Sensor Message Column Name	<p>This setting is only visible if you select Column name and Use Data Table Value in Sensor Message above. Enter the name of a column. The sensor message will show the value in row 0 of this column. Please enter a string.</p> <p> Columns and rows start with index 0.</p>
Sensor Message Row Number	<p>This setting is only visible if you select Row number and Use Data Table Value in Sensor Message above. Enter the number of a row. The sensor message will show value in column 0 of this row. Please enter an integer value.</p> <p> Columns and rows start with index 0.</p>
Sensor Message Key	<p>This setting is only visible if you select Key value pair and Use Data Table Value in Sensor Message above. Enter a key to search for in column 0 of the data table. The sensor message will show the value in column 1 of the row where the key has been found. Please enter a string.</p> <p> Columns and rows start with index 0.</p>
Sensor Message	<p>This setting is only visible if you select Use Data Table Value in Sensor Message above. Define the sensor message. Please enter a string. Use the placeholder {0} at the position where the value will be added.</p> <p>Example: The message is {0}</p>
If Sensor Message Changes	<p>Define what this sensor will do when the sensor value changes. You can choose between:</p> <ul style="list-style-type: none"> ▪ Ignore changes (default): The sensor takes no action on change. ▪ Trigger 'change' notification: The sensor sends an internal message indicating that its value has changed. In combination with a Change Trigger, you can use this mechanism to trigger a notification <small>(3170)</small> whenever the sensor value changes.
Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p>

DATA

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).
- Stack Unit** This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

PRTG Manual:

- [Monitoring Databases](#)³⁵³⁴

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.4 Amazon CloudWatch Alarm Sensor

The Amazon CloudWatch Alarm sensor monitors the status of an Amazon CloudWatch alarm. It reads the data via the AWS CloudWatch Application Programming Interface (API).

- This sensor can show the status of a configured alarm for a CloudWatch service.

✓ **Sensor Amazon CloudWatch Alarm** ★★★★☆
Threshold Crossed: 1 datapoint (54.92) was not greater than the threshold (1000.0).

Overview Live Data 2 days 30 days 365 days Historic Data Log Settings

Alarm State	1	Ok	Ok	Ok	⚙️
Downtime	-4				⚙️

Amazon CloudWatch Alarm Sensor

Sensor in Other Languages

Dutch: **Amazon CloudWatch Alarm**, French: **Alarme Amazon CloudWatch**, German: **Amazon CloudWatch Alarm**, Japanese: **Amazon CloudWatch** ? ? ? ? , Portuguese: **Amazon CloudWatch Alarmes**, Russian: **Сигнал тревоги Amazon CloudWatch**, Simplified Chinese: **Amazon CloudWatch** ? ? , Spanish: **Alarma Amazon CloudWatch**

Remarks

- The data you see in the sensor message is not necessarily the current data. It merely shows the reason for the current [status](#)^[195] and why the sensor changed to it. This means for the **Up** status, for example, that this data is as old as the amount of time that has passed since the last alarm disappeared.
- [Requires](#)^[480] access rights for CloudWatch queries. For details, see the Knowledge Base: [How do I define access rights for Amazon CloudWatch queries?](#)
- [Requires](#)^[480] .NET 4.5 or higher on the probe system.
- Define [Credentials for Amazon CloudWatch](#)^[415] in settings that are higher in the [Object Hierarchy](#)^[133], for example, in the [parent device settings](#)^[402].
- Names of configured alarms that you want to monitor must not contain double spaces.

- Amazon will charge you (a small amount) for each "Amazon CloudWatch API Request" query the sensor sends to the Amazon servers. For details, see the Knowledge Base: [How much does Amazon charge for using the CloudWatch API?](#)
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).
- Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: Access Rights for Amazon CloudWatch Queries

The **AWS Identity and Access Management (IAM)** account that you use with the Amazon CloudWatch sensor needs specific rights to query any metrics.

 For details, see this Knowledge Base article: [How do I define access rights for Amazon CloudWatch queries?](#)

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#). If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG looks for configured alarms on CloudWatch. This can take up to several minutes.

Select which alarm(s) you want to monitor. PRTG creates one sensor for each alarm you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

AMAZON CLOUDWATCH SPECIFIC

Services Select the alarms you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

To better find what you want to monitor, especially in large tables, use the search function in the upper-right corner.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).
----------	---

AMAZON CLOUDWATCH SPECIFIC

Region	<p>Shows the region in which the monitored AWS instance runs. It is one of the following regions:</p> <ul style="list-style-type: none"> ▪ US East (Northern Virginia) ▪ US West (Oregon) ▪ US West (Northern California) ▪ Canada (Central) ▪ EU (Ireland) ▪ EU (London) ▪ EU (Frankfurt) ▪ Asia Pacific (Singapore) ▪ Asia Pacific (Tokyo) ▪ Asia Pacific (Sydney) ▪ Asia Pacific (Seoul) ▪ Asia Pacific (Mumbai) ▪ South America (Sao Paulo) <p>Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p>
Description	Shows the description of the AWS service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
ID	Shows the ID of the AWS instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

AMAZON CLOUDWATCH SPECIFIC

- Result Handling** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result:** Do not store the sensor result.
 - **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).
- Stack Unit** This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ³³⁵ on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

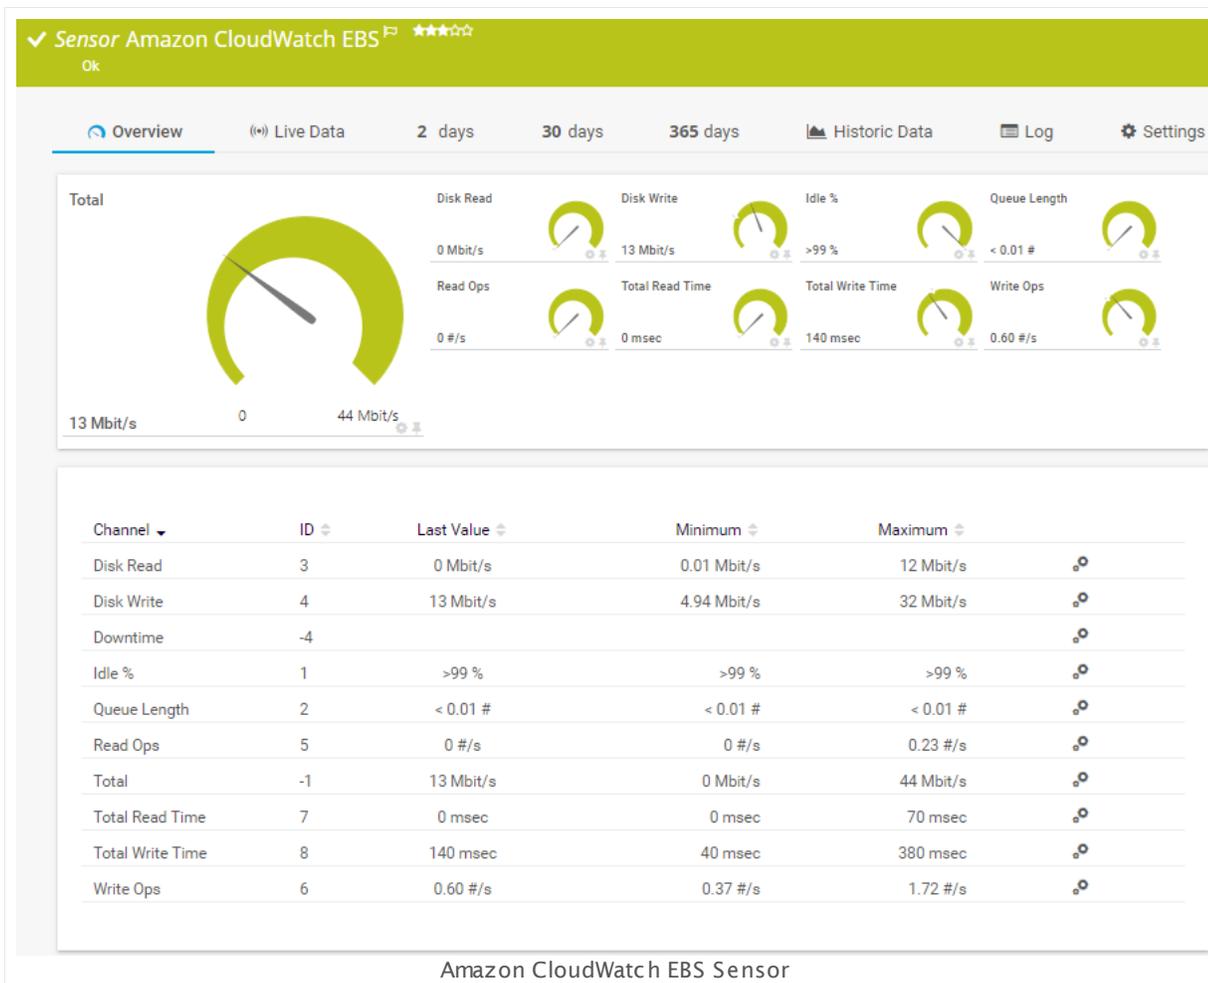

7.8.5 Amazon CloudWatch EBS Sensor

The Amazon CloudWatch EBS sensor monitors the performance of the Amazon Cloud service Elastic Block Store (EBS).

The sensor can show the following:

- Total volume of I/O operations
- Total disk read and write time
- Disk read and write speed
- Number of disk read and write operations per second
- Idle time with no submitted operations
- Number of read and write operations waiting to be completed

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Remarks

- Requires access rights for CloudWatch queries. For details, see the Knowledge Base: [How do I define access rights for Amazon CloudWatch queries?](#)
- Requires .NET 4.5 or higher on the probe system.
- Define [Credentials for Amazon CloudWatch](#) in settings that are higher in the [Object Hierarchy](#), for example, in the [parent device settings](#).
- The minimum scanning interval for this sensor is **15 minutes**.
- Configure [notification triggers](#) with a latency of **0 seconds** to receive all notifications for this sensor (**[...] for at least 0 seconds**).
- This sensor will only show those channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the AWS website. To know which channels are possible for the various services of this Amazon CloudWatch sensor, see the manual section **Supported Metrics**. If the sensor does not receive data from Amazon for more than 6 hours, it will go into error status.
- To know which dimensions you can monitor, see the manual section **Supported Dimensions**.
- Amazon will charge you (a small amount) for each "Amazon CloudWatch API Request" query the sensor sends to the Amazon servers. Depending on the service, each Amazon CloudWatch sensor sends about 10 to 30 requests with each scanning interval. Last time we checked the Amazon price list, they charged max. US\$ 0.014 per 1,000 requests (depending on your region).
For details, see the Knowledge Base: [How much does Amazon charge for using the CloudWatch API?](#)
- Currently, this sensor type is in beta status. The methods of operating can change at any **BETA** time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: Access Rights for Amazon CloudWatch Queries

The **AWS Identity and Access Management (IAM)** account that you use with the Amazon CloudWatch sensor needs specific rights to query any metrics.

 For details, see this Knowledge Base article: [How do I define access rights for Amazon CloudWatch queries?](#)

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#). If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG looks for available instances.

 This can take up to several minutes.

Select which service instance(s) you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

AMAZON CLOUDWATCH SPECIFIC

Services

Select the **Volume** you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

To better find what you want to monitor, especially in large tables, use the search function in the upper-right corner.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

AMAZON CLOUDWATCH SPECIFIC

Region	<p>Shows the region in which the monitored AWS instance runs. It is one of the following regions:</p> <ul style="list-style-type: none"> ▪ US East (Northern Virginia) ▪ US West (Oregon) ▪ US West (Northern California) ▪ Canada (Central) ▪ EU (Ireland) ▪ EU (London) ▪ EU (Frankfurt) ▪ Asia Pacific (Singapore)
--------	---

AMAZON CLOUDWATCH SPECIFIC

- Asia Pacific (Tokyo)
- Asia Pacific (Sydney)
- Asia Pacific (Seoul)
- Asia Pacific (Mumbai)
- South America (Sao Paulo)

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Description	Shows the description of the AWS service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
ID	Shows the ID of the AWS instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Result Handling	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none">  For more information on how to find the folder used for storage, see section Data Storage³⁷³⁴. <p> This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend
-----------------	--

SENSOR DISPLAY

on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁶⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

i This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in [System Administration—Monitoring](#)³³⁵⁵ are not available for this sensor.

For Amazon CloudWatch sensors, the minimum scanning interval is **15 minutes**.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Supported Metrics

AMAZON CLOUDWATCH METRICS

- Elastic Block Store (EBS)

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.6 Amazon CloudWatch EC2 Sensor

The Amazon CloudWatch EC2 sensor monitors the performance of the Amazon Cloud service Elastic Cloud Computing (EC2).

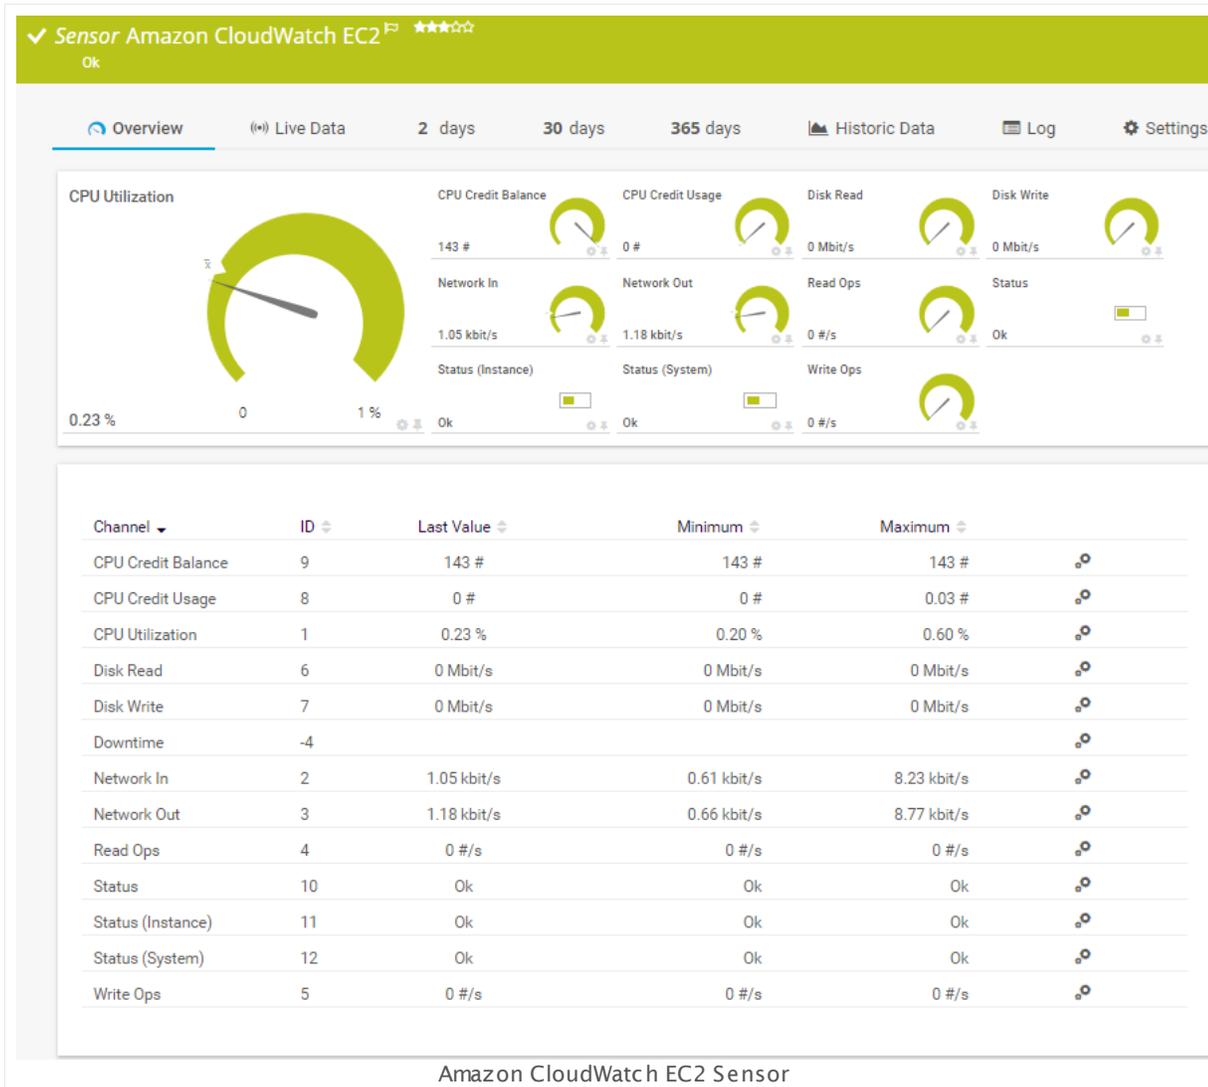

The sensor can show the following:

- CPU utilization
- Network load in and out
- Disk I/O:
 - Read and write speed
 - Number of disk read and write operations per second
- CPU credit usage and balance
- EC2 status checks

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

6 Amazon CloudWatch EC2 Sensor

Remarks

- Requires access rights for CloudWatch queries. For details, see the Knowledge Base: [How do I define access rights for Amazon CloudWatch queries?](#)
- Requires .NET 4.5 or higher on the probe system.
- Define [Credentials for Amazon CloudWatch](#)^[415] in settings that are higher in the [Object Hierarchy](#)^[133], for example, in the [parent device settings](#)^[402].
- The minimum scanning interval for this sensor is **15 minutes**.
- Configure [notification triggers](#)^[3170] with a latency of **0 seconds** to receive all notifications for this sensor ([\[...\] for at least 0 seconds](#)).

- This sensor will only show those channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the AWS website. To know which channels are possible for the various services of this Amazon CloudWatch sensor, see the manual section **Supported Metrics**. If the sensor does not receive data from Amazon for more than 6 hours, it will go into error status.
- To know which dimensions you can monitor, see the manual section **Supported Dimensions**.
- Amazon will charge you (a small amount) for each "Amazon CloudWatch API Request" query the sensor sends to the Amazon servers. Depending on the service, each Amazon CloudWatch sensor sends about 10 to 30 requests with each scanning interval. Last time we checked the Amazon price list, they charged max. US\$ 0.014 per 1,000 requests (depending on your region).
For details, see the Knowledge Base: [How much does Amazon charge for using the CloudWatch API?](#)
- **BETA** Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: Access Rights for Amazon CloudWatch Queries

The **AWS Identity and Access Management (IAM)** account that you use with the Amazon CloudWatch sensor needs specific rights to query any metrics.

 For details, see this Knowledge Base article: [How do I define access rights for Amazon CloudWatch queries?](#)

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵¹ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG looks for available instances.

 This can take up to several minutes.

Select which service instance(s) you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

AMAZON CLOUDWATCH SPECIFIC

Services Select the **Instances** or **Auto Scaling Groups** you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

To better find what you want to monitor, especially in large tables, use the search function in the upper-right corner.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)^[181], as well as in [alarms](#)^[213], [logs](#)^[228], [notifications](#)^[3216], [reports](#)^[3262], [maps](#)^[3270], [libraries](#)^[3235], and [tickets](#)^[230].

Parent Tags Shows [Tags](#)^[139] that this sensor [inherits](#)^[140] from its [parent device, group, and probe](#)^[133]. This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#)^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

AMAZON CLOUDWATCH SPECIFIC

Region Shows the region in which the monitored AWS instance runs. It is one of the following regions:

- US East (Northern Virginia)
- US West (Oregon)
- US West (Northern California)
- Canada (Central)
- EU (Ireland)
- EU (London)
- EU (Frankfurt)
- Asia Pacific (Singapore)
- Asia Pacific (Tokyo)
- Asia Pacific (Sydney)
- Asia Pacific (Seoul)
- Asia Pacific (Mumbai)
- South America (Sao Paulo)

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

AMAZON CLOUDWATCH SPECIFIC

Description	Shows the description of the AWS service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
ID	Shows the ID of the AWS instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Result Handling	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none">  For more information on how to find the folder used for storage, see section Data Storage³⁷³⁴.  This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.

Detailed Monitoring	<p>Choose whether you would like to import more or less detailed monitoring data from the AWS API. Choose between</p> <ul style="list-style-type: none"> ▪ Enabled: You get 1 dataset per minute. ▪ Disabled (default): You get 1 dataset per 5 minutes. <p> To use detailed monitoring in PRTG, you must also activate it for your monitored instance in the AWS web console.</p>
---------------------	---

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-----------------	--

SENSOR DISPLAY

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁶⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

i This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in [System Administration—Monitoring](#)³³⁵⁵ are not available for this sensor.

For Amazon CloudWatch sensors, the minimum scanning interval is **15 minutes**.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Supported Metrics

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.7 Amazon CloudWatch ElastiCache Sensor

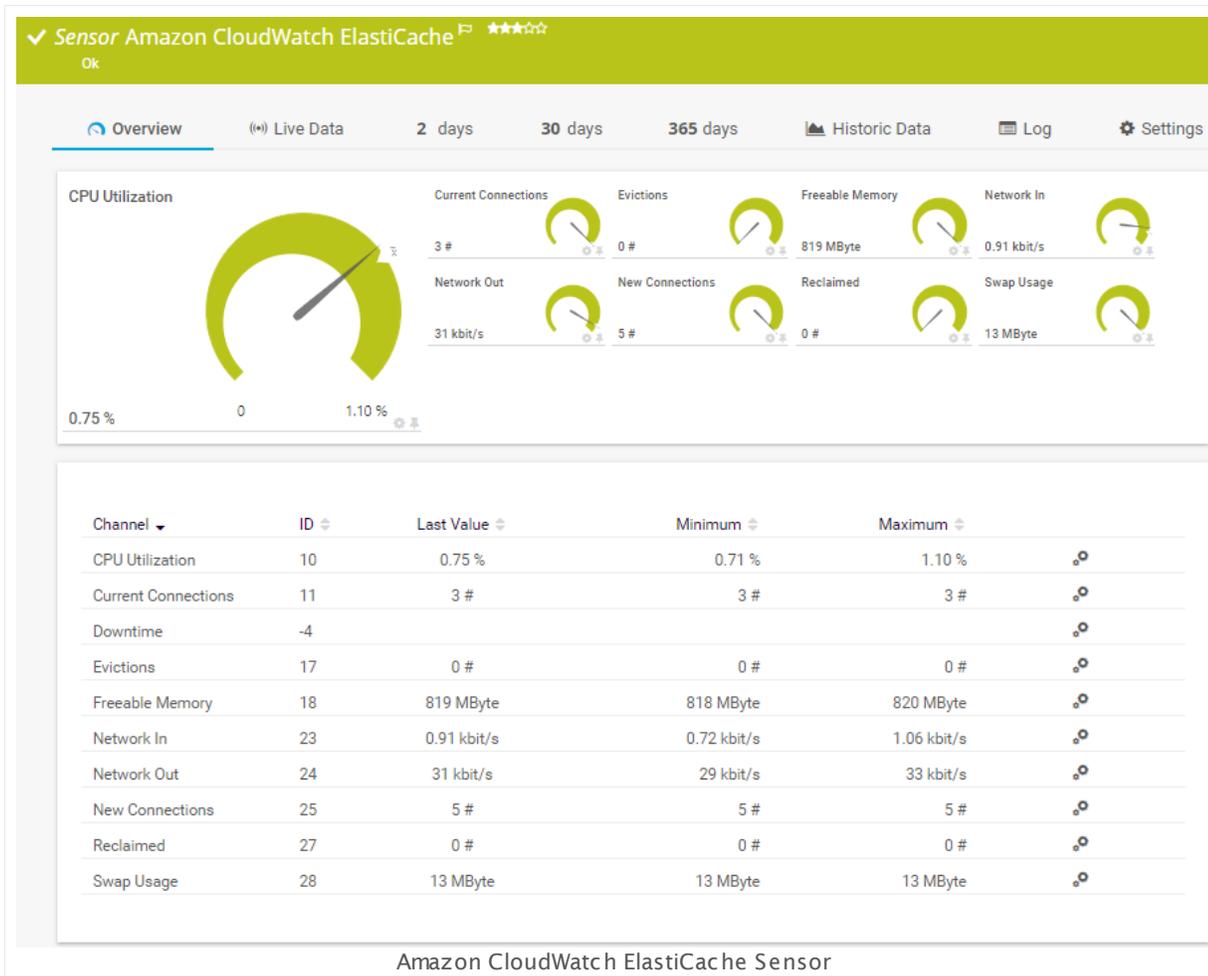

The Amazon CloudWatch ElastiCache sensor monitors the performance of the Amazon Cloud service ElastiCache.

The sensor can show the following:

- CPU utilization
- Memory
- Cache I/O
- Network I/O
- Cache Statistics

See [Supported Metrics](#) ⁵²⁴ for a list of data that this sensor can potentially show in dedicated channels.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Remarks

- Requires access rights for CloudWatch queries. For details, see the Knowledge Base: [How do I define access rights for Amazon CloudWatch queries?](#)
- Requires .NET 4.5 or higher on the probe system.
- Define [Credentials for Amazon CloudWatch](#)^[415] in settings that are higher in the [Object Hierarchy](#)^[133], for example, in the [parent device settings](#)^[402].
- The minimum scanning interval for this sensor is **15 minutes**.
- Configure [notification triggers](#)^[3170] with a latency of **0 seconds** to receive all notifications for this sensor (**[...] for at least 0 seconds**).
- This sensor will only show those channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the AWS website. To know which channels are possible for the various services of this Amazon CloudWatch sensor, see the manual section **Supported Metrics**. If the sensor does not receive data from Amazon for more than 6 hours, it will go into error status.
- To know which dimensions you can monitor, see the manual section **Supported Dimensions**.
- Amazon will charge you (a small amount) for each "Amazon CloudWatch API Request" query the sensor sends to the Amazon servers. Depending on the service, each Amazon CloudWatch sensor sends about 10 to 30 requests with each scanning interval. Last time we checked the Amazon price list, they charged max. US\$ 0.014 per 1,000 requests (depending on your region).
For details, see the Knowledge Base: [How much does Amazon charge for using the CloudWatch API?](#)
- Currently, this sensor type is in beta status. The methods of operating can change at any **BETA** time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: Access Rights for Amazon CloudWatch Queries

The **AWS Identity and Access Management (IAM)** account that you use with the Amazon CloudWatch sensor needs specific rights to query any metrics.

 For details, see this Knowledge Base article: [How do I define access rights for Amazon CloudWatch queries?](#)

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG looks for available instances.

 This can take up to several minutes.

Select which service instance(s) you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

AMAZON CLOUDWATCH SPECIFIC

Services

Select the **Cache Clusters** or **Cache Cluster Nodes** you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

To better find what you want to monitor, especially in large tables, use the search function in the upper-right corner.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

AMAZON CLOUDWATCH SPECIFIC

Region	<p>Shows the region in which the monitored AWS instance runs. It is one of the following regions:</p> <ul style="list-style-type: none"> ▪ US East (Northern Virginia) ▪ US West (Oregon) ▪ US West (Northern California) ▪ Canada (Central) ▪ EU (Ireland) ▪ EU (London) ▪ EU (Frankfurt) ▪ Asia Pacific (Singapore)
--------	---

AMAZON CLOUDWATCH SPECIFIC

- Asia Pacific (Tokyo)
- Asia Pacific (Sydney)
- Asia Pacific (Seoul)
- Asia Pacific (Mumbai)
- South America (Sao Paulo)

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Description

Shows the description of the AWS service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

ID

Shows the ID of the AWS instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Result Handling

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.

 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend

SENSOR DISPLAY

on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁶⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

 This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in [System Administration—Monitoring](#)³³⁵⁵ are not available for this sensor.

For Amazon CloudWatch sensors, the minimum scanning interval is **15 minutes**.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.8 Amazon CloudWatch ELB Sensor

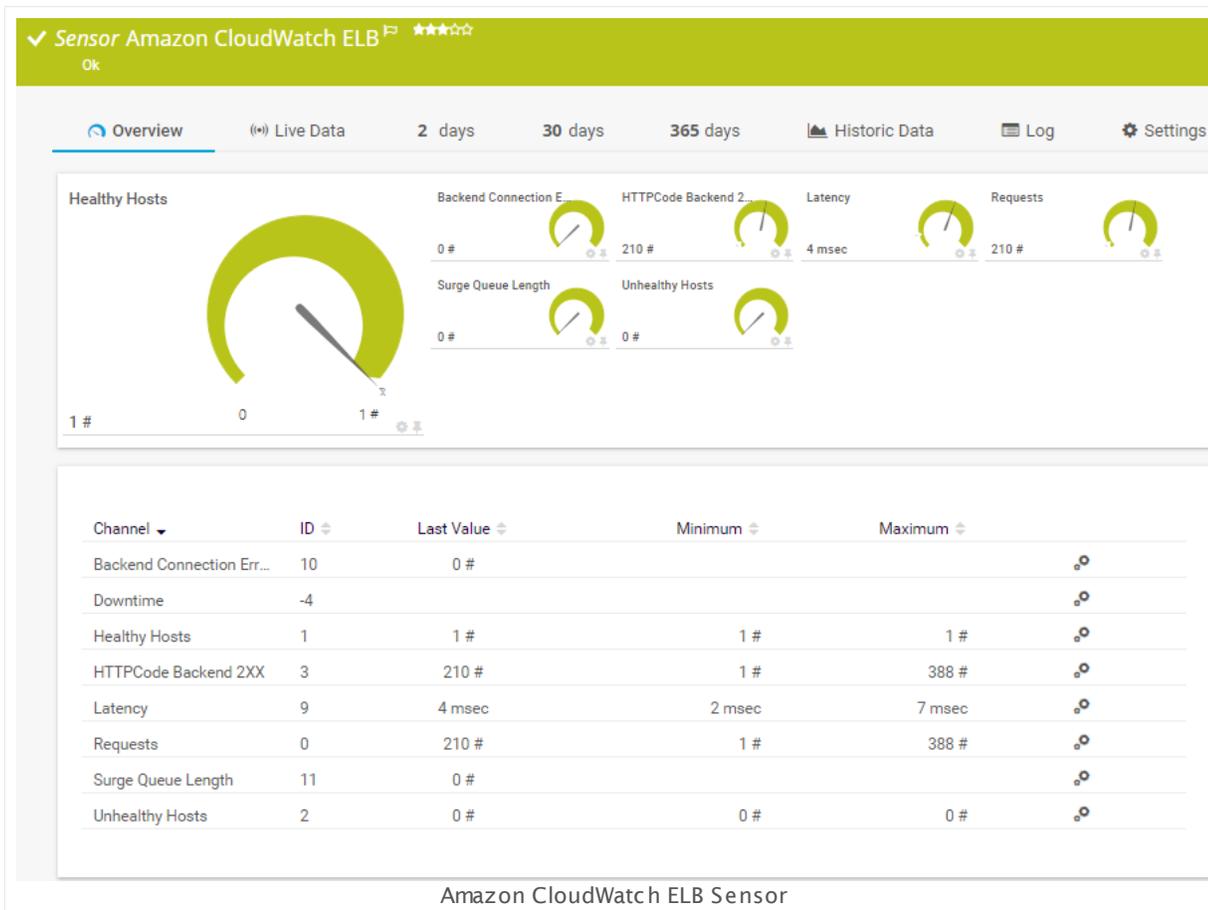

The Amazon CloudWatch ELB sensor monitors the performance of the Amazon Cloud service Elastic Load Balancing (ELB).

The sensor can show the following:

- Host Count
- HTTP Result Count (2xx, 3xx, 4xx, 5xx)
- Latency
- Queue

See [Supported Metrics](#)⁵³⁷ for a list of data that this sensor can potentially show in dedicated channels.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Remarks

- Requires access rights for CloudWatch queries. For details, see the Knowledge Base: [How do I define access rights for Amazon CloudWatch queries?](#)

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
8 Amazon CloudWatch ELB Sensor

- Requires .NET 4.5 or higher on the probe system.
- Define [Credentials for Amazon CloudWatch](#)^[415] in settings that are higher in the [Object Hierarchy](#)^[133], for example, in the [parent device settings](#)^[402].
- The minimum scanning interval for this sensor is **15 minutes**.
- Configure [notification triggers](#)^[3170] with a latency of **0 seconds** to receive all notifications for this sensor (**[...] for at least 0 seconds**).
- This sensor will only show those channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the AWS website. To know which channels are possible for the various services of this Amazon CloudWatch sensor, see the manual section **Supported Metrics**. If the sensor does not receive data from Amazon for more than 6 hours, it will go into error status.
- To know which dimensions you can monitor, see the manual section **Supported Dimensions**.
- Amazon will charge you (a small amount) for each "Amazon CloudWatch API Request" query the sensor sends to the Amazon servers. Depending on the service, each Amazon CloudWatch sensor sends about 10 to 30 requests with each scanning interval. Last time we checked the Amazon price list, they charged max. US\$ 0.014 per 1,000 requests (depending on your region).
For details, see the Knowledge Base: [How much does Amazon charge for using the CloudWatch API?](#)
- Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: Access Rights for Amazon CloudWatch Queries

The [AWS Identity and Access Management \(IAM\)](#) account that you use with the Amazon CloudWatch sensor needs specific rights to query any metrics.

 For details, see this Knowledge Base article: [How do I define access rights for Amazon CloudWatch queries?](#)

Requirement: .NET Framework

 This sensor type requires the [Microsoft .NET Framework](#) to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required [.NET](#) version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG looks for available instances.

 This can take up to several minutes.

Select which service instance(s) you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

AMAZON CLOUDWATCH SPECIFIC

Services Select the **Load Balancers** or **Availability Zones** you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

To better find what you want to monitor, especially in large tables, use the search function in the upper-right corner.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

AMAZON CLOUDWATCH SPECIFIC

Region	<p>Shows the region in which the monitored AWS instance runs. It is one of the following regions:</p> <ul style="list-style-type: none"> ▪ US East (Northern Virginia) ▪ US West (Oregon) ▪ US West (Northern California) ▪ Canada (Central) ▪ EU (Ireland) ▪ EU (London) ▪ EU (Frankfurt) ▪ Asia Pacific (Singapore)
--------	---

AMAZON CLOUDWATCH SPECIFIC

- Asia Pacific (Tokyo)
- Asia Pacific (Sydney)
- Asia Pacific (Seoul)
- Asia Pacific (Mumbai)
- South America (Sao Paulo)

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Description	Shows the description of the AWS service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
ID	Shows the ID of the AWS instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Result Handling	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none">  For more information on how to find the folder used for storage, see section Data Storage³⁷³⁴. <p> This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend
-----------------	--

SENSOR DISPLAY

on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁶⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

i This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in [System Administration—Monitoring](#)³³⁵⁵ are not available for this sensor.

For Amazon CloudWatch sensors, the minimum scanning interval is **15 minutes**.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.9 Amazon CloudWatch RDS Sensor

The Amazon CloudWatch RDS sensor monitors the performance of the Amazon Cloud service Relational Database Service (RDS).

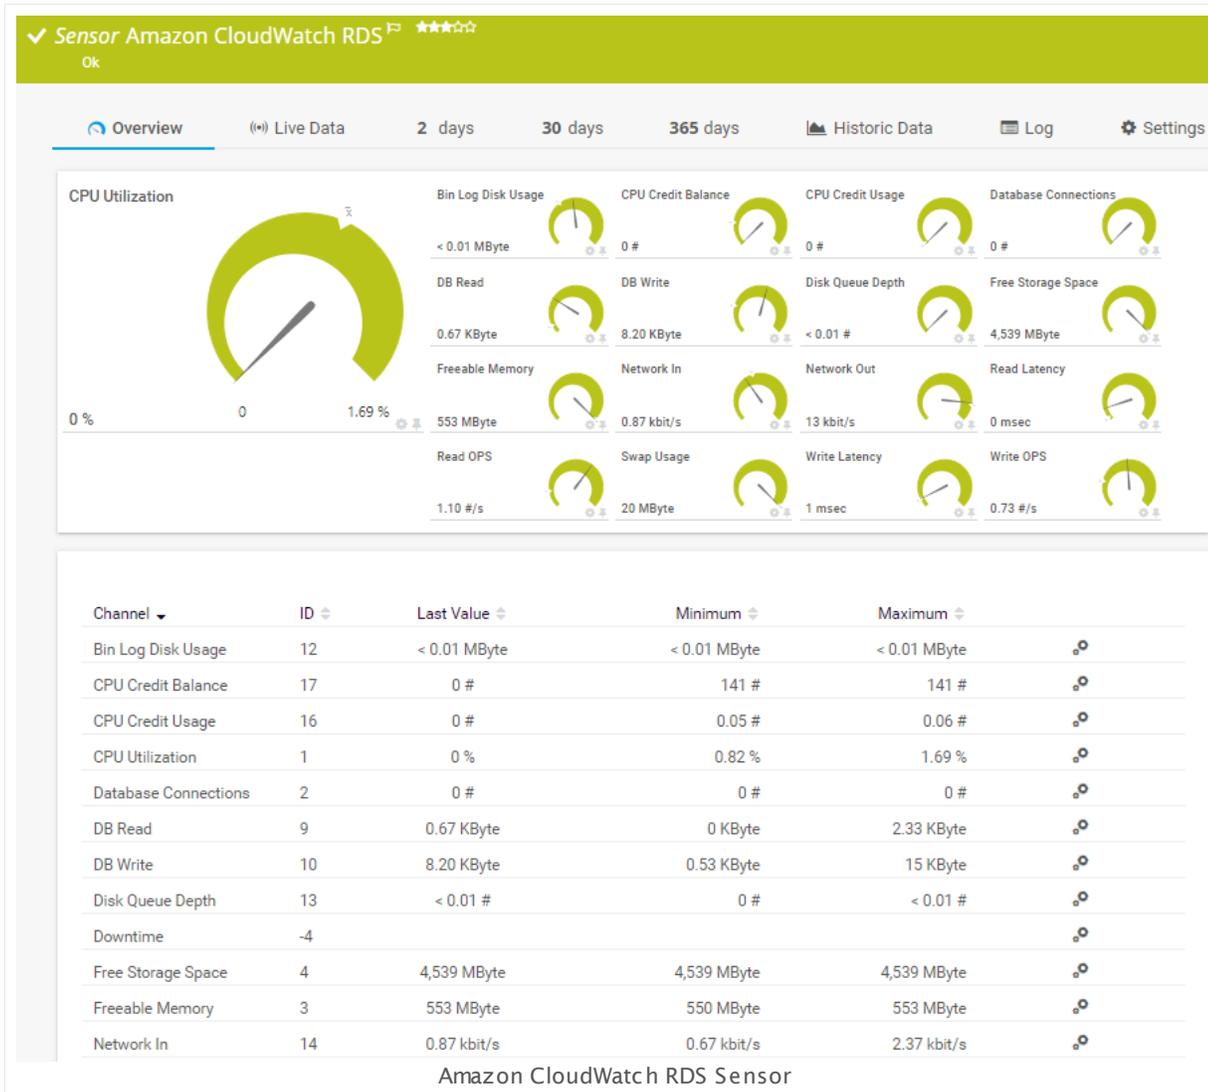

The sensor can show the following:

- CPU Utilization
- CPU Credit Usage and CPU Credit Balance
- Memory Usage
- Database I/O
- Network I/O
- Storage information

See [Supported Metrics](#)⁵⁵⁰ for a list of data that this sensor can potentially show in dedicated channels.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
 9 Amazon CloudWatch RDS Sensor

Remarks

- Requires access rights for CloudWatch queries. For details, see the Knowledge Base: [How do I define access rights for Amazon CloudWatch queries?](#)
- Requires .NET 4.5 or higher on the probe system.
- Define [Credentials for Amazon CloudWatch](#)^[415] in settings that are higher in the [Object Hierarchy](#)^[133], for example, in the [parent device settings](#)^[402].
- The minimum scanning interval for this sensor is **15 minutes**.
- Configure [notification triggers](#)^[3170] with a latency of **0 seconds** to receive all notifications for this sensor ([\[...\] for at least 0 seconds](#)).

- This sensor will only show those channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the AWS website. To know which channels are possible for the various services of this Amazon CloudWatch sensor, see the manual section **Supported Metrics**. If the sensor does not receive data from Amazon for more than 6 hours, it will go into error status.
- To know which dimensions you can monitor, see the manual section **Supported Dimensions**.
- Amazon will charge you (a small amount) for each "Amazon CloudWatch API Request" query the sensor sends to the Amazon servers. Depending on the service, each Amazon CloudWatch sensor sends about 10 to 30 requests with each scanning interval. Last time we checked the Amazon price list, they charged max. US\$ 0.014 per 1,000 requests (depending on your region).
For details, see the Knowledge Base: [How much does Amazon charge for using the CloudWatch API?](#)
- Currently, this sensor type is in beta status. The methods of operating can change at any **BETA** time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: Access Rights for Amazon CloudWatch Queries

The **AWS Identity and Access Management (IAM)** account that you use with the Amazon CloudWatch sensor needs specific rights to query any metrics.

 For details, see this Knowledge Base article: [How do I define access rights for Amazon CloudWatch queries?](#)

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵¹ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG looks for available instances.

 This can take up to several minutes.

Select which service instance(s) you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

AMAZON CLOUDWATCH SPECIFIC

Services Select the **Engines** or **Database Instances** you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

To better find what you want to monitor, especially in large tables, use the search function in the upper right corner.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)^[181], as well as in [alarms](#)^[213], [logs](#)^[228], [notifications](#)^[3216], [reports](#)^[3262], [maps](#)^[3270], [libraries](#)^[3235], and [tickets](#)^[230].

Parent Tags Shows [Tags](#)^[139] that this sensor [inherits](#)^[140] from its [parent device, group, and probe](#)^[133]. This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#)^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

AMAZON CLOUDWATCH SPECIFIC

Region Shows the region in which the monitored AWS instance runs. It is one of the following regions:

- US East (Northern Virginia)
- US West (Oregon)
- US West (Northern California)
- Canada (Central)
- EU (Ireland)
- EU (London)
- EU (Frankfurt)
- Asia Pacific (Singapore)
- Asia Pacific (Tokyo)
- Asia Pacific (Sydney)
- Asia Pacific (Seoul)
- Asia Pacific (Mumbai)
- South America (Sao Paulo)

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

AMAZON CLOUDWATCH SPECIFIC

Description	Shows the description of the AWS service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
ID	Shows the ID of the AWS instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Result Handling	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none"> 📁 For more information on how to find the folder used for storage, see section Data Storage³⁷³⁴. ☁ This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

i This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in [System Administration—Monitoring](#) are not available for this sensor.

For Amazon CloudWatch sensors, the minimum scanning interval is **15 minutes**.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>3311</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none">▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none">▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.10 Amazon CloudWatch SNS Sensor

The Amazon CloudWatch SNS sensor monitors the performance of the Amazon Cloud service Simple Notification Service (SNS).

The sensor can show the following:

- Message Counting
- Error Counting

See [Supported Metrics](#)^[562] for a list of data that this sensor can potentially show in dedicated channels.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Remarks

- Requires access rights for CloudWatch queries. For details, see the Knowledge Base: [How do I define access rights for Amazon CloudWatch queries?](#)
- Requires .NET 4.5 or higher on the probe system.
- Define [Credentials for Amazon CloudWatch](#)^[415] in settings that are higher in the [Object Hierarchy](#)^[133], for example, in the [parent device settings](#)^[402].
- The minimum scanning interval for this sensor is **15 minutes**.

- Configure [notification triggers](#)³¹⁷⁰ with a latency of **0 seconds** to receive all notifications for this sensor ([\[...\] for at least 0 seconds](#)).
- This sensor will only show those channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the AWS website. To know which channels are possible for the various services of this Amazon CloudWatch sensor, see the manual section **Supported Metrics**. If the sensor does not receive data from Amazon for more than 6 hours, it will go into error status.
- To know which dimensions you can monitor, see the manual section **Supported Dimensions**.
- Amazon will charge you (a small amount) for each "Amazon CloudWatch API Request" query the sensor sends to the Amazon servers. Depending on the service, each Amazon CloudWatch sensor sends about 10 to 30 requests with each scanning interval. Last time we checked the Amazon price list, they charged max. US\$ 0.014 per 1,000 requests (depending on your region). For details, see the Knowledge Base: [How much does Amazon charge for using the CloudWatch API?](#)
- Currently, this sensor type is in beta status. The methods of operating can change at any **BETA** time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: Access Rights for Amazon CloudWatch Queries

The **AWS Identity and Access Management (IAM)** account that you use with the Amazon CloudWatch sensor needs specific rights to query any metrics.

 For details, see this Knowledge Base article: [How do I define access rights for Amazon CloudWatch queries?](#)

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵¹ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG looks for available instances.

i This can take up to several minutes.

Select which service instance(s) you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

AMAZON CLOUDWATCH SPECIFIC

Services Select the **Applications**, **Platforms** or **Topics** you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

To better find what you want to monitor, especially in large tables, use the search function in the upper-right corner.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)^[181], as well as in [alarms](#)^[219], [logs](#)^[228], [notifications](#)^[3216], [reports](#)^[3252], [maps](#)^[3278], [libraries](#)^[3235], and [tickets](#)^[230].

Parent Tags Shows [Tags](#)^[139] that this sensor [inherits](#)^[140] from its [parent device, group, and probe](#)^[133]. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

AMAZON CLOUDWATCH SPECIFIC

Region	<p>Shows the region in which the monitored AWS instance runs. It is one of the following regions:</p> <ul style="list-style-type: none">▪ US East (Northern Virginia)▪ US West (Oregon)▪ US West (Northern California)▪ Canada (Central)▪ EU (Ireland)▪ EU (London)▪ EU (Frankfurt)▪ Asia Pacific (Singapore)▪ Asia Pacific (Tokyo)▪ Asia Pacific (Sydney)▪ Asia Pacific (Seoul)▪ Asia Pacific (Mumbai)▪ South America (Sao Paulo)

	Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Description	Shows the description of the AWS service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
ID	Shows the ID of the AWS instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Result Handling	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none"> 📖 For more information on how to find the folder used for storage, see section Data Storage ³⁷³⁴. <p>☁ This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

i This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in [System Administration—Monitoring](#) are not available for this sensor.

For Amazon CloudWatch sensors, the minimum scanning interval is **15 minutes**.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>3311</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none">▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none">▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.11 Amazon CloudWatch SQS Sensor

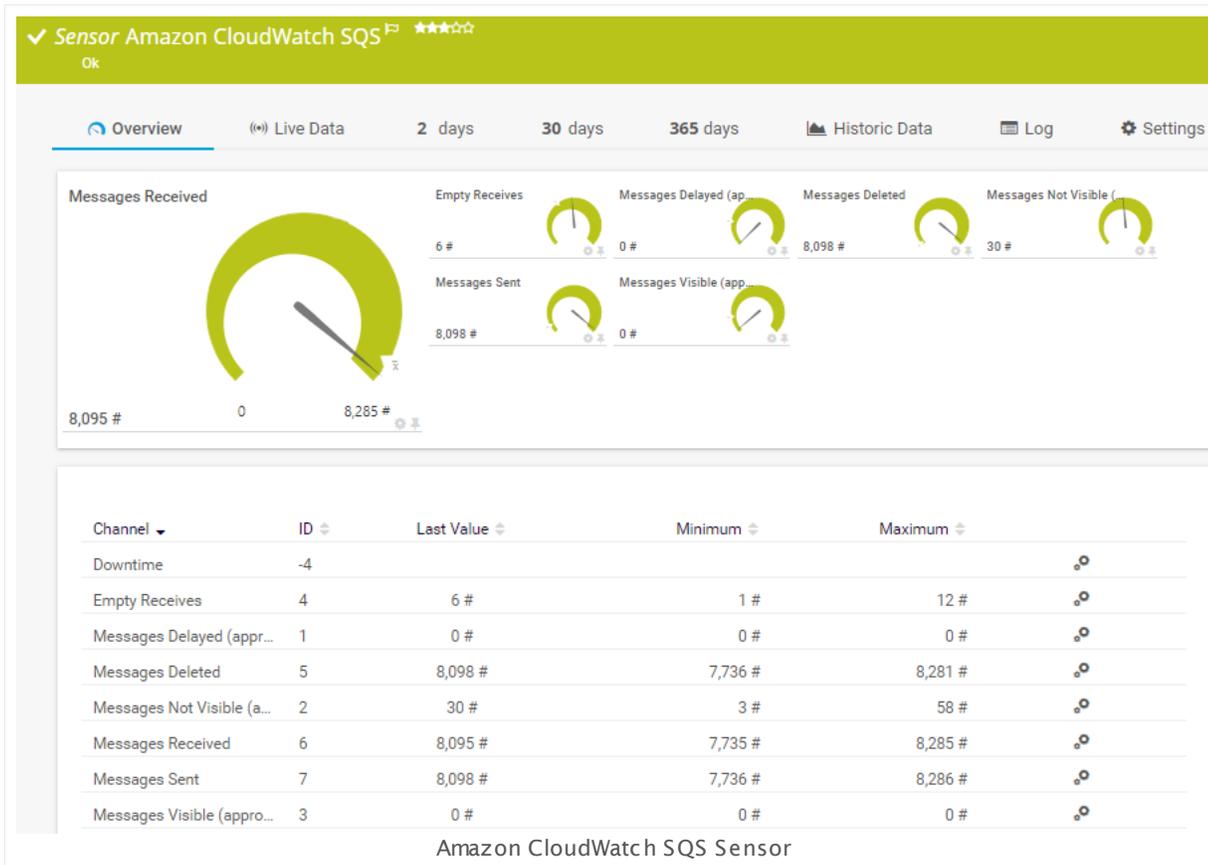

The Amazon CloudWatch SQS sensor monitors the performance of the Amazon Cloud service Simple Queue Service (SQS).

The sensor can show the following:

- Message Counting
- Error Counting
- Delay

See [Supported Metrics](#)⁵⁷⁴ for a list of data that this sensor can potentially show in dedicated channels.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Remarks

- Requires access rights for CloudWatch queries. For details, see the Knowledge Base: [How do I define access rights for Amazon CloudWatch queries?](#)
- Requires .NET 4.5 or higher on the probe system.

- Define [Credentials for Amazon CloudWatch](#)^[415] in settings that are higher in the [Object Hierarchy](#)^[133], for example, in the [parent device settings](#)^[402].
- The minimum scanning interval for this sensor is **15 minutes**.
- Configure [notification triggers](#)^[3170] with a latency of **0 seconds** to receive all notifications for this sensor ([\[...\] for at least 0 seconds](#)).
- This sensor will only show those channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the AWS website. To know which channels are possible for the various services of this Amazon CloudWatch sensor, see the manual section **Supported Metrics**. If the sensor does not receive data from Amazon for more than 6 hours, it will go into error status.
- To know which dimensions you can monitor, see the manual section **Supported Dimensions**.
- Amazon will charge you (a small amount) for each "Amazon CloudWatch API Request" query the sensor sends to the Amazon servers. Depending on the service, each Amazon CloudWatch sensor sends about 10 to 30 requests with each scanning interval. Last time we checked the Amazon price list, they charged max. US\$ 0.014 per 1,000 requests (depending on your region).
For details, see the Knowledge Base: [How much does Amazon charge for using the CloudWatch API?](#)
- **BETA** Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: Access Rights for Amazon CloudWatch Queries

The [AWS Identity and Access Management \(IAM\)](#) account that you use with the Amazon CloudWatch sensor needs specific rights to query any metrics.

 For details, see this Knowledge Base article: [How do I define access rights for Amazon CloudWatch queries?](#)

Requirement: .NET Framework

 This sensor type requires the [Microsoft .NET Framework](#) to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required [.NET](#) version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG looks for available instances.

 This can take up to several minutes.

Select which service instance(s) you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

AMAZON CLOUDWATCH SPECIFIC

Services Select the **Queues** you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

To better find what you want to monitor, especially in large tables, use the search function in the upper right corner.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)^[181], as well as in [alarms](#)^[219], [logs](#)^[228], [notifications](#)^[3216], [reports](#)^[3252], [maps](#)^[3278], [libraries](#)^[3235], and [tickets](#)

BASIC SENSOR SETTINGS

Parent Tags

Shows **Tags** that this sensor inherits from its parent device, group, and probe. This setting is shown for your information only and cannot be changed here.

Tags

Enter one or more **Tags**, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority

Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

AMAZON CLOUDWATCH SPECIFIC

Region

Shows the region in which the monitored AWS instance runs. It is one of the following regions:

- US East (Northern Virginia)
- US West (Oregon)
- US West (Northern California)
- Canada (Central)
- EU (Ireland)
- EU (London)
- EU (Frankfurt)
- Asia Pacific (Singapore)
- Asia Pacific (Tokyo)
- Asia Pacific (Sydney)

AMAZON CLOUDWATCH SPECIFIC

- Asia Pacific (Seoul)
- Asia Pacific (Mumbai)
- South America (Sao Paulo)

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Description	Shows the description of the AWS service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
ID	Shows the ID of the AWS instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Result Handling	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none">  For more information on how to find the folder used for storage, see section Data Storage³⁷³⁴. <p> This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
-----------------	---

SENSOR DISPLAY

Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> ⓘ This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings^[3160] settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration^[336] on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p>

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- ⓘ If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- ⓘ If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

ⓘ This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in [System Administration—Monitoring](#) are not available for this sensor.

For Amazon CloudWatch sensors, the minimum scanning interval is **15 minutes**.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.12 Business Process Sensor

The Business Process sensor is a powerful and very flexible sensor that allows you to give a summary status of whole business processes while monitoring several process components.

This means that you can create your very own and individual sensor with channels based on data from other sensors ("source sensors") that are specific to your network.

The sensor can show the following:

- The summarized status of the objects contained in each channel according to the individually defined error and warning thresholds
 - The overall and summarized status of all channels in the Global State channel
- ❗ The Business Process sensor does not show values in the "Downtime" channel because they cannot be calculated for this sensor type.
- ❗ If you want to process values from other sensors and you want to perform calculations with these values, for example, use the [Sensor Factory Sensor](#) instead.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Channel	ID	Last Value	Minimum	Maximum
Downtime	-4			
Global State	0	Inactive	Inactive	Inactive
TEST	1	Inactive	Inactive	Inactive

Business Process Sensor

Sensor in Other Languages

Dutch: **Bedrijfs Proces**, French: **Processus métier**, German: **Business Process**, Japanese: ? ?
? ? ? ? ? ? , Portuguese: **Processo de Negócio**, Russian: **Бизнес-процесс**, Simplified Chinese:

????, Spanish: **Proceso comercial**

Remarks

- Knowledge Base: [How does the Business Process sensor calculate summarized sensor states?](#)
- This sensor [does not support more than 50 channels](#) officially.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).

Limited to 50 Sensor Channels

⚠ PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

BUSINESS PROCESS SPECIFIC SETTINGS

Channel Name	<p>Enter a meaningful name to identify the channel. To add a new channel to the sensor, click the Enter Channel Name field, enter a name for the channel, and confirm with the enter or tab key.</p> <p>i It might take several sensor scans until new channel names or changes to existing channel names become visible.</p>
Error Threshold %	<p>Set a percentage limit to define when the sensor channel displays a Down status. Please enter an integer value. Default is 50%.</p> <p>i This value depends on how many objects you feed into a business process channel.</p> <p>If a channel contains less source objects in "up" condition than the error threshold defines, this channel and the Global State channel of the Business Process sensor will show a Down.</p> <p>The Sensor States^[195] that allow for the "up" condition ▲ of a Business Process channel are the following:</p> <ul style="list-style-type: none">▪ Up▪ Warning▪ Unusual

BUSINESS PROCESS SPECIFIC SETTINGS

- Partial Down

All other sensor states will support the "down" condition ▼ (see the table below).

For example, if you define 4 source sensors for a channel, an error threshold of 50% means that 3 source sensors have to be in "down" condition to set this channel to a **Down** status. So, 50% means that more than half of the source sensors must not be in "up" condition to set the sensor to **Down**.

 For more information, an illustration of the business process mechanisms, and some use cases of the Business Process sensor, see the table [below](#) ^[580] and this Knowledge Base article: [How can I use the Business Process sensor?](#)

Warning Threshold %

Set a percentage limit to define when the sensor channel displays a **Warning** status. Please enter an integer value. Default is **75%**.

 This value depends on how many objects you feed into a business process channel.

If a channel contains less source objects in "up" condition than the threshold defines, this channel and the **Global State** channel of the Business Process sensor will show a **Warning** status (and so the sensor status is **Warning**).

The [Sensor States](#) ^[195] that allow for the "up" condition ▲ of a Business Process channel are the following:

- Up
- Warning
- Unusual
- Partial Down

All other sensor states will support the "down" condition ▼ (see the table below).

For example, if you define 4 source sensors for a channel, a warning threshold of 75% means that all 4 source sensors have to be in "down" condition to set this channel to a **Warning** status. So, 75% means that more than three out of four of the source sensors must not be in "up" condition to set the sensor to **Warning**.

 For more information, an illustration of the business process mechanisms, and some use cases of the Business Process sensor, see the table [below](#) ^[580] and this Knowledge Base article: [How can I use the Business Process sensor?](#)

BUSINESS PROCESS SPECIFIC SETTINGS

Objects

Enter the objects you want to have in a channel using the + sign. This way, you can choose the desired objects from the device tree with the [Object Selector](#)^[240]. You can also start typing the object's ID, name, or a tag. PRTG then suggests the possible objects to be selected.

You can add sensors, devices, groups, and probes to a channel. Each object you add is weighted equally, no matter if it is a single sensor or a whole device with many sensors. To give more weight to a specific object, add it several times. For example, add it twice to give double weight to an object, add it three times to give it triple weight.

 A probe, group, or device is as long in "up" condition  as it does not contain any sensors in "down" condition .

Up and Down Conditions

The **Business Process Up**  and **Down**  **conditions** are different from the normal PRTG up and down [Sensor States](#)^[195]. This is necessary for the Business Process sensor to be able to calculate summarized states and to show a calculated result for a whole business process. This table illustrates which sensor status leads to which Business Process condition.

THE RELATION BETWEEN OBJECT STATES AND BUSINESS PROCESS CONDITIONS

Channel Object Status	Business Process Condition	Reason: Why does a given sensor status correspond to a given Business Process condition?
 Up	Up 	The monitored object works, so everything is fine.
 Warning	Up 	The sensor may show a warning, but the monitored object still works.
 Partial Down	Up 	This status is available in a cluster setup and is displayed if at least one cluster node reports the sensor as up and at least one cluster node reports it as down. With at least one up report, the monitored object is supposed to be working and meets the business process up condition.

THE RELATION BETWEEN OBJECT STATES AND BUSINESS PROCESS CONDITIONS

 Unusual	Up		The sensor may show unusual values, but the monitored object works.
 Collecting	Up		The sensor still waits for more monitoring data to definitely decide about the sensor status, but so far the monitored object works. This PRTG internal status is visualized as Unknown in the PRTG web interface.
 Down	Do wn		The monitored object does not work.
 Unknown	Do wn		The sensor does not know if the monitored object works, for example because it has not yet received any data or because it has not received any data for a certain amount of time.
 None	Do wn		The sensor has not yet received any monitoring data from the monitored object. This PRTG internal status is visualized as Unknown in the PRTG web interface.
 Paused	Do wn		The monitored object does not work and monitoring has been paused, for example actively by the user, by inheritance, or by executed schedules. It might be convenient to exclude regularly or frequently paused objects from your business process monitoring, so you do not give more weight than necessary to a Business Process down status because of issues you already know about.
 Down Acknowledged	Do wn		The monitored object does not work and someone already knows.

 If you encounter issues with your Business Process sensor and want to [contact our support team](#)³⁴²¹, please send us your exact configuration. It helps us find the cause more easily and quickly. Click the little clipboard icon in the upper-right of the **Business Process Specific Settings** table to copy your configuration:

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
12 Business Process Sensor

Business Process Specific Settings

States and Conditions *Step 1. The sensor checks the conditions of the objects in its channels. The following object states allow for the up condition of a channel:*
Up, Warning, Unusual, Partial Down, Unknown (Collecting)

These are the object states that will support the down condition of a channel:
Down, Unknown (None), Paused, Down Acknowledged

Have a look at the manual if you are interested in the reasoning behind these decisions. A probe, group, or device that you add to a channel is in up condition as long as none of its sensors are in down condition.

Step 2. The Business Process sensor compares your thresholds with the conditions of the objects in a channel to check if the channel is in an all-over up, warning, or down status. If there is a smaller percentage of up objects than indicated by your warning or error threshold, the channel status will be set to warning or down respectively.

Channel Name	Error	Warning	Objects
Test	50	75	
Enter Channel Name	50	75	

The Business Process Sensor Configuration Clipboard

You find your configuration in the window that opens. Copy the marked text and paste it into the [support form](#)³⁴²⁴ to send it our support team.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
-  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies <small>3209</small> in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.13 Cisco IP SLA Sensor

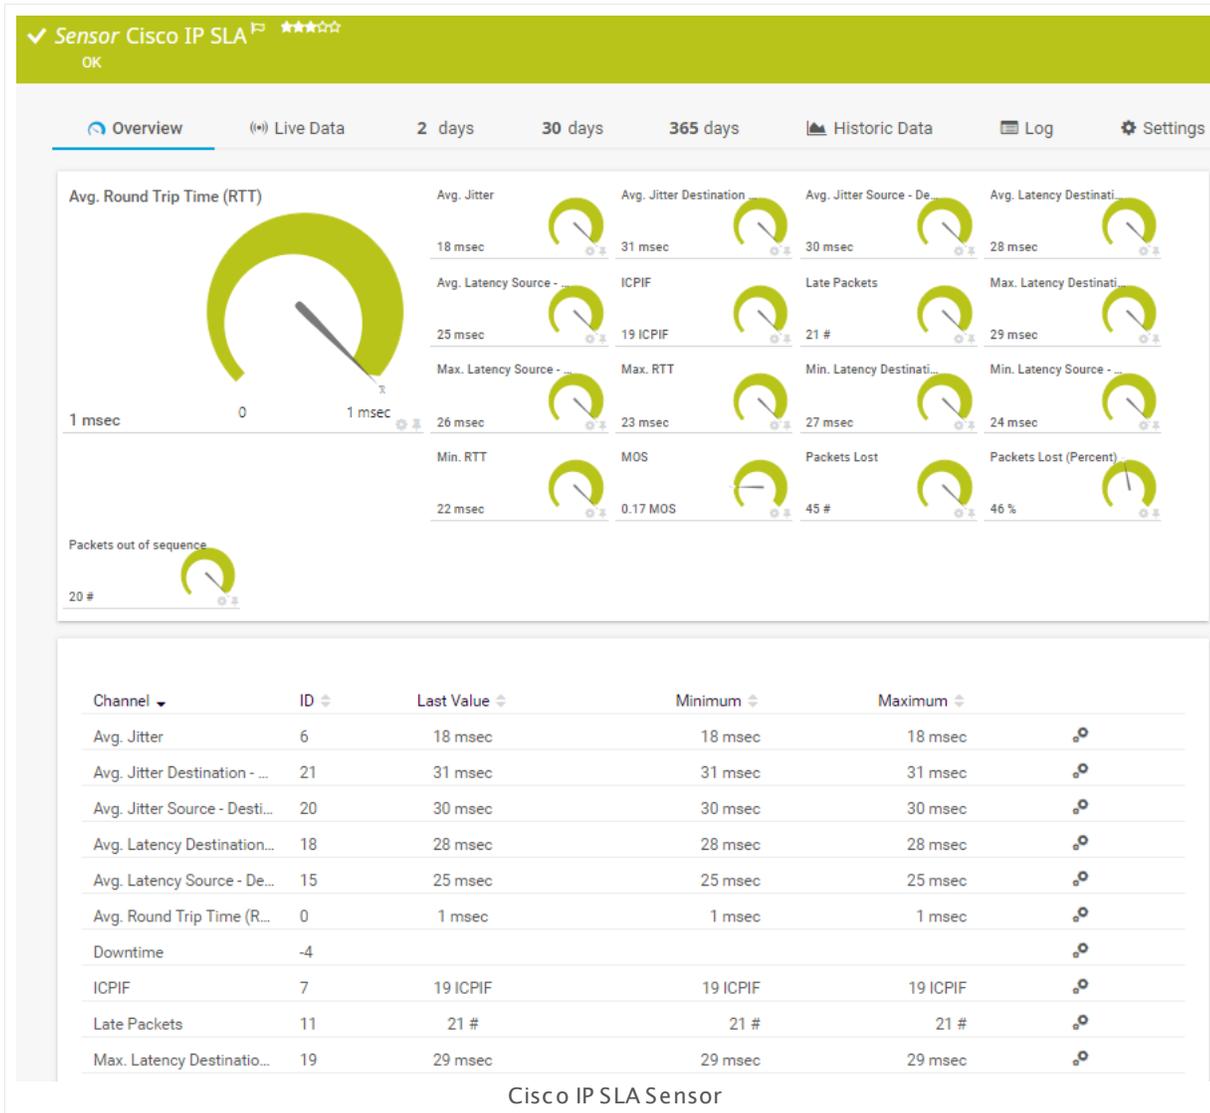

The Cisco IP SLA sensor monitors Voice over IP (VoIP) network parameters using IP Service Level Agreement (SLA) from Cisco via Simple Network Management Protocol (SNMP).

It shows different aspects provided by the queried device:

- Average, maximum, and minimum Round Trip Time (RTT)
- Average jitter
- Average jitter from source to destination and vice versa
- Average latency from source to destination and vice versa
- Impairment Calculated Planning Impairment Factor (ICPIF)
- Late packets in percent
- Average, maximum, and minimum latency from source to destination and vice versa
- Mean Opinion Score (MOS)
- Number of lost packets and in percent
- Packets out of sequence in percent
- Sense code (status code of RTT entry)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
 13 Cisco IP SLA Sensor

Remarks

- For a general introduction to the technology behind Quality of Service monitoring, please see manual section [Monitoring Quality of Service](#).
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select which SLAs you want to monitor. PRTG creates one sensor for each SLA you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

IP SLA SPECIFIC

IP SLAs

Select the IP SLAs you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

The list options depend on the configuration of the queried device. If you miss a type here, please check the configuration of your target device. PRTG can support the following operations with the given type IDs:

- **echo** (1)
- **pathEcho** (2)
- **fileIO** (3)
- **script** (4)
- **udpEcho** (5)
- **tcpConnect** (6)
- **http** (7)
- **dns** (8)
- **jitter** (9)
- **dls** (10)
- **dhcp** (11)
- **ftp** (12)
- **icmp-jitter** (16)
- **path-jitter** (23)

 The numbers above are the IDs of the SLA types as reported by the target device. PRTG translates them into the corresponding strings. These IDs are independent from the IDs that you see in the first column of the list. If the target device returns other values than given above, the sensor will show an error message that it cannot find the type.

IP SLA SPECIFIC

- Packet Loss values are summarized, but have no explicit channel for Source—Destination or Destination—Source values.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

- Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <ul style="list-style-type: none"> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IP SLA SPECIFIC

ID

Type

Name (Tag)

Owner

Frequency

These fields show SLA specific settings that the queried SLA device provides. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#) settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁰⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.14 Citrix XenServer Host Sensor

The Citrix XenServer Host sensor monitors a Xen host server via Hypertext Transfer Protocol (HTTP).

It can show the following:

- CPU usage
- Memory usage (free, used, allocation)
- Network usage
- Number of running virtual machines
- Load average

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: Citrix XenServer Host, French: Hôte Citrix XenServer, German: Citrix XenServer Host, Japanese: Citrix XenServer, Portuguese: Citrix XenServer Host, Russian: Узел Citrix XenServer, Simplified Chinese: Citrix XenServer, Spanish: Citrix XenServer Host

Remarks

- The parent device must be a Citrix XenServer version 5.0 or later.
- The parent device has to represent one host server of your XenServer pool.
- Requires credentials for Xen servers to be defined for the device you want to use the sensor on.
- Requires .NET 4.5 or later on the probe system.
- This sensor type does not fully support TLS 1.2 connections and cannot be added to XenServers with security protocol setting "TLS 1.2 only".
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

Monitoring a XenServer Pool

In a XenServer pool there is one "pool master" that manages the pool. Incoming queries on any host are automatically forwarded to the pool master. If you want to monitor your virtual machines, or host servers, simply create respective sensors on a device that represents **one** host server of your pool. Internal processes will make sure that monitoring will take place and continue independently from the physical host.

- ❗ In PRTG's device tree, the sensors for virtual machines will always remain on the host you originally created it on, also if it is currently running on a different host.

Requirement: .NET Framework

✘ This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

- 🧠 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select which XenServer hosts you want to monitor. PRTG creates one sensor for each host you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

HOST SETTINGS

Host Select the hosts you want to add a sensor for, including the ones that are not running. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) [402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#) [181], as well as in [alarms](#) [219], [logs](#) [228], [notifications](#) [3216], [reports](#) [3252], [maps](#) [3278], [libraries](#) [3235], and [tickets](#) [230].

Parent Tags Shows [Tags](#) [139] that this sensor [inherits](#) [140] from its [parent device, group, and probe](#) [133]. This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#) [139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) [140] from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HOST SETTINGS

UUID Shows the Universally Unique Identifier (UUID) of the host that this sensor monitors. This value is shown for reference purposes only. We strongly recommend that you only change it if Paessler support explicitly asks you to do so. Wrong usage can result in incorrect monitoring data!

Name Shows the name of the host that this sensor monitors.
Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

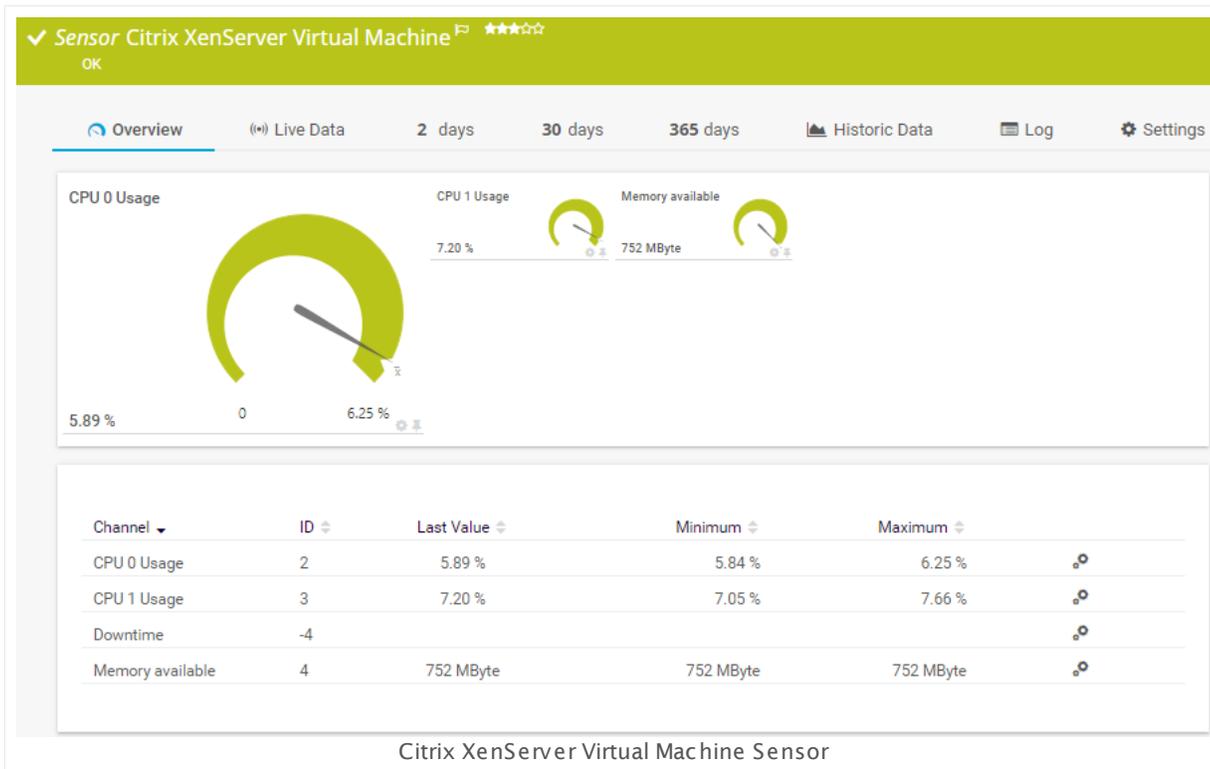

7.8.15 Citrix XenServer Virtual Machine Sensor

The Citrix XenServer Virtual Machine sensor monitors a virtual machine on a Xen server via Hypertext Transfer Protocol (HTTP).

It can show the following:

- CPU usage
- Memory usage (available, used)
- Disk usage (reads and writes per second)
- Network usage (bytes received and sent)
- Balloon driver target size

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **Citrix XenServer Virtuelle Machine**, French: **Machine virtuelle Citrix XenServer**, German: **Citrix XenServer Virtuelle Maschine**, Japanese: **Citrix Xen? ? ? ? ? ? ? ?**, Portuguese: **Citrix XenServer Máquina virtual**, Russian: **Виртуальная машина Citrix XenServer**, Simplified Chinese: **Citrix XenServer ? ? ?**, Spanish: **Máquina virtual Citrix XenServer**

Remarks

- The parent device must be a Citrix XenServer version 5.0 or later.
- The parent device has to represent one host server of your XenServer pool.
- Requires credentials for Xen servers to be defined for the device you want to use the sensor on.
- Requires .NET 4.5 or later on the probe system.
- This sensor type does not fully support TLS 1.2 connections and cannot be added to XenServers with security protocol setting "TLS 1.2 only".
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

Monitoring a XenServer Pool

In a XenServer pool there is one "pool master" that manages the pool. Incoming queries on any host are automatically forwarded to the pool master. If you want to monitor your virtual machines, or host servers, simply create respective sensors on a device that represents **one** host server of your pool. Internal processes will make sure that monitoring will take place and continue independently from the physical host.

- ❗ In PRTG's device tree, the sensors for virtual machines will always remain on the host you originally created it on, also if it is currently running on a different host.

Requirement: .NET Framework

✘ This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

- 💡 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

- ❗ PRTG requests a full list of all virtual machines configured on the Xen server. Therefore, it may take a few seconds before the dialog is loaded.

Select which virtual machines you want to monitor. PRTG creates one sensor for each virtual machine you select in the **Add Sensor** dialog. The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

VIRTUAL MACHINE SETTINGS

Virtual Machine Select the Virtual Machines (VM) you want to add a sensor for, including the ones that are not running. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) ^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#) ^[181], as well as in [alarms](#) ^[219], [logs](#) ^[228], [notifications](#) ^[3216], [reports](#) ^[3252], [maps](#) ^[3278], [libraries](#) ^[3235], and [tickets](#) ^[230].

Parent Tags Shows [Tags](#) ^[139] that this sensor [inherits](#) ^[140] from its [parent device, group, and probe](#) ^[133]. This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#) ^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) ^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

VIRTUAL MACHINE SETTINGS

UUID Shows the Universally Unique Identifier (UUID) of the virtual machine. This value is shown for reference purposes only. We strongly recommend that you only change it if Paessler support explicitly asks you to do so. Wrong usage can result in incorrect monitoring data!

Name Shows the name of the virtual machine. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵⁵ on PRTG on premises installations.</p>
-------------------	---

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.16 Cloud HTTP Sensor

The Cloud HTTP sensor monitors the loading time of a web server via Hypertext Transfer Protocol (HTTP) from different locations worldwide using the PRTG Cloud. The locations are distributed over three continents around the globe.

The sensor can show **response time** and **response code** of the target server monitored from the following locations:

- Asia Pacific: Tokyo
- EU West: Ireland
- US East: Northern Virginia
- US West: Oregon
- Global average response time

Sensor in Other Languages

Dutch: **Cloud HTTP**, French: **Cloud HTTP**, German: **Cloud HTTP**, Japanese: ? ? ? ? HTTP, Portuguese: **Cloud HTTP**, Russian: **Облако HTTP**, Simplified Chinese: ? HTTP, Spanish: **Htt p de nube**

Remarks

- The server on which the [PRTG probe](#)^[134] with this sensor runs must have access to the internet. The probe system needs to be able to reach <https://api.prtgcloud.com:443> to communicate with the PRTG Cloud.
- The address you define in the [parent device settings](#)^[402] must be reachable over the internet. You cannot use this sensor to monitor localhost (127.0.0.1) or other target devices that are only reachable within your private network.
- This sensor type does not support IPv6.
- Knowledge Base: [Are there any limits for using Cloud Ping and Cloud HTTP sensors?](#)
- Knowledge Base: [What is the PRTG Cloud Bot?](#)
- This sensor type inherits [Proxy Settings for HTTP Sensors](#)^[419] from the parent device.
- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, refer to the manual section [Sensor Channels Settings](#)^[3180].
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP SETTINGS

URL	<p>Enter the URL the sensor connects to. It has to be URL encoded! If you enter an absolute URL, the sensor uses this address independently from the IP address/DNS name setting of the device on which you create this sensor. You can enter an URL leading to a webpage (to measure the page source code's loading time), or enter the URL of an image or of another page asset to measure this element's availability and loading time.</p> <p>PRTG uses a smart URL replacement that allows you to use the parent device's IP address or DNS name setting as part of the URL.</p> <p> For more information, see section Smart URL Replacement below.</p>
Request Method	Choose an HTTP request method to determine how the sensor will request the given URL.

HTTP SETTINGS

- **GET:** Request the website directly, like browsing the web. We recommend using this setting for a simple check of a web page.
- **POST:** Send post form data to the URL. If this setting is chosen, you must enter the data that will be sent in the **Postdata** field below.
- **HEAD:** Only request the HTTP header from the server; without the actual web page. Although this saves bandwidth since less data is transferred, it is not recommended because the measured request time is not the one experienced by your users and you might not be notified for slow results or timeouts.

Postdata

This field is only visible when you select the **POST Request Method** setting above. Enter the data part for the POST request here.

 No XML is allowed here!

Timeout (Sec.)

Enter a timeout in seconds for the server request. If the reply takes longer than this value defines, the PRTG will cancel the request and shows an error message. The maximum timeout value is **5** seconds.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#) settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- ⓘ If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- ⓘ If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

ⓘ This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in [System Administration—Monitoring](#) are not available for this sensor.

For Cloud HTTP sensors, the minimum scanning interval is **10 minutes**.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

ⓘ Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

ⓘ Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none">▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p> To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none">▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below.▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

i This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- User Group Access
- Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:
- **Inherited:** Use the access rights settings of the parent object.
 - **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
 - **Read:** Users in this group can see the object and review its monitoring results.
 - **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
 - **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either [http:///](#) or [https:///](#) or even a simple slash / as equivalent for [http:///](#)). PRTG will fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically.

Whether this results in a valid URL or not depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** [www.example.com](#) and you add an HTTP sensor to it, you can provide values the following ways:

- Providing the value [https:///](#) in the URL field, PRTG will automatically create the URL [https://www.example.com/](#)

- Using the value `/help` in the URL field, PRTG will automatically create and monitor the URL <http://www.example.com/help>
- It is also possible to provide a port number in the URL field, which will be taken over by the device's DNS name and internally added, for example, <http://:8080/>

 Smart URL replacement does not work for sensors running on the **Probe Device**.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

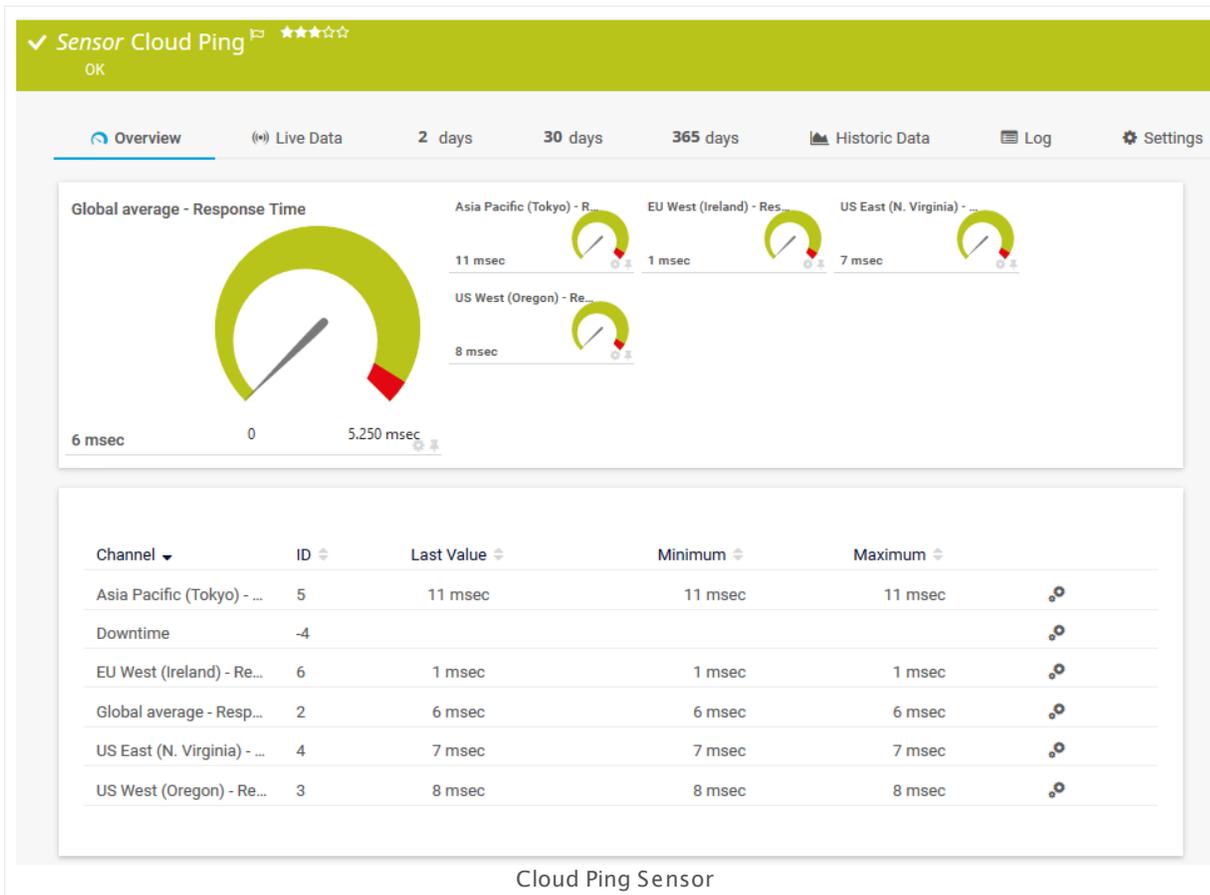

For more general information about settings, see the [Object Settings](#)²¹⁷¹ section.

7.8.17 Cloud Ping Sensor

The Cloud Ping sensor monitors the Transport Control Protocol (TCP) ping times to its parent device from different locations worldwide using the PRTG Cloud. These locations are distributed over three continents around the globe.

The sensor can show the **response times** of the target server pinged from the following locations:

- Asia Pacific: Tokyo
- EU West: Ireland
- US East: Northern Virginia
- US West: Oregon
- Global average response time

Sensor in Other Languages

Dutch: **Cloud Ping**, French: **Cloud Ping**, German: **Cloud Ping**, Japanese: ? ? ? ? Ping,
Portuguese: **Cloud Ping**, Russian: **Пинг из облака**, Simplified Chinese: ? Ping, Spanish: **Ping de nube**

Remarks

- The server on which the [PRTG probe](#) with this sensor runs must have access to the internet. The probe system needs to be able to reach <https://api.prtgcloud.com:443> to communicate with the PRTG Cloud.
- The address you define in the [parent device settings](#) must be reachable over the internet. You cannot use this sensor to monitor localhost (127.0.0.1) or other target devices that are only reachable within your private network.
- This sensor type does not support IPv6.
- Knowledge Base: [Are there any limits for using Cloud Ping and Cloud HTTP sensors?](#)
- Knowledge Base: [What is the PRTG Cloud Bot?](#)
- This sensor type inherits [Proxy Settings for HTTP Sensors](#) from the parent device.
- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, refer to the manual section [Sensor Channels Settings](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

PING SETTINGS

Packet Size (Bytes)	<p>Enter the packet size in bytes for the Ping. You can choose any value between 1 and 10000. We recommend that you use the default value.</p>
Ping Count	<p>Enter the number of Pings to be sent in a row to the parent device with one scan. Please enter an integer value. The default value is 1, the maximum supported ping count is 5.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the Ping. If the reply takes longer than this value defines, the PRTG will cancel the request and shows an error message. The maximum timeout value is 5 seconds.</p>
Port	<p>Enter the number of the port that the sensor uses for TCP ping. The default port is 80.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

i This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in [System Administration—Monitoring](#)³³⁵⁵ are not available for this sensor.

For Cloud Ping sensors, the minimum scanning interval is **10 minutes**.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

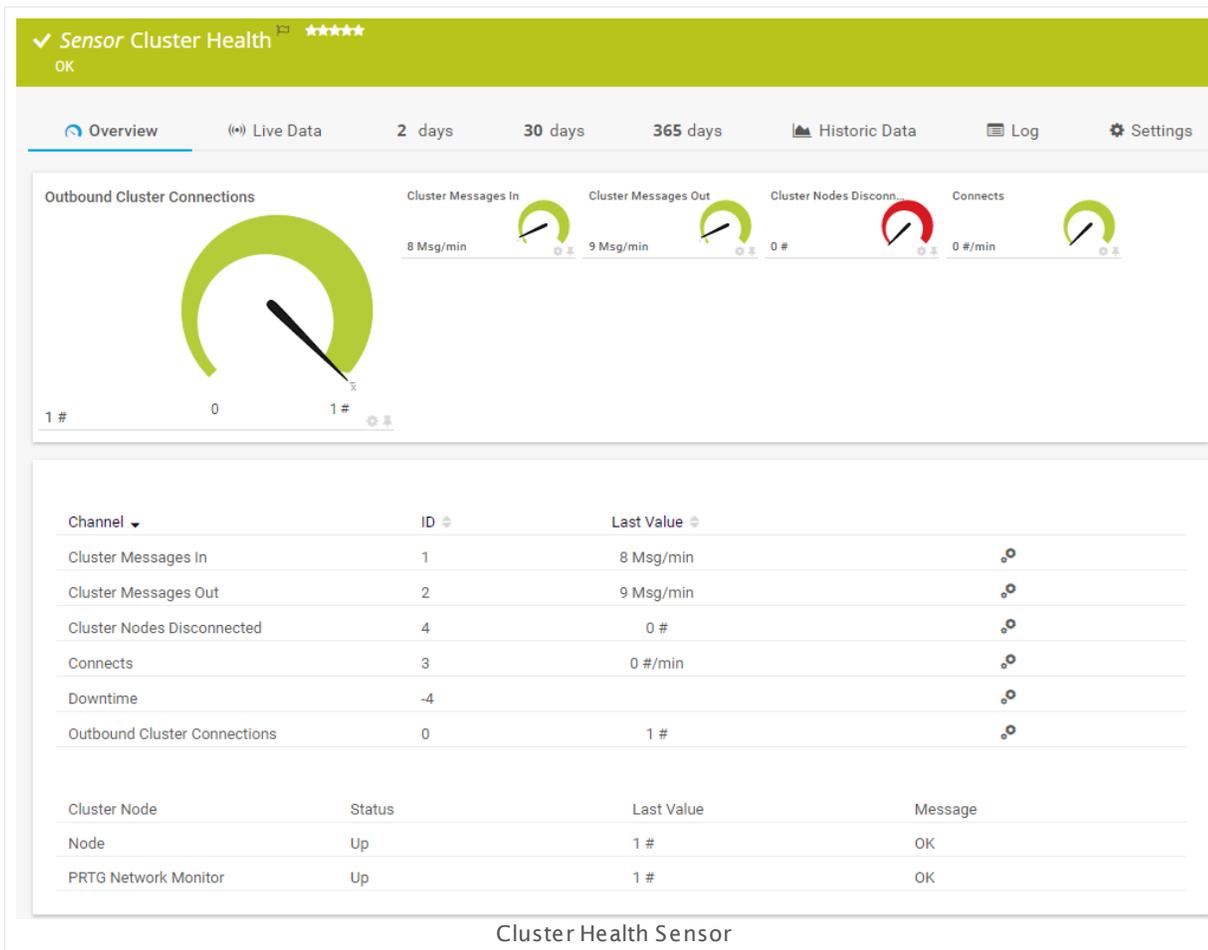

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.18 Cluster Health Sensor

The Cluster Health sensor monitors the health of a [PRTG cluster](#) and indicates the PRTG own system health status.

It measures various internal system parameters of the cluster system:

- Number of connects per minute
- Cluster ingoing and outgoing messages per minute
- Number of connected and disconnected cluster nodes.

Sensor in Other Languages

Dutch: **Cluster Status**, French: **État du cluster**, German: **Cluster-Zustand**, Japanese: クラスターヘルス, Portuguese: **Funcionamento do cluster**, Russian: **Работоспособность кластера**, Simplified Chinese: ? ? ? ? ? , Spanish: **Salud de clúster**

Remarks

- PRTG creates this sensor automatically with a cluster installation. You cannot delete or add it manually.
- If at least one cluster node is disconnected, this sensor will show a **Down status** by default.
- You can review the states of each cluster node on the sensor's **Overview** tab .
- You can choose the cluster member of which you want to show data (or of all nodes) on the **monitoring data review tabs**.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.
- If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:
- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
-  Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
-  If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
-  If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- User Group Access
- Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:
- **Inherited:** Use the access rights settings of the parent object.
 - **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
 - **Read:** Users in this group can see the object and review its monitoring results.
 - **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
 - **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

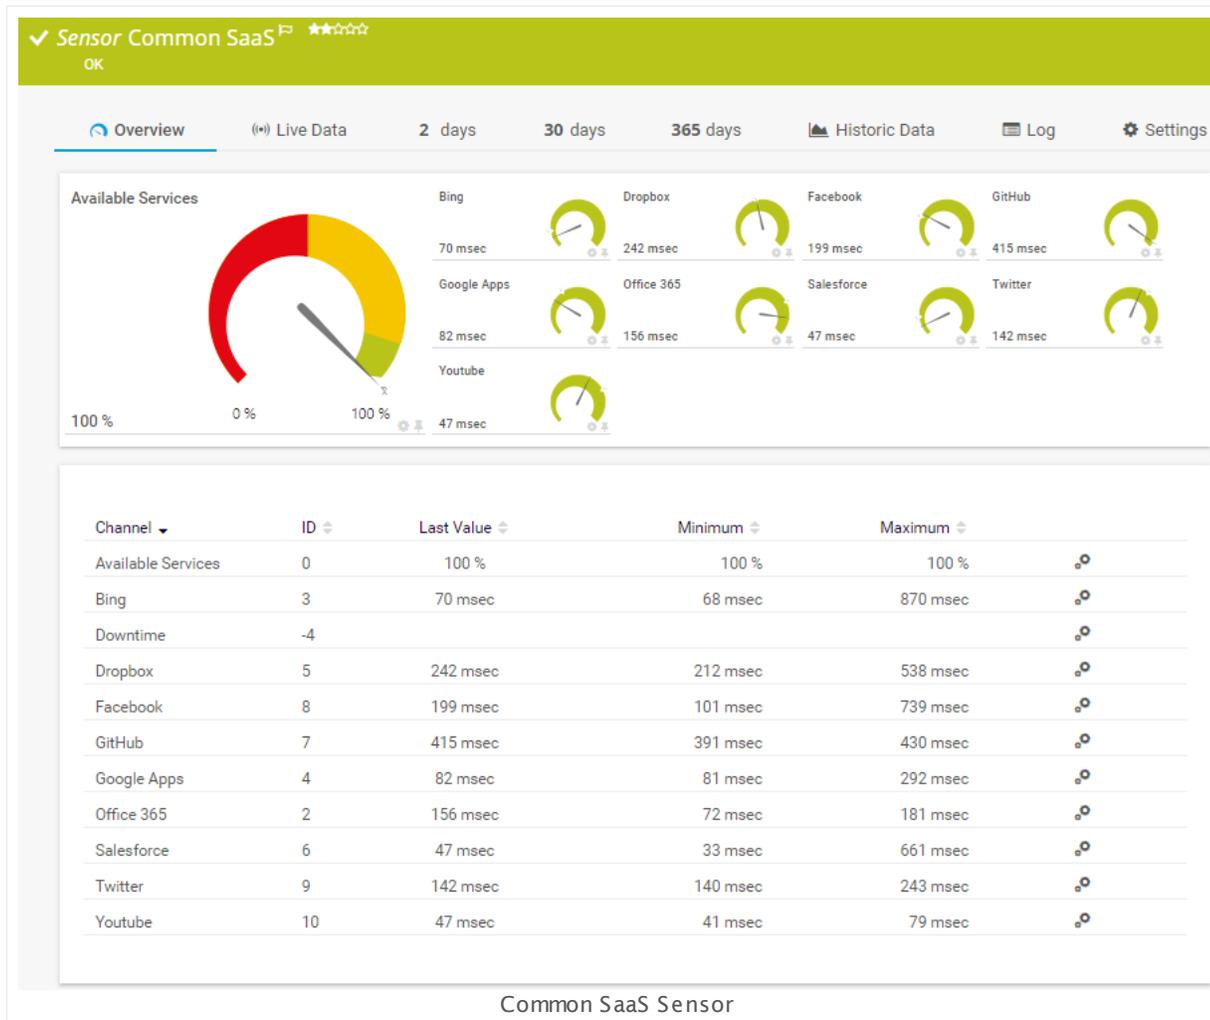

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.19 Common SaaS Sensor

The Common SaaS sensor monitors the availability of several Software as a Service (SaaS) providers. Because your business processes depend more and more on cloud hosts, this sensor type is an important pillar for unified monitoring. With this sensor you can get alarms if your cloud services are not reachable anymore.

This sensor shows the following:

- Available services in percent
- Response times of the following SaaS providers:
 - Bing
 - Dropbox
 - Facebook
 - GitHub
 - Google Apps
 - Office 365
 - Salesforce
 - Twitter
 - Youtube

Sensor in Other Languages

Dutch: **Algemene SaaS**, French: **SaaS courants**, German: **Verbreitete SaaS-Dienste**, Japanese: **Common SaaS**, Portuguese: **Provedores SaaS Comuns**, Russian: **Общий для SaaS**, Simplified Chinese: **?? SaaS**, Spanish: **SaaS común**

Remarks

- The server where the PRTG probe with this sensor runs must have access to the internet.
- PRTG creates this sensor automatically on every new probe device. If the system running the probe has no connection to the internet, please [pause](#)^[245] or [delete](#)^[259] this sensor manually to avoid error messages.
- This sensor type has a fixed scanning interval (15 minutes). You cannot change it.
- This sensor type inherits [Proxy Settings for HTTP Sensors](#)^[419] from the parent device.
- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, refer to the manual section [Sensor Channels Settings](#)^[3160].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) ^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select which SaaS providers you want to monitor. The sensor will create one channel for each service you choose in the **Add Sensor** dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

COMMON SAAS SPECIFIC

SaaS Checklist	Select the services you want to monitor with this sensor. You see a list with the names of all items that are available to monitor. Select the desired items by adding check marks in front of the respective lines. The sensor creates one channel for each selection. You can also select and deselect all items by using the check box in the table head.
----------------	--

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) ^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[213] , logs ^[228] , notifications ^[3216] , reports ^[3262] , maps ^[3270] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

- Tags** Enter one or more [Tags](#)¹³⁹, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.
- You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)¹⁴⁰ from objects further up in the device tree. These are visible above as **Parent Tags**.
-  It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).
- Priority** Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result**: Do not store the sensor result.
 - **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>3311</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

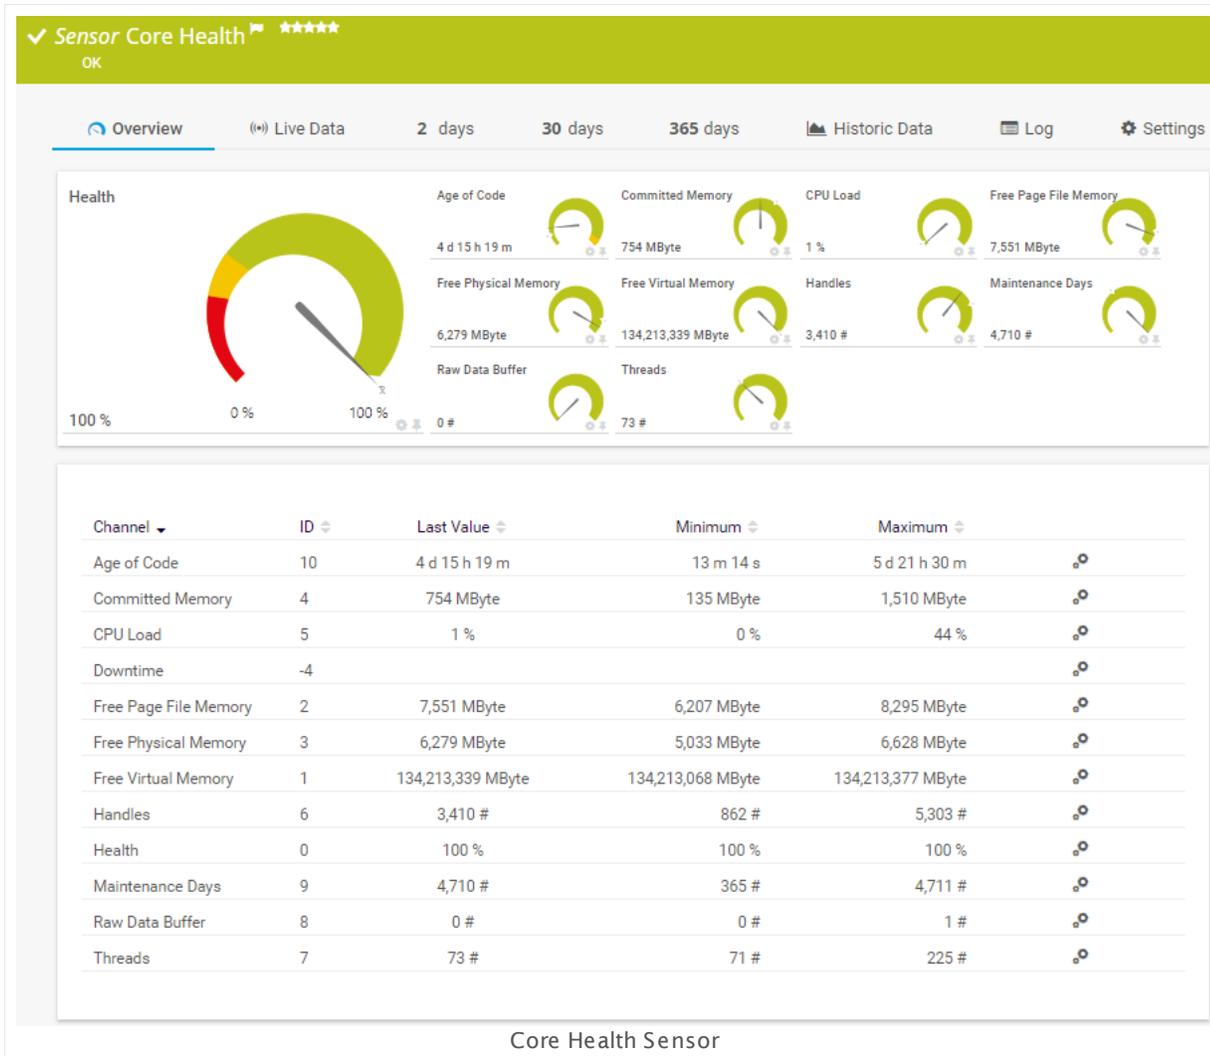

7.8.20 Core Health Sensor

The Core Health sensor monitors internal PRTG parameters. It shows the status of the PRTG core server.

This sensor type checks various parameters of your PRTG core that have an impact on the stability of the system:

- **Health:** This index value sums up the core state into a value between 100% (healthy) and 0% (failing). Frequent or repeated health values below 100% should be investigated.
- **Age of Code:** This channel shows the time that has passed since the last update of your PRTG installation. Please update regularly to get best security and stability for PRTG, as well as the latest features. We recommend that you use the PRTG [Auto-Update](#) 3407 to get new versions automatically.
- **CPU Load:** This channel shows the current percentage CPU load. Extensive CPU load can lead to false, incomplete, and incorrect monitoring results. This value should usually stay below 50%.
- **Handles:** This is a counter for the data structures of the operating system. It is responsible for internal resource management. Repeated obviously increasing values should be investigated.
- **Committed Memory:** This channel shows the amount of memory committed to the PRTG core server as reported by the memory manager.
- **Free Page File Memory:** This channel shows the amount of free page file memory currently available on the system. Page file memory is aggregated RAM and the size of page file. It is the maximum amount of memory that is available on the system to be used for all currently running processes. If it gets too low the system can crash, at least some applications will throw "Out of memory" errors.
- **Free Physical Memory:** This channel shows the amount of free physical memory currently available on the system. This is the RAM that is physically built into the computer. If it gets too low the system will become very slow and PRTG is not usable in a reasonable way anymore. It can happen that some sensors will not be displayed correctly in that case, they will appear disabled (grayed out).
- **Free Virtual Memory:** This channel shows the accessible address space on the system for PRTG. PRTG cannot use more memory than reported here, independently from free page file and physical memory. On a 32-bit OS (operating system) the maximum is 2 GB (3 GB with special settings under Windows); on a 64-bit OS it is 4 GB if PRTG is running as 32-bit version, and unlimited as 64-bit version (only Core). If free virtual memory gets too low, PRTG will throw "Out of memory" errors or the message "not enough storage to process this command" (visible in the Core log).
- **Maintenance Days:** This channel shows the remaining maintenance days of your PRTG on premises license. Please renew your maintenance on time to be sure to get updates for your PRTG on premises installation. PRTG hosted by Paessler instances show a fixed value here for technical reasons.
- **Threads:** This channel shows the number of program parts that are currently running simultaneously. This number can increase with heavy load. The number should not exceed 100 in normal operation.

- **Raw Data Buffer:** This channel shows how much raw data is temporarily stored on the physical memory while I/O operations on the disk. Usually, this value should be 0 (or very low). Investigate increasing values.

Sensor in Other Languages

Dutch: **Core Status**, French: **État du serveur principal**, German: **Serverzustand**, Japanese: ? ? ? ? , Portuguese: **Funcionamento do núcleo**, Russian: **Работоспособность базового сервера**, Simplified Chinese: ? ? ? ? ? , Spanish: **Salud de núcleo**

Remarks

- PRTG creates this sensor automatically and you cannot delete it.
- You can set up this sensor only on a Local Probe device!
- You can find PRTG core system memory related information also in the [PRTG System Status](#) ³³⁹⁹. For details, see the Knowledge Base: [What do the PRTG core system memory parameters mean?](#)

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-----------------	--

SENSOR DISPLAY

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

-  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁶⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: What do the PRTG core system parameters mean?

- <https://kb.paessler.com/en/topic/71671>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

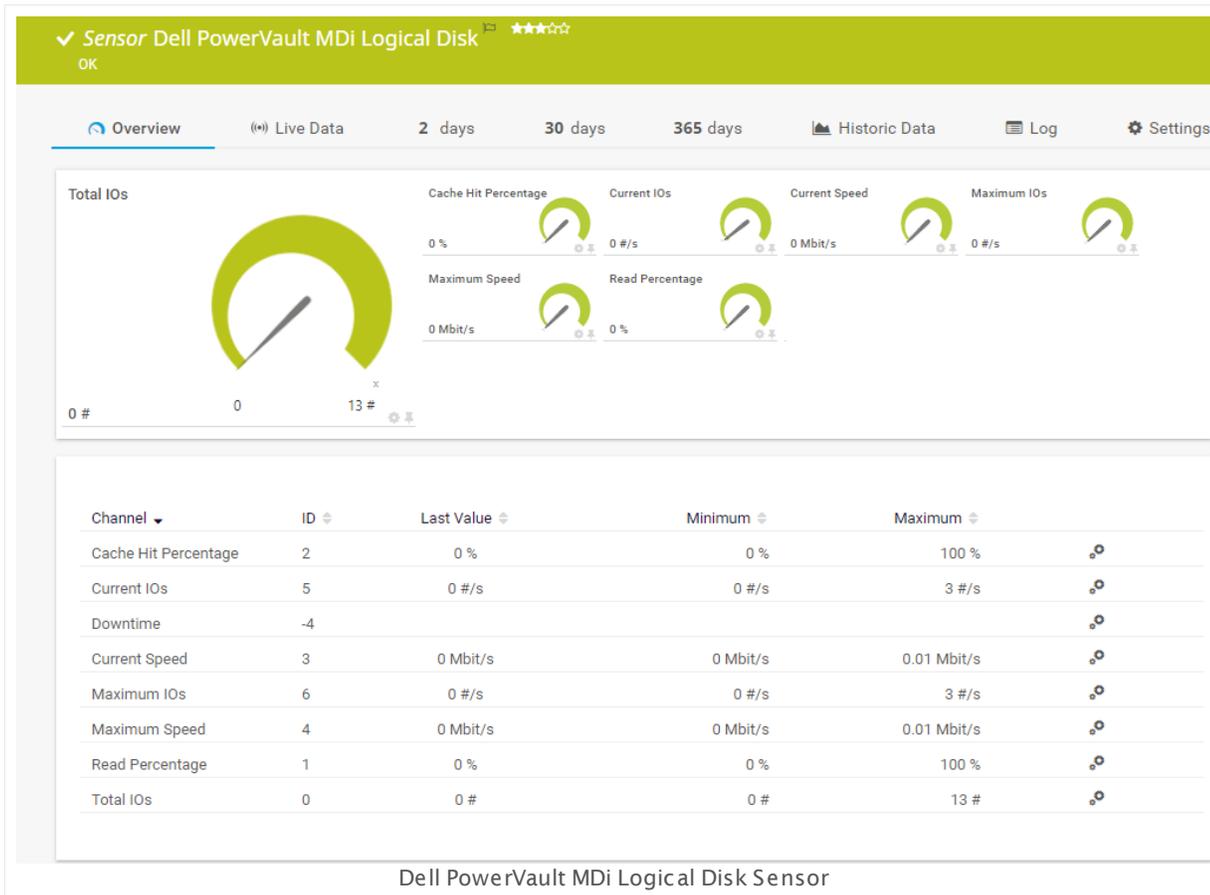

7.8.21 Dell PowerVault MDi Logical Disk Sensor

The Dell PowerVault MDi Logical Disk sensor monitors a virtual disk on a Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, MD3620f, or MD3820i. It might work with other models, too.

This sensor can show the following:

- Total number of I/O operations
- Number of current and maximum I/O operations per second
- Current and maximum disk speed
- Read and cache hit percentages

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **Dell PowerVault MDi Log. Schijf**, French: **Disque logique Dell PowerVault MDi**, German: **Dell PowerVault MDi Log. Datenträger**, Japanese: **Dell PowerVault MDi ? ? ? ? ?**, Portuguese: **Dell PowerVault MDi Disco Lógico**, Russian: **Лог. диск Dell PowerVault**

MDi, Simplified Chinese: Dell PowerVault MDi ? ? ? ? , Spanish: **Disco de registro de Dell PowerVault MDi**

Remarks

- Works with Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, MD3620f, or MD3820i, and might support other models.
 - **Requires** ⁶⁶⁰ Dell Modular Disk Storage Manager on the probe system. See the Knowledge Base: [Where do I find the Dell PowerVault Modular Disk Storage Manager for use with my MDi SAN?](#)
 - Needs the IP address of the Storage Area Network (SAN) defined in the parent device settings.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Dell Modular Disk Storage Manager

 This sensor requires the installation of the **Dell Modular Disk Storage Manager** program. You have to install it on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#) ³⁷⁰. For details about setup, please see **More** section below.

 Create this sensor on a device that has the SAN's IP address configured in the **IP Address/DNS Name** field of the sensor settings.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) ³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select which virtual disks you want to monitor. PRTG will create one sensor for each disk you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Virtual Disks

Select the disks you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Virtual Disk	Shows the name of the virtual disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none"> 📁 For more information on how to find the folder used for storage, see section Data Storage³⁷³⁴. <p>☁ This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> 📘 This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

i Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#) 3209 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.22 Dell PowerVault MDi Physical Disk Sensor

The Dell PowerVault MDi Physical Disk sensor monitors a physical disk on a Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, or MD3620f. It might work with other models, too.

This sensor can show following:

- **Mode** of the physical disk
- **Status** of the physical disk

The sensor shows these channels as reported in the **Modular Disk Storage Manager**. Status and mode combined indicate the particular status of a RAID controller physical disk. The table below provides you with the status description according to the Dell documentation:

"STATUS" CHANNEL	"MODE" CHANNEL	DESCRIPTION
Optimal (status: up)	Unassigned (status: up)	The physical disk in the indicated slot is unused and available to be configured.
	Assigned (status: up)	The physical disk in the indicated slot is configured as part of a disk group.
	Hot Spare Standby (status: up)	The physical disk in the indicated slot is configured as a hot spare.
	Hot Spare In Use (status: up)	The physical disk in the indicated slot is in use as a hot spare within a disk group.
Failed (status: down)	▪ Assigned	The physical disk in the indicated slot has been failed because of an unrecoverable error, an incorrect drive type or drive size, or by its operational state being set to failed.
	▪ Unassigned	
	▪ Hot Spare In Use	
	▪ Hot Spare Standby	
Replaced (status: up)	Assigned	The physical disk in the indicated slot has been replaced and is ready to be, or is actively being, configured into a disk group.
Pending Failure (status: down)	▪ Assigned	A SMART error has been detected on the physical disk in the indicated slot.
	▪ Unassigned	
	▪ Hot Spare In Use	
	▪ Hot Spare Standby	

"STATUS" CHANNEL	"MODE" CHANNEL	DESCRIPTION
None (status: warning)	None (status: warning)	The indicated slot is empty, or the array cannot detect the physical disk.
Undefined (status: down)

Dell PowerVault MDi Physical Disk Sensor

Sensor in Other Languages

Dutch: **Dell PowerVault MDi Phy. Schijf**, French: **Disque physique Dell PowerVault MDi**, German: **Dell PowerVault MDi Phy. Datenträger**, Japanese: **Dell PowerVault MDi ? ? ? ? ? ?**, Portuguese: **Dell PowerVault MDi Disco Físico**, Russian: **Физ. диск Dell PowerVault MDi**, Simplified Chinese: **Dell PowerVault MDi ? ? ? ?**, Spanish: **Disco de Dell PowerVault MDi Phy.**

Remarks

- Works with Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, MD3620f, or MD3820i, and might support other models.
- [Requires](#) ⁶⁶⁹¹ Dell Modular Disk Storage Manager on the probe system. See the Knowledge Base: [Where do I find the Dell PowerVault Modular Disk Storage Manager for use with my MDi SAN?](#)

- Needs the IP address of the Storage Area Network (SAN) defined in the parent device settings.
 - This sensor supports devices with one drawer of hard-drives only. Multiple drawers are not supported and prevent sensor creation.
 - This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
 - **BETA** Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Dell Modular Disk Storage Manager

 This sensor requires the installation of the **Dell Modular Disk Storage Manager** program. You have to install it on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. For details about setup, please see **More** section below.

 Create this sensor on a device that has the SAN's IP address configured in the **IP Address/DNS Name** field of the sensor settings.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the physical disks you want to monitor. PRTG will create one sensor for each disk you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Physical Disks

Select the disks you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Physical Disks	Shows the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none"> 📁 For more information on how to find the folder used for storage, see section Data Storage³⁷³⁴. <p>☁ This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> 📘 This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)^[335] on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

i Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#) 3209 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Where do I find the Dell PowerVault Modular Disk Storage Manager for use with my MDi SAN?

- <https://kb.paessler.com/en/topic/38743>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

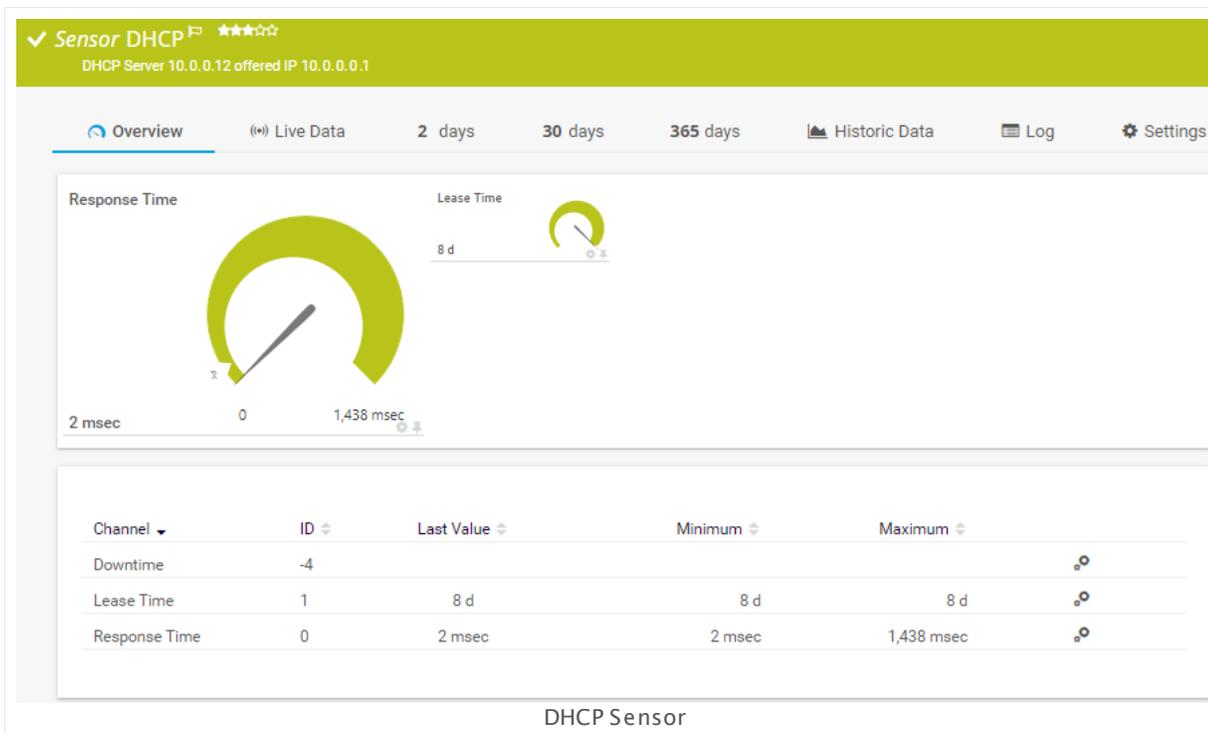

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.23 DHCP Sensor

The DHCP sensor monitors a Dynamic Host Configuration Protocol (DHCP) server. It sends a broadcast message to the network and waits for a DHCP server to respond. When creating this sensor, choose the network card on the probe system that will be used to send the broadcast message.

If a server responds, the sensor shows the following:

- Address of the server and the offered IP in the sensor message. You can check the server's response using [Regular Expressions](#).
- Response time (msec)
- Lease time given by the server (in days)

Remarks

- You can create this sensor only on a probe device (either local probe, a remote probe, or a cluster probe).
- The probe device where you create a DHCP sensor must have a static IP address. It cannot get its IP address from DHCP because this can cause a DHCP failure that will result in a severe issue for the probe device and you risk losing monitoring data.
- Do not use more than 2 DHCP sensors per device. Otherwise your DHCP sensors will show a timeout error.
- Knowledge Base: [How can I monitor a DHCP server in a specific network if there are several DHCP networks?](#)

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) ^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the desired network interfaces to monitor DHCP servers. PRTG will create one sensor for each network interface you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

DHCP SPECIFIC

Specify Network Interface

Select the network adapters you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) ^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name

Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#) ^[181], as well as in [alarms](#) ^[219], [logs](#) ^[228], [notifications](#) ^[3216], [reports](#) ^[3262], [maps](#) ^[3276], [libraries](#) ^[3235], and [tickets](#) ^[230].

BASIC SENSOR SETTINGS

Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DHCP SPECIFIC

MAC	Shows the MAC address of the network adapter that is used to send the broadcast message to the network. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Client IP	<p>Specify if you want to check the returned client IP with a regular expression. Choose between:</p> <ul style="list-style-type: none"> ▪ Don't check: The IP will only appear in the sensor message without further processes. ▪ Check: Enter the regular expression you want to use below.
Client IP Must Include	This field is only visible if you choose to Check the client IP above. In the response of the DHCP server, search using a regular expression. If the answer for the client IP does not contain the defined string, the sensor shows a Down status .

DHCP SPECIFIC

For example, enter `10\0\5\.*` to make sure any answering DHCP server returns an client IP address starting with "10.0.5.". If it does not, the sensor will show an error. Leave empty to not use this field.

 PRTG supports **PCRE** regex. You cannot use regex options or flags. For more details, see manual section [Regular Expressions](#) 3704.

Client IP Must Not Include

This field is only visible if you choose to check the client IP above. In the response of the DHCP server, search using a regular expression. If the answer for the client IP **contains** the defined string, the sensor shows a **Down** status. See the example above. Leave empty to not use this field.

 PRTG supports **PCRE** regex. You cannot use regex options or flags. For more details, see manual section [Regular Expressions](#) 3704.

Server IP

Specify if you want to check the returned server IP with a regular expression. Choose between:

- **Don't check:** The IP will only appears in the sensor message without further processes.
- **Check:** Enter the regular expression you want to use below.

Server IP Must Include

This field is only visible if you choose to check the server IP above. In the response of the DHCP server, search using a regular expression. If the answer for the server IP **does not contain** the defined string, the sensor shows a **Down** status. See example above. Leave empty to not use this field.

 PRTG supports **PCRE** regex. You cannot use regex options or flags. For more details, see manual section [Regular Expressions](#) 3704.

Server IP Must Not Include

This field is only visible if you choose to check the server IP above. In the response of the DHCP server, search using a regular expression. If the answer for the server IP **contains** the defined string, the sensor shows a **Down** status. Leave empty to not use this field. See example above.

 PRTG supports **PCRE** regex. You cannot use regex options or flags. For more details, see manual section [Regular Expressions](#) 3704.

DHCP SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
DHCP Server Change	<p>If there is more than one DHCP server in the network that may answer to the broadcast message, the sensor can receive an answer from a different DHCP server, compared to the last scan of the sensor. In this case, PRTG can write an entry to the system logs^[228]. Choose between:</p> <ul style="list-style-type: none"> ▪ Ignore: Do not write a log entry if the DHCP server changes. ▪ Write log entry: Write an entry to the system logs whenever the DHCP server changes between two sensor scans. <p> Regardless of this setting, those entries will always be added to the sensor log.</p>
Offered IP Change	<p>If the IP address offered by the DHCP server changes between two sensor scans, PRTG can write an entry to the system logs^[228]. Choose between:</p> <ul style="list-style-type: none"> ▪ Ignore: Do not write a log entry if the offered IP address changes. ▪ Write log entry: Write an entry to the system logs whenever the DHCP server offers a different IP address compared to the last sensor scan. <p> Regardless of this setting, those entries will always be added to the sensor log.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#).

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

23 DHCP Sensor

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

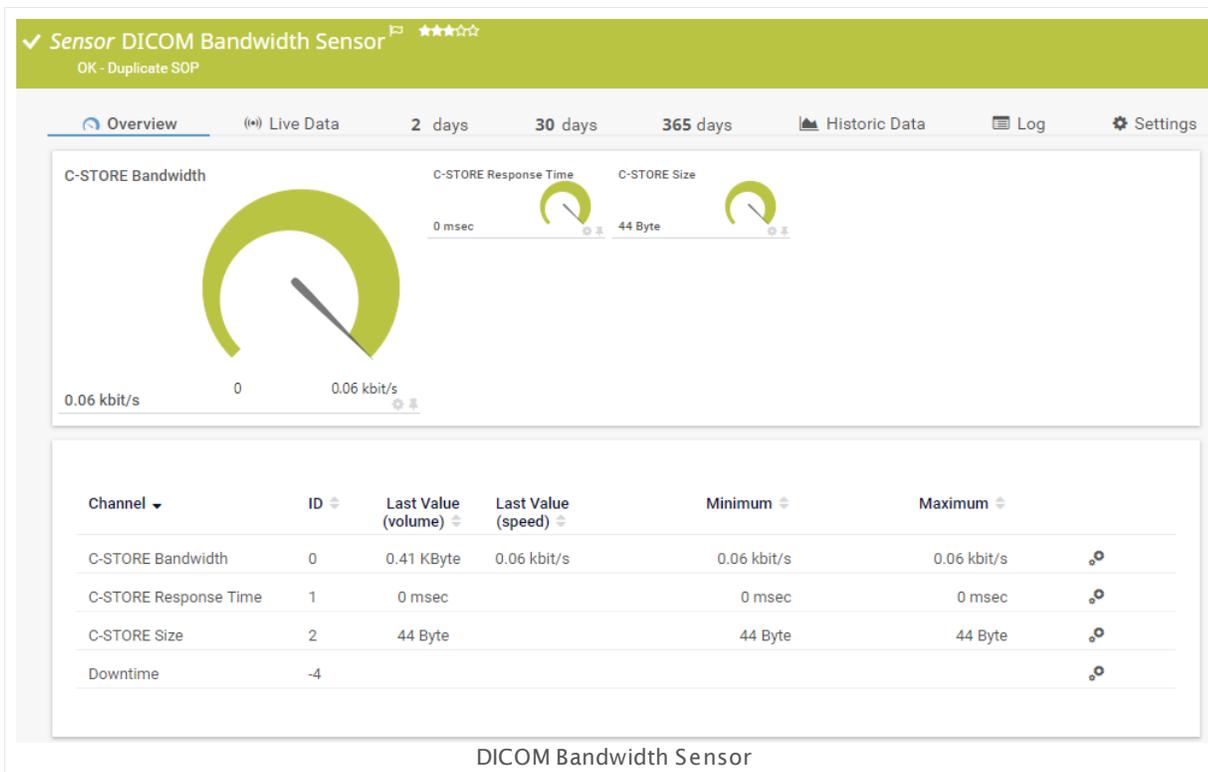

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.24 DICOM Bandwidth Sensor

The DICOM Bandwidth sensor monitors the bandwidth usage of a C-STORE request to a DICOM capable device. It sends one or more DICOM images and files that you have stored in a folder on a local disk or share and checks if the DICOM device can handle the C-STORE request. You can use the sensor to test your **Picture Archiving and Communication (PACS)** system, for example.

The sensor shows the following:

- C-STORE bandwidth (bandwidth usage of the sent files)
- Response time of the C-STORE request
- C-STORE size (total size of the sent files)

Sensor in Other Languages

Dutch: **DICOM Bandbreedte Sensor**, French: **Captteur de bande passante DICOM**, German: **DICOM-Bandbreiten-Sensor**, Japanese: **DI COM ? ? ? ? ? ?**, Portuguese: **Sensor de largura de banda do DICOM**, Russian: **Сенсор пропускной способности DICOM**, Simplified Chinese: **DICOM ? ? ? ? ?**, Spanish: **Sensor de anchura de banda de DICOM**

Remarks

- [Requires](#) ⁶⁹² .NET 4.6 or later on the probe system.

- Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: .NET Framework

- ✘ This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#). If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.6 or .NET 4.7.

- 📖 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

- 📘 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags¹³⁹, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited¹⁴⁰ from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

DICOM CONNECTION

Calling Application Entity Title	<p>Enter the Application Entity Title (AET) of PRTG to initialize a DICOM connection.</p> <p> The AET is case sensitive and does not support special characters.</p>
Called Application Entity Title	<p>Enter the configured Application Entity Title (AET) of the target system to initialize a DICOM connection.</p> <p> The AET is case sensitive and does not support special characters.</p>
Port	<p>Enter the port of the DICOM interface that is used for the connection.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).</p>

BANDWIDTH SETTINGS

- File Path** Enter the full path to the folder where you have stored your DICOM files and images (ending with **.dcm**). The sensor will send all files in the folder to the target DICOM device with each request. You can use any folder on a disk or share that the PRTG probe on which the sensor runs has access to.
-  For example, enter **C:\DICOM** to send files that are stored in a folder named "DICOM" on the parent probe system.
 -  The path must contain ***.dcm** files. Enter the path without a backslash (\) at the end.

DEBUG OPTIONS

- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result:** Do not store the sensor result.
 - **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

SENSOR DISPLAY

Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> ⓘ This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings^[3160] settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration^[336] on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p>

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

7.8.25 DICOM C-ECHO Sensor

The DICOM C-ECHO sensor monitors the availability of DICOM capable systems and devices by sending C-ECHO requests to the target system. C-ECHO is also known as DICOM-Ping. You can use the sensor to verify that the DICOM handshake is executed and that your target system is capable of answering DICOM messages.

The sensor shows the following:

- C-ECHO response time average, maximum, and minimum

Remarks

- [Requires](#) ⁷⁰¹ .NET 4.6 or later on the probe system.
- Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: .NET Framework

X This sensor type requires the [Microsoft .NET Framework](#) to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#) ³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required [.NET](#) version (with latest update): .NET 4.6 or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DICOM CONNECTION

Calling Application Entity Title	<p>Enter the Application Entity Title (AET) of PRTG to initialize a DICOM connection.</p> <p> The AET is case sensitive and does not support special characters.</p>
Called Application Entity Title	<p>Enter the configured Application Entity Title (AET) of the target system to initialize a DICOM connection.</p> <p> The AET is case sensitive and does not support special characters.</p>
Port	<p>Enter the port of the DICOM interface that is used for the connection.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).</p>

C-ECHO SETTINGS

C-ECHO Count	<p>Enter the number of C-ECHO requests that the sensor sends in a row for one interval. Please enter an integer value. The default value is 5.</p>
Ping Delay (ms)	<p>Enter the time in milliseconds the sensor will wait between two C-ECHO requests. Please enter an integer value. The default value is 10.</p>

DEBUG OPTIONS

Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none">▪ Discard sensor result: Do not store the sensor result.
---------------	--

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

- <https://kb.paessler.com/en/topic/60543>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

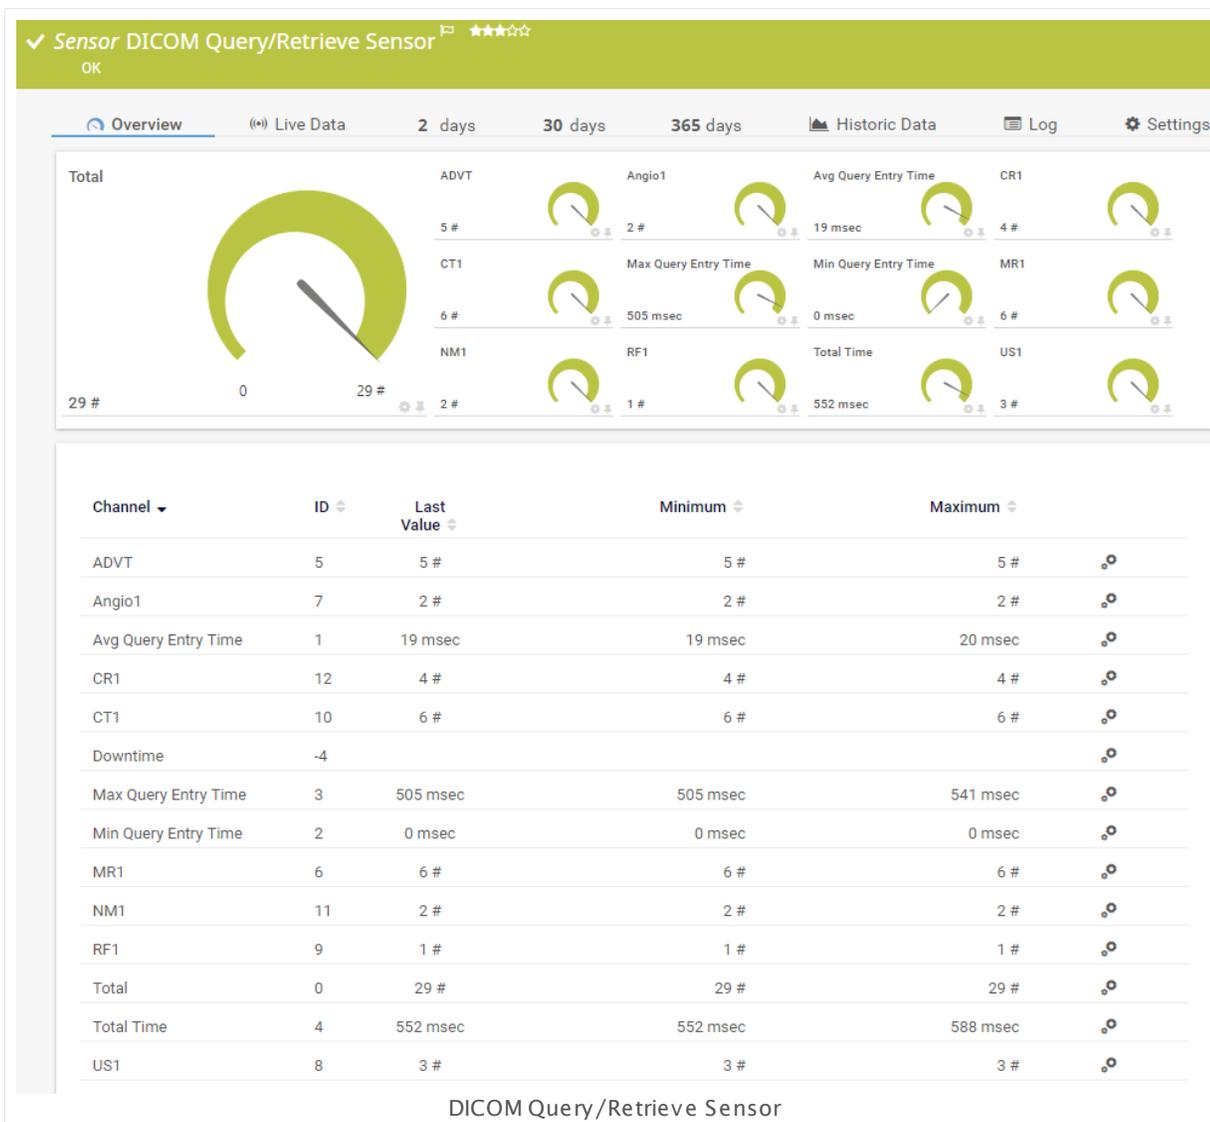

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.26 DICOM Query/Retrieve Sensor

The DICOM Query/Retrieve sensor monitors the C-FIND capability of DICOM capable systems and devices. It sends a C-FIND request or Modality Worklist (MWL) query to the target device and counts all found items. You can specify search levels to only count specific items.

The sensor shows the following:

- Minimum, maximum, and average time between receiving two responses
- Total communication time
- Total number of found items
- Number of found items by field

Sensor in Other Languages

Dutch: **DICOM Query/Retrieve Sensor**, French: **Capteur de requête/récupération de DICOM**, German: **DICOM-Abfrage-Sensor**, Japanese: **DI COM? ? ? /? ? ? ? ? ?**, Portuguese: **Sensor de recuperação/consulta do DICOM**, Russian: **Сенсор запроса/получения DICOM**, Simplified Chinese: **DICOM? ? /? ? ? ? ? ?**, Spanish: **Sensor de Consulta/Recuperación DICOM**

Remarks

- [Requires](#)^[711] .NET 4.6 or later on the probe system.
- Currently, this sensor type is in beta status. The methods of operating can change at any **BETA** time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.6 or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DICOM CONNECTION

Calling Application Entity Title	<p>Enter the Application Entity Title (AET) of PRTG to initialize a DICOM connection.</p> <p> The AET is case sensitive and does not support special characters.</p>
Called Application Entity Title	<p>Enter the configured Application Entity Title (AET) of the target system to initialize a DICOM connection.</p> <p> The AET is case sensitive and does not support special characters.</p>
Port	Enter the port of the DICOM interface that is used for the connection.

DICOM CONNECTION

Timeout (Sec.) Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is **900** seconds (15 minutes).

QUERY/RETRIEVE SETTINGS

C-FIND Level Define the search level of the C-FIND request. Choose between:

- **Patient**: Retrieve data from the patient column via C-FIND. Enter a search key below.
- **Study**: Retrieve data from the study column via C-FIND. Enter a search key and modality below.
- **Series**: Retrieve data from the series column via C-FIND. Enter a search key and modality below.
- **Worklist**: Use a **Modality Worklist (MWL)** query to retrieve data from the worklist. Define desired fields below.

Search Key This field is not available for MWL queries. Enter a key to search for in the field that you selected above, for example, an instance UID, series UID, patient UID, or an asterisk (*) to search for all items.
Please enter a string.

Modality This field is only available if you search in the **Study** or **Series** column. Enter a modality in short form to search for, for example, **CT, MRI, US**, or an asterisk (*) to search for all modalities.
Please enter a string.

Filter Field This option is only available for MWL queries. Define a field of the worklist that you want to filter for. Choose between:

- **Station AET**
- **Station Name**
- **Modality**

Filter String This field is only available for MWL queries. Enter a string you want to filter for, for example, a station name, station AET, modality, or an asterisk (*) to filter for all items.

QUERY/RETRIEVE SETTINGS

Please enter a string.

Channel Field

This option is only available for MWL queries. Define which field you want to use to name the sensor channels. Choose between:

- **Station AET**
- **Station Name**
- **Modality**

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

26 DICOM Query/Retrieve Sensor

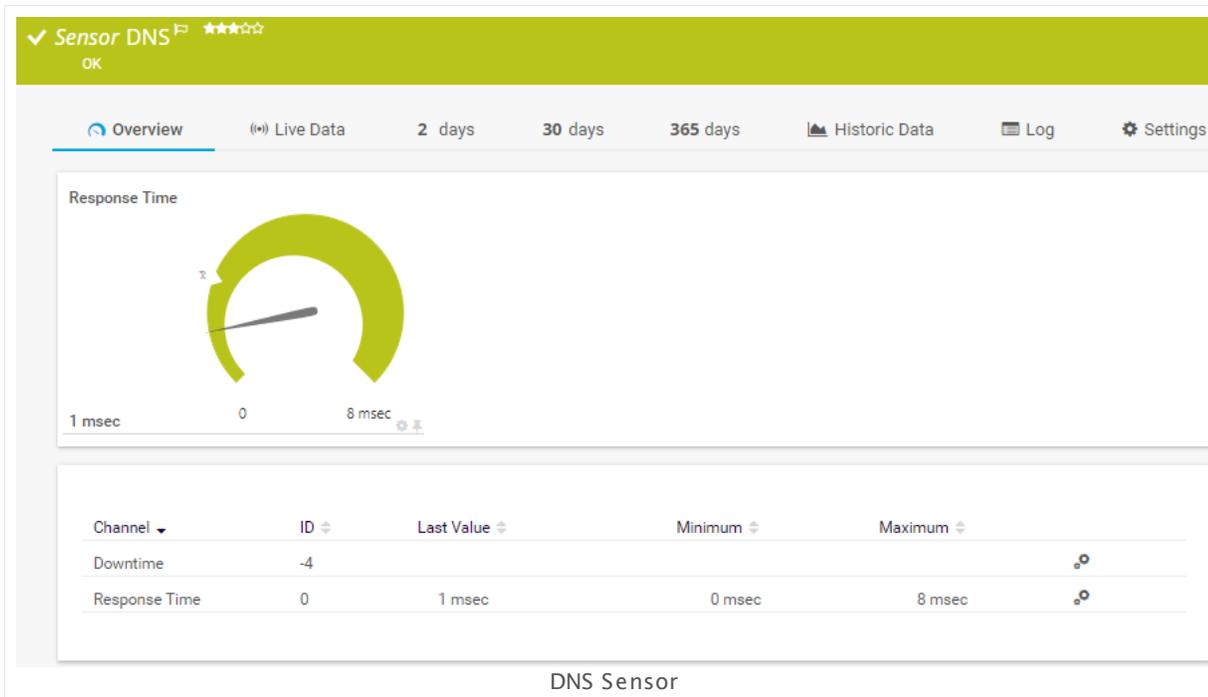

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.27 DNS Sensor

The DNS sensor monitors a Domain Name Service (DNS) server. It resolves a domain name and compares it to a given IP address.

- The sensor shows the response time of the DNS server.
- It will show a **Down status** ^[195] if the DNS server does not resolve a given domain name correctly.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) ^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) ^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DNS SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port	<p>Enter the number of the port to which the sensor tries to connect. This must be the port the sensor's parent device is running the DNS service on. Usually you will use port 53. We recommend that you use the default value.</p> <p> The sensor connects to the IP Address or DNS Name value of the device^[402] on which you create it.</p>

DNS SPECIFIC

Domain	Enter the domain name that the sensor resolves using the Domain Name Service (DNS) server specified in the sensor's parent device settings ^[402] . You can enter an internet domain name here (for example, example.com) or a DNS name in your internal network (such as computer-xyz), depending on the type of DNS server you monitor. You can also enter an IP address here, but there might occur an error with certain query types.
Query Type	Select the type of query that the sensor sends to the DNS server. Choose between: <ul style="list-style-type: none">▪ Host address IPv4 (A)▪ Host address IPv6 (AAAA)▪ Authoritative name server (NS)▪ Start of a zone of authority marker (SOA)▪ Domain name pointer (PTR)▪ Mail exchange (MX)▪ Canonical name for an alias (CNAME)
Check Result	Define if the sensor checks the result from the DNS server. Choose between: <ul style="list-style-type: none">▪ Ignore result: Accept any valid answer of the DNS server.▪ Check result: Check if the response contains certain strings. Define below.
Value	<p>This field is only visible if you enable result checking above. Enter elements that the response of the DNS server must contain. Enter each entry in one line. The received result must contain at least one of the elements. If none of the element matches the response, the sensor will show a red Down status.</p> <p>For example, you can enter an IP address here if your Domain field contains a host name. Only if the host name is resolved to the correct IP address, your sensor will show a green Up status.</p>
Sensor Result	Define what PRTG will do with the sensor results. Choose between: <ul style="list-style-type: none">▪ Discard sensor result: Do not store the sensor result.

DNS SPECIFIC

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 🔗 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
- ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

- 📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - 📘 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings.</p> <ul style="list-style-type: none"> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> <p>▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.</p> <p>▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.</p> <ul style="list-style-type: none"> <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[338] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[310] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

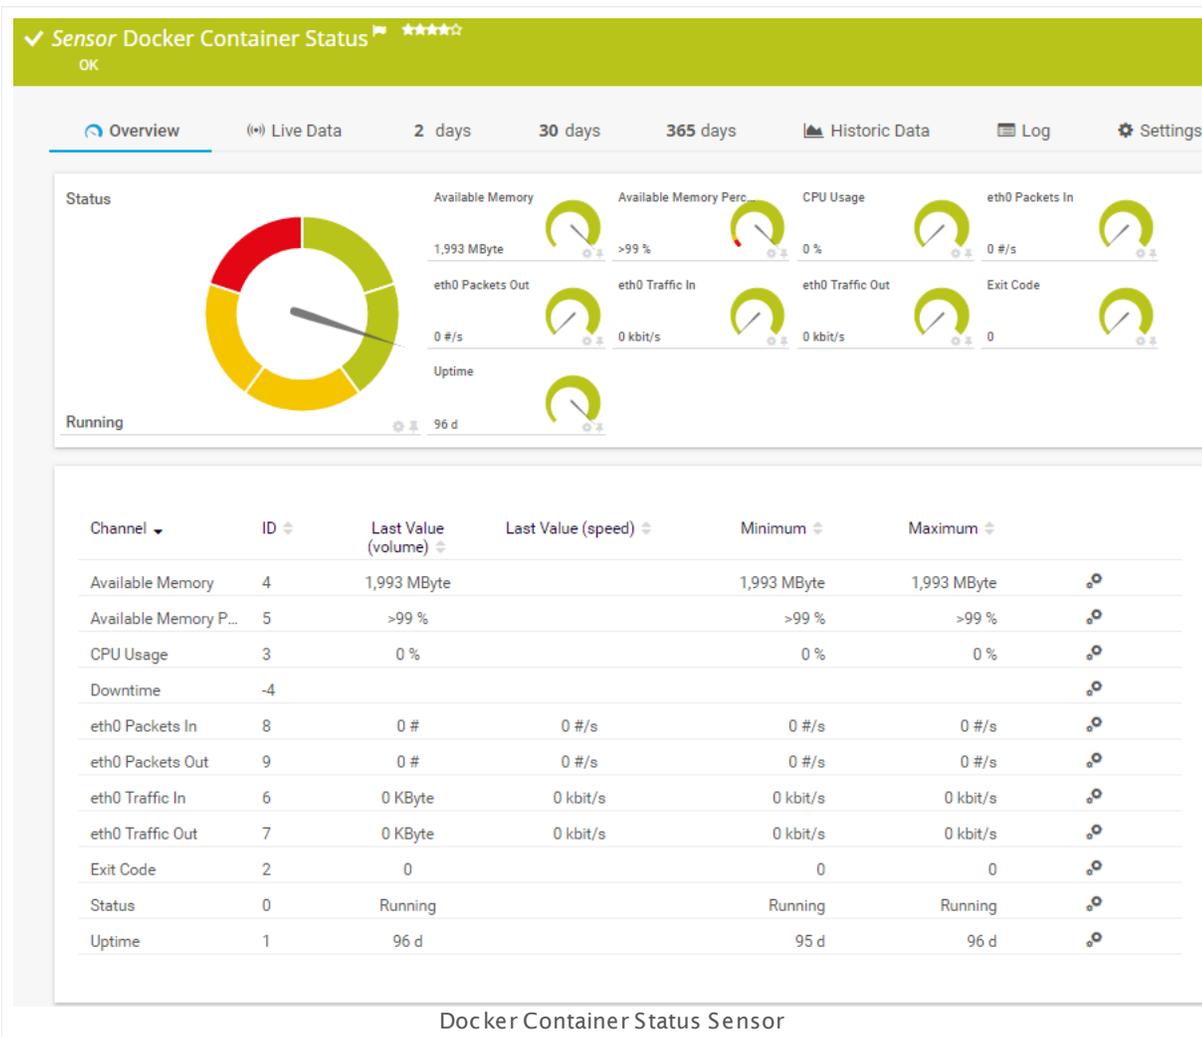

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.28 Docker Container Status Sensor

The Docker Container Status sensor monitors the status of a Docker container. It can show the following:

- Overall status of the container (create, running, paused, restarting, exited)
- Uptime
- Exit code
- CPU usage
- Available memory in bytes and percent

Sensor in Other Languages

Dutch: **Docker Container Status**, French: **État de conteneur Docker**, German: **Docker-Container-Zustand**, Japanese: **Dockerコンテナの状態**, Portuguese: **Status do Container Docker**, Russian: **Статус контейнера Docker**, Simplified Chinese: **Docker ? ? ? ?**, Spanish: **Estado de contenedor de Docker**

Remarks

- The parent device for this sensor must be the Docker machine on which the container runs that you want to monitor.
- You need to provide certificates and private keys to monitor Docker with this sensor. For details, see the Knowledge Base: [How can I create private key and certificate for the Docker sensor?](#)
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).
- Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG requires an authentication with certificate and private key before you can actually add this sensor. Provide **Port** (usually **2375**), **Private Key**, and **Certificate** in the appearing dialog window and click **OK**. PRTG can now scan Docker for existing containers.

Select which Docker containers you want to monitor. PRTG creates one sensor for each container you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

DOCKER SPECIFIC

Container	<p>Select the containers you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.</p> <p>To better find what you want to monitor, especially in large tables, use the search function in the upper-right corner.</p>
-----------	--

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DOCKER CREDENTIALS

Port	Enter the number of the port to which this sensor connects. The default port on which Docker over TLS runs is 2376 .
------	---

DOCKER CREDENTIALS

Private Key	<p>Provide the private key for the connection to Docker. If you have already created a key, you can use it here. Otherwise, please create a certificate on Docker first.</p> <p>Open the key with a text editor, copy everything that the file includes, and paste it here. Usually, the key starts with <code>-----BEGIN RSA PRIVATE KEY-----</code> and ends with <code>-----END RSA PRIVATE KEY-----</code></p> <p> See this Knowledge Base article on how to create a Docker certificate: How can I create private key and certificate for the Docker sensor?</p>
Certificate	<p>Provide the certificate for the connection to Docker. If you have already created a certificate, you can use it here. Otherwise, please create a certificate on Docker first.</p> <p>Open the certificate with a text editor, copy everything that the file includes, and paste it here. Usually, the certificate starts with <code>-----BEGIN CERTIFICATE-----</code> and ends with <code>-----END CERTIFICATE-----</code></p> <p> See this Knowledge Base article on how to create a Docker certificate: How can I create private key and certificate for the Docker sensor?</p>

DOCKER SPECIFIC

Container ID	Shows the ID of the container that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Container Name	Shows the name of the container that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Image	Shows the name of the image that was used to create the monitored Docker container. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Container Identification	Define how the sensor will identify the Docker container that it monitors. Choose between: <ul style="list-style-type: none">▪ By container ID (default): Use the ID of the Docker container to identify it.

DOCKER SPECIFIC

- **By container name:** Use the name of the Docker container to identify it. This is a good option if the IDs of your containers regularly change, for example, because of nightly deployments of your Docker containers.

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.

 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

- ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)^[335] on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies <small>3209</small> in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: How can I create private key and certificate for the Docker sensor?

- <https://kb.paessler.com/en/topic/67250>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

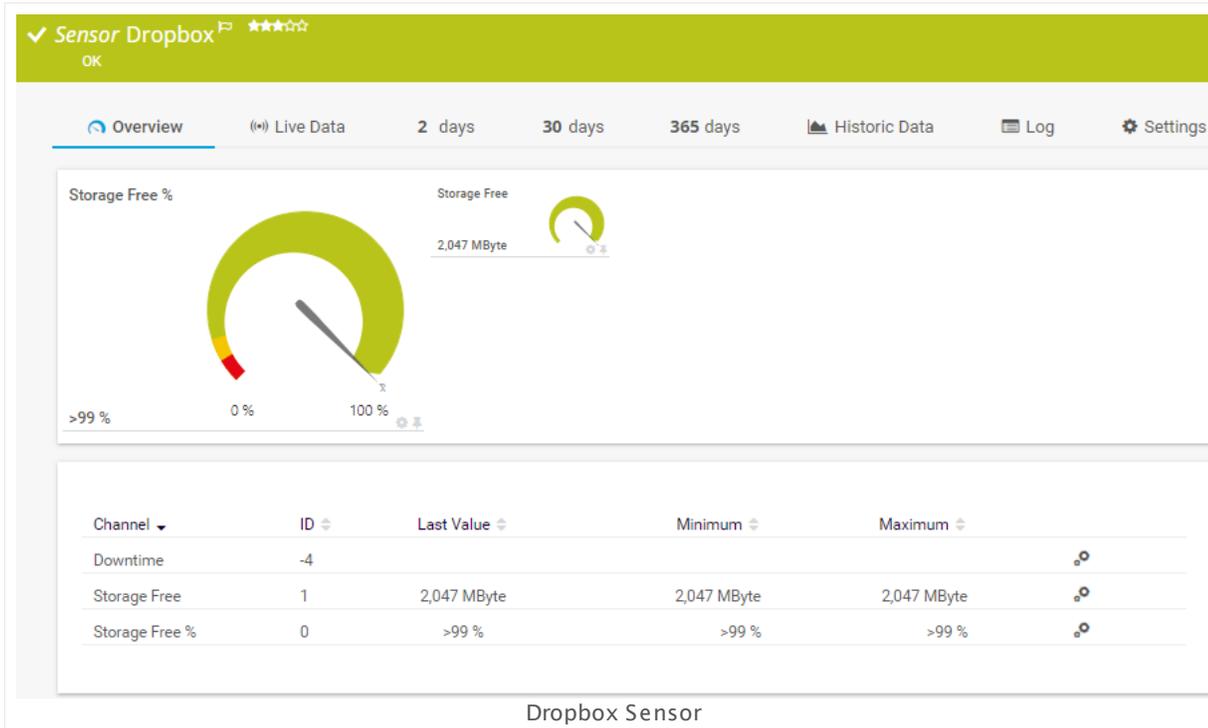

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.29 Dropbox Sensor

The Dropbox sensor monitors a Dropbox account using the Dropbox Application Programming Interface (API) and OAuth2. It shows the following:

- Free storage in bytes and percent

Remarks

- The minimum scanning interval for this sensor type is **30 minutes**.
- For details about OAuth2 authentication, see manual section [Authentication Using OAuth2](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

- PRTG requires OAuth2 authorization before you can actually add this sensor type. Provide the requested credentials in the appearing window.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

DROPBOX CREDENTIALS

This sensor type uses OAuth2 authentication to get access to your Dropbox account.

 For details about the authentication approach, see section [Authentication Using OAuth2](#)⁷⁴⁹.

OAuth URL Click the button **Get Access Code** to connect this sensor to your Dropbox account using OAuth2. This is necessary to allow the sensor to query data from Dropbox. A new browser window appears.

Follow the steps in the window and confirm the permission for PRTG to connect to your Dropbox account. Copy the OAuth code you get and paste it into the **OAuth Code** field below.

OAuth Code Paste the access code that you receive after completing the authorization process for PRTG at your Dropbox account. Click **OK** to define the [sensor settings](#)⁹³⁵.

 It is mandatory to connect this sensor to your Dropbox account to create this sensor. Complete the OAuth approach first to get the OAuth code.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)¹⁸¹, as well as in [alarms](#)²¹⁹, [logs](#)²²⁸, [notifications](#)³²¹⁶, [reports](#)³²⁵², [maps](#)³²⁷⁶, [libraries](#)³²³⁵, and [tickets](#)²³⁰.

Parent Tags Shows [Tags](#)¹³⁹ that this sensor [inherits](#)¹⁴⁰ from its [parent device, group, and probe](#)¹³³. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

- Tags** Enter one or more [Tags](#)¹³⁹, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.
- You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)¹⁴⁰ from objects further up in the device tree. These are visible above as **Parent Tags**.
- i** It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).
- Priority** Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DROPBOX CREDENTIALS

- OAuth Code** Shows the authorization code that the sensor uses to get access to your Dropbox account. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
- i** You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

i This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in [System Administration—Monitoring](#) are not available for this sensor.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>3311</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Authentication Using OAuth2

 This sensor type uses the OAuth2 security protocol to access the account from which you want to retrieve and monitor data. OAuth2 enables you to grant access to the target account without sharing your password with PRTG. The authorization approach of PRTG using OAuth2 works as follows.

1. Authorization Request

First, you have to request authorization for this sensor to access service resources from your account. For this purpose you are asked to get an access code for this sensor in the **Add Sensor** dialog. Click the **Get Access Code** button to start the authorization process using OAuth2. A new browser window will open on the authorization server of the target service.

2. Verifying Identity

This new window contains a login form for your account that you want to monitor. Log in to your account using your credentials for this service to authenticate your identity. This is a common login to your account on the target server so PRTG will not see your password. The service will forward you to the authorization page and asks you to permit PRTG to access the data in your account.

 If you are already logged in to the service with a user account, you do not have to enter credentials in this step and get directly to the access permission page.

3. Authorizing PRTG

Permit PRTG to access information on your account. Note that this permission holds only for this specific sensor, not for other sensors of this type or PRTG as a whole. For each sensor of this type you add, you have to confirm the access permission anew. You can change the account permissions at any time in your account at the target service.

4. Getting Authorization Code

Permitting PRTG to access your account data forwards you to a page where the service provides an **authorization code**. Copy this code and switch back to the **Add Sensor** dialog in PRTG.

-  The code is only valid a short period of time and expires after a few minutes. You can use a particular code only once.

5. Providing Authorization Code

Paste the authorization code into the **OAuth Code** field and complete the **Add Sensor** dialog. You do not have to go through further configuration steps manually. The sensor will accomplish the following steps automatically.

6. Requesting Access Token

After receiving the authorization code, PRTG will request an access token from the API of the target service. For this purpose, PRTG transmits the authorization code together with several authentication details. The API checks if the authorization is valid and returns the access token to PRTG. Access tokens are specific for one account and one application (here: PRTG). The authorization process to read data from your account is now complete.

7. Retrieving Data

The sensor transmits the access token with each sensor scan in the defined scanning interval to authenticate with your account. It is not necessary to use the original account credentials anew. The used tokens will refresh automatically from time to time.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.30 Enterprise Virtual Array Sensor

The Enterprise Virtual Array sensor monitors an HP StorageWorks Enterprise Virtual Array (EVA) using the `ssu.exe` from [HP Command View EVA Software](#).

It can show the status of several HPE EVA modules, depending on the available measurement components:

- System controllers
- Enclosures
- Disks
- Disk groups
- Folders
- Hosts
- Snapshots
- Data replication
- Cabinets
- If the devices have measuring tools for fans and temperature, the sensor displays corresponding data as well.

For these EVA components, this sensor type can show the following:

- Operational status
- Predicted failures
- Accessible media
- Allocation in percent
- Availability for VRaids in bytes
- Exaggerated bytes
- Group host access
- Number of grouped and ungrouped disks
- Age of snapshots
- License status

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **Enterprise Virtual Array**, French: **Enterprise Virtual Array**, German: **Enterprise Virtual Array**, Japanese: **Enterprise 仮想アレイ**, Portuguese: **Enterprise Virtual Array**, Russian: **Виртуальный массив предприятия**, Simplified Chinese: **??????**, Spanish: **Enterprise Virtual Array**

Remarks

- You have to explicitly specify the credentials of the EVA in the sensor settings.
 - [Requires](#)⁷⁵² the HP Command View EVA Software on the probe system, or the alternative described in this Knowledge Base article: [Do I really have to install the whole Command View on the probe to use the EVA sensor?](#)
 - This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Command View

 The EVA sensor needs the HP Command View EVA Software to be installed on the probe system.

 If you do not want to install the whole command view tool, you can use another option. For details, see this Knowledge Base article: [Do I really have to install the whole Command View on the probe to use the EVA sensor?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page.

EVA CREDENTIALS

Scanning Mode

Specify the depth of the meta scan. Choose between:

- **Basic:** We recommend using this scanning mode. Various modules of your EVA will be available for monitoring.
- **Full Detail:** PRTG will scan for each disk of your EVA. Every disk will be listed in the module selection.

Select which modules you want to monitor. PRTG will create one sensor for each module you choose. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

EVA SETTINGS

Modules Select the modules you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

EVA CREDENTIALS

Username Enter the username for the EVA.

Password Enter the password for the EVA.

EVA SETTINGS

Module Shows the monitored module. You can adjust this setting if the module was renamed or moved to another folder. This way, PRTG can find the module again and the monitoring history will not be lost.

System Shows further information about the monitored module. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Module Type

Description

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.

EVA SETTINGS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ³³⁵ on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to Down status¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none"> ▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request. ▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests. ▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests. ▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests. ▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> <p> If a channel uses lookup³⁶⁹³ values, it will always show a Down status immediately, so no "wait" options will apply.</p> |

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>[3311]</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: Do I really have to install the whole Command View on the probe to use the EVA sensor?

- <https://kb.paessler.com/en/topic/55983>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

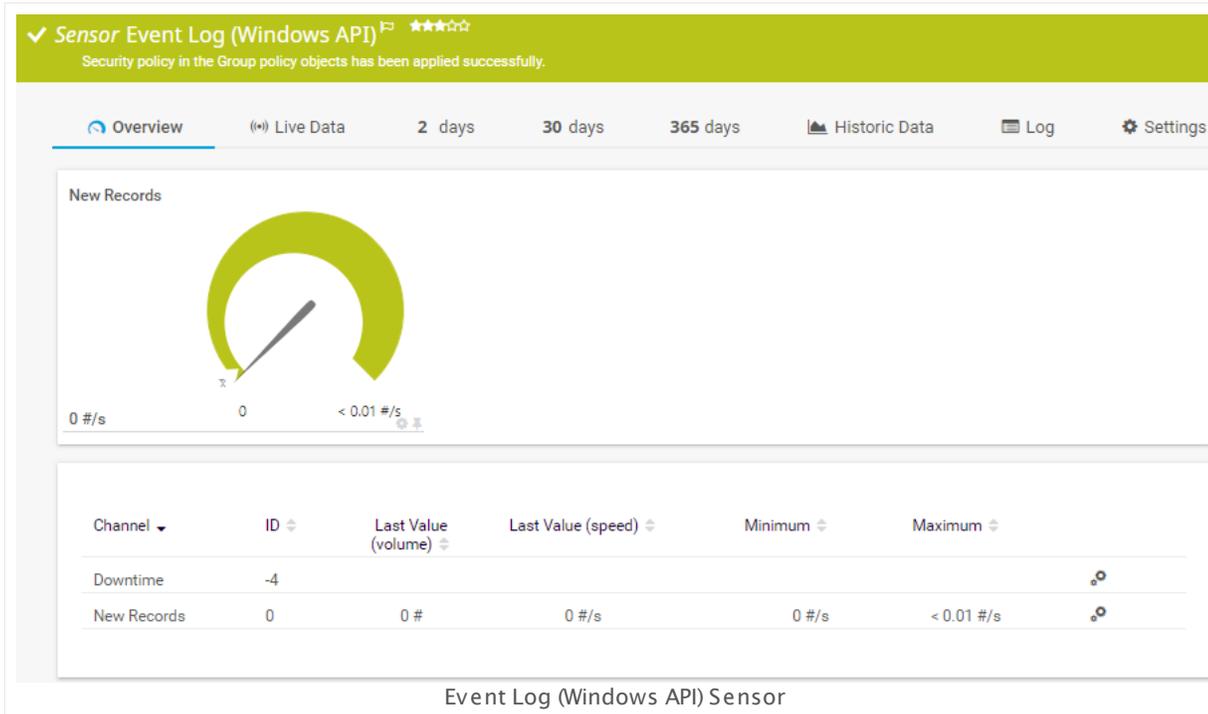

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.31 Event Log (Windows API) Sensor

The Event Log (Windows API) sensor monitors Event Log entries using Windows Application Programming Interface (API).

- It shows the number of new records per second (speed).

Sensor in Other Languages

Dutch: **Event Log (Windows API)**, French: **Log des événements (Windows API)**, German: **Ereignisprotokoll (Windows API)**, Japanese: **イベントログ (Windows API)**, Portuguese: **Log de Eventos do Windows (API)**, Russian: **Журнал событий (API Windows)**, Simplified Chinese: **???** (Windows API), Spanish: **Log de eventos (Windows API)**

Remarks

- Knowledge Base: [My Event Log sensor ignores changes in the event log. What can I do?](#)
- Knowledge Base: [How can I configure sensors using speed limits to keep the status for more than scanning interval?](#)
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WINDOWS API EVENT LOG SPECIFIC

Log File	<p>Specify the log file that this sensor monitors. The Windows event log provides several different log files, which PRTG shows here. Choose between:</p> <ul style="list-style-type: none">▪ Application▪ System▪ Security▪ Directory Service▪ DNS Server▪ File Replication Service
----------	---

FILTER EVENT LOG ENTRIES

Event Type	<p>Specify the type of event that this sensor processes. Other event types cannot be processed. Choose between the following event types:</p> <ul style="list-style-type: none">▪ Any▪ Error▪ Warning▪ Information▪ Security Audit Success▪ Security Audit Failure
Filter by Source	<p>Filter all received events for a certain event source. If you enable this option, this sensor only processes messages that match the defined value. Choose between:</p> <ul style="list-style-type: none">• Off: Do not filter by event source.• On: Enable filtering by event source.
Filter Type	<p>This field is only visible if you enable source filtering above. Choose between:</p> <ul style="list-style-type: none">• Include Filter: Include the specified value and disregard all other values.• Exclude Filter: Exclude the specified value and regard all other values.

FILTER EVENT LOG ENTRIES

Match String (Event Source)	This field is only visible if you enable source filtering above. Enter an event source that you want to filter for. Depending on the kind of filter, the event source is processed (Include Filter) or not processed (Exclude Filter). Please enter a string.
Filter by ID	<p>Filter all received events for a certain event ID. If you enable this option, this sensor processes only messages that match the defined value(s). Choose between:</p> <ul style="list-style-type: none"> • Off: Do not filter by event ID. • On: Enable filtering by event ID.
Filter Type	<p>This field is only visible if you enable ID filtering above. Choose between:</p> <ul style="list-style-type: none"> • Include Filter: Include the specified value and disregard all other values. • Exclude Filter: Exclude the specified value and regard all other values.
Match Values (Event ID)	<p>This field is only visible if you enable ID filtering above. Enter an event ID that you want to filter for. Depending on the kind of filter, the event ID is processed (Include Filter) or not processed (Exclude Filter).</p> <p> The Event Log (Windows API) Sensor⁷⁶¹ supports more than one event ID. Using this sensor type, you can enter a comma-separated list of event IDs to filter for more than one ID.</p> <p> The WMI Event Log Sensor²⁸⁸⁹ supports filtering for only one ID.</p>
Filter by Category	<p>Filter all received events for a certain event category. If you enable this option, this sensor only processes messages that match the defined value. Choose between:</p> <ul style="list-style-type: none"> • Off: Do not filter by event category. • On: Enable filtering by event category.
Filter Type	<p>This field is only visible if you enable category filtering above. Choose between:</p> <ul style="list-style-type: none"> • Include Filter: Include the specified value and disregard all other values. • Exclude Filter: Exclude the specified value and regard all other values.

FILTER EVENT LOG ENTRIES

Match String (Event Category)	This field is only visible if you enable category filtering above. Enter a category that you want to filter for. Depending on the kind of filter, the event category is processed (Include Filter) or not processed (Exclude Filter). Please enter a string.
Filter by User	Filter all received events for a certain event user. If you enable this option, this sensor only processes messages that match the defined value. Choose between: <ul style="list-style-type: none">• Off: Do not filter by event user.• On: Enable filtering by event user.
Filter Type	This field is only visible if you enable user filtering above. Choose between: <ul style="list-style-type: none">• Include Filter: Include the specified value and disregard all other values.• Exclude Filter: Exclude the specified value and regard all other values.
Match String (Event User)	This field is only visible if you enable user filtering above. Enter a username that you want to filter for. Depending on the kind of filter, the event user is processed (Include Filter) or not processed (Exclude Filter). Please enter a string.
Filter by Computer	Filter all received events for a certain event computer. If you enable this option, this sensor only processes messages that match the defined value. Choose between: <ul style="list-style-type: none">• Off: Do not filter by event computer.• On: Enable filtering by event computer.
Filter Type	This field is only visible if you enable computer filtering above. Choose between: <ul style="list-style-type: none">• Include Filter: Include the specified value and disregard all other values.• Exclude Filter: Exclude the specified value and regard all other values.
Match String (Event Computer)	This field is only visible if you enable computer filtering above. Enter a computer name that you want to filter for. Depending on the kind of filter, the event computer is processed (Include Filter) or not processed (Exclude Filter). Please enter a string.

FILTER EVENT LOG ENTRIES

Filter by Message	<p>Filter all received events for a certain event message. If you enable this option, this sensor only processes messages that match the defined value. Choose between:</p> <ul style="list-style-type: none">• Off: Do not filter by event message.• On: Enable filtering by event message.
Filter Type	<p>This field is only visible if you enable message filtering above. Choose between:</p> <ul style="list-style-type: none">• Include Filter: Include the specified value and disregard all other values.• Exclude Filter: Exclude the specified value and regard all other values.
Match String (Event Message)	<p>This field is only visible if you enable message filtering above. Enter a message that you want to filter for. Depending on the kind of filter, the event message is processed (Include Filter) or not processed (Exclude Filter). Please enter a string.</p>

 The **Event Log (Windows API) Sensor** always performs a substring match. Please do not use any placeholder character. For example, enter **RAS** for any event source containing this string in partial or whole form.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none">▪ Show channels independently (default): Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

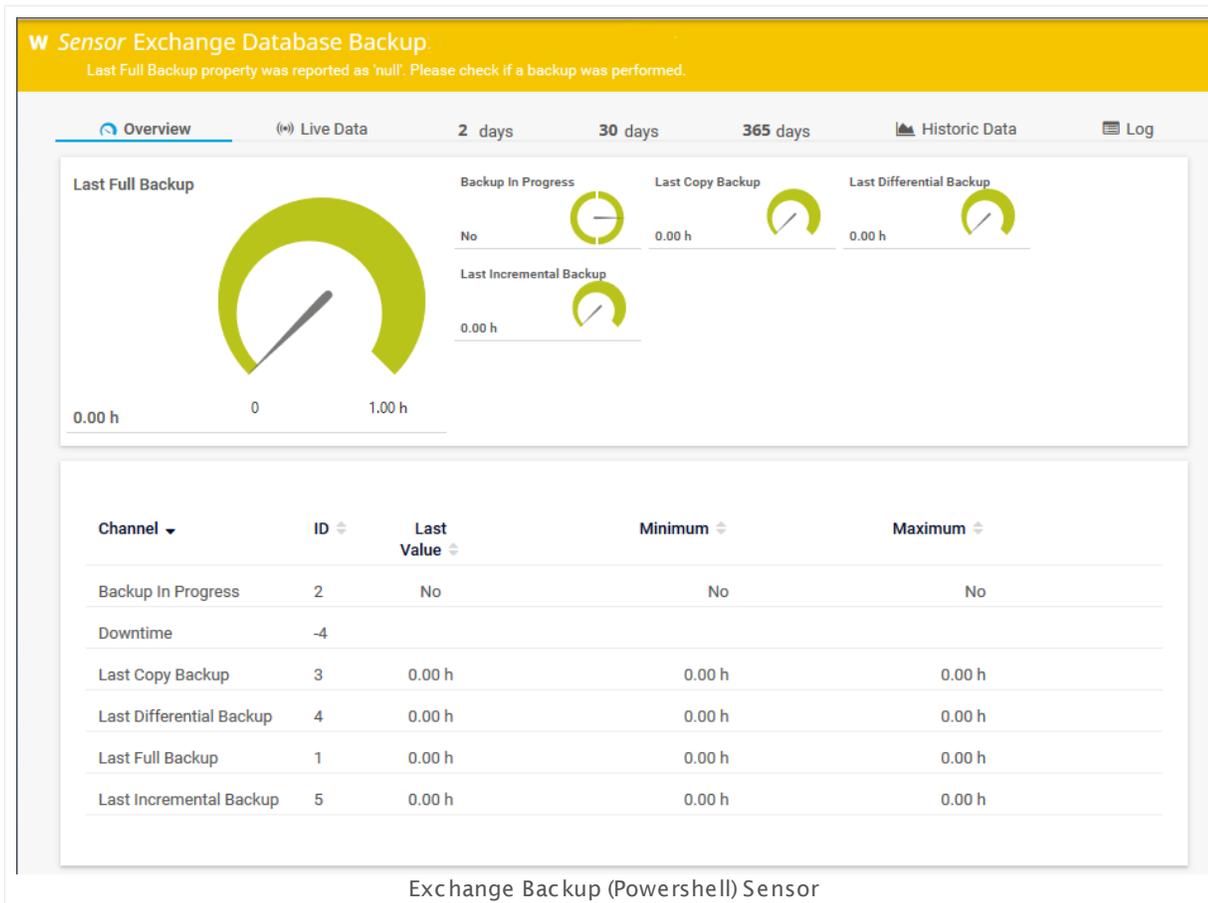

7.8.32 Exchange Backup (PowerShell) Sensor

The Exchange Backup (PowerShell) sensor monitors backups of an Exchange server using Remote PowerShell.

It can show several states of an Exchange database backup, for example:

- Passed time since the last full backup
- Passed time since the last copy backup
- Passed time since the last differential backup
- Passed time since the last incremental backup
- If a backup is currently running: Up [status](#)¹⁹⁵ for yes and no

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: Exchange Backup (PowerShell), French: Sauvegarde Exchange (PowerShell), German: Exchange Sicherung (PowerShell), Japanese: Exchange バックアップ (PowerShell),

Portuguese: **Exchange Backup (PowerShell)**, Russian: **Резервная копия Exchange (PowerShell)**, Simplified Chinese: Exchange? ? (PowerShell), Spanish: **Copia de seguridad de Exchange (PowerShell)**

Remarks

- The parent device for this sensor must be the Exchange server (version 2010 or higher) that hosts the database you want to monitor.
 - Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
 - [Requires](#)^[774] Remote PowerShell and Remote Exchange Management Shell on the target servers and PowerShell 2.0 on the probe system.
 - [Requires](#)^[774] the FQDN of the Exchange server in the [parent device settings](#)^[402].
 - [Requires](#)^[775] .NET 4.5 or higher on the probe system.
 - Knowledge Base: [PowerShell Sensors: FAQ](#)
 - This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Remote PowerShell and Remote Exchange Management Shell

-  This sensor type uses PowerShell commands. To monitor Exchange servers with this sensor, you have to enable **Remote PowerShell** and **Remote Exchange Management Shell** on the target servers that you want to monitor. Also ensure you have installed **PowerShell 2.0** or later on your probe machine.
-  In larger environments, the default memory limit for the remote shell might be insufficient. This might result in the error message **The WSMAN provider host process did not return a proper response**. In this case, increase the memory limit for Remote PowerShell.
-  For more information, please see this Knowledge Base article: [How do I enable and use remote commands in Windows PowerShell?](#)

Requirement: Fully Qualified Domain Name (FQDN)

-  To connect to Exchange servers, this sensor type needs the **fully qualified domain name (FQDN)**. In PRTG's device settings of the Exchange server, provide the FQDN instead of the IP address.
-  For more information, see this Knowledge Base article: [I have problems with the PowerShell Exchange sensors, what can I do?](#)

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Exchange server databases you want to monitor. PRTG creates one sensor for each database you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Exchange Databases	Select the databases you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
--------------------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Database	Shows the name of the monitored database. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result.

SENSOR SETTINGS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 🔗 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
- ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> 📘 This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ³³⁵ on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

7.8.33 Exchange Database (PowerShell) Sensor

The Exchange Database (PowerShell) sensor monitors database information of an Exchange server using Remote PowerShell.

It shows several states of an Exchange database:

- Database size
- If the database is mounted
- If the database is recognized as valid

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: Exchange Database (PowerShell), French: Base de données Exchange (PowerShell), German: Exchange-Datenbank (PowerShell), Japanese: Exchange データベース (PowerShell), Portuguese: Exchange Banco de Dados (PowerShell), Russian: База данных Exchange (PowerShell), Simplified Chinese: Exchange ? ? ? (PowerShell), Spanish: Base de datos de Exchange (PowerShell)

Remarks

- The parent device for this sensor must be the Exchange server (version 2010 or higher) that hosts the database you want to monitor.

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- [Requires](#)^[784] Remote PowerShell and Remote Exchange Management Shell on the target servers and PowerShell 2.0 on the probe system.
- [Requires](#)^[784] the FQDN of the Exchange server in the [parent device settings](#)^[402].
- [Requires](#)^[784] .NET 4.5 or later on the probe system.
- Knowledge Base: [PowerShell Sensors: FAQ](#)
- Knowledge Base: [How can I monitor additional values of Exchange databases?](#)

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Remote PowerShell and Remote Exchange Management Shell

 This sensor type uses PowerShell commands. To monitor Exchange servers with this sensor, you have to enable **Remote PowerShell** and **Remote Exchange Management Shell** on the target servers that you want to monitor. Also ensure you have installed **PowerShell 2.0** or later on your probe machine.

 In larger environments, the default memory limit for the remote shell might be insufficient. This might result in the error message **The WSMAN provider host process did not return a proper response**. In this case, increase the memory limit for Remote PowerShell.

 For more information, please see this Knowledge Base article: [How do I enable and use remote commands in Windows PowerShell?](#)

Requirement: Fully Qualified Domain Name (FQDN)

 To connect to Exchange servers, this sensor type needs the **fully qualified domain name (FQDN)**. In PRTG's device settings of the Exchange server, provide the FQDN instead of the IP address.

 For more information, see this Knowledge Base article: [I have problems with the PowerShell Exchange sensors, what can I do?](#)

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the **local system** (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Exchange server databases you want to monitor. PRTG creates one sensor for each database you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Exchange Databases Select the databases you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags¹³⁹, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited¹⁴⁰ from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

SENSOR SETTINGS

Database	<p>Shows the name of the monitored database. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p>
AutoRemount Database	<p>Define if you want the sensor to try to remount the database automatically if it is unmounted. Choose between:</p> <ul style="list-style-type: none"> ▪ Try to remount ▪ Just report the current reading and keep unmounted
Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none"> ▪  For more information on how to find the folder used for storage, see section Data Storage³⁷³⁴.

SENSOR SETTINGS

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.
- If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:
- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
-  Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
-  If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
-  If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>[3311]</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.34 Exchange Database DAG (Powershell) Sensor

The Exchange Database DAG (PowerShell) sensor monitors the Database Availability Group (DAG) status of a database on an Exchange server using Remote PowerShell.

It can show the following:

- Overall DAG status (for example, if it is mounted, failed, suspended)
- Copy status (active, not active)
- Content index status (healthy, crawling, error)
- If activation is suspended
- If log copy queue is increasing
- If replay queue is increasing
- Length of copy queue
- Length of Replay queue
- Number of single page restores

Exchange Database DAG (Powershell) Sensor

Sensor in Other Languages

Dutch: **Exchange Database DAG (PowerShell)**, French: **DAG de base de données Exchange (PowerShell)**, German: **Exchange-Datenbank DAG (PowerShell)**, Japanese: **Exchange データベース DAG (PowerShell)**, Portuguese: **Exchange Banco de Dados DAG (PowerShell)**, Russian: **ДAG базы данных Exchange (PowerShell)**, Simplified Chinese: **Exchange ? ? ? DAG (PowerShell)**, Spanish: **Base de datos DAG de Exchange (PowerShell)**

Remarks

- The parent device for this sensor must be the Exchange server (version 2010 or higher) that hosts the database you want to monitor.
 - Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
 - [Requires](#)⁷⁹⁵ Remote PowerShell and Remote Exchange Management Shell on the target servers and PowerShell 2.0 on the probe system.
 - [Requires](#)⁷⁹⁶ the FQDN of the Exchange server in the [parent device settings](#)⁴⁰².
 - [Requires](#)⁷⁹⁶ .NET 4.5 or later on the probe system.
 - Make sure that the Exchange database is mounted on the target device. Otherwise, you might not be able to properly add the sensor.
 - Knowledge Base: [PowerShell Sensors: FAQ](#)
 - Knowledge Base: [How can I monitor additional values of Exchange databases?](#)
 - This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Remote PowerShell and Remote Exchange Management Shell

-  This sensor type uses PowerShell commands. To monitor Exchange servers with this sensor, you have to enable **Remote PowerShell** and **Remote Exchange Management Shell** on the target servers that you want to monitor. Also ensure you have installed **PowerShell 2.0** or later on your probe machine.
-  In larger environments, the default memory limit for the remote shell might be insufficient. This might result in the error message **The WSMAN provider host process did not return a proper response**. In this case, increase the memory limit for Remote PowerShell.
-  For more information, please see this Knowledge Base article: [How do I enable and use remote commands in Windows PowerShell?](#)

Requirement: Fully Qualified Domain Name (FQDN)

-  To connect to Exchange servers, this sensor type needs the **fully qualified domain name (FQDN)**. In PRTG's device settings of the Exchange server, provide the FQDN instead of the IP address.
-  For more information, see this Knowledge Base article: [I have problems with the PowerShell Exchange sensors, what can I do?](#)

Requirement: .NET Framework

-  This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

-  For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Exchange server databases you want to monitor. PRTG creates one sensor for each database you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Exchange Databases	Select the databases you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
--------------------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Database	Shows the name of the monitored database. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	Define what PRTG will do with the sensor results. Choose between:

SENSOR SETTINGS

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

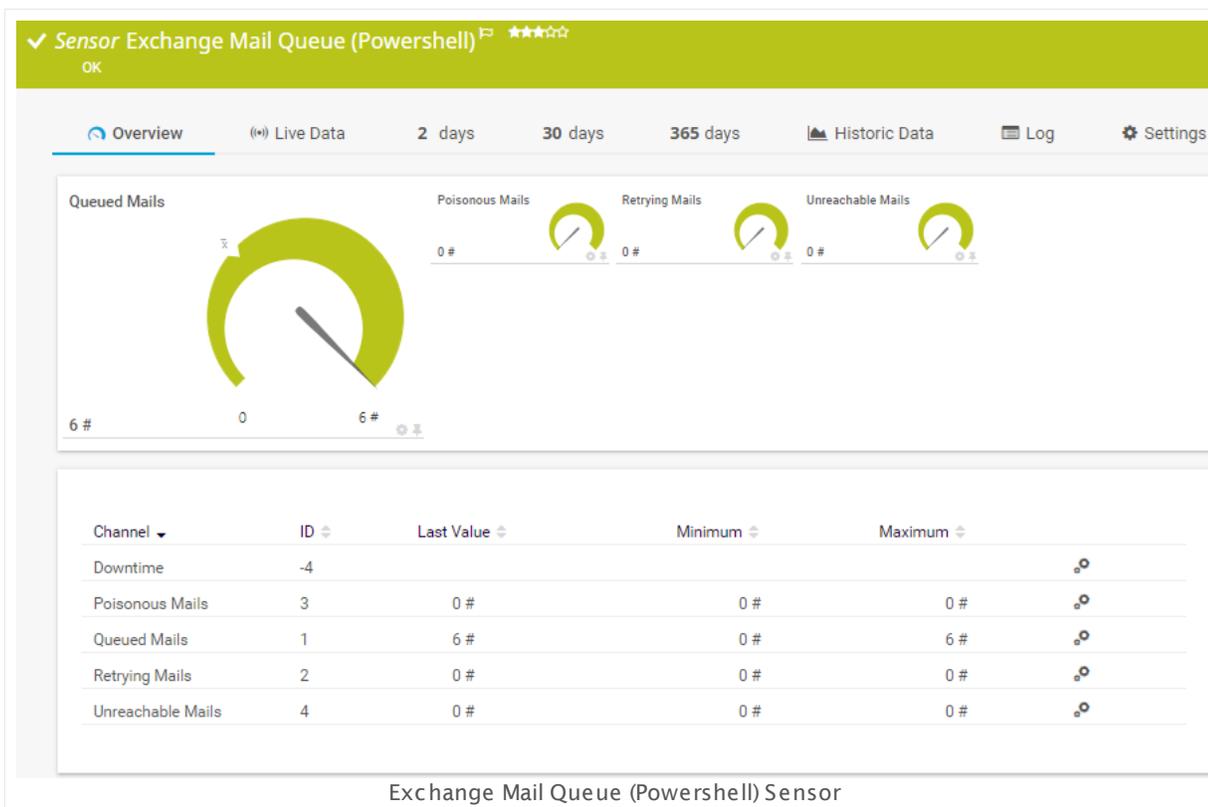

7.8.35 Exchange Mail Queue (PowerShell) Sensor

The Exchange Mail Queue (PowerShell) sensor monitors the number of items in the outgoing mail queue of an Exchange server using Remote PowerShell.

It can show the following:

- Number of queued mails
- Number of retrying mails
- Number of unreachable mails
- Number of poisonous mails

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **Exchange Mail Wachtrij (PowerShell)**, French: **File d'attente de messagerie Exchange (PowerShell)**, German: **Exchange Nachrichtenwarteschlange (PowerShell)**, Japanese: **Exchange Mail キュー (PowerShell)**, Portuguese: **Exchange Fila de Email (PowerShell)**, Russian: **Очередь почтовых сообщений Exchange (PowerShell)**, Simplified Chinese: **Exchange ? ? ? ? (PowerShell)**, Spanish: **Cola de correo de Exchange (PowerShell)**

Remarks

- The parent device for this sensor must be the Exchange server (version 2010 or higher) that hosts the database you want to monitor.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- [Requires](#) ⁸⁰⁵ Remote PowerShell and Remote Exchange Management Shell on the target servers and PowerShell 2.0 on the probe system.
- [Requires](#) ⁸⁰⁵ the FQDN of the Exchange server in the [parent device settings](#) ⁴⁰².
- [Requires](#) ⁸⁰⁵ .NET 4.5 or later on the probe system.
- Knowledge Base: [PowerShell Sensors: FAQ](#)
- Knowledge Base: [What types of Exchange transport queues are there?](#)

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Remote PowerShell and Remote Exchange Management Shell

 This sensor type uses PowerShell commands. To monitor Exchange servers with this sensor, you have to enable **Remote PowerShell** and **Remote Exchange Management Shell** on the target servers that you want to monitor. Also ensure you have installed **PowerShell 2.0** or later on your probe machine.

 In larger environments, the default memory limit for the remote shell might be insufficient. This might result in the error message **The WSMAN provider host process did not return a proper response**. In this case, increase the memory limit for Remote PowerShell.

 For more information, please see this Knowledge Base article: [How do I enable and use remote commands in Windows PowerShell?](#)

Requirement: Fully Qualified Domain Name (FQDN)

 To connect to Exchange servers, this sensor type needs the **fully qualified domain name (FQDN)**. In PRTG's device settings of the Exchange server, provide the FQDN instead of the IP address.

 For more information, see this Knowledge Base article: [I have problems with the PowerShell Exchange sensors, what can I do?](#)

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#) ³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the roles you want to monitor. PRTG creates one sensor for each role you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Hub-Transport or Edge-Server Select the roles you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

BASIC SENSOR SETTINGS

Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none">  For more information on how to find the folder used for storage, see section Data Storage.  This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.
---------------	--

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

For more general information about settings, see the [Object Settings](#)^[217] section.

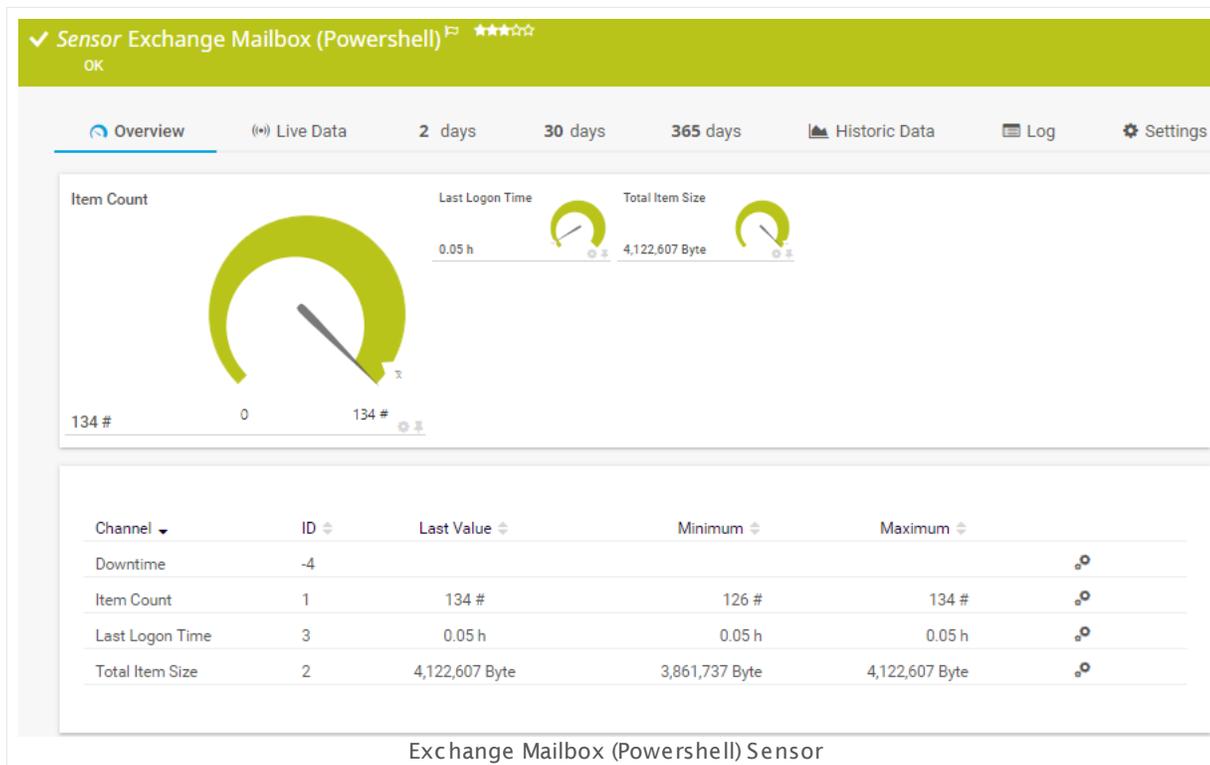

7.8.36 Exchange Mailbox (Powershell) Sensor

The Exchange Mailbox (PowerShell) sensor monitors mailboxes of an Exchange server using Remote PowerShell.

It shows several states of a mailbox, for example:

- Total size of items in place
- Number of items in place
- Passed time since the last mailbox logon

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **Exchange Postbus (PowerShell)**, French: **Boîte aux lettres Exchange (PowerShell)**, German: **Exchange Postfach (PowerShell)**, Japanese: **Exchange Mailbox (PowerShell)**, Portuguese: **Exchange Caixa de Email (PowerShell)**, Russian: **Почтовый ящик Exchange (PowerShell)**, Simplified Chinese: **Exchange ? ? (PowerShell)**, Spanish: **Buzón de Exchange (PowerShell)**

Remarks

- The parent device for this sensor must be the Exchange server (version 2010 or higher) that hosts the database you want to monitor.

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- [Requires](#)^[815] Remote PowerShell and Remote Exchange Management Shell on the target servers and PowerShell 2.0 on the probe system.
- [Requires](#)^[815] the FQDN of the Exchange server in the [parent device settings](#)^[402].
- Requires elevated rights for the user of this sensor on the Exchange system. It is not sufficient to have administrator rights. For details, see the Knowledge Base: [I have problems with the PowerShell Exchange sensors, what can I do?](#) (solution (2) in the reply)
- [Requires](#)^[815] .NET 4.5 or later on the probe system.
- Knowledge Base: [PowerShell Sensors: FAQ](#)

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Remote PowerShell and Remote Exchange Management Shell

 This sensor type uses PowerShell commands. To monitor Exchange servers with this sensor, you have to enable **Remote PowerShell** and **Remote Exchange Management Shell** on the target servers that you want to monitor. Also ensure you have installed **PowerShell 2.0** or later on your probe machine.

 In larger environments, the default memory limit for the remote shell might be insufficient. This might result in the error message **The WSMAN provider host process did not return a proper response**. In this case, increase the memory limit for Remote PowerShell.

 For more information, please see this Knowledge Base article: [How do I enable and use remote commands in Windows PowerShell?](#)

Requirement: Fully Qualified Domain Name (FQDN)

 To connect to Exchange servers, this sensor type needs the **fully qualified domain name (FQDN)**. In PRTG's device settings of the Exchange server, provide the FQDN instead of the IP address.

 For more information, see this Knowledge Base article: [I have problems with the PowerShell Exchange sensors, what can I do?](#)

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Exchange server mailboxes you want to monitor. PRTG creates one sensor for each mailbox you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Mailboxes Select the mailboxes you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

- Tags** Enter one or more [Tags](#)¹³⁹, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.
- You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)¹⁴⁰ from objects further up in the device tree. These are visible above as **Parent Tags**.
-  It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).
- Priority** Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

- Mailbox Name** Shows the name of the monitored mailbox. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result**: Do not store the sensor result.
 - **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

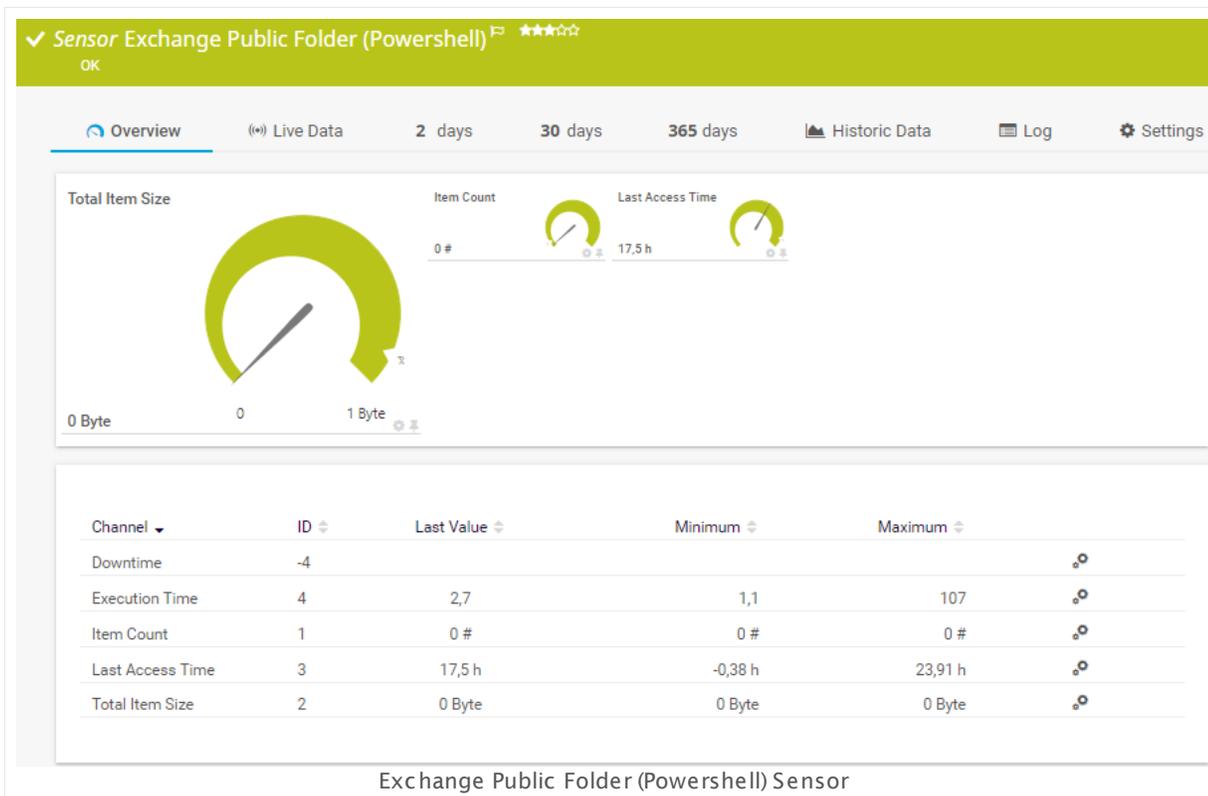

7.8.37 Exchange Public Folder (PowerShell) Sensor

The Exchange Public Folder (PowerShell) sensor monitors public folders and subfolders of an Exchange server using Remote PowerShell.

It can show several states of a public folder:

- Total size of items in place
- Number of items in place
- Passed time since the last access

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **Exchange Openbare Map (PowerShell)**, French: **Dossier public Exchange (PowerShell)**, German: **Exchange Öffentlicher Ordner (PowerShell)**, Japanese: **Exchange パブリックフォルダー (PowerShell)**, Portuguese: **Exchange Pasta Pública (PowerShell)**, Russian: **Общая папка Exchange (PowerShell)**, Simplified Chinese: **Exchange ? ? ? ? (PowerShell)**, Spanish: **Carpeta pública de Exchange (PowerShell)**

Remarks

- The parent device for this sensor must be the Exchange server (version 2010 or higher) that hosts the database you want to monitor.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- [Requires](#)^[825] Remote PowerShell and Remote Exchange Management Shell on the target servers and PowerShell 2.0 on the probe system.
- [Requires](#)^[825] the FQDN of the Exchange server in the [parent device settings](#)^[402].
- [Requires](#)^[825] .NET 4.5 or later on the probe system.
- Knowledge Base: [PowerShell Sensors: FAQ](#)

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Remote PowerShell and Remote Exchange Management Shell

 This sensor type uses PowerShell commands. To monitor Exchange servers with this sensor, you have to enable **Remote PowerShell** and **Remote Exchange Management Shell** on the target servers that you want to monitor. Also ensure you have installed **PowerShell 2.0** or later on your probe machine.

 In larger environments, the default memory limit for the remote shell might be insufficient. This might result in the error message **The WSMAN provider host process did not return a proper response**. In this case, increase the memory limit for Remote PowerShell.

 For more information, please see this Knowledge Base article: [How do I enable and use remote commands in Windows PowerShell?](#)

Requirement: Fully Qualified Domain Name (FQDN)

 To connect to Exchange servers, this sensor type needs the **fully qualified domain name (FQDN)**. In PRTG's device settings of the Exchange server, provide the FQDN instead of the IP address.

 For more information, see this Knowledge Base article: [I have problems with the PowerShell Exchange sensors, what can I do?](#)

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Exchange server mailboxes you want to monitor. PRTG creates one sensor for each mailbox you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Public Folder	Select the folders you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
---------------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
-------------	--

BASIC SENSOR SETTINGS

Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Public Folder	Shows the name of the monitored folder. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none">  For more information on how to find the folder used for storage, see section Data Storage.

SENSOR SETTINGS

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ³³⁵ on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none"> ▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request. ▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests. ▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests. ▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests. ▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> <p> If a channel uses lookup³⁶⁹³ values, it will always show a Down status immediately, so no "wait" options will apply.</p> |

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>3311</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

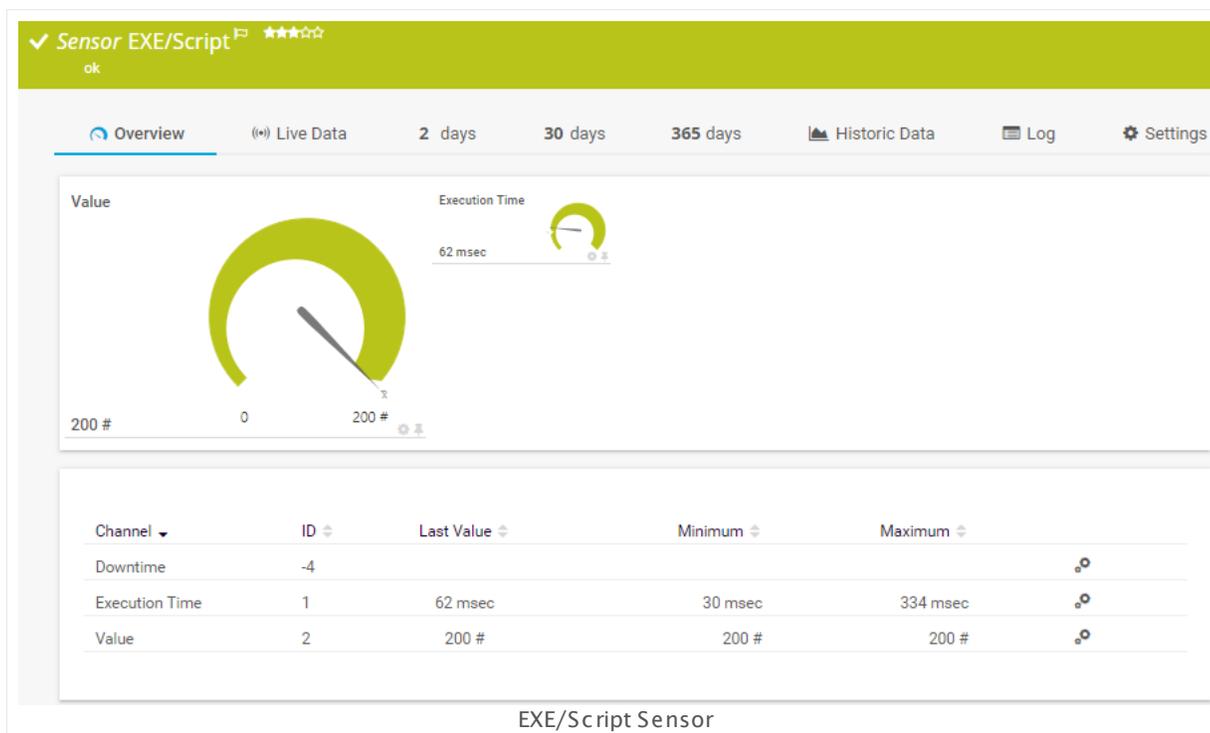

7.8.38 EXE/Script Sensor

The EXE/Script sensor runs an executable file (EXE, DLL) or a script (batch file, VBScript, PowerShell) on the computer running the local or remote probe. This option is provided as part of the PRTG Application Programming Interface (API).

This sensor can show the following:

- One value returned by the executable file or script (in one channel only)
- Execution time

For details about the return value format, see section [Custom Sensors](#).

Sensor in Other Languages

Dutch: **EXE/Script**, French: **Script/EXE**, German: **Programm/Skript**, Japanese: **EXE / スクリプト**, Portuguese: **EXE/Script**, Russian: **EXE/скрипт**, Simplified Chinese: **EXE/? ?**, Spanish: **EXE/Script**

Remarks

- The executable or script file must be stored on the system of the probe the sensor is created on: If used on a remote probe, the file must be stored on the system running the remote probe. In a cluster setup, please copy the file to every cluster node.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- If you want to execute a custom Windows Management Instrumentation Query Language (WQL) script, please use the [WMI Custom Sensor](#).

- Knowledge Base: [What is the Mutex Name in PRTG's EXE/Script Sensor's settings?](#)
- Knowledge Base: [How can I test if parameters are correctly transmitted to my script when using an EXE/Script sensor?](#)
- Knowledge Base: [How can I show special characters with EXE/Script sensors?](#)
- Knowledge Base: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)  add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Script	<p>Select an executable file from the list. The sensor will execute it with every scanning interval.</p> <p>In this list, files in the corresponding \Custom Sensors\EXE sub-directory of the probe system's PRTG program directory are shown (see Data Storage³⁷³⁴). To appear in this list, store the file into this folder ending in BAT, CMD, DLL, EXE, PS1, or VBS.</p> <p>To show the expected sensor values and status, your files must use the correct format for the returned values (in this case, value:message to standard output). The exit code of the file determines the sensor status¹⁹⁵.</p> <p> For detailed information on how to build custom sensors and for the expected return format, see section Custom Sensors³⁶³⁹ for more information.</p> <p> When using custom sensors on the Cluster Probe, please copy your files to every cluster node installation.</p>
Value Type	<p>Define what kind of values your executable or script file gives back. Choose between:</p> <ul style="list-style-type: none">▪ Integer: An integer is expected as return value. If the script gives back a float, PRTG will display the value 0.▪ Float: A float is expected as return value, with a dot (.) between pre-decimal position and decimal places. In this setting, the sensor will also display integer values unless they produce a buffer overflow.▪ Counter: Your script returns an integer that increases. PRTG will show the difference between the values of two sensor scans.  A counter must return an integer, float is not supported. <p> The sensor cannot handle string values.</p>
Channel Name	<p>Enter a name for the channel in which the sensor shows returned values. Please enter a string. This is for display purposes only. You can change the name later in the sensor's channel settings³¹⁶⁰.</p>
Unit String	<p>Enter the unit for the values that this sensor returns. Please enter a string. This unit string is used for display purposes and will be shown in graphs, data tables, and gauges. If you want to change the Unit after having created the sensor, you can change it in the sensor's channel settings³¹⁶⁰.</p>

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

EXE/Script	Shows the executable or script file that the sensor executes with each sensor scan as defined on sensor creation. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Parameters	<p>If your executable or script file catches command line parameters, you can define them here. You can use placeholders as well.</p> <p> For a full list of all placeholders, see section Custom Sensors³⁶⁵⁴.</p> <p>Please enter a string or leave the field empty.</p> <p> You need to escape special characters and whitespaces in your parameters and surround them with double quotes. See section Escape Special Characters and Whitespaces in Parameters⁸⁴⁵ for details.</p>
Environment	<p>Choose if PRTG command line parameters will also be available as environment parameters.</p> <ul style="list-style-type: none"> ▪ Default Environment: Do not provide PRTG placeholders' values in the environment. Choose this secure option if you are not sure. ▪ Set placeholders as environment values: From within your executable or script, the values of PRTG's command line parameters will be available via environment variables. For example, you can then read and use the current host value of the PRTG device this EXE/script sensor is created on from within your script. This option can mean a security risk, because also credentials are provided in several variables. <p> For a full list of all available variables, see section Custom Sensors³⁶⁵⁶ for more information.</p>
Security Context	<p>Define the Windows user account that the sensor uses to run the executable or script file. Choose between:</p> <ul style="list-style-type: none"> ▪ Use security context of probe service: Run the selected file under the same Windows user account the probe runs on. By default, this is the Windows system user account (if not manually changed). ▪ Use Windows credentials of parent device: Use the Windows user account defined in the settings of the parent device this sensor is created on. Please open the parent device settings⁴⁰² of this sensor to change these Windows credentials.

SENSOR SETTINGS

Mutex Name	<p>Define any desired mutex name for the process. All EXE/Script sensors having the same mutex name will be executed serially (not simultaneously).</p> <p>This is useful if you use a lot of sensors and want to avoid high resource usage caused by processes running simultaneously. Please enter a string or leave the field empty.</p> <p> For more information, see this Knowledge Base article: What is the Mutex Name in the PRTG EXE/Script Sensor settings?</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).</p>
Value Type	<p>Shows the expected value type that you chose on sensor creation. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p> <p> The sensor cannot handle string values.</p>
If Value Changes	<p>Define what this sensor will do when the sensor value changes. You can choose between:</p> <ul style="list-style-type: none">▪ Ignore changes (default): The sensor takes no action on change.▪ Trigger 'change' notification: The sensor sends an internal message indicating that its value has changed. In combination with a Change Trigger, you can use this mechanism to trigger a notification <small>3170</small> whenever the sensor value changes.
EXE Result	<p>Define what this sensor will do with the result that the executable file gives back. Choose between:</p> <ul style="list-style-type: none">▪ Discard EXE result: Do not store the script result.▪ Write EXE result to disk: Store the last result received from the script to the Logs (Sensors) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File name: Result of Sensor [ID].txt. This is for debugging purposes. The file will be overridden with each scanning interval. <p> For information on how to find the folder used for storage, see section Data Storage <small>3734</small>.</p>

SENSOR SETTINGS

- **Write EXE result to disk in case of error:** Store the last result received from the script only if the sensor is in a down status. File name: **Result of Sensor [ID].txt**, located in the **Logs (Sensors)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). Enable this option if you do not want failures to be overwritten by a following success of the script.

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Escape Special Characters and Whitespaces in Parameters

X You need to escape special characters in parameters that you pass to an executable or script and surround them with quotation marks to make sure the characters are interpreted correctly. Especially PowerShell scripts require adequate escaping so that the parameters are passed in a valid PowerShell syntax. To make escaping easy and secure, PRTG automatically does most of the escaping for you.

Please follow these rules to escape special characters and whitespaces in the parameters fields:

- Use quotes for parameters that contain whitespaces.

```
-name "Mr John Q Public"
-name 'Mr John Q Public'
```

- Use double quotes for parameters that contain single quotes.

```
-name "Mr 'John Q' Public"
```

- Use single quotes for parameters that contain double quotes.

```
-name 'Mr "John Q" Public'
```

- Use a backslash (\) to escape and pass a literal double quote.

```
-name pub\"lic
```

- Use double quotes for parameters that contain double **and** single quotes and escape double quotes.

```
-name "pu'b\"lic"
```

In Secure Shell (SSH) scripts, you can use alphanumeric characters and the special characters ".", "_", "-", "=", and "/" outside of quoted strings.

A We recommend that you do not pass passwords in parameters. Use PRTG placeholders instead. See section [Custom Sensors](#)³⁶⁵⁰ for details.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.39 EXE/Script Advanced Sensor

The EXE/Script Advanced sensor runs an executable file (EXE, DLL) or a script (batch file, VBScript, PowerShell) on the computer running the local or remote probe. This option is provided as part of the PRTG Application Programming Interface (API). The return value of this sensor must be valid XML or JSON.

- The sensor can show values returned by the executable file or script in multiple channels.

For details about the return value format, see section [Custom Sensors](#)³⁶⁴¹.

Channel	ID	Last Value	Minimum	Maximum
Demo Custom	5	855 Pieces	855 Pieces	855 Pieces
Demo Disk Free	3	38.4487 %	38.4487 %	38.4487 %
Demo Minimum Example	2	3 #	3 #	3 #
Demo Network Speed	4	996 Mbit/s	996 Mbit/s	996 Mbit/s
Downtime	-4			

EXE/Script Advanced Sensor

Sensor in Other Languages

Dutch: **EXE/Script Geavanceerd**, French: **Script/EXE version améliorée**, German: **Programm/Skript (Erweitert)**, Japanese: **EXE / スクリプト(アドバンスト)**, Portuguese: **EXE/Script avançado**, Russian: **Расширенный сенсор EXE/скрипта**, Simplified Chinese: **?? EXE/? ?**, Spanish: **EXE/Script Avanzado**

Remarks

- This sensor [does not support more than 50 channels](#)⁸⁴⁸ officially.
- The executable or script file must be stored on the system of the probe the sensor is created on: If used on a remote probe, the file must be stored on the system running the remote probe. In a cluster setup, please copy the file to every cluster node.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.

- If you want to execute a custom Windows Management Instrumentation Query Language (WQL) script, please use the [WMI Custom Sensor](#)²⁸⁶⁷.
- Knowledge Base: [What is the Mutex Name in PRTG's EXE/Script Sensor's settings?](#)
- Knowledge Base: [How can I test if parameters are correctly transmitted to my script when using an EXE/Script sensor?](#)
- Knowledge Base: [How can I show special characters with EXE/Script sensors?](#)
- Knowledge Base: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)
- Knowledge Base: [How can I use meta-scans for custom EXE/Script sensors?](#)

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Limited to 50 Sensor Channels

 PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

EXE/Script

Select an executable file from the list. The sensor will execute it with every scanning interval.

This list shows all files available in the corresponding **\Custom Sensors\EXEXML** sub-directory of the probe system's PRTG program directory (see [Data Storage](#)³⁷³⁴). To appear in this list, please store the files into this folder ending in BAT, CMD, DLL, EXE, PS1, or VBS.

To show the expected values and sensor status, your files must return the expected XML or JSON format to standard output. Values and message must be embedded in the XML or JSON.

SENSOR SETTINGS

-  For detailed information on how to build custom sensors and for the expected return format, see section [Custom Sensors](#) for more information.
-  When using custom sensors on the **Cluster Probe**, please copy your files to every cluster node installation.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

-  Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

- | | |
|-------------|---|
| Sensor Name | Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets . |
| Parent Tags | Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here. |
| Tags | <p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <ul style="list-style-type: none">  It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>). |

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

EXE/Script Shows the executable or script file that the sensor executes with each scan as defined on sensor creation. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Parameters If your executable or script file catches command line parameters, you can define them here. You can use placeholders as well.

 For a full list of all placeholders, see the API documentation in your PRTG installation. See section [Custom Sensors](#)³⁶⁵⁴ for more information.

Please enter a string or leave the field empty.

 You need to escape special characters and whitespaces in your parameters and surround them with double quotes. See section [Escape Special Characters and Whitespaces in Parameters](#)⁸⁵⁷¹ for details.

Environment Choose if PRTG command line parameters will also be available as environment parameters.

- **Default Environment:** Do not provide PRTG placeholders' values in the environment. Choose this secure option if you are not sure.
- **Set placeholders as environment values:** From within your executable or script, the values of PRTG command line parameters will be available via environment variables. For example, you can then read and use the current **host** value of the PRTG device this EXE/Script sensor is created on from within your script. This option can mean a security risk, because also credentials are provided in several variables.

 For a full list of all available variables, see section [Custom Sensors](#)³⁶⁵⁶.

Security Context Define the Windows user account that the sensor uses to run the executable or script file. Choose between:

SENSOR SETTINGS

- **Use security context of probe service:** Run the selected file under the same Windows user account the probe is running on. By default, this is the Windows system user account (if not manually changed).
- **Use Windows credentials of parent device:** Use the Windows user account defined in the settings of the parent device this sensor is created on. Please open the [parent device settings](#)⁴⁰² of this sensor to change these Windows credentials.

Mutex Name

Define any desired mutex name for the process. All EXE/Script sensors having the same mutex name will be executed serially (not simultaneously). This is useful if you use a lot of sensors and want to avoid high resource usage caused by processes running simultaneously. Please enter a string or leave the field empty.

 For more information, see this Knowledge Base article: <http://kb.paessler.com/en/topic/6673>

Timeout (Sec.)

Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is **900** seconds (15 minutes).

EXE Result

Define what the sensor will do with the results the executable file gives back. Choose between:

- **Discard EXE result:** Do not store the script result.
- **Write EXE result to disk:** Store the last result received from the script to the **Logs (Sensors)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File name: **Result of Sensor [ID].txt**. This is for debugging purposes. The file will be overridden with each scanning interval.

 For information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

- **Write EXE result to disk in case of error:** Store the last result received from the script only if the sensor is in a down status. File name: **Result of Sensor [ID].txt**, located in the **Logs (Sensors)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). Enable this option if you do not want failures to be overwritten by a following success of the script.

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

 The **Stack Unit** option for stacking graphs will only work if you explicitly define the same **<unit>** for at least two channels. For detailed information about sensor settings, see section [Custom Sensors](#)³⁶⁴².

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

SCANNING INTERVAL

- Scanning Interval** Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#) ³³⁸⁵ on PRTG on premises installations.
- If a Sensor Query Fails** Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status** ¹⁹⁵¹. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:
- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) ³⁶⁸³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Escape Special Characters and Whitespaces in Parameters

 You need to escape special characters in parameters that you pass to an executable or script and surround them with quotation marks to make sure the characters are interpreted correctly. Especially PowerShell scripts require adequate escaping so that the parameters are passed in a valid PowerShell syntax. To make escaping easy and secure, PRTG automatically does most of the escaping for you.

Please follow these rules to escape special characters and whitespaces in the parameters fields:

- Use quotes for parameters that contain whitespaces.

```
-name "Mr John Q Public"
-name 'Mr John Q Public'
```

- Use double quotes for parameters that contain single quotes.

```
-name "Mr 'John Q' Public"
```

- Use single quotes for parameters that contain double quotes.

```
-name 'Mr "John Q" Public'
```

- Use a backslash (\) to escape and pass a literal double quote.

```
-name pub\"lic
```

- Use double quotes for parameters that contain double **and** single quotes and escape double quotes.

```
-name "pu'b\"lic"
```

In Secure Shell (SSH) scripts, you can use alphanumeric characters and the special characters ":", "_", "-", "=", and "/" outside of quoted strings.

 We recommend that you do not pass passwords in parameters. Use PRTG placeholders instead. See section [Custom Sensors](#)³⁶⁵⁵ for details.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

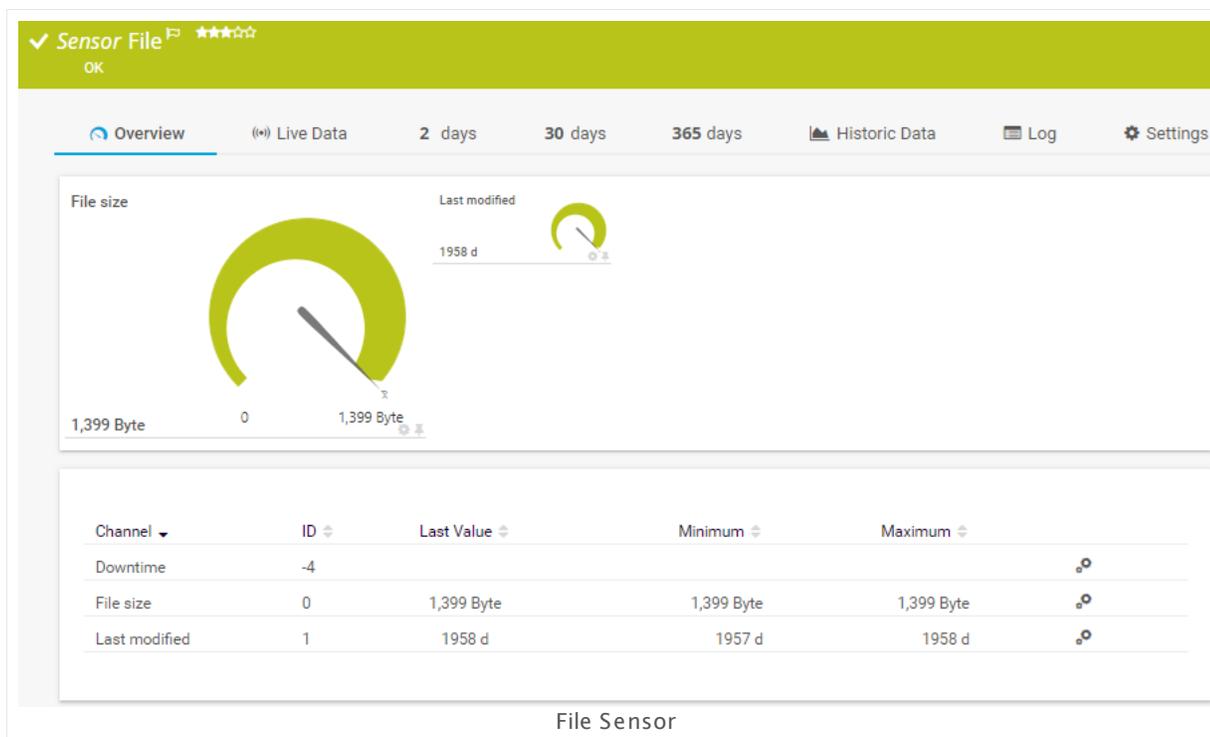

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.40 File Sensor

The File sensor monitors a file located on the local disk on the parent probe system, parent device, or a file accessible via Server Message Block (SMB). You can monitor changes to the file content and file time stamp.

It can show the following:

- File size
- Passed time since the file was modified the last time (in days, hours, and minutes, depending on the elapsed time)
- In contrast to the [Folder sensor](#)^[880], you can also monitor if the actual content of a specific file has changed.

Sensor in Other Languages

Dutch: **Bestand**, French: **Fichier**, German: **Datei**, Japanese: **ファイル**, Portuguese: **Arquivo**, Russian: **Файл**, Simplified Chinese: **文件**, Spanish: **Archivo**

Remarks

- [Requires](#)^[881] the LanmanServer ("Server") Windows service to be running on the target computer to monitor files on a share.
- Try using the Fully Qualified Domain Name (FQDN) of the target device if the sensor does not get a connection with the IP address.

- Knowledge Base: [What can I do if PRTG doesn't succeed with monitoring a share? PE029 PE032](#)
- Knowledge Base: [Can I use placeholders in file names to monitor log files?](#)

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: LanmanServer ("Server") Windows Service

 To monitor files on Windows shares, please make sure the **LanmanServer** ("Server") Windows service is running on the target computer.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[213] , logs ^[228] , notifications ^[3216] , reports ^[3262] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

SENSOR SPECIFIC

File Name	<p>Enter the full path to the file that this sensor will monitor. For example, enter <code>C:\Windows\file.txt</code> to monitor a file on the parent probe system.</p> <p>If you use a local path, the sensor will only look for the target file on the system on which the parent probe runs, not on the parent device! To monitor a file on the parent device, use the dollar sign (\$) like <code>C\$\User\johnqpublic\file.txt</code></p> <p>If the file is located on a network device, use the Uniform Naming Convention (UNC) path without the server part: only enter <code>share\folder\file.txt</code>. The server part <code>\\server\</code> is taken from the parent device settings^[402] of this sensor. Enter a valid path and file name.</p> <p>i To provide any shares, the LanmanServer "Server" Windows service must be running on the target computer.</p>
Sensor Behavior	<p>Specify when the sensor shows a Down status^[195]. Choose between:</p> <ul style="list-style-type: none">▪ Show 'Down' status if file does not exist: The sensor will show an error if the file does not exist.▪ Show 'Down' status if file exists: The sensor will show an error if the file does exist.

SENSOR SPECIFIC

- Monitor File Content** Specify if the sensor will send a change notification when the content of the file changes (based on a checksum). Choose between:
- **Ignore changes:** No action will be taken on change.
 - **Trigger 'change' notification:** The sensor will send an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to [trigger a notification](#) 3170 whenever the sensor value changes.
- Monitor File Time Stamp** Specify if the sensor will send a change notification when the content of the file's time stamp changes. Choose between:
- **Ignore changes:** No action will be taken on change.
 - **Trigger 'change' notification:** The sensor will send an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to [trigger a notification](#) 3170 whenever the sensor value changes.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
-  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#) 3160 settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies <small>3209</small> in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

- <https://kb.paessler.com/en/topic/67965>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

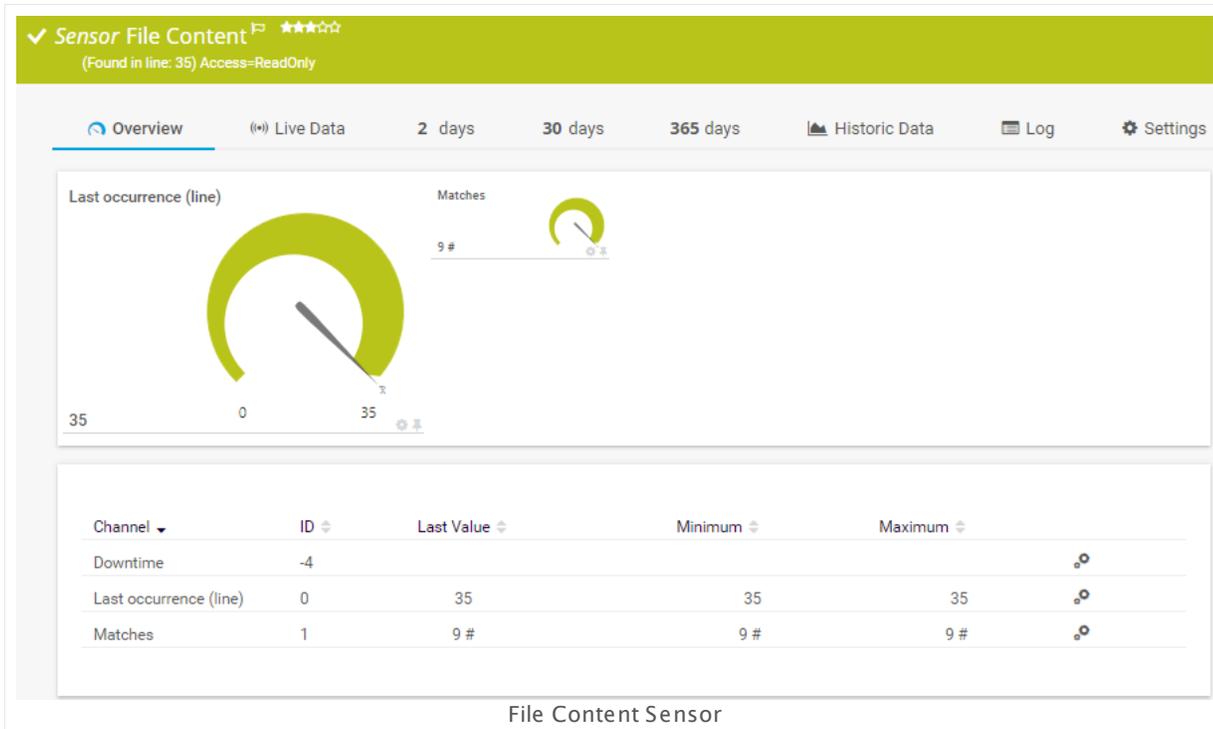

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.41 File Content Sensor

The File Content sensor checks a text file (for example, logfiles) for certain strings and returns the following:

- Line number of the last match
- Number of total matches.
- Additionally, the sensor quotes matching lines in the sensor message field.

Sensor in Other Languages

Dutch: **Bestands inhoud**, French: **Contenu du fichier**, German: **Dat ei-Inhalt**, Japanese: **ファイル内容**, Portuguese: **Conteúdo de arquivo**, Russian: **Содержимое файла**, Simplified Chinese: **??**, Spanish: **Contenido de archivo**

Remarks

- This sensor does not support UTF-16 encoded files! In this case, please try to use a custom sensor like the [EXE/Script Sensor](#)^[834] or the [EXE/Script Advanced Sensor](#)^[847].
- This sensor does not officially support binary files! If you would still like to monitor binary files contrary to our recommendation, then please choose the option **Always transmit to PRTG the entire file** in section **Network Usage** in the sensor settings.
- This sensor supports Unix line feeds.
- [Requires](#)^[871] the LanmanServer ("Server") Windows service to be running on the target computer to monitor files on a share.

- To monitor files on a Linux system, the folder has to be accessible via SMB.
- Try using the Fully Qualified Domain Name (FQDN) of the target device if the sensor does not get a connection with the IP address.
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: LanmanServer ("Server") Windows Service

 To monitor files on Windows shares, please make sure the **LanmanServer** ("Server") Windows service is running on the target computer.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

SENSOR SPECIFIC

File Name	<p>Enter the full path to the file that this sensor will monitor. For example, enter <code>C:\Windows\file.txt</code>. to monitor a file on the parent probe system.</p> <p>If you use a local path, the sensor looks for the target file only on the system on which the parent probe runs, not on the parent device! To monitor a file on the parent device, use the dollar sign (\$) like <code>C\$\User\johnqpublic\file.txt</code>.</p> <p>If the file is located on a network device, use the Uniform Naming Convention (UNC) path without the server part (only enter <code>share\folder\file.txt</code>). The server part (<code>\\server\</code>) is taken from the parent device settings^[402] of this sensor. Enter a valid path and file name.</p> <p> To provide any Windows shares, the LanmanServer "Server" Windows service must run on the target computer.</p> <p> To monitor any Linux files, the folder with these files has to be accessible via Server Message Block (SMB).</p> <p> Please be aware that it might produce high network traffic if you define PRTG to query an entire file on your network with every scanning interval.</p>
-----------	---

SENSOR SPECIFIC

Search String Define the string inside the logfile you want to check for. The input is not case-sensitive. Please enter a string.

Search Method Define the method you want to provide the search string with. The pattern must be in **one** line and only the **last** matching line will be given back. Choose between:

- **Simple string search:** Search for a simple plain text expression.
- **Regular Expression:** Search using a regular expression.

 PRTG supports **PCRE** regex. You cannot use regex options or flags. For more details, see manual section [Regular Expressions](#) ³⁷⁰⁴.

Network Usage Define in which way the sensor will transmit the target file to PRTG. Choose between:

- **Only transmit to PRTG new lines at the end of the file (default):** This option improves the performance of the sensor. It sends the whole file only with the first scan to PRTG. With the following sensor scans, the sensor will only transmit lines that were appended since the last scan. All other lines (that already existed in the previous scan) are not sent. The sensor assumes that they are unchanged and still counts them.

BETA This option is currently in beta status. Please do not expect that it will work as expected in every usage scenario!

- **Always transmit to PRTG the entire file:** The sensor sends the whole file with every sensor scanning interval to PRTG. If this results in too much traffic on the target system, we recommend that you choose the new lines option.

The sensor can only transmit newly added lines in the following cases:

- the file is bigger than at the previous scan, and
- the last line in the file at the previous scan still has to be at the same place in the file.

 The sensor supports Windows and Linux line endings (**CRLF** or **LF**).

File Encoding Specify the encoding of the file that this sensor monitors. Choose between:

- **Windows-1252**

SENSOR SPECIFIC

- UTF-8
- UTF-16

Warning Behavior

Define under which condition the sensor will show a **Warning status** ¹⁹⁵. Choose between:

- **Go into warning status when string is not found:** The sensor will show a **Warning** status if there is **no** match. Otherwise it will remain in **Up** status.
- **Go into warning status when string is found:** The sensor will show a **Warning** status if there **is** a match. Otherwise it will remain in **Up** status.

If Value Changes

Define what this sensor will do when the sensor value changes. You can choose between:

- **Ignore changes (default):** The sensor takes no action on change.
- **Trigger 'change' notification:** The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to [trigger a notification](#) ³¹⁷⁰ whenever the sensor value changes.

 The change notification for this sensor is triggered if the value of the channel **Last occurrence (line)** changes. It is **not** triggered when the number of **Matches** changes.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.

 For more information on how to find the folder used for storage, see section [Data Storage](#) ³⁷³⁴.

DEBUG OPTIONS

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ³³⁵ on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none"> ▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request. ▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests. ▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests. ▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests. ▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> <p> If a channel uses lookup³⁶⁹³ values, it will always show a Down status immediately, so no "wait" options will apply.</p> |

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>[3311]</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.42 Folder Sensor

The Folder sensor monitors a folder using Server Message Block (SMB). You can monitor file changes and file ages.

It can show the following:

- Folder size in bytes
- Number of files in the folder
- Passed time since the last change to a file in the folder ("newest file")
- Passed time since the oldest modification of a file in the folder ("oldest file")

i The Folder sensor counts all files in a folder, including **hidden files**.

Sensor in Other Languages

Dutch: **Map**, French: **Dossier**, German: **Ordner**, Japanese: フォルダー, Portuguese: **Pasta**, Russian: Папка, Simplified Chinese: ? ? ? , Spanish: **Carpeta**

Remarks

- This sensor counts all files in a folder, including hidden files.

- [Requires](#)⁸⁸¹ the LanmanServer ("Server") Windows service to be running on the target computer to monitor shares.
- Knowledge Base: [What can I do if PRTG doesn't succeed with monitoring a share? PE029 PE032](#)

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: LanmanServer ("Server") Windows Service

- ✘ To monitor shares on Windows machines, please make sure the **LanmanServer** ("Server") Windows service is running on the target computer.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page. You can change the file age check later via the **Limits** section in the [channel settings](#)³¹⁶² of **Newest File** and **Oldest File**.

FOLDER MONITOR

Check of File Ages	<p>Specify if the sensor will monitor the folder for certain file ages and show a corresponding status¹⁹⁵. Choose between:</p> <ul style="list-style-type: none"> ▪ Don't check: Do not check for the age of the files in the specified folder(s). ▪ Show Warning if older: Set the sensor to Warning status if one of the files in the specified folder is older than a specific time unit. ▪ Show Error if older: Set the sensor to Down status if one of the files in the specified folder is older than a specific time unit. ▪ Show Warning if younger: Set the sensor to Warning status if one of the files in the specified folder is younger than a specific time unit. ▪ Show Error if younger: Set the sensor to Down status if one of the files in the specified folder is younger than a specific time unit.
--------------------	---

FOLDER MONITOR

File Age Limit	<p>This field is only visible if you enable a file age check above. Enter the age of a file in the folder that will trigger the sensor status change if the defined age is undercut respectively exceeded. Please enter an integer value.</p> <p>The value will be interpreted as days, hours, or minutes, according to your setting below.</p>
File Age Limit Unit	<p>This field is only visible if you enable a file age above. Specify the unit for the file age value that you entered above. Choose between:</p> <ul style="list-style-type: none"> • In days: Choose this option if you entered a number of days in the field above. • In hours: Choose this option if you entered a number of hours in the field above. • In minutes: Choose this option if you entered a number of minutes in the field above.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	<p>Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree^[181], as well as in alarms^[219], logs^[228], notifications^[3216], reports^[3252], maps^[3278], libraries^[3235], and tickets^[230].</p>
Parent Tags	<p>Shows Tags^[139] that this sensor inherits^[140] from its parent device, group, and probe^[133]. This setting is shown for your information only and cannot be changed here.</p>

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

FOLDER MONITOR

Folder Name	<p>Enter the full path to the folder this sensor will monitor. For example, enter <code>C:\Windows</code>.</p> <p>If the file is located on a network device, use the Uniform Naming Convention (UNC) path without the server part (you would only enter <code>share\folder</code>). The server part (<code>\\server\</code>) is taken from parent device settings^[402] of this sensor. Please enter a valid path name.</p> <p> To monitor shares, the LanmanServer "Server" Windows service must be running on the target computer.</p>
Subfolder Recursion	<p>Specify if the sensor will include subfolders in the folder monitoring. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not recurse subfolders: Only monitor the folder specified above and do not monitor its subfolders. ▪ Monitor the folder and its subfolders (use with caution!): Monitor the folder specified above and all of its subfolders. <ul style="list-style-type: none">  Recursing subfolders in large directories with a high number of branches may evoke timeout errors or performance issues.
Monitor Folder Changes	<p>Specify if the sensor will send a change notification when the content of the folder changes. Choose between:</p>

FOLDER MONITOR

- **Ignore changes:** Changes to the folder will not trigger a change notification.
- **Trigger 'On Change' notification:** The sensor will trigger a change notification if a file changes its timestamp or filename, or if there are new or deleted files. [Create a change trigger](#)³¹⁸⁰ on the **Notification Triggers** tab of this sensor to receive a notification whenever there is a change.

Timeout

Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is **900** seconds (15 minutes).

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.

 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

SENSOR DISPLAY

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

-  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁶⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[320] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: What can I do if PRTG doesn't succeed with monitoring a share? PE029 PE032

- <https://kb.paessler.com/en/topic/513>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

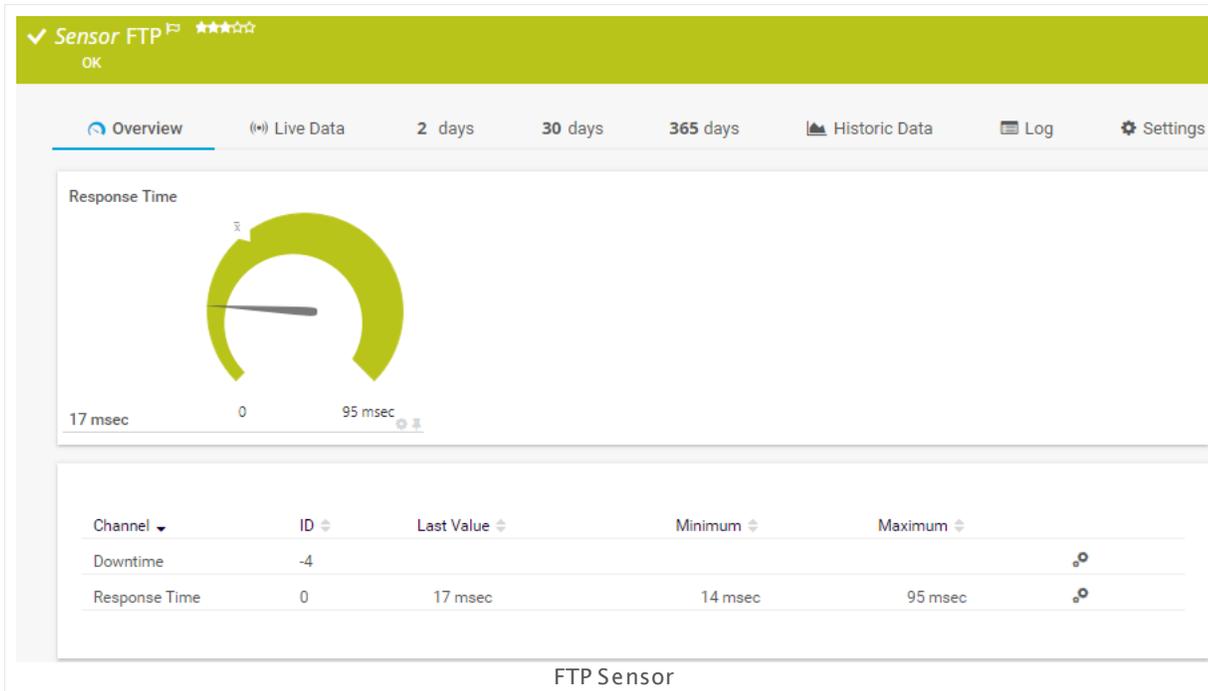

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.43 FTP Sensor

The FTP sensor monitors file servers using File Transfer Protocol (FTP) and FTP over SSL (FTPS). It can show the following:

- Response time of the server
- Response message of the server

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port	<p>Enter the number of the port the sensor tries to connect to. Please enter an integer value. We recommend that you use the default value.</p> <p>If you cannot make a connection, please try another port number.</p>
FTP Mode	<p>Define the FTP connection mode that the sensor will use for the connection to FTP server. Choose between:</p> <ul style="list-style-type: none"> ▪ Use active mode

SENSOR SPECIFIC

- **Use passive mode**

 We recommend that you use the default value. If you cannot establish a connection, please try the passive mode.

TRANSPORT-LEVEL SECURITY

FTP Specific

Specify if the sensor uses encryption for the connection. Choose between:

- **Use Transport-Level Security if available:** The sensor tries to connect via TLS. It determines automatically whether to connect via explicit or implicit mode. If TLS is not supported by the server, the sensor will try connecting without encryption and show an **Up** status if this works.
 - **Enforce Transport-Level Security:** The connection **must** be established using TLS (explicit or implicit mode). Otherwise, the sensor will show a **Down** status.
 - **Do not use Transport-Level-Security:** The sensor connects to the FTP server without encryption.
-  You can see in the sensor logs which method the sensor used previously to connect to the FTP server.

AUTHENTICATION

Username

Enter a username for the FTP login. Please enter a string or leave the field empty.

 Default username is "anonymous". If the sensor cannot log into the FTP server with this username (or another one that you define), the sensor message will show that the credentials are incorrect but the sensor will remain in **Up** status.

Password

Enter a password for the FTP login. Please enter a string or leave the field empty.

 If the sensor cannot log onto the FTP server with this password, the sensor message will show that the credentials are incorrect but the sensor will remain in **Up** status.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)^[335] on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

i Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#) 3209 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[310] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

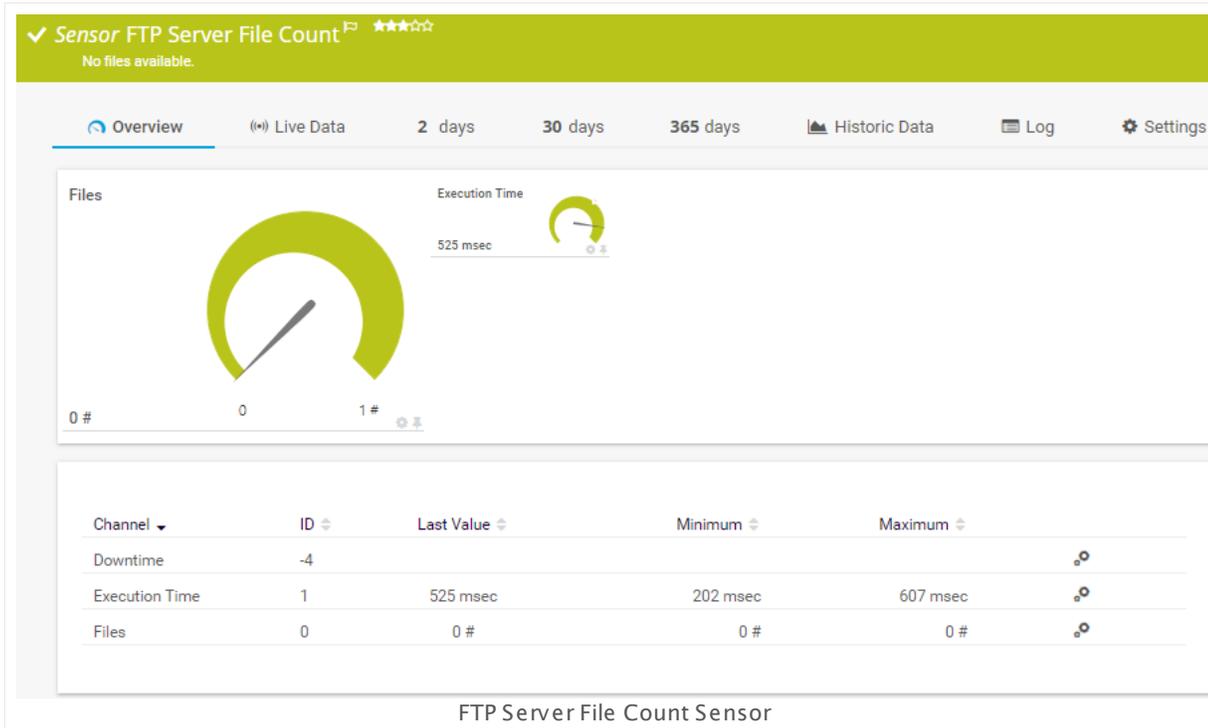

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.44 FTP Server File Count Sensor

The FTP Server File Count sensor logs in to an File Transfer Protocol (FTP) server and can monitor changes to files.

- It can show the number of files available in the directory listing.

Sensor in Other Languages

Dutch: **FTP Server File Aantal**, French: **Nombre de fichiers du serveur FTP**, German: **FTP-Server Dateienanzahl**, Japanese: **FTP サーバファイルカウント**, Portuguese: **Contagem de arquivos no FTP**, Russian: **Количество файлов на FTP-сервере**, Simplified Chinese: **FTP 服务器文件数量**, Spanish: **Número de archivos en el servidor FTP**

Remarks

- [Requires](#) .NET 4.5 or later on the probe system. If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3276] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags ^[139] , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)¹⁴⁰ from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

FTP Mode Define the FTP connection mode that the sensor will use for the connection to FTP server. Choose between:

- **Use active mode**
- **Use passive mode**

i We recommend that you use the default value. If you cannot establish a connection, please try the passive mode.

Check Method Define how to access the FTP server directory that this sensor monitors. Choose between:

- **Check URL:** The sensor uses an explicitly defined URL of an FTP server to access the target directory.
- **Check folder on parent device:** The sensor uses the IP address or DNS name of the parent device where you add this sensor to and monitors a defined folder on this device.

FTP URL This field is only visible if you select the URL method above. Enter the URL that this sensor checks. The URL can look like this:
`ftp://10.0.0.1/upload`

i If you use this method, this sensor will **not** use the **IP Address/DNS value** of the parent device.

i You can add a port number to the URL by using a colon, for example, `ftp://10.0.0.1/upload:21`

SENSOR SETTINGS

FTP Port	This field is only visible if you select the parent device method above. Enter the number of the port to which this sensor connects. Default port is 21 .
FTP Folder	This field is only visible if you select the parent device method above. Enter the name of the folder on the parent device that this sensor monitors, for example: upload
Subfolder Recursion	<p>This field is only visible if you select the parent device method above. Define if the sensor additionally monitors the subfolders of the FTP folder you specify above. Choose between:</p> <ul style="list-style-type: none">▪ Do not recurse subfolders: The sensor monitors only the folder that you define above and ignores its subfolders.▪ Monitor the folder and its subfolders (use with caution!): The sensor recursively checks all subfolders in addition to the folder that you define above.  Recursing subfolders in large directories with a high number of branches may evoke timeout errors or performance issues.
Username	Enter the username for the login to the FTP server. Please enter a string.
Password	Define the password for the login to the FTP server. Please enter a string.
File Count	<p>Define which file the sensor counts. Choose between:</p> <ul style="list-style-type: none">▪ Count the total number of files: The sensor always shows the total number of all files in the defined folder.▪ Count only new files: The sensor shows only the number of new files since the last sensor scan. You can define the frequency of sensor scans in section Scanning Interval ⁹⁰⁵.  With every sensor scan, any new files from the previous scan will be regarded as old.
Security	<p>Define the the encryption of the connection. Choose between:</p> <ul style="list-style-type: none">▪ Do not use an encryption: The sensor connects without encryption.▪ Use explicit SSL: The sensor establishes the connection to the FTP server via SSL.  This sensor type only supports explicit SSL.

SENSOR SETTINGS

If Value Changes

Define what this sensor will do when the sensor value changes. You can choose between:

- **Ignore changes (default):** The sensor takes no action on change.
- **Trigger 'change' notification:** The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to [trigger a notification](#) ³⁷⁷⁰ whenever the sensor value changes.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 📁 For more information on how to find the folder used for storage, see section [Data Storage](#) ³⁷³⁴.
 - ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

- 📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: Which .NET version does PRTG require?

- <https://kb.paessler.com/en/topic/60543>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

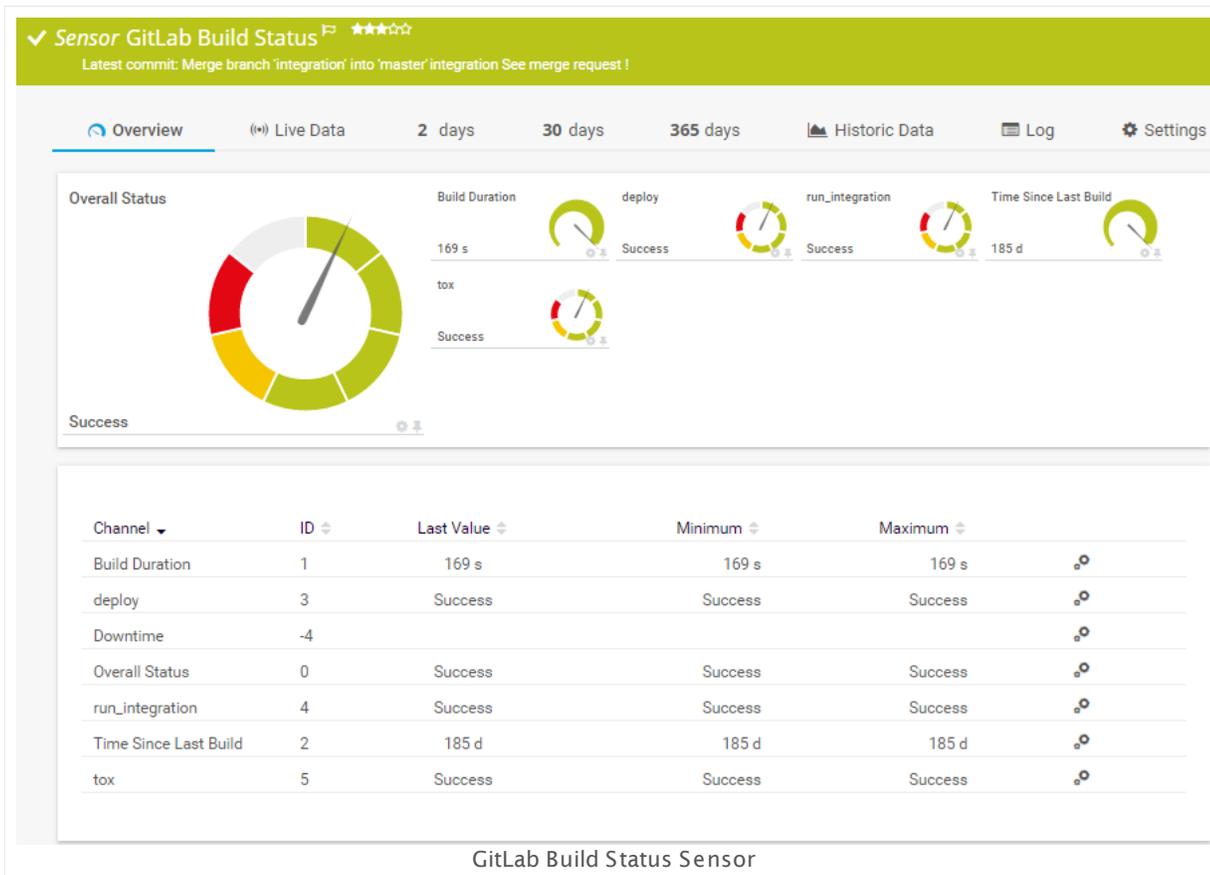

7.8.45 GitLab Build Status Sensor

The GitLab Build Status sensor monitors the status of the latest build on one specific branch. You can monitor your builds in either your own GitLab environment or on [GitLab.com](https://gitlab.com).

It can show the following:

- Overall status of the latest build (unknown, success, pending, canceled, failed)
- Duration of the latest build
- Time since the last build
- Status of the different build steps

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **GitLab Build Status**, French: **État de build de GitLab**, German: **GitLab Buildstatus**, Japanese: **GitLabビルドステータス**, Portuguese: **Estado do build no GitLab**, Russian: **Статус сборки GitLab**, Simplified Chinese: **GitLab ? ? ? ?**, Spanish: **Estado de compilación de GitLab**

Remarks

- The sensor uses the IP or DNS address of the parent device to find the GitLab server. To monitor branches in the GitLab cloud, enter **gitlab.com** as address in the [parent device settings](#)^[402].
- The sensor can only monitor builds that are using **GitLab Continuous Integration (CI)**. Builds using external CI tools (for example, **Jenkins**) are not supported.
- Use with care! This sensor has high impact on the performance of your GitLab server. Please do not add too many sensors of this type to your GitLab server, only monitor the most important branches.
- We do not recommend to add this sensor for temporarily existing branches. This is not useful in most cases.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
- Currently, this sensor type is in beta status. The methods of operating can change at any **BETA** time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The sensor requires an **Access Token** to access your projects on GitLab. Before you can actually create the sensor, it will ask you for this token. You can create it on the GitLab web interface in your profile under **Profile Settings | Access Token**. Copy the created token and paste it into the **GitLab Access Token** field in the **GitLab Credentials** dialog of the sensor.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

GITLAB REPOSITORY

Branch	Select the branches you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
--------	--

GITLAB REPOSITORY

To better find what you want to monitor, especially in large tables, use the search function in the upper right corner. For example, you can filter for a specific project to show related branches only.

i The sensor scans the last 100 builds of all projects during sensor creation (meta-scan). If you miss a branch in the overview, start a build on the branch that is missing and add the sensor anew.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

GITLAB CREDENTIALS

GitLab Access Token Enter the **Access Token** that you have defined in your GitLab profile. You can create the token on the GitLab web interface in your profile under **Profile Settings | Access Token**.

By default, this field show the access token that you have provided during sensor creation.

GITLAB REPOSITORY

Project ID These fields show various information about the project and branch that this sensor monitors.

Project Name

Branch

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

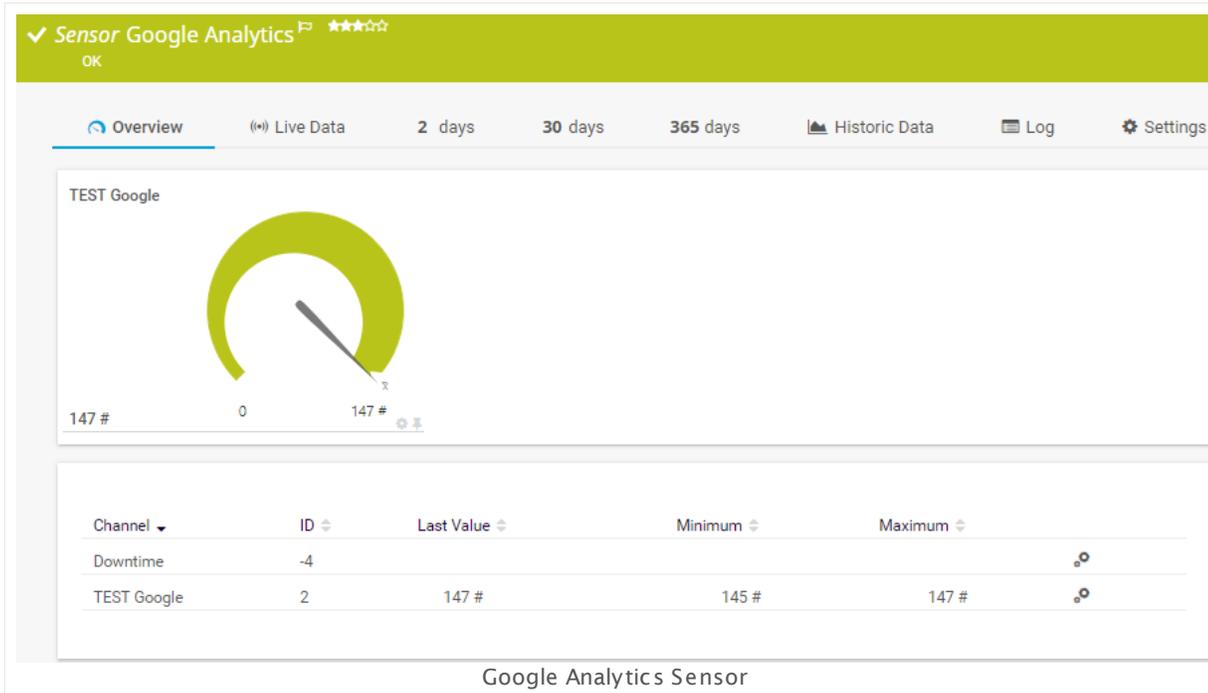

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.46 Google Analytics Sensor

The Google Analytics sensor queries and monitors several metrics from a Google Analytics account using the Google Application Programming Interface (API) and [OAuth2](#).

- It can show the values for all available Google Analytics metrics in different sensor channels.

Remarks

- The minimum scanning interval for this sensor type is **30 minutes**.
- For details about OAuth2 authentication, see manual section [Authentication Using OAuth2](#).
- Some dimensions and metrics cannot be queried together. See the Knowledge Base: [Where do I find available Google Analytics metrics?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

- X** PRTG requires OAuth2 authorization before you can actually add this sensor type. Provide the requested credentials in the appearing window.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

GOOGLE CREDENTIALS

This sensor type uses **OAuth2** authentication to get access to your Google account. For details about the authentication approach, see section [Authentication Using OAuth2](#)⁹³².

OAuth URL Click the **Get Access Code** button to connect this sensor to your Google Analytics account using OAuth2. This is necessary to allow the sensor to query data from Google Analytics. A new browser window appears. Please follow the steps there and confirm the permission for PRTG to connect to your Google Analytics account. Copy the OAuth code you get and paste it into the **OAuth Code** field below.

OAuth Code Paste the access code that you receive after completing the authorization process for PRTG at your Google Analytics account. Click **OK** to define the [sensor settings](#)⁹²³.

i It is mandatory to connect this sensor to your Google Analytics account to create this sensor. Please complete the OAuth approach first to get the OAuth code.

GOOGLE ANALYTICS SPECIFIC

Profile Choose the Google Analytics profile that you want to monitor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Channel #2 - #10 You can create up to 10 different sensor channels for this sensor. You have to define at least one data channel, so you will see all available settings for **Sensor Channel #1** without enabling it manually. Additionally you can define **Sensor Channel #2** up to **Sensor Channel #10**. To do so, choose between:

- **Disable:** The sensor will not create this channel.
- **Enable:** Create an additional channel and define all its characteristics below (name, metric, mode, and unit).

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

GOOGLE ANALYTICS SPECIFIC

 It is not possible to enable or disable sensor channels after the creation of this sensor!

Channel #x Mode

Define how to display the retrieved value in the channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

- **Absolute (recommended):** Shows the value as the sensor retrieves it from Google Analytics.
- **Difference:** The sensor calculates and shows the difference between the last and the current value returned from Google Analytics. This mode is not compatible with the unit **Value Lookup**.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

GOOGLE CREDENTIALS

OAuth Code Shows the authorization code that the sensor uses to get access to your Google Analytics account. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

GOOGLE ANALYTICS SPECIFIC

Profile Shows the Google Analytics profile that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Time Span Define the time that the queried monitoring covers. Choose between:

- **Last week (default)**
- **Yesterday**
- **Today**

Sensor Channel #x Name Enter a name for the channel in which the sensor shows the results for the metric you choose below. Please enter a string.

Sensor Channel #x Metric Select a metric that you want to monitor. You can choose between available Google Analytics. If your desired metric is not listed, choose **Custom Metric** and specify below.

GOOGLE ANALYTICS SPECIFIC

Sensor Channel #x Custom Metric This field is only visible if you choose custom metric above. Enter the identifier of the metric that you want to monitor. Type it exactly as shown in Google Analytics. Metric identifiers always start with **ga:**

Please enter a string.

Sensor Channel #x Mode Shows how the sensor displays the retrieved value in the channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Channel #x Unit Define the unit of the channel value. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

- BytesBandwidth
- BytesMemory
- BytesDisk
- Temperature
- Percent
- TimeResponse
- TimeSeconds
- TimeHours
- Count
- CPU
- BytesFile
- SpeedDisk
- SpeedNet
- Custom
- Value Lookup

For more information about the available units, see section [Custom Sensors](#)³⁶⁴².

i To use [lookups](#)³⁶⁹³ with this channel, choose the unit **Value Lookup** and select your lookup file below. Do not use the unit **Custom** for using lookups with this sensor and do not use the [channel settings](#)³¹⁰⁰ to define a lookup file!

GOOGLE ANALYTICS SPECIFIC

 Using the unit **Value Lookup** is not possible when you choose the **Difference** mode. You will not be able to create the sensor in this case.

Sensor Channel #x
Custom Unit This setting is only visible if you select the **Custom** unit option above. Define a unit for the channel value. Please enter a string.

Sensor Channel #x
Value Lookup This setting is only visible if you select the **Value Lookup** option above. Choose a [lookup](#) file that you want to use with this channel.

Sensor Channel #x Shows if you enabled or disabled a channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

 You can define up to 10 different sensor channels per sensor.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#) settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)^[335] on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- ⓘ If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- ⓘ If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

ⓘ This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in [System Administration—Monitoring](#) are not available for this sensor.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

ⓘ Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

ⓘ Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none">▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p> To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none">▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below.▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

i This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Authentication Using OAuth2

 This sensor type uses the OAuth2 security protocol to access the account from which you want to retrieve and monitor data. OAuth2 enables you to grant access to the target account without sharing your password with PRTG. The authorization approach of PRTG using OAuth2 works as follows.

1. Authorization Request

First, you have to request authorization for this sensor to access service resources from your account. For this purpose you are asked to get an access code for this sensor in the **Add Sensor** dialog. Click the **Get Access Code** button to start the authorization process using OAuth2. A new browser window will open on the authorization server of the target service.

2. Verifying Identity

This new window contains a login form for your account that you want to monitor. Log in to your account using your credentials for this service to authenticate your identity. This is a common login to your account on the target server so PRTG will not see your password. The service will forward you to the authorization page and asks you to permit PRTG to access the data in your account.

 If you are already logged in to the service with a user account, you do not have to enter credentials in this step and get directly to the access permission page.

3. Authorizing PRTG

Permit PRTG to access information on your account. Note that this permission holds only for this specific sensor, not for other sensors of this type or PRTG as a whole. For each sensor of this type you add, you have to confirm the access permission anew. You can change the account permissions at any time in your account at the target service.

4. Getting Authorization Code

Permitting PRTG to access your account data forwards you to a page where the service provides an **authorization code**. Copy this code and switch back to the **Add Sensor** dialog in PRTG.

-  The code is only valid a short period of time and expires after a few minutes. You can use a particular code only once.

5. Providing Authorization Code

Paste the authorization code into the **OAuth Code** field and complete the **Add Sensor** dialog. You do not have to go through further configuration steps manually. The sensor will accomplish the following steps automatically.

6. Requesting Access Token

After receiving the authorization code, PRTG will request an access token from the API of the target service. For this purpose, PRTG transmits the authorization code together with several authentication details. The API checks if the authorization is valid and returns the access token to PRTG. Access tokens are specific for one account and one application (here: PRTG). The authorization process to read data from your account is now complete.

7. Retrieving Data

The sensor transmits the access token with each sensor scan in the defined scanning interval to authenticate with your account. It is not necessary to use the original account credentials anew. The used tokens will refresh automatically from time to time.

More

Knowledge Base: Where do I find available Google Analytics metrics?

- <https://kb.paessler.com/en/topic/35373>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

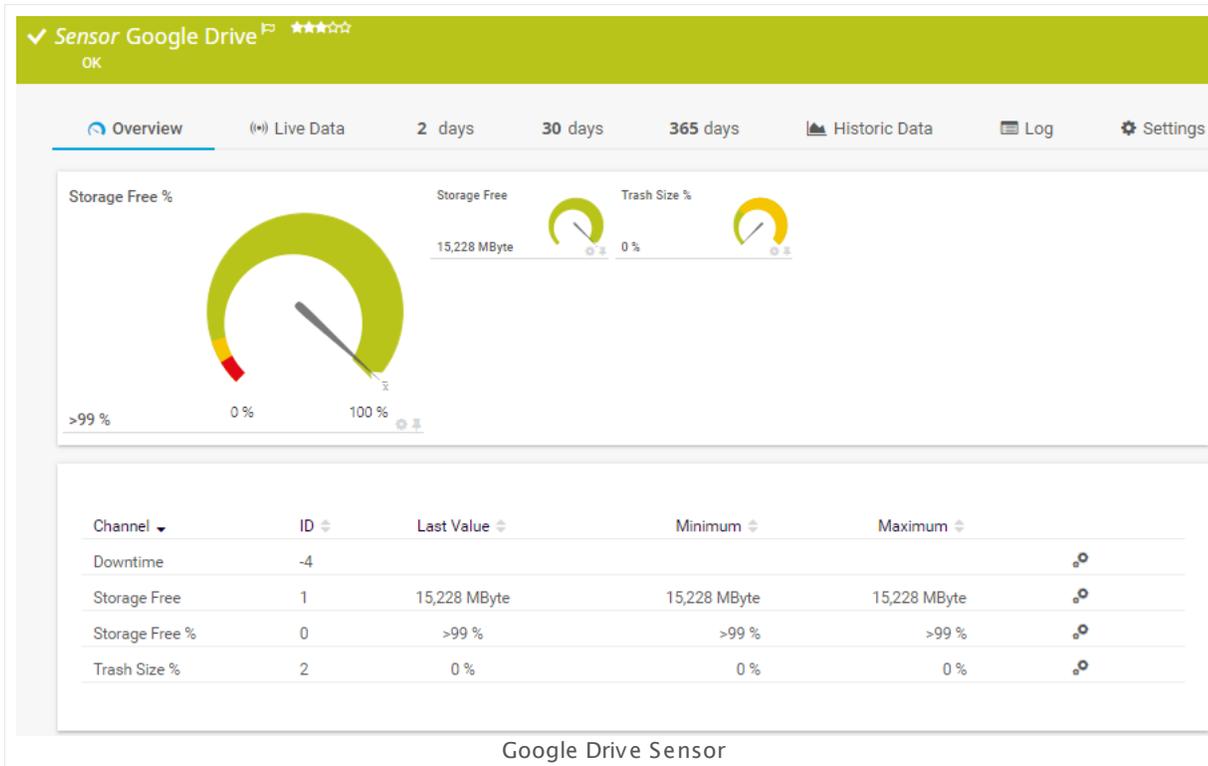

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.47 Google Drive Sensor

The Google Drive sensor monitors a Google Drive account using the Google Application Programming Interface (API) and [OAuth2](#). It shows the following:

- Free storage in bytes and percent
- Trash size in percent

Sensor in Other Languages

Dutch: **Google Drive**, French: **Google Drive**, German: **Google Drive**, Japanese: **Google ドライブ**, Portuguese: **Google Drive**, Russian: **Google Диск**, Simplified Chinese: **Google Drive**, Spanish: **Google Drive**

Remarks

- The minimum scanning interval for this sensor type is **30 minutes**.
- For details about OAuth2 authentication, see manual section [Authentication Using OAuth2](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

- ✘ PRTG requires OAuth2 authorization before you can actually add this sensor type. Provide the requested credentials in the appearing window.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

GOOGLE CREDENTIALS

This sensor type uses **OAuth2** authentication to get access to your Google account. For details about the authentication approach, see section [Authentication Using OAuth2](#)^[942].

OAuth URL Click the **Get Access Code** button to connect this sensor to your Google Drive account using OAuth2. This is necessary to allow the sensor to query data from Google Drive. A new browser window appears. Please follow the steps there and confirm the permission for PRTG to connect to your Google Drive account. Copy the OAuth code you get and paste it into the **OAuth Code** field below.

OAuth Code Paste the access code that you receive after completing the authorization process for PRTG at your Google Drive account. Click **OK** to define the [sensor settings](#)^[935].

i It is mandatory to connect this sensor to your Google Drive account to create this sensor. Please complete the OAuth approach first to get the OAuth code.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)^[181], as well as in [alarms](#)^[219], [logs](#)^[228], [notifications](#)^[3216], [reports](#)^[3252], [maps](#)^[3278], [libraries](#)^[3235], and [tickets](#)^[230].

BASIC SENSOR SETTINGS

Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

GOOGLE CREDENTIALS

OAuth Code	Shows the authorization code that the sensor uses to get access to your Google Drive account. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
------------	--

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none">▪ Show channels independently (default): Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

i This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in [System Administration—Monitoring](#) are not available for this sensor.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>3311</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Authentication Using OAuth2

 This sensor type uses the OAuth2 security protocol to access the account from which you want to retrieve and monitor data. OAuth2 enables you to grant access to the target account without sharing your password with PRTG. The authorization approach of PRTG using OAuth2 works as follows.

1. Authorization Request

First, you have to request authorization for this sensor to access service resources from your account. For this purpose you are asked to get an access code for this sensor in the **Add Sensor** dialog. Click the **Get Access Code** button to start the authorization process using OAuth2. A new browser window will open on the authorization server of the target service.

2. Verifying Identity

This new window contains a login form for your account that you want to monitor. Log in to your account using your credentials for this service to authenticate your identity. This is a common login to your account on the target server so PRTG will not see your password. The service will forward you to the authorization page and asks you to permit PRTG to access the data in your account.

 If you are already logged in to the service with a user account, you do not have to enter credentials in this step and get directly to the access permission page.

3. Authorizing PRTG

Permit PRTG to access information on your account. Note that this permission holds only for this specific sensor, not for other sensors of this type or PRTG as a whole. For each sensor of this type you add, you have to confirm the access permission anew. You can change the account permissions at any time in your account at the target service.

4. Getting Authorization Code

Permitting PRTG to access your account data forwards you to a page where the service provides an **authorization code**. Copy this code and switch back to the **Add Sensor** dialog in PRTG.

-  The code is only valid a short period of time and expires after a few minutes. You can use a particular code only once.

5. Providing Authorization Code

Paste the authorization code into the **OAuth Code** field and complete the **Add Sensor** dialog. You do not have to go through further configuration steps manually. The sensor will accomplish the following steps automatically.

6. Requesting Access Token

After receiving the authorization code, PRTG will request an access token from the API of the target service. For this purpose, PRTG transmits the authorization code together with several authentication details. The API checks if the authorization is valid and returns the access token to PRTG. Access tokens are specific for one account and one application (here: PRTG). The authorization process to read data from your account is now complete.

7. Retrieving Data

The sensor transmits the access token with each sensor scan in the defined scanning interval to authenticate with your account. It is not necessary to use the original account credentials anew. The used tokens will refresh automatically from time to time.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

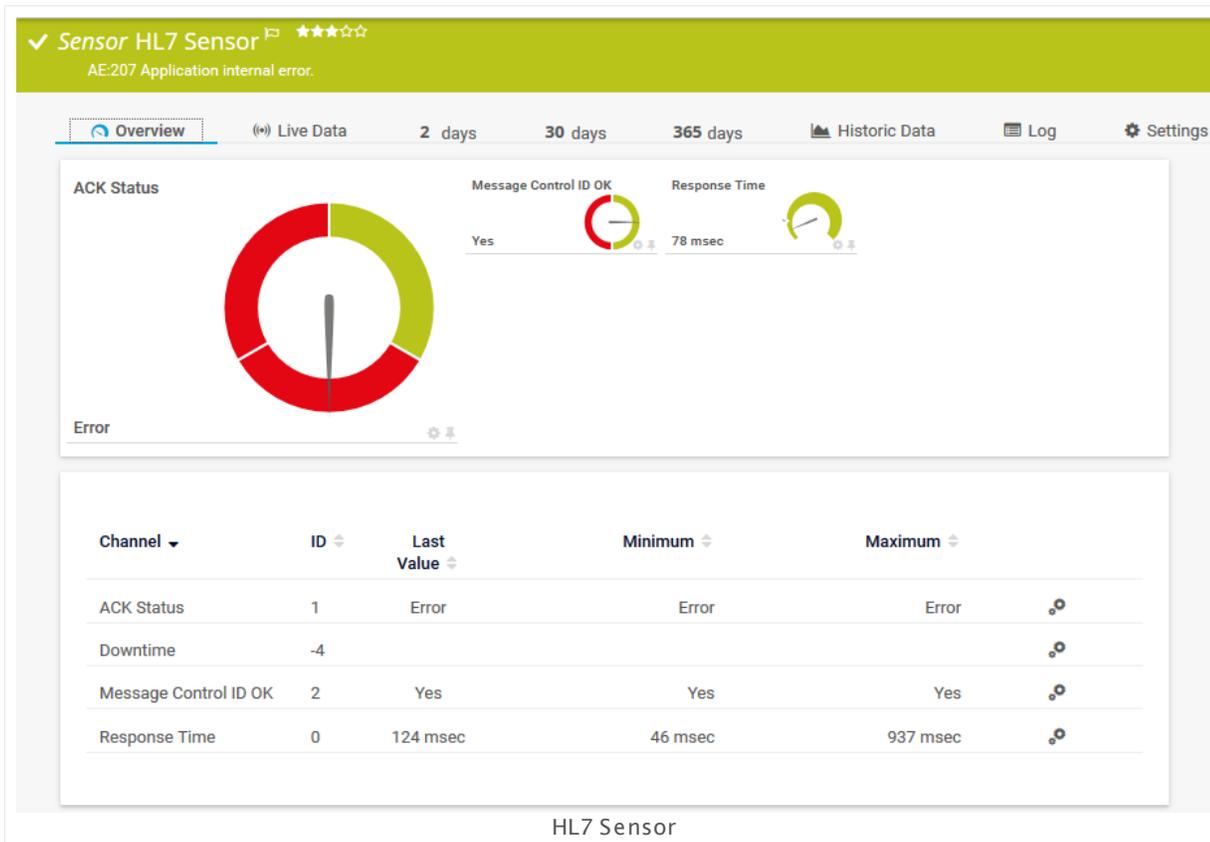

7.8.48 HL7 Sensor

The HL7 sensor monitors the availability of HL7 interfaces. It sends an HL7 message to the target device and checks for a valid response.

The sensor shows the following:

- Acknowledgment (ACK) status
 - **Up status** ¹⁹⁵ for accepted messages
 - **Down status** for rejected messages or errors
- Message control ID status
- Response time

You can define your own messages in HL7 format as **.hl7** files in the [PRTG program directory](#) ³⁷⁴. The sensor sends them to the HL7 capable system with each sensor scan.

Remarks

- [Requires](#) ⁹⁴⁵ .NET 4.6 or later on the probe system.

- Currently, this sensor type is in beta status. The methods of operating can change at any **BETA** time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.6 or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

HL7 MESSAGE SPECIFIC

HL7 Messages

Select an HL7 file from the list. The sensor will send it to the target device with every scanning interval.

The list shows all files available in the corresponding **\Custom Sensors\hl7** sub-directory of the probe system's PRTG program directory (see [Data Storage](#)³⁷³⁴). To appear in this list, please store the files into this folder ending in HL7.

To be accepted by the HL7 interface, your files must have the expected HL7 message format.

PRTG comes with two sample HL7 message files by default that you can use to test your HL7 monitoring and to have a look at the expected format. They are located in the **\Custom Sensors\hl7** folder.

HL7 MESSAGE SPECIFIC

You can override certain headers using the **Message Header (MSH)** sensor setting.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HL7 CONNECTION

Port	Enter the port of the HL7 interface that is used for the connection.
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

HL7 MESSAGE SPECIFIC

Message Header (MSH)	<p>Define if you want to use the default message headers (MSH) as defined in the selected HL7 message file or if you want to override certain headers. Choose between:</p> <ul style="list-style-type: none">▪ Default MSH: Send the MSH as defined in the HL7 message file.▪ Override MSH: Define custom MSH below that will override the MSH in the HL7 message file.
Sending Application	<p>This field is only available if you choose to override the MSH above. Enter the name of the sending application, for example, PRTG. It will override the default value in the message.</p> <p>Please enter a string.</p>
Sending Facility	<p>This field is only available if you choose to override the MSH above. Enter the name of the sending facility. It will override the default value in the message.</p> <p>Please enter a string.</p>
Receiving Application	<p>This field is only available if you choose to override the MSH above. Enter the name of the receiving application. It will override the default value in the message.</p> <p>Please enter a string.</p>
Receiving Facility	<p>This field is only available if you choose to override the MSH above. Enter the name of the receiving facility. It will override the default value in the message.</p> <p>Please enter a string.</p>

HL7 MESSAGE SPECIFIC

HL7 Message	Shows the HL7 message file that the sensor uses to send the message with each scan. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
-------------	--

DEBUG OPTIONS

Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none"> 📁 For more information on how to find the folder used for storage, see section Data Storage³⁷³⁴. <p>☁ This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>
---------------	---

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

Knowledge Base: Which .NET version does PRTG require?

- <https://kb.paessler.com/en/topic/60543>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

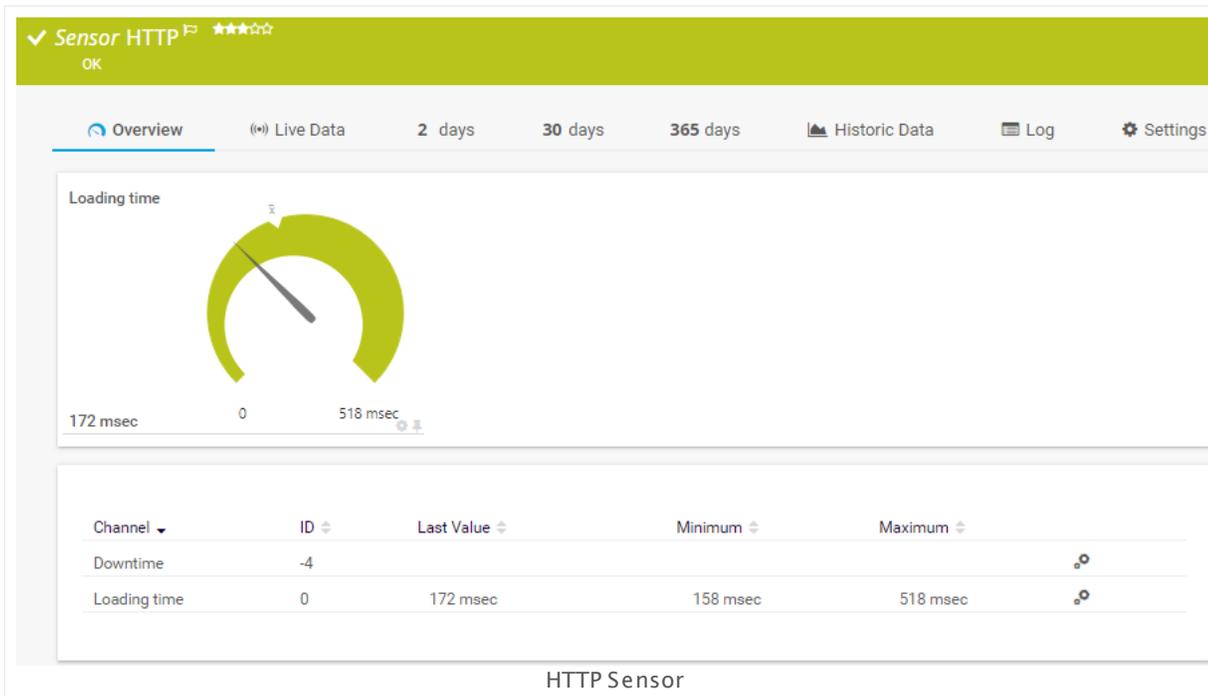

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.49 HTTP Sensor

The HTTP sensor monitors a web server using Hypertext Transfer Protocol (HTTP). This is the easiest way to monitor if a website (or a specific website element) is reachable.

- It shows the loading time of a web page or element.

Remarks

- Knowledge Base: [My HTTP sensors fail to monitor websites which use SNI. What can I do?](#)
- Knowledge Base: [Which HTTP status code leads to which HTTP sensor status?](#)
- This sensor type does not support Secure Remote Password (SRP) ciphers.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
URL	<p>Enter the URL the sensor connects to. It has to be URL encoded!</p> <p>If you enter an absolute URL, the sensor uses this address independently from the IP Address/DNS Name setting of the device on which you create this sensor. You can enter an URL leading to a webpage (to measure the page source code's loading time), or enter the URL of an image or of another page asset to measure this element's availability and loading time.</p>

HTTP SPECIFIC

 PRTG uses a smart URL replacement that allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section **Smart URL Replacement** below.

Request Method

Choose an HTTP request method to determine how the sensor will request the given URL.

- **GET:** Request the website directly, like browsing the web. We recommend using this setting for a simple check of a web page.
- **POST:** Send post form data to the URL. If this setting is chosen, you must enter the data that will be sent in the **Postdata** field below.
- **HEAD:** Only request the HTTP header from the server without the actual web page. Although this saves bandwidth since less data is transferred, it is not recommended because the measured request time is not the one experienced by your users and you might not be notified for slow results or timeouts.

Postdata

This field is only visible when you select the **POST Request Method** setting above. Enter the data part for the POST request here.

 No XML is allowed here!

Content Type

This setting is only visible when you select the **POST Request Method** setting above. Define the content type of a POST request. Choose between:

- **Default (application/x-www-form-urlencoded):** This is the default content type used to encode the form data set for submission to the server.
- **Custom:** If you need another content type than default, enter this content type below.

Custom Content Type

This field is only visible when you select **Custom** above. Define the content type that is needed, for example, XML, JSON, HTTP.

Server Name Indication

Shows the Server Name Identification (SNI) that the sensor automatically determined from the host address of the [parent device](#)⁴⁰² or the target URL of the sensor. SNI has to be a **Fully Qualified Domain Name (FQDN)**. Please ensure it matches the configuration of the target server.

 For details, see the Knowledge Base article [My HTTP sensors fail to monitor websites which use SNI. What can I do?](#)

HTTP SPECIFIC

- SNI Inheritance** Define if you want to inherit the Server Name Identification (SNI) from the parent device. See the **Server Name Indication** setting above which SNI is determined. Choose between:
- **Inherit SNI from parent device:** The sensor determines the SNI from the host address of the parent device.
 - **Do not inherit SNI from parent device:** The sensor determines the SNI from the target **URL** as defined in the settings of this sensor.

i This sensor type implicitly supports Server Name Identification (SNI), an extension to the TLS protocol.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

- Graph Type** Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

i This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#) settings).

- Stack Unit** This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

HTTP Proxy Settings The proxy settings determine how a sensor connects to a given URL. You can enter data for an HTTP proxy server that sensors will use when connecting via HTTP or HTTPS.

-  This setting affects monitoring only and determines the behavior of HTTP sensors. To change proxy settings for the core server, see [System Administration—Core & Probes](#)³³⁸.
-  The [SSL Certificate Sensor](#)²⁶³⁵ and the [SSL Security Check Sensor](#)²⁶⁴⁶ do not support HTTP proxies, but you can configure connections via SOCKS proxies in their sensor settings.

Name Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.

Port Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.

User If the proxy requires authentication, enter the username for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

Password If the proxy requires authentication, enter the password for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ³³⁵ on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none"> ▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request. ▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests. ▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests. ▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests. ▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> <p> If a channel uses lookup³⁶⁹³ values, it will always show a Down status immediately, so no "wait" options will apply.</p> |

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>3311</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either [http:///](#) or [https:///](#) or even a simple slash / as equivalent for [http:///](#)). PRTG will fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically.

Whether this results in a valid URL or not depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** [www.example.com](#) and you add an HTTP sensor to it, you can provide values the following ways:

- Providing the value [https:///](#) in the URL field, PRTG will automatically create the URL [https://www.example.com/](#)

- Using the value `/help` in the URL field, PRTG will automatically create and monitor the URL <http://www.example.com/help>
- It is also possible to provide a port number in the URL field, which will be taken over by the device's DNS name and internally added, for example, <http://:8080/>

 Smart URL replacement does not work for sensors running on the **Probe Device**.

More

Knowledge Base: Which HTTP status code leads to which HTTP sensor status?

- <https://kb.paessler.com/en/topic/65731>

Knowledge Base: My HTTP sensors fail to monitor websites which use SNI. What can I do?

- <https://kb.paessler.com/en/topic/67398>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

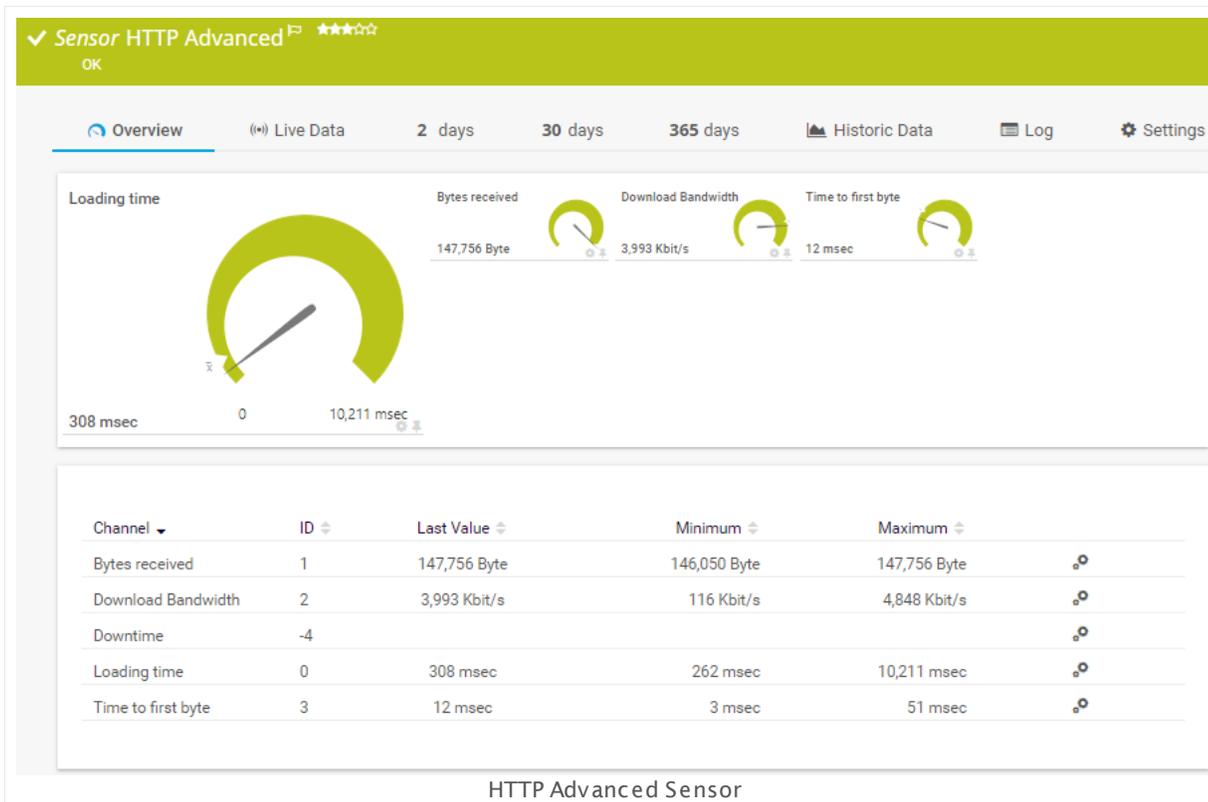

For more general information about settings, see the [Object Settings](#)²¹⁷¹ section.

7.8.50 HTTP Advanced Sensor

The HTTP Advanced sensor monitors the source code of a web page using Hypertext Transfer Protocol (HTTP). It supports authentication, content checks, and other advanced parameters.

The sensor can show the following:

- Loading time
 - Bytes received
 - Download bandwidth (speed)
 - Time to first byte
- ⓘ The monitored content size is uncompressed.

Sensor in Other Languages

Dutch: **HTTP Geavanceerd**, French: **HTTP (avancé)**, German: **HTTP (Erweitert)**, Japanese: **HTTP アドバンスド**, Portuguese: **HTTP avançado**, Russian: **HTTP (Расширенный)**, Simplified Chinese: **HTTP 高级**, Spanish: **HTTP Avanzado**

Remarks

- Supports [Smart URL Replacement](#)⁹⁸⁰.

- Knowledge Base: [Which user agent should I use in the HTTP Advanced sensor's settings?](#)
- Knowledge Base: [My HTTP sensors fail to monitor websites which use SNI. What can I do?](#)
- Knowledge Base: [Which HTTP status code leads to which HTTP sensor status?](#)
- This sensor type does not support Secure Remote Password (SRP) ciphers.
- If you need to use SRP ciphers, please choose the **Alternate/Compatibility Mode** in the sensor settings.
- Bandwidth monitoring of fast internet connections may be inaccurate.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags .

BASIC SENSOR SETTINGS

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP SPECIFIC

Timeout (Sec.) Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is **900** seconds (15 minutes).

URL Enter the URL the sensor connects to. It has to be **URL encoded!**

If you enter an absolute URL, the sensor uses this address independently from the **IP Address/DNS Name** setting of the device on which you create this sensor. You can enter an URL leading to a webpage (to measure the page source code's loading time), or enter the URL of an image or of another page asset to measure this element's availability and loading time.

 PRTG uses a smart URL replacement that allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section **Smart URL Replacement** below.

Request Method Choose an HTTP request method to determine how the sensor will request the given URL.

- **GET:** Request the website directly, like browsing the web. We recommend using this setting for a simple check of a web page.
- **POST:** Send post form data to the URL. If this setting is chosen, you must enter the data that will be sent in the **Post data** field below.
- **HEAD:** Only request the HTTP header from the server without the actual web page. Although this saves bandwidth since less data is transferred, it is not recommended because the measured request time is not the one experienced by your users and you might not be notified for slow results or timeouts.

HTTP SPECIFIC

Postdata	<p>This field is only visible when you select the POST Request Method setting above. Enter the data part for the POST request here.</p> <p> No XML is allowed here!</p>
Content Type	<p>This setting is only visible when you select the POST Request Method setting above. Define the content type of a POST request. Choose between:</p> <ul style="list-style-type: none"> ▪ Default (application/x-www-form-urlencoded): This is the default content type used to encode the form data set for submission to the server. ▪ Custom: If you need another content type than default, enter this content type below.
Custom Content Type	<p>This field is only visible when you select Custom above. Define the content type that is needed, for example, XML, JSON, HTTP.</p>
Server Name Indication	<p>Shows the Server Name Identification (SNI) that the sensor automatically determined from the host address of the parent device or the target URL of the sensor. SNI has to be a Fully Qualified Domain Name (FQDN). Please ensure it matches the configuration of the target server.</p> <p> For details, see the Knowledge Base article My HTTP sensors fail to monitor websites which use SNI. What can I do?</p>
SNI Inheritance	<p>Define if you want to inherit the Server Name Identification (SNI) from the parent device. See the Server Name Indication setting above which SNI is determined. Choose between:</p> <ul style="list-style-type: none"> ▪ Inherit SNI from parent device: The sensor determines the SNI from the host address of the parent device. ▪ Do not inherit SNI from parent device: The sensor determines the SNI from the target URL as defined in the settings of this sensor.

HTTP ENGINE

Monitoring Engine	<p>If you encounter unexpected errors with the standard method that is used to monitor a URL, try to use the compatibility mode, which is based on .NET. Choose between:</p>
-------------------	---

HTTP ENGINE

- **Default/High Performance (recommended):** This is the default monitoring method for this sensor type.
- **Alternate/Compatibility Mode:** Try this method as an alternative for websites that do not work with the default approach. Using the compatibility mode, this sensor executes an external `exe`. Because of this, this method needs more resources, but it can be helpful in particular cases.
 - ⓘ If you select the compatibility mode, the options for the SSL method will be slightly different. You can also check for trusted certificates. Please see below.
 - ⚠ When using the Compatibility Mode, **Smart URL Replacement** will not work, so this sensor will **not** use the **IP Address/DNS value** of the parent device automatically then.

SSL SPECIFIC (WHEN USING COMPATIBILITY MODE)

SSL Method	<p>When using the compatibility mode, the SSL specific settings are a bit different to the default (automatically used) SSL settings. You can choose between:</p> <ul style="list-style-type: none"> ▪ SSL 3.0 ▪ TLS 1.0, TLS 1.1, TLS 1.2 ▪ SSL 3.0, TLS 1.0, TLS 1.1, TLS 1.2 This is the default setting.
Check SSL Certificates	<p>Specify if the sensor will check the certificate of the monitored URL. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not check used certificates: Do not consider the certificates of the monitored web pages. This the default setting. ▪ Check if the used certificates are trusted: Inspect the certificates. If the certificate of the server is not trusted, the sensor shows a Down status and displays a corresponding message.

- ⓘ This sensor type implicitly supports Server Name Identification (SNI), an extension to the TLS protocol.

ADVANCED SENSOR DATA

Protocol Version	<p>Define the HTTP protocol version that the sensor will use when connecting to the target URL. Choose between:</p> <ul style="list-style-type: none"> ▪ HTTP 1.0 ▪ HTTP 1.1: This is the default setting.
User Agent	<p>Choose which user agent string the sensor will send when connecting to the target URL. Choose between:</p> <ul style="list-style-type: none"> ▪ Use PRTG's default string: Do not enter a specific user agent, use the default setting. Usually, this is: Mozilla/5.0 (compatible; PRTG Network Monitor (www.paessler.com); Windows) ▪ Use a custom string: Use a custom user agent. Define below.
Custom User Agent	<p>This field is only visible if you enable custom user agent above. Enter a string to be used as user agent when connecting to the URL specified above.</p>
Use Custom HTTP Headers	<p>Define if you want to send custom HTTP headers to the target URL. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not use custom HTTP headers ▪ Use custom HTTP headers
Custom HTTP Headers	<p>This field is only available if you select using custom headers above. Enter a list of custom HTTP headers with their respective values that you want to transmit to the URL you define above, each pair in one line. The syntax of a header-value pair is header1:value1</p> <p> The sensor does not support the header field names user-agent, content-length, host.</p> <p> Ensure the HTTP header statement is valid! Otherwise, the sensor request will not be successful.</p>

Content Changes	<p>Define what the sensor will do if the content of the monitored web page (element) changes. You can choose between:</p> <ul style="list-style-type: none"> • Ignore changes: No action will be taken on change. • Trigger 'change' notification: The sensor will send an internal message indicating that the web page content has changed. In combination with a Change Trigger, you can use this mechanism to trigger a notification^[3170] whenever the web page content changes.
-----------------	---

Require Keyword	<p>Define if the sensor will check the result at the configured URL for keywords. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not check for keyword (default): Do not search for keywords in the result returned at the URL. ▪ Set sensor to warning if keyword is missing: Check if a keyword exists in the result and set the sensor to a Warning status ^[195] if yes. ▪ Set sensor to error if keyword is missing: Check if a keyword exists in the result and set the sensor to a Down status ^[195] if yes. <p> The content check is only intended for HTML websites and might not work with other target URLs. For example, binary files are not supported.</p>
Response Must Include	<p>This field is only visible if you enable keyword checking above (include). Define which string must be part of the source code at the given URL. You can either enter plain text or a Regular Expression ^[3704]. Specify below.</p> <p>If the data does not include the search pattern, the sensor will show the status defined above. Please enter a string.</p>
Check Method	<p>Define the format of the search expression in the field above.</p> <ul style="list-style-type: none"> ▪ String search (default): Search for the string as plain text. The characters * and ? work here as placeholder, whereas * stands for no or any number of characters and ? stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible with plain text search. You can also search for HTML tags. ▪ Regular Expression: Use the search pattern as a Regular Expression ^[3704]. <p> PRTG supports PCRE regex. You cannot use regex options or flags. For more details, see manual section Regular Expressions ^[3704].</p>
Exclude Keyword	<p>Define if the sensor will check the result at the configured URL for keywords. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not check for keyword (default): Do not search for keywords in the result returned at the URL. ▪ Set sensor to warning if keyword is found: Check if a keyword exists in the result and set the sensor to a Warning status ^[195] if yes.

	<ul style="list-style-type: none"> ▪ Set sensor to error if keyword is found: Check if a keyword exists in the result and set the sensor to a Down status ^[195] if yes. <p> The content check is only intended for HTML websites and might not work with other target URLs. For example, binary files are not supported.</p>
Response Must Not include	This field is only visible if you enable keyword checking (exclude) above. Define which string must not be part of the source code at the given URL. You can either enter plain text or a Regular Expression ^[3704] . If the data does include this string, the sensor will show the status defined above. Please enter a string.
Check Method	Define in which format you have entered the search expression in the field above. <ul style="list-style-type: none"> ▪ String Search (default): Search for the string as plain text. The characters asterisk (*) and question mark (?) work here as placeholder, whereas * stands for no or any number of characters and ? stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible with plain text search. You can also search for HTML tags. ▪ Regular Expression: Use the search pattern as a Regular Expression ^[3704]. <p> PRTG supports PCRE regex. You cannot use regex options or flags. For more details, see manual section Regular Expressions ^[3704].</p>
Limit Download (kb)	Enter a maximum amount of data that the sensor can transfer per every single request. If you set content checks, please be aware that only the content downloaded up to this limit can be checked for search expressions.
Result Handling	Define what the sensor will do with the data loaded at the given URL. Choose between: <ul style="list-style-type: none"> • Discard HTML result: Do not store the requested data. • Store latest HTML result: Store the last result of the requested data to the Logs (Sensors) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File name: Result of Sensor [ID].txt. This is for debugging purposes, especially in combination with content checks. The file will be overridden with each scanning interval. <p> For information on how to find the folder used for storage, see section Data Storage ^[3734].</p>

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

-  This sensor loads the source code at the given URL. If you set up a content check, only this source code is checked for the keywords. The code is not necessarily identical to the one used to display the page when opening the same URL in a web browser, as there may be a reload configured or certain information may be inserted after loading, for example, via JavaScript.
-  PRTG does not follow links to embedded objects nor does it execute scripts. Only the first page at the given URL is loaded and checked against the expressions configured.
-  For debugging, please use the **Result Handling** option to write the source code file to disk and look up what exactly PRTG gets when calling the URL. If the URL configured does not point to a web page, but to a binary file, for example, to an image, you usually will not check for content.

AUTHENTICATION

Authentication	Define if the web page at the configured URL needs authentication. Choose between: <ul style="list-style-type: none"> ▪ No authentication needed ▪ Web page needs authentication
User	This field is only visible if you enable authentication above. Enter a username. Please enter a string.
Password	This field is only visible if you enable authentication above. Enter a password. Please enter a string.
Authentication Method	This field is only visible if enable authentication above. Select the authentication method the given URL is protected with. Choose between: <ul style="list-style-type: none"> ▪ Basic access authentication (HTTP): Use simple HTTP authentication. This is the default setting and suitable for most cases. <ul style="list-style-type: none">  This authentication method transmits credentials as plain text. ▪ Windows NT LAN Manager (NTLM): Use the Microsoft NTLM protocol for authentication. This is sometimes used in intranets for single sign-on.

AUTHENTICATION

- **Digest Access Authentication:** Use digest access authentication that applies a hash function to the password, which is safer than basic access authentication.

We recommend that you use the default value.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

HTTP Proxy Settings The proxy settings determine how a sensor connects to a given URL. You can enter data for an HTTP proxy server that sensors will use when connecting via HTTP or HTTPS.

-  This setting affects monitoring only and determines the behavior of HTTP sensors. To change proxy settings for the core server, see [System Administration—Core & Probes](#)³³⁶⁸.
-  The [SSL Certificate Sensor](#)²⁶³⁵ and the [SSL Security Check Sensor](#)²⁶⁴⁶ do not support HTTP proxies, but you can configure connections via SOCKS proxies in their sensor settings.

Name Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.

Port Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.

User If the proxy requires authentication, enter the username for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

Password If the proxy requires authentication, enter the password for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either [http://](#) or [https://](#) or even a simple slash / as equivalent for [http://](#)). PRTG will fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically.

Whether this results in a valid URL or not depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** [www.example.com](#) and you add an HTTP sensor to it, you can provide values the following ways:

- Providing the value [https://](#) in the URL field, PRTG will automatically create the URL [https://www.example.com/](#)
- Using the value [/help](#) in the URL field, PRTG will automatically create and monitor the URL [http://www.example.com/help](#)
- It is also possible to provide a port number in the URL field, which will be taken over by the device's DNS name and internally added, for example, [http://:8080/](#)

 Smart URL replacement does not work for sensors running on the **Probe Device**.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

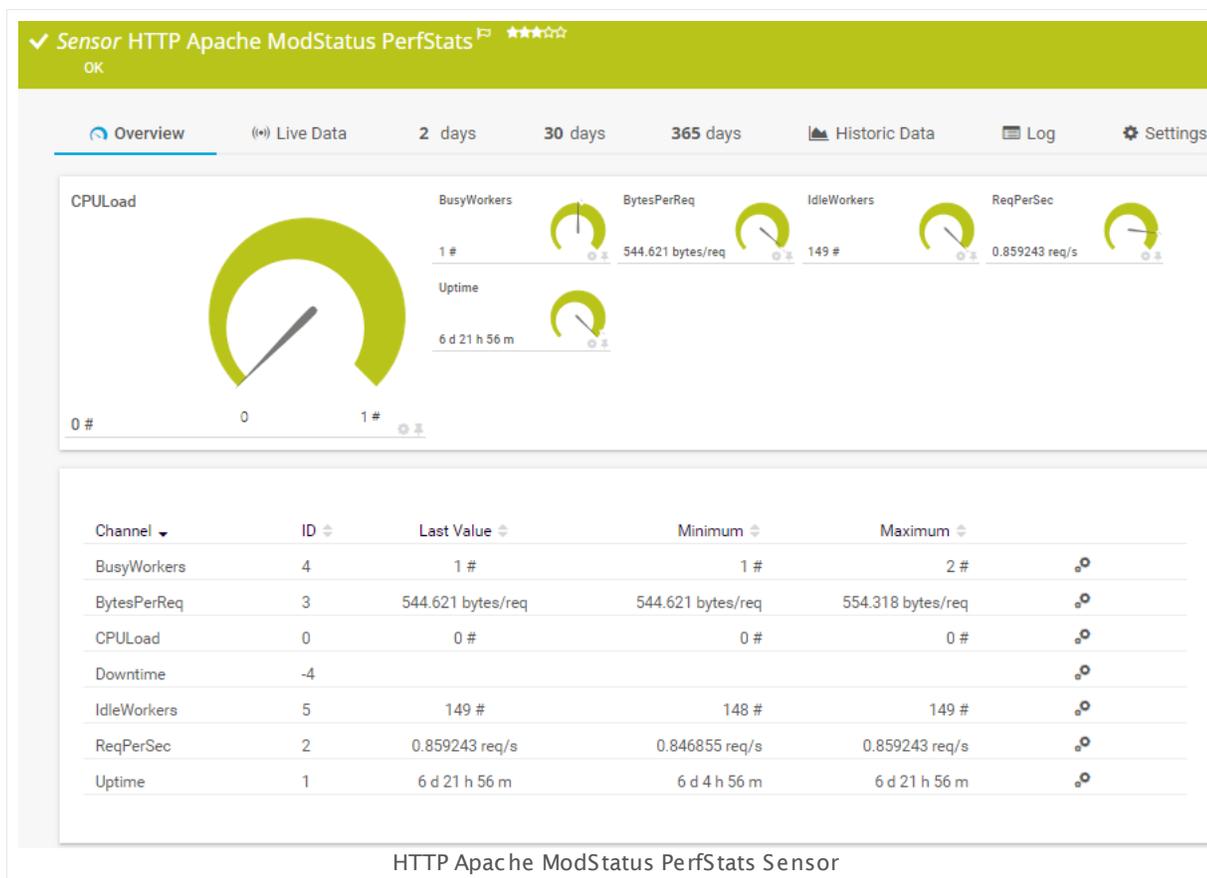

7.8.51 HTTP Apache ModStatus PerfStats Sensor

The HTTP Apache ModStatus PerfStats sensor monitors performance statistics of an Apache web server using `mod_status` over Hypertext Transfer Protocol (HTTP).

It can show the following about the Apache at scan time:

- CPU load
- Server uptime
- Requests per second
- Bytes per request
- Number of current busy worker threads
- Number of idle worker threads

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: HTTP Apache ModStatus PerfStats, French: HTTP Apache ModStatus PerfStats, German: HTTP Apache ModStatus PerfStats, Japanese: HTTP Apache ModStatus 性能統計,

Portuguese: **HTTP Apache ModStatus PerfStats**, Russian: **HTTP Apache ModStatus — стат. произв-сти**, Simplified Chinese: HTTP Apache ModStatus PerfStats, Spanish: **ModStatus PerfStats de HTTP Apache**

Remarks

- Supports [Smart URL Replacement](#)^[990].
- Knowledge Base: [Which HTTP status code leads to which HTTP sensor status?](#)
- This sensor type does not support Secure Remote Password (SRP) ciphers.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags ^[139] , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited ^[140] from objects further up in the device tree. These are visible above as Parent Tags .

BASIC SENSOR SETTINGS

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP SPECIFIC

Timeout (Sec.) Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is **900** seconds (15 minutes).

URL Enter the URL to the **mod_status** module on your Apache server. PRTG will append a **/server_status?auto** part automatically. If you enter an absolute URL, this address will be independent from the **IP Address/DNS Name** setting of the device this sensor is created on.

i PRTG uses a smart URL replacement that allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section **Smart URL Replacement** below.

i This sensor type implicitly supports Server Name Identification (SNI), an extension to the TLS protocol.

AUTHENTICATION

Authentication Define if the web page at the configured URL needs authentication. Choose between:

- **No authentication needed**
- **Web page needs authentication**

User This field is only visible if you enable authentication above. Enter a username. Please enter a string.

AUTHENTICATION

- Password** This field is only visible if you enable authentication above. Enter a password. Please enter a string.
- Authentication Method** This field is only visible if enable authentication above. Select the authentication method the given URL is protected with. Choose between:
- **Basic access authentication (HTTP):** Use simple HTTP authentication. This is the default setting and suitable for most cases.
 This authentication method transmits credentials as plain text.
 - **Windows NT LAN Manager (NTLM):** Use the Microsoft NTLM protocol for authentication. This is sometimes used in intranets for single sign-on.
 - **Digest Access Authentication:** Use digest access authentication that applies a hash function to the password, which is safer than basic access authentication.
- We recommend that you use the default value.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#) settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

HTTP Proxy Settings The proxy settings determine how a sensor connects to a given URL. You can enter data for an HTTP proxy server that sensors will use when connecting via HTTP or HTTPS.

-  This setting affects monitoring only and determines the behavior of HTTP sensors. To change proxy settings for the core server, see [System Administration—Core & Probes](#)^[338].
-  The [SSL Certificate Sensor](#)^[2635] and the [SSL Security Check Sensor](#)^[2646] do not support HTTP proxies, but you can configure connections via SOCKS proxies in their sensor settings.

Name Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.

Port Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.

User If the proxy requires authentication, enter the username for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

Password If the proxy requires authentication, enter the password for the proxy login.

PROXY SETTINGS FOR HTTP SENSORS

 Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings.</p> <ul style="list-style-type: none"> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> <p>▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.</p> <p>▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.</p> <ul style="list-style-type: none"> <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either [http://](#) or [https://](#) or even a simple slash [/](#) as equivalent for [http://](#)). PRTG will fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically.

Whether this results in a valid URL or not depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** `www.example.com` and you add an HTTP sensor to it, you can provide values the following ways:

- Providing the value `https:///` in the URL field, PRTG will automatically create the URL `https://www.example.com/`
- Using the value `/help` in the URL field, PRTG will automatically create and monitor the URL `http://www.example.com/help`
- It is also possible to provide a port number in the URL field, which will be taken over by the device's DNS name and internally added, for example, `http://:8080/`

 Smart URL replacement does not work for sensors running on the **Probe Device**.

- <https://kb.paessler.com/en/topic/65731>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

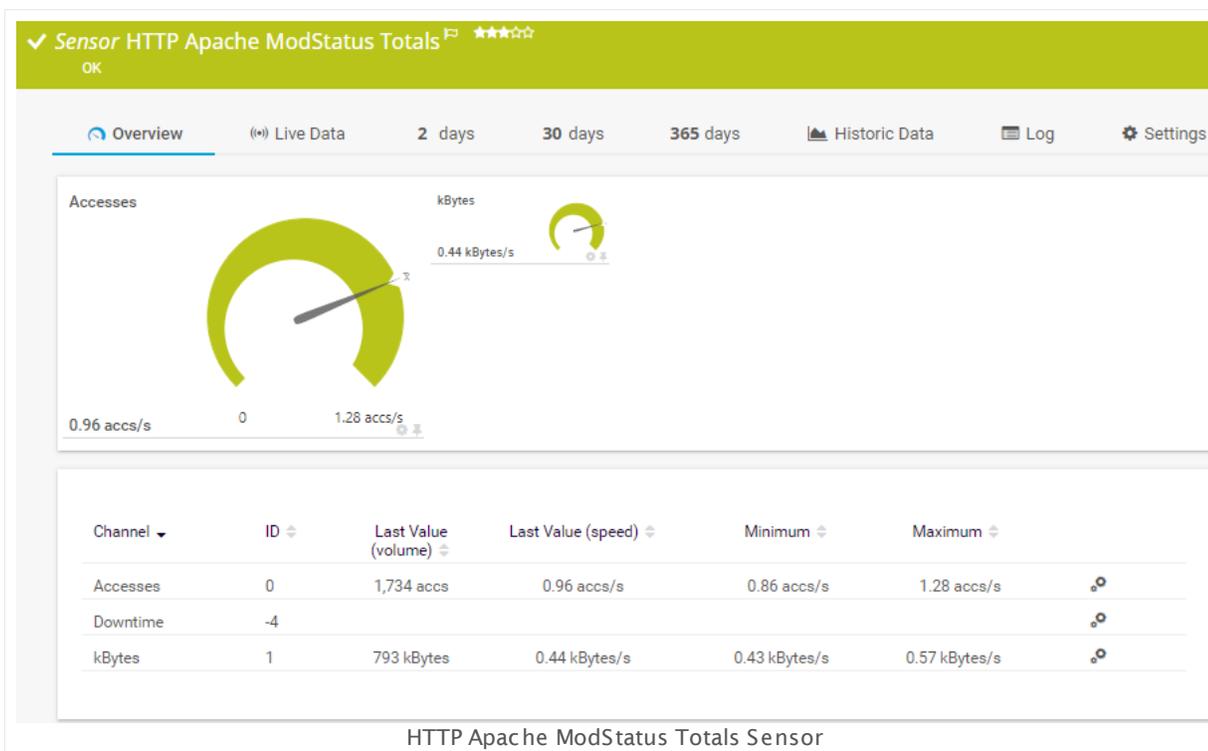

7.8.52 HTTP Apache ModStatus Totals Sensor

The HTTP Apache ModStatus Totals sensor monitors the activity of an Apache web server using `mod_status` over Hypertext Transfer Protocol (HTTP).

It can show the following:

- Number of accesses
- Transferred data in kilobytes per second

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **HTTP Apache ModStatus Totalen**, French: **Totaux HTTP Apache ModStatus**, German: **HTTP Apache ModStatus Totals**, Japanese: **HTTP Apache ModStatus 合計**, Portuguese: **HTTP Apache ModStatus totais**, Russian: **HTTP Apache ModStatus — итоги**, Simplified Chinese: **HTTP Apache ModStatus ? ?**, Spanish: **ModStat us total de HTTP Apache**

Remarks

- Supports [Smart URL Replacement](#) ¹⁰⁰⁰.
- Knowledge Base: [Which HTTP status code leads to which HTTP sensor status?](#)
- This sensor type does not support Secure Remote Password (SRP) ciphers.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
URL	<p>Enter the URL to the mod_status module on your Apache server. PRTG will append a /server_status?auto part automatically. If you enter an absolute URL, this address will be independent from the IP Address/DNS Name setting of the device this sensor is created on.</p> <p> PRTG uses a smart URL replacement that allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section Smart URL Replacement below.</p>

-  This sensor type implicitly supports Server Name Identification (SNI), an extension to the TLS protocol.

AUTHENTICATION

Authentication	<p>Define if the web page at the configured URL needs authentication. Choose between:</p> <ul style="list-style-type: none"> ▪ No authentication needed ▪ Web page needs authentication
User	This field is only visible if you enable authentication above. Enter a username. Please enter a string.
Password	This field is only visible if you enable authentication above. Enter a password. Please enter a string.
Authentication Method	<p>This field is only visible if enable authentication above. Select the authentication method the given URL is protected with. Choose between:</p> <ul style="list-style-type: none"> ▪ Basic access authentication (HTTP): Use simple HTTP authentication. This is the default setting and suitable for most cases. ▪  This authentication method transmits credentials as plain text.

AUTHENTICATION

- **Windows NT LAN Manager (NTLM):** Use the Microsoft NTLM protocol for authentication. This is sometimes used in intranets for single sign-on.
- **Digest Access Authentication:** Use digest access authentication that applies a hash function to the password, which is safer than basic access authentication.

We recommend that you use the default value.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

HTTP Proxy Settings The proxy settings determine how a sensor connects to a given URL. You can enter data for an HTTP proxy server that sensors will use when connecting via HTTP or HTTPS.

 This setting affects monitoring only and determines the behavior of HTTP sensors. To change proxy settings for the core server, see [System Administration—Core & Probes](#)^[3368].

 The [SSL Certificate Sensor](#)^[2635] and the [SSL Security Check Sensor](#)^[2646] do not support HTTP proxies, but you can configure connections via SOCKS proxies in their sensor settings.

Name Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.

Port Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.

User If the proxy requires authentication, enter the username for the proxy login.

 Only basic authentication is available! Please enter a string or leave the field empty.

Password If the proxy requires authentication, enter the password for the proxy login.

 Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)^[3355] on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either [http:///](#) or [https:///](#) or even a simple slash / as equivalent for [http:///](#)). PRTG will fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically.

Whether this results in a valid URL or not depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** [www.example.com](#) and you add an HTTP sensor to it, you can provide values the following ways:

- Providing the value [https:///](#) in the URL field, PRTG will automatically create the URL [https://www.example.com/](#)

- Using the value `/help` in the URL field, PRTG will automatically create and monitor the URL <http://www.example.com/help>
- It is also possible to provide a port number in the URL field, which will be taken over by the device's DNS name and internally added, for example, <http://:8080/>

 Smart URL replacement does not work for sensors running on the **Probe Device**.

More

Knowledge Base: Which HTTP status code leads to which HTTP sensor status?

- <https://kb.paessler.com/en/topic/65731>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

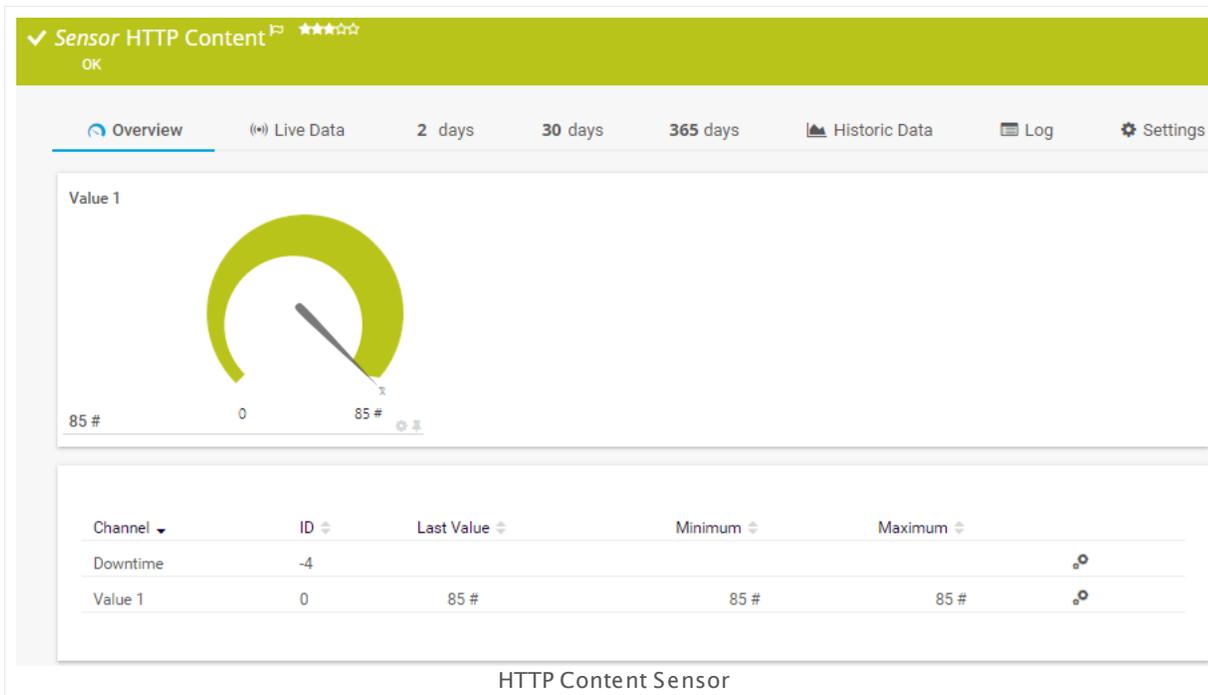

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.53 HTTP Content Sensor

The HTTP Content sensor monitors a numerical value returned by an Hypertext Transfer Protocol (HTTP) request. In the returned HTML page, each value must be placed between square brackets []. See the [example](#) below.

- It shows the returned numbers in dedicated channels, one channel for each value.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **HTTP (Inhoud)**, French: **HTTP (contenu)**, German: **HTTP (Inhalt)**, Japanese: **HTTP コンテンツ**, Portuguese: **Conteúdo HTTP**, Russian: **HTTP: Содержимое**, Simplified Chinese: **HTTP ? ?**, Spanish: **HTTP Contenido**

Remarks

- This sensor [does not support more than 50 channels](#) officially.
- Supports [Smart URL Replacement](#).
- Knowledge Base: [How can I monitor internal values of a web application with PRTG?](#)
- See also the PRTG manual: [HTTP Content Sensor—Example](#)
- Knowledge Base: [Which HTTP status code leads to which HTTP sensor status?](#)
- This sensor type does not support Secure Remote Password (SRP) ciphers.

Limited to 50 Sensor Channels

 PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

HTTP SPECIFIC

Value Type	<p>Define what kind of values your HTML file gives back. Choose between:</p> <ul style="list-style-type: none"> ▪ Integer: An integer is expected as return value. ▪ Float: A float is expected as return value, with a dot <code>.</code> between pre-decimal position and decimal places. In this setting, the sensor will also display integer values unless they don't produce a buffer overflow. <p> The sensor cannot handle string values.</p>
Number of Channels	<p>Define how many values your HTML file gives back. The sensor handles each value in its own sensor channel^[136]. Each value must be placed between square brackets <code>[]</code>. Enter the number of bracket-value pairs that the defined URL will return. Please enter an integer value.</p> <p> Do not enter a number less than the number of values returned. Otherwise you will get an error message.</p>

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Script URL	<p>Enter the URL the sensor connects to. It has to be URL encoded! If you enter an absolute URL, this address will be independent from the IP Address/DNS Name setting of the device this sensor is created on.</p> <p>i PRTG uses a smart URL replacement that allows you to use the parent device's IP Address/DNS Name setting as part of the URL. For more information, see section Smart URL Replacement below.</p>

HTTP SPECIFIC

Value Type	Shows the kind of values that the HTML file returns. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
------------	---

-  This sensor type implicitly supports Server Name Identification (SNI), an extension to the TLS protocol.

ADVANCED SENSOR DATA

Content Changes Define what the sensor will do if the content of the monitored web page changes. Choose between:

- **Ignore changes:** No action will be taken on change.
- **Trigger 'change' notification:** The sensor will send an internal message indicating that the web page content has changed. In combination with a **Change Trigger**, you can use this mechanism to [trigger a notification](#)³¹⁷⁰ whenever the web page content changes.

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

AUTHENTICATION

Authentication	<p>Define if the web page at the configured URL needs authentication. Choose between:</p> <ul style="list-style-type: none">▪ No authentication needed▪ Web page needs authentication
User	<p>This field is only visible if you enable authentication above. Enter a username. Please enter a string.</p>
Password	<p>This field is only visible if you enable authentication above. Enter a password. Please enter a string.</p>
Authentication Method	<p>This field is only visible if enable authentication above. Select the authentication method the given URL is protected with. Choose between:</p> <ul style="list-style-type: none">▪ Basic access authentication (HTTP): Use simple HTTP authentication. This is the default setting and suitable for most cases.  This authentication method transmits credentials as plain text.▪ Windows NT LAN Manager (NTLM): Use the Microsoft NTLM protocol for authentication. This is sometimes used in intranets for single sign-on.▪ Digest Access Authentication: Use digest access authentication that applies a hash function to the password, which is safer than basic access authentication. <p>We recommend that you use the default value.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none">▪ Show channels independently (default): Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

i This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷¹ group's settings, see section [Inheritance of Settings](#)¹³⁷¹ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷¹ for more information.

HTTP Proxy Settings

The proxy settings determine how a sensor connects to a given URL. You can enter data for an HTTP proxy server that sensors will use when connecting via HTTP or HTTPS.

i This setting affects monitoring only and determines the behavior of HTTP sensors. To change proxy settings for the core server, see [System Administration—Core & Probes](#)³³⁶⁸.

i The [SSL Certificate Sensor](#)²⁶³⁵ and the [SSL Security Check Sensor](#)²⁶⁴⁶ do not support HTTP proxies, but you can configure connections via SOCKS proxies in their sensor settings.

Name

Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.

Port

Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.

PROXY SETTINGS FOR HTTP SENSORS

User	<p>If the proxy requires authentication, enter the username for the proxy login.</p> <p> Only basic authentication is available! Please enter a string or leave the field empty.</p>
Password	<p>If the proxy requires authentication, enter the password for the proxy login.</p> <p> Only basic authentication is available! Please enter a string or leave the field empty.</p>

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration^[335] on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none"> ▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request. ▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests. ▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Example

- For example, consider a URL <http://www.example.com/status.html> that returns a PHP script with the current system status in a simple HTML page as follows:

```
<html>
<body>
  Description: Script gives back current status of disk free (%) and CPU usage (%).
  [85.5][12.0]
</body>
</html>
```

You would configure the HTTP Content sensor using

- the script **URL** from above,
- value type **Float**,
- and number of channels **2**.

The sensor calls the URL with every scanning interval and only regard the two values in square brackets `[]`, handling each of them in one sensor channel. The additional description text and HTML tags are not necessary. In this example they are added in case a human calls the URL.

i If you define the number of channels as **1**, the sensor will read only the first value. The second value will be ignored. Using **3** as number of channels will result in a sensor error message.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either <http://> or <https://> or even a simple slash `/` as equivalent for <http://>). PRTG will fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically.

Whether this results in a valid URL or not depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** www.example.com and you add an HTTP sensor to it, you can provide values the following ways:

- Providing the value <https://> in the URL field, PRTG will automatically create the URL <https://www.example.com/>
- Using the value [/help](http://www.example.com/help) in the URL field, PRTG will automatically create and monitor the URL <http://www.example.com/help>
- It is also possible to provide a port number in the URL field, which will be taken over by the device's DNS name and internally added, for example, <http://:8080/>

 Smart URL replacement does not work for sensors running on the **Probe Device**.

More

Knowledge Base: Which HTTP status code leads to which HTTP sensor status?

- <https://kb.paessler.com/en/topic/65731>

Knowledge Base: How can I monitor internal values of a web application with PRTG?

- <https://kb.paessler.com/en/topic/4>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

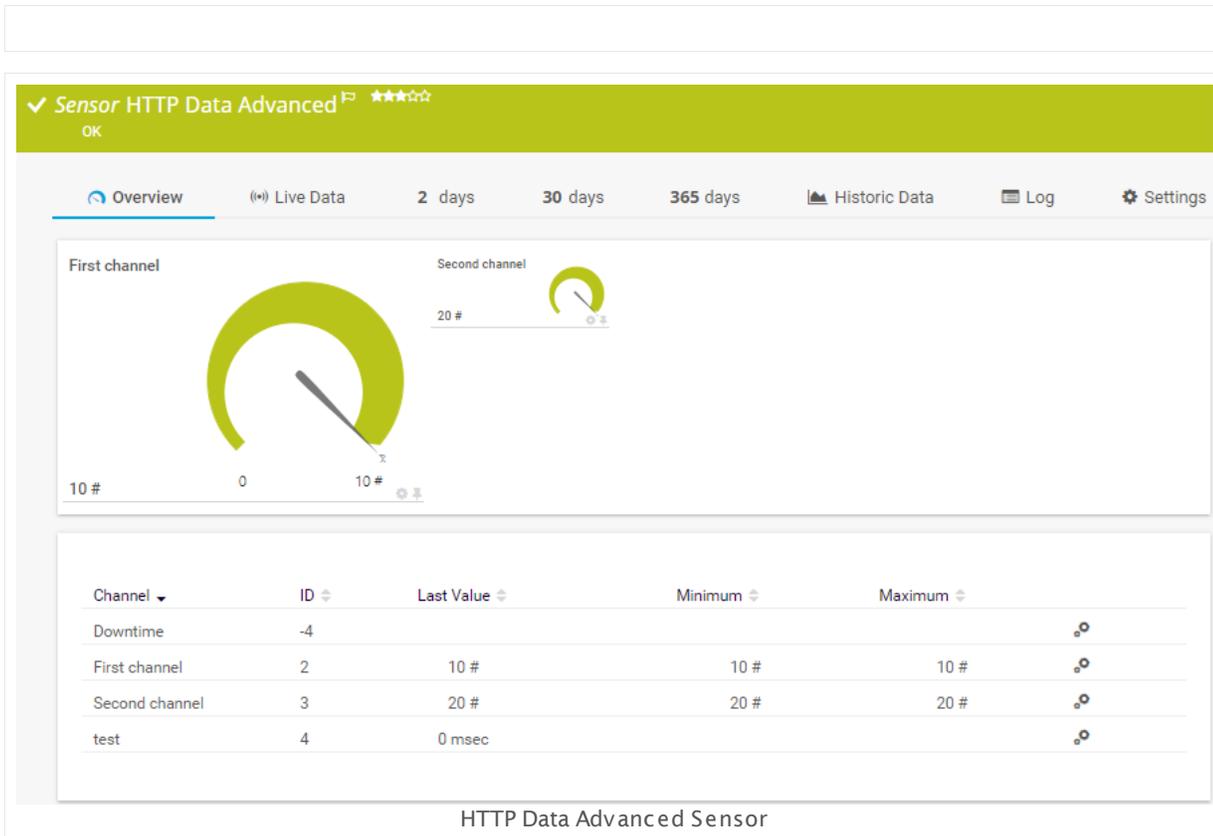

For more general information about settings, see the [Object Settings](#)²¹⁷¹ section.

7.8.54 HTTP Data Advanced Sensor

The HTTP Data Advanced sensor accesses a web server and retrieves XML or JSON encoded data.

- The sensor can show values returned by the web server in multiple channels.

For details about the return value format, see section [Custom Sensors](#)³⁶⁴¹.

Sensor in Other Languages

Dutch: **HTTP Data Geavanceerd**, French: **Données avancées HTTP**, German: **HTTP Daten (Erweitert)**, Japanese: **HTTP データアドバンスド**, Portuguese: **Dados HTTP Avançado**, Russian: **HTTP: Данные (Расширенный)**, Simplified Chinese: **HTTP ? ? ? ?**, Spanish: **Datos HTTP avanzados**

Remarks

- The requested web server must return XML or JSON encoded data that matches the format as defined in manual section [Custom Sensors](#)³⁶⁴¹.
- For best sensor performance, we recommend you specify the content type on the target server, which is `application/xml` or `application/json`.
- Knowledge Base: [Which HTTP status code leads to which HTTP sensor status?](#)
- This sensor type does not support Secure Remote Password (SRP) ciphers.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP SPECIFIC

Timeout (Sec.) Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is **900** seconds (15 minutes).

URL Enter the URL the sensor connects to. It has to be **URL encoded!**

If you enter an absolute URL, the sensor uses this address independently from the **IP Address/DNS Name** setting of the device on which you create this sensor. You can enter an URL leading to a webpage (to measure the page source code's loading time), or enter the URL of an image or of another page asset to measure this element's availability and loading time.

 PRTG uses a smart URL replacement that allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section **Smart URL Replacement** below.

Request Method Choose an HTTP request method to determine how the sensor will request the given URL.

- **GET:** Request the website directly, like browsing the web. We recommend using this setting for a simple check of a web page.
- **POST:** Send post form data to the URL. If this setting is chosen, you must enter the data that will be sent in the **Postdata** field below.
- **HEAD:** Only request the HTTP header from the server without the actual web page. Although this saves bandwidth since less data is transferred, it is not recommended because the measured request time is not the one experienced by your users and you might not be notified for slow results or timeouts.

Postdata This field is only visible when you select the **POST Request Method** setting above. Enter the data part for the POST request here.

 No XML is allowed here!

Content Type This setting is only visible when you select the **POST Request Method** setting above. Define the content type of a POST request. Choose between:

- **Default (application/x-www-form-urlencoded):** This is the default content type used to encode the form data set for submission to the server.
- **Custom:** If you need another content type than default, enter this content type below.

HTTP SPECIFIC

- Custom Content Type** This field is only visible when you select **Custom** above. Define the content type that is needed, for example, XML, JSON, HTTP.
- Server Name Indication** Shows the Server Name Identification (SNI) that the sensor automatically determined from the host address of the [parent device](#)^[402] or the target URL of the sensor. SNI has to be a **Fully Qualified Domain Name (FQDN)**. Please ensure it matches the configuration of the target server.
-  For details, see the Knowledge Base article [My HTTP sensors fail to monitor websites which use SNI. What can I do?](#)
- SNI Inheritance** Define if you want to inherit the Server Name Identification (SNI) from the parent device. See the **Server Name Indication** setting above which SNI is determined. Choose between:
- **Inherit SNI from parent device:** The sensor determines the SNI from the host address of the parent device.
 - **Do not inherit SNI from parent device:** The sensor determines the SNI from the target **URL** as defined in the settings of this sensor.

- Result Handling** Define what the sensor will do with the data loaded at the given URL. Choose between:
- **Discard HTML result:** Do not store the requested data.
 - **Store latest HTML result:** Store the last result of the requested data to the **Logs (Sensors)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File name: **Result of Sensor [ID].txt**. This is for debugging purposes, especially in combination with content checks. The file will be overridden with each scanning interval.
-  For information on how to find the folder used for storage, see section [Data Storage](#)^[3734].
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

ADVANCED SENSOR DATA

Protocol Version	<p>Define the HTTP protocol version that the sensor will use when connecting to the target URL. Choose between:</p> <ul style="list-style-type: none">▪ HTTP 1.0▪ HTTP 1.1: This is the default setting.
User Agent	<p>Choose which user agent string the sensor will send when connecting to the target URL. Choose between:</p> <ul style="list-style-type: none">▪ Use PRTG's default string: Do not enter a specific user agent, use the default setting. Usually, this is: Mozilla/5.0 (compatible; PRTG Network Monitor (www.paessler.com); Windows)▪ Use a custom string: Use a custom user agent. Define below.
Custom User Agent	<p>This field is only visible if you enable custom user agent above. Enter a string to be used as user agent when connecting to the URL specified above.</p>
Use Custom HTTP Headers	<p>Define if you want to send custom HTTP headers to the target URL. Choose between:</p> <ul style="list-style-type: none">▪ Do not use custom HTTP headers▪ Use custom HTTP headers
Custom HTTP Headers	<p>This field is only available if you select using custom headers above. Enter a list of custom HTTP headers with their respective values that you want to transmit to the URL you define above, each pair in one line. The syntax of a header-value pair is header1:value1</p> <p> The sensor does not support the header field names user-agent, content-length, host.</p> <p> Ensure the HTTP header statement is valid! Otherwise, the sensor request will not be successful.</p>

AUTHENTICATION

Authentication	<p>Define if the web page at the configured URL needs authentication. Choose between:</p> <ul style="list-style-type: none">▪ No authentication needed▪ Web page needs authentication
----------------	--

AUTHENTICATION

- User** This field is only visible if you enable authentication above. Enter a username. Please enter a string.
- Password** This field is only visible if you enable authentication above. Enter a password. Please enter a string.
- Authentication Method** This field is only visible if enable authentication above. Select the authentication method the given URL is protected with. Choose between:
- **Basic access authentication (HTTP):** Use simple HTTP authentication. This is the default setting and suitable for most cases.
 This authentication method transmits credentials as plain text.
 - **Windows NT LAN Manager (NTLM):** Use the Microsoft NTLM protocol for authentication. This is sometimes used in intranets for single sign-on.
 - **Digest Access Authentication:** Use digest access authentication that applies a hash function to the password, which is safer than basic access authentication.
- We recommend that you use the default value.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷¹ group's settings, see section [Inheritance of Settings](#)¹³⁷¹ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷¹ for more information.

HTTP Proxy Settings

The proxy settings determine how a sensor connects to a given URL. You can enter data for an HTTP proxy server that sensors will use when connecting via HTTP or HTTPS.

- ⓘ This setting affects monitoring only and determines the behavior of HTTP sensors. To change proxy settings for the core server, see [System Administration—Core & Probes](#)³³⁶⁸.
- ⓘ The [SSL Certificate Sensor](#)²⁶³⁵ and the [SSL Security Check Sensor](#)²⁶⁴⁶ do not support HTTP proxies, but you can configure connections via SOCKS proxies in their sensor settings.

Name

Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.

Port

Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.

PROXY SETTINGS FOR HTTP SENSORS

User	<p>If the proxy requires authentication, enter the username for the proxy login.</p> <p> Only basic authentication is available! Please enter a string or leave the field empty.</p>
Password	<p>If the proxy requires authentication, enter the password for the proxy login.</p> <p> Only basic authentication is available! Please enter a string or leave the field empty.</p>

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration^[335] on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none"> ▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request. ▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests. ▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either [http:///](#) or [https:///](#) or even a simple slash / as equivalent for [http:///](#)). PRTG will fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically.

Whether this results in a valid URL or not depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** [www.example.com](#) and you add an HTTP sensor to it, you can provide values the following ways:

- Providing the value [https:///](#) in the URL field, PRTG will automatically create the URL [https://www.example.com/](#)
- Using the value [/help](#) in the URL field, PRTG will automatically create and monitor the URL [http://www.example.com/help](#)
- It is also possible to provide a port number in the URL field, which will be taken over by the device's DNS name and internally added, for example, [http://:8080/](#)

 Smart URL replacement does not work for sensors running on the **Probe Device**.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

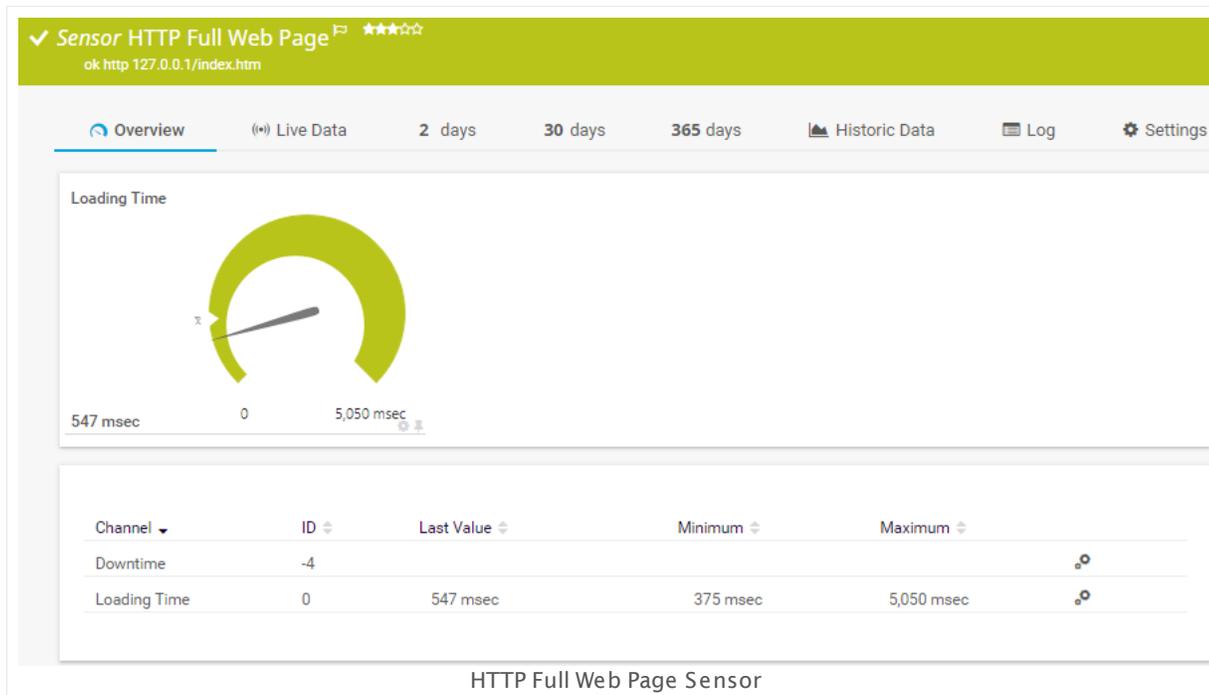

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.55 HTTP Full Web Page Sensor

The HTTP Full Web Page sensor monitors the full download time of a web page including assets such as images. In the background, it opens the web page in a browser instance to perform the measurement. Links are not followed.

- This sensor shows the loading time of the full web page.

⚠ Be careful with this sensor, because it can generate considerable internet traffic if you use it with a low scanning interval!

Sensor in Other Languages

Dutch: **HTTP Volledige Webpagina**, French: **HTTP (page Web complète)**, German: **HTTP (Komplette Webseite)**, Japanese: **HTTP 完全 Web ページ監視**, Portuguese: **HTTP Página Completa**, Russian: **HTTP: Полное время загрузки веб-страницы**, Simplified Chinese: **HTTP ? ? ? ?**, Spanish: **HTTP Página Web Completa**

Remarks

- Supports [Smart URL Replacement](#)
- Knowledge Base: [What to do when I see a CreateUniqueTempDir\(\) error message for my HTTP Full Webpage Sensor?](#)
- Knowledge Base: [HTTP Full Web Page sensor is unable to navigate. What can I do?](#)
- Knowledge Base: [How can I change the size of PhantomJS full web page screenshots?](#)
- Knowledge Base: [Which HTTP status code leads to which HTTP sensor status?](#)
- This sensor type does not support Secure Remote Password (SRP) ciphers.

- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. These are visible above as **Parent Tags**.

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

FULL PAGE DOWNLOAD SETTINGS

Timeout (Sec.) Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is **900** seconds (15 minutes).

URL Enter the address of the web page that the sensor loads. It has to be **URL encoded!** If you enter an absolute URL, this address will be independent from the **IP Address/DNS Name** setting of the device this sensor is created on.

PRTG uses a smart URL replacement that allows you to use the parent device's **IP Address/DNS Name** setting as part of the URL. For more information, please see section **Smart URL Replacement** below.

Browser Engine Define which browser the sensor uses to load the web page. Choose between:

- **Chromium (recommended):** Use the "WebKit" engine that is delivered with PRTG to perform the loading test. With each scanning interval, PRTG will load the URL defined above in an instance of "Chromium" and measure the time until the page is fully loaded. This is the recommended setting.
- **PhantomJS (Headless Webkit):** Use the "PhantomJS" engine. This engine can have a high impact on your probe system's CPU and memory load, but there are additional options for result handling available (see below).
- **Internet Explorer:** With each scanning interval, the URL defined above is loaded in the background in an instance of Internet Explorer. PRTG uses the Internet Explorer of the system running the PRTG probe.
 For full functionality we strongly recommend you to install Internet Explorer 11 or higher on the system running the PRTG probe. The probe machine is either the local system (on every node, if on a cluster probe), or the system running the [remote probe](#)³⁷⁰⁹ where the sensor is created.

FULL PAGE DOWNLOAD SETTINGS

 For all browser engines, the same proxy settings are used that are configured for the Windows user account that the PRTG probe is running on (this is usually the Windows local "system" user account, if not changed). These settings are accessible via the Internet Explorer of this system. If you want to use a proxy for this full web page sensor test, for example, please adjust the Internet Explorer's settings accordingly (on the computer running the probe; on all nodes, if in a cluster).

Security Context

Define the Windows user account that the sensor uses to run the browser engine. Choose between:

- **Use security context of probe service (default):** Run the browser engine under the same Windows user account the PRTG probe is running on. By default, this is the local Windows "system" user account (if not manually changed).

- **Use Windows credentials of parent device:** Use the Windows user account defined in the settings of the parent device this sensor is created on. Open the sensor's parent [device settings](#)  to change the Windows credentials.

 We recommended that you use this setting when using the Chromium browser engine.

Result Handling

This setting is only visible if you select the PhantomJS engine above. This browser engine can render and store screenshots of the loaded web page. Choose between:

- **Discard HTML result (recommended):** Do not store the requested web page.

- **Render and store a screenshot of most recent sensor result as JPG:** Render and store the last result of the web page to the **Logs (Sensors)** directory (on the remote system, when used on a remote probe; on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. It will be named using the pattern **Fullpage of Sensor (ID).jpg**.

 For information on how to find the folder used for storage, see section [Data Storage](#) .

FULL PAGE DOWNLOAD SETTINGS

- **Render and store screenshots of all sensor results as JPGs (requires lots of disk space):** Render and store one new screenshot of the web page with each sensor scan, and store the pictures in the **Screenshots (Fullpage Sensor)** directory (on the remote system, when used on a remote probe). This option can be used to create a visual history of the web page.

 For information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

 Depending on the monitored website and the scanning interval of the sensor, this option can create a very high amount of data! Use with care and make sure you set appropriate data purging limits in the [System Administration—Core & Probes](#)³³⁷³ settings.

 If necessary, you can change the window size of the rendered screenshots. For details, see the Knowledge Base article [How can I change the size of PhantomJS full web page screenshots?](#)

 Depending on the result handling method you choose, the sensor does not only store files in the screenshot directory, but there will also be files in an extra cache directory. If your disk on the probe system runs full, please also check this path (you might have to set folder options appropriately to see this directory):

`C:\Windows\System32\config\systemprofile\AppData\Local\Microsoft\Windows\Temporary Internet Files\Content.IE5`

Authentication

This setting is only visible if you select the **PhantomJS** engine above. Define if the monitored web page needs authentication for access. Choose between:

- **No authentication needed:** Access to the web page is granted without authentication.
- **Web page needs authentication:** PRTG automatically tries to use HTTP Basic authentication (BA) or Windows NT LAN Manager (NTLM) to access the web page with authentication. Enter the credentials below.

 Basic access authentication forwards the credentials in plain text!

User

This setting is only visible if you select the **PhantomJS** engine with authentication above. Enter the username for the web page.

Password

This setting is only visible if you select the **PhantomJS** engine with authentication above. Enter the password for the web page.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either [http:///](#) or [https:///](#) or even a simple slash / as equivalent for [http:///](#)). PRTG will fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically.

Whether this results in a valid URL or not depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** [www.example.com](#) and you add an HTTP sensor to it, you can provide values the following ways:

- Providing the value [https:///](#) in the URL field, PRTG will automatically create the URL [https://www.example.com/](#)

- Using the value `/help` in the URL field, PRTG will automatically create and monitor the URL <http://www.example.com/help>
- It is also possible to provide a port number in the URL field, which will be taken over by the device's DNS name and internally added, for example, <http://:8080/>

 Smart URL replacement does not work for sensors running on the **Probe Device**.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

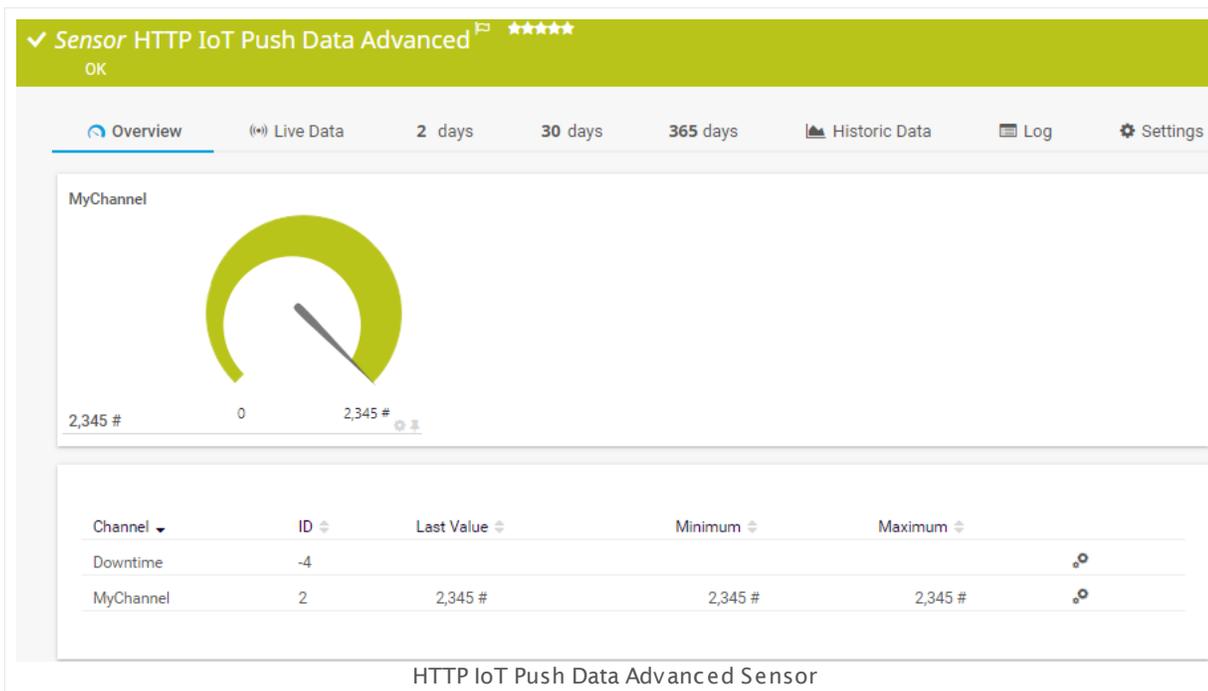

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.56 HTTP IoT Push Data Advanced

The HTTP IoT Push Data Advanced sensor displays data from messages received from IoT-capable devices (for example, Sigfox devices) that are pushed via a Hypertext Transfer Protocol Secure (HTTPS) request to PRTG. It provides a URL that you can use to push messages to the PRTG probe system via HTTPS (TLS 1.2 encrypted). This sensor type is especially useful when you want to push data to a PRTG hosted by Paessler instance.

- This sensor can show received values and a message encoded in valid XML or JSON in multiple channels.

For details about the return value format, see section [Custom Sensors](#).

Sensor in Other Languages

Dutch: **HTTP Push Data geavanceerd**, French: **Données avancées Push HTTP**, German: **HTTP Push-Daten (Erw.)**, Japanese: **HTTP プッシュデータ(アドバンスド)**, Portuguese: **Dados HTTP Avançado via Push**, Russian: **HTTP: Данные push-объекта (Расширенный)**, Simplified Chinese: **HTTP ? ? ? ? ? ? ?**, Spanish: **Datos Push de HTTP avanzandos**

Remarks

- For details about the usage, see manual section [HTTP IoT Push Data Advanced Sensor—How to Use](#).
- If you use this sensor with multiple channels, we recommend that you **simultaneously** push the data for **all** your channels to the PRTG server. You can push data to only one of your sensor channels, but in this case all other channels will record the value of **0** for this push message.

- This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
- This sensor type has a fixed port (5051). You cannot change it.
- This sensor type has a fixed SSL version (HTTPS (TLS 1.2 only)). You cannot change it.
- Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.
- For a general introduction to the technology behind push, please see the manual section [Monitoring via Push](#) ³⁶⁴⁰.

How to Use

This function is known as **webhook**. Basically, a webhook works like a **push notification**. Webhooks are usually triggered by some event (for example, a new comment to a blog post) and send according information to a specified URL. The HTTP IoT Push Data Advanced sensor then displays the data of pushed and received messages.

The data that is pushed to this sensor must be valid XML or JSON.

 For details about the return value format, see section [Custom Sensors](#) ³⁶⁴¹.

The **HTTP IoT Push Data Advanced Sensor** uses the following URLs depending on the type of HTTPS request.

- **GET requests:** `https://<probe_ip>:5051/<token>?content=<valid XML_or_JSON>`

The XML encoded value of the content parameter has to match the format as defined in section [Custom Sensors](#) ³⁶⁴¹.

- **POST requests:** `https://<probe_ip>:5051/<token>`

This HTTPS request method sends the XML or JSON encoded HTTPS body as POST data. The body has to match the format as defined in section [Custom Sensors](#) ³⁶⁴¹. We strongly recommend the HTTPS content type `application/xml` or `application/json`.

Replace the parameters `<probe_ip>`, `<token>`, and `<valid XML_or_JSON>` (for GET requests) with the corresponding values:

- For PRTG on premises, the **probe IP** is the IP address of the system on which your PRTG probe with this sensor is running. For PRTG hosted by Paessler instances, the **probe IP** is the DNS name of the instance.
- The **port number** is always `5051`. You cannot change this.
- You can define **identification token** in the sensor settings.
- The content of GET requests has to be valid XML or JSON in the PRTG API format.
 -  The content has to be URL encoded (for example, the whitespaces in the sample URL below); most browsers achieve this automatically.

Minimum example for the GET method that returns one static channel value:

```
https://127.0.0.1:5051/XYZ123?content=<prtg><result><channel>MyChannel</channel><value>10</value></result>
```

! By default, values within the `<value>` tags in the returned XML or JSON must be **integers** to be processed. If **float** values are returned, you have to explicitly define this value type as defined in section [Custom Sensors](#) with `<float>` tags, otherwise the sensor will show **0** values in affected channels. Example:

```
https://127.0.0.1:5051/XYZ123?content=<prtg><result><channel>MyChannel</channel><value>10.45</value><float>
```

i You can use several sensors with the same port and identification token. In this case, the data of push messages will be shown in each of these sensors.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags .

BASIC SENSOR SETTINGS

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSL SETTINGS

SSL Settings The security of the incoming HTTPS push requests.

- **HTTPS (TLS 1.2 only):** Send push messages to the PRTG probe system via secure HTTPS. The sensor only supports TLS 1.2 connections.

This setting is shown for your information only and cannot be changed.

SSL Port The number of the port on which this sensor listens for incoming HTTPS requests. This is always **5051**.

This setting is shown for your information only and cannot be changed.

HTTP PUSH AUTHENTICATION

Identification Token This is the token that is used to find the matching sensor for the incoming message. When you create the sensor, this token is `{__guid__}`.

This token will be replaced with an automatically generated token after you have completed the sensor creation. If you want to use another identification token, you can edit it while or after sensor creation.

 The token will not be replaced automatically if you change it already during sensor creation.

HTTP PUSH DATA

No Incoming Data

Define which [status](#)¹⁹⁵ the sensor will show if it has not received a push message for at least two sensor scans. Choose between:

- **Ignore and keep last status (default):** The sensor remains in the status as defined by the last message that the sensor received.
 The probe on which this sensor runs must be connected to keep the last status. If the probe is disconnected, the sensor will show the **Unknown** status. If the probe is connected again, the sensor does not automatically return from **Unknown** to the last status before the probe disconnect.
- **Switch to "Unknown" status:** The sensor will show an **Unknown** status if it has not received any message for at least two sensor scans.
- **Switch to "Error" after x minutes:** The sensor will show a **Down** status if it has not received any message within a defined time span. Define the time threshold below.

Time Threshold (Minutes)

This field is only visible if you select the error option above. Enter a time threshold in minutes. If this time elapses, the sensor will show a **Down** status if it has not received a push message within this time span.

Please enter an integer value. The maximum threshold is **1440** minutes.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷¹ group's settings, see section [Inheritance of Settings](#)¹³⁷¹ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷¹ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

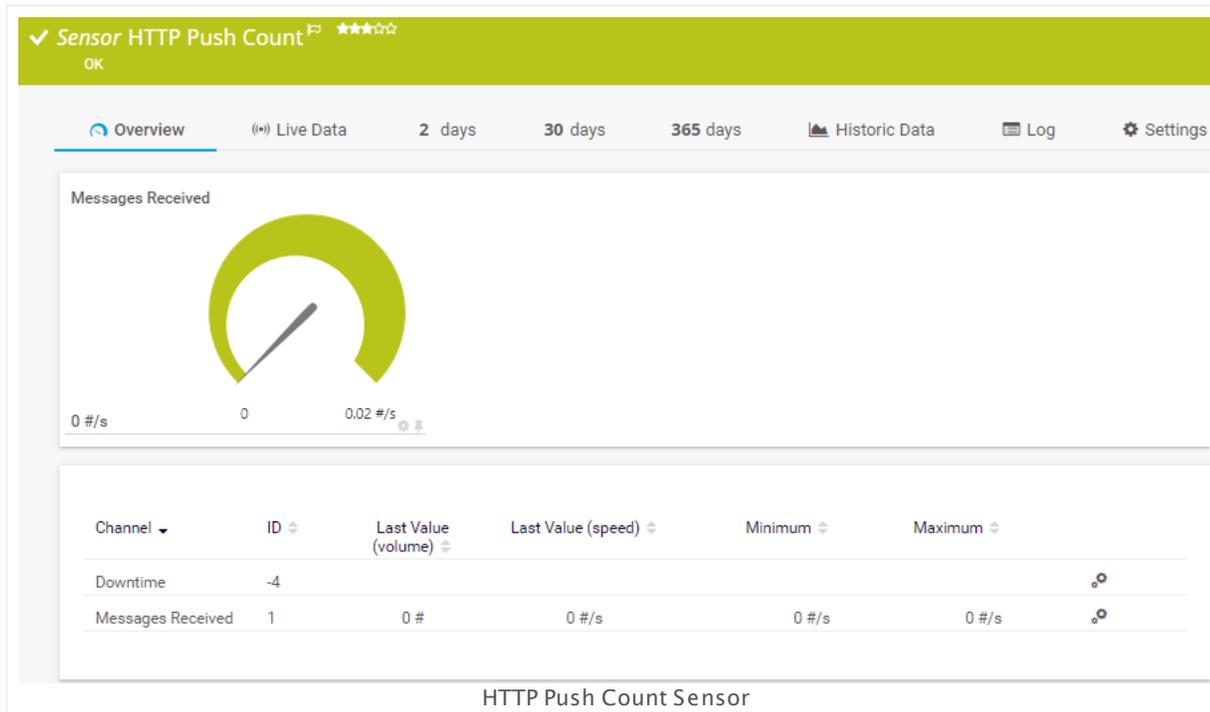

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.57 HTTP Push Count Sensor

The HTTP Push Count sensor counts received messages that are pushed via a Hypertext Transfer Protocol (HTTP) request to PRTG. It provides a URL that you can use to push messages to the PRTG probe system via HTTP (insecure or TLS 1.2 encrypted).

- It shows the number of received messages per second.

Sensor in Other Languages

Dutch: **HTTP Push Aantal**, French: **Nombre de Push HTTP**, German: **HTTP Push-Anzahl**, Japanese: **HTTP プッシュ数**, Portuguese: **Contagem de push HTTP**, Russian: **HTTP: Количество push-объектов**, Simplified Chinese: **Http ? ? ?**, Spanish: **Recuento Push de HTTP**

Remarks

- For details about the usage, see manual section [HTTP Push Count Sensor—How to Use](#) ¹⁰⁵⁰.
 - This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
 - For a general introduction to the technology behind push, please see the manual section [Monitoring via Push](#) ³⁵⁴⁸.
- ☁ You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

How to Use

This function is known as **webhook**. Basically, a webhook works like a **push notification**. Webhooks are usually triggered by some event (for example, a new comment to a blog post) and send according information to a specified URL. The HTTP Push Count sensor then displays the number of pushed and received messages.

The **HTTP Push Count Sensor** uses the following URL:

```
http://<probe_ip>:<port_number>/<token>
```

Replace the parameters **<probe_ip>**, **<port_number>**, and **<token>** with the corresponding values.

- The **<probe_ip>** is the IP address of the system where the PRTG probe with the sensor is running.
- The **<port_number>** is where the sensor listens for incoming HTTP calls.
- The **<token>** is used to define the matching sensor.

Example:

```
http://192.0.2.0:5050/XYZ123
```

 You can use several sensors with the same port and identification token. In this case, the number of push messages will be shown in each of these sensors.

Add Sensor

The **Add Sensor** dialog appears when you **manually**  add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

HTTP PUSH

SSL Settings

Define the security of the incoming HTTP push requests. Choose between:

- **HTTP (unsafe):** Send push messages to the PRTG probe system via insecure HTTP.

HTTP PUSH

- **HTTPS (TLS 1.2 only):** Send push messages to the PRTG probe system via secure HTTPS. The sensor only supports TLS 1.2 connections. It will use the SSL certificate that is delivered with PRTG or [your own trusted SSL certificate](#) that you have imported for the PRTG web server.

Port	This field is only visible if you choose HTTP above. Enter the number of the port on which this sensor listens for incoming HTTP requests. Default is 5050 .
SSL Port	This field is only visible if you choose HTTPS above. Enter the number of the port on which this sensor listens for incoming HTTPS requests. Default is 5051 .

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags .

BASIC SENSOR SETTINGS

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP PUSH

SSL Settings Shows whether the sensor accepts push messages via HTTP or HTTPS.

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Port This field is only visible for sensors that accept push messages via HTTP. It shows the port number on which this sensor listens for incoming HTTP requests.

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SSL Port This field is only visible for sensors that accept push messages via HTTPS. It shows the port number on which this sensor listens for incoming HTTPS requests.

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Request Method Select the request method of your webhook:

- **ANY:** Do not use any filter for the request method.
- **GET:** Choose this method if your webhook uses GET.
- **POST:** Choose this method if your webhook sends post form data. Postdata has to be `application/x-www-form-urlencoded` with the same parameters as for GET requests.

HTTP PUSH

- Identification Token** This is the token that is used to find the matching sensor for the incoming message. When you create the sensor, this token is `{_guid_}`.
- This token will be replaced with an automatically generated token after you have completed the sensor creation. If you want to use another identification token, you can edit it while or after sensor creation.
-  The token will not be replaced automatically if you change it already during sensor creation.
- Incoming Request** Define what PRTG will do with the incoming messages. Choose between:
- **Discard request:** Do not store the pushed messages.
 - **Write request to disk (Filename: "Request for Sensor [ID].txt"):** Store the last message received from the sensor to the **Logs (Sensor)** directory (on the Master node, if in a cluster). File name: `Request for Sensor [ID].txt`. This is for debugging purposes. The file will be overridden with each scanning interval.
 -  For information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)^[335] on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies <small>3209</small> in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

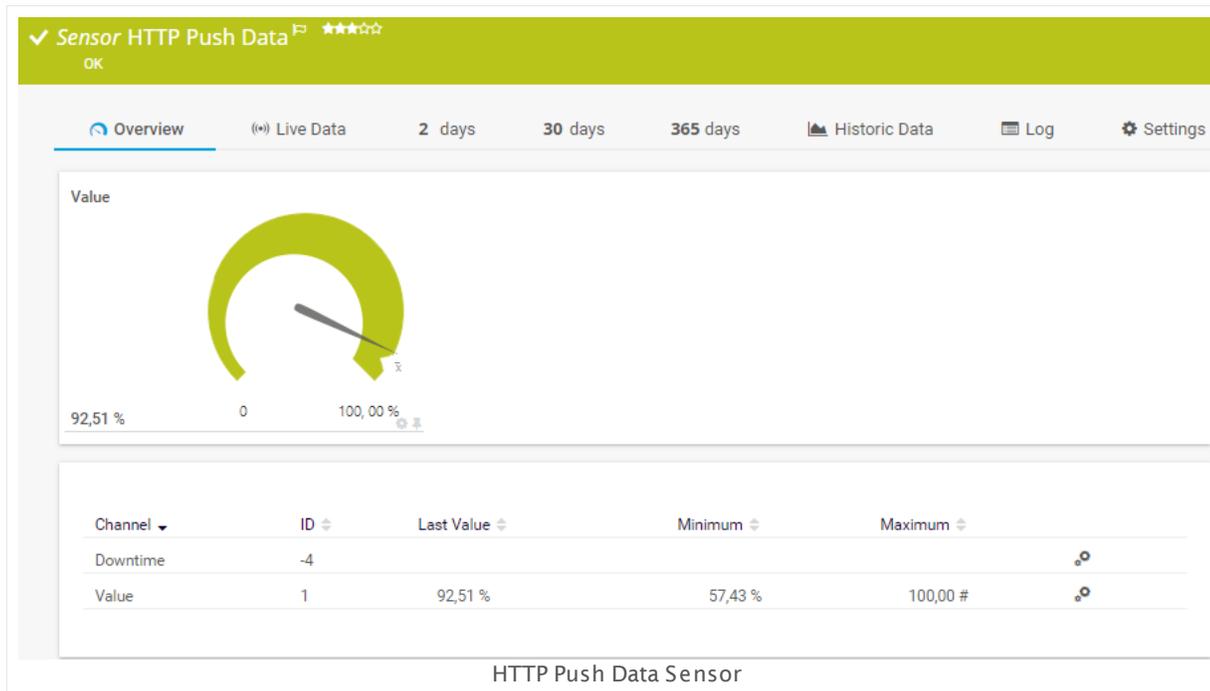

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.58 HTTP Push Data Sensor

The HTTP Push Data sensor displays numerical values from received messages that are pushed via a Hypertext Transfer Protocol (HTTP) request to PRTG. It provides a URL that you can use to push messages to the PRTG probe system via HTTP (insecure or TLS 1.2 encrypted).

- The sensor shows the received value and an optional message in one channel.

Sensor in Other Languages

Dutch: **HTTP Push Data**, French: **Données Push HTTP**, German: **HTTP Push-Daten**, Japanese: **HTTP プッシュデータ**, Portuguese: **Dados HTTP via Push**, Russian: **HTTP: Данные push-объекта**, Simplified Chinese: **HTTP ? ? ? ?**, Spanish: **Datos Push de HTTP**

Remarks

- For details about the usage, see manual section [HTTP Push Data Sensor—How to Use](#).
 - This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
 - **BETA** Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.
 - For a general introduction to the technology behind push, please see the manual section [Monitoring via Push](#).
- ☁ You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

How to Use

This function is known as **webhook**. Basically, a webhook works like a **push notification**. Webhooks are usually triggered by some event (for example, a new comment to a blog post) and send according information to a specified URL. The HTTP Push Data sensor then displays the data of pushed and received messages.

The **HTTP Push Data Sensor** uses the following URL:

```
http://<probe_ip>:<port_number>/<token>?value=<integer_or_float>&text=<text message>
```

Replace the parameters **<probe_ip>**, **<port_number>**, **<token>**, and **<integer_or_float>** with the corresponding values. The **&text** parameter is optional: You can omit it.

- You can define **port number** and **identification token** in the sensor settings.
- The **probe IP** is the IP address of the system on which your PRTG probe with this sensor is running.
- The **value** can be an integer or a float value, depending on the data of your application; you have to set the value type accordingly in the sensor settings. This parameter will be the sensor value.

 If this parameter is missing, the sensor will show a **down** status.

- You can **optionally** add a custom text message by replacing the parameter **<text message>** with it. The text will be shown as sensor message. If there is no value but only a text, the text will be shown as error message.

 This text message has to be URL encoded (for example, the whitespaces in the sample URL below); most browsers achieve this automatically.

Example:

```
http://192.0.2.0:5050/XYZ123?value=0&text=this%20is%20a%20message
```

- ① You can use several sensors with the same port and identification token. In this case, the data of push messages will be shown in each of these sensors.

Add Sensor

The **Add Sensor** dialog appears when you **manually**  add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

HTTP PUSH

SSL Settings	<p>Define the security of the incoming HTTP push requests. Choose between:</p> <ul style="list-style-type: none"> ▪ HTTP (unsafe): Send push messages to the PRTG probe system via insecure HTTP. ▪ HTTPS (TLS 1.2 only): Send push messages to the PRTG probe system via secure HTTPS. The sensor only supports TLS 1.2 connections. It will use the SSL certificate that is delivered with PRTG or your own trusted SSL certificate that you have imported for the PRTG web server.
Port	This field is only visible if you choose HTTP above. Enter the number of the port on which this sensor listens for incoming HTTP requests. Default is 5050 .
SSL Port	This field is only visible if you choose HTTPS above. Enter the number of the port on which this sensor listens for incoming HTTPS requests. Default is 5051 .

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

HTTP PUSH

SSL Settings	<p>Shows whether the sensor accepts push messages via HTTP or HTTPS.</p> <p>Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p>
Port	<p>This field is only visible for sensors that accept push messages via HTTP. It shows the port number on which this sensor listens for incoming HTTP requests.</p> <p>Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p>
SSL Port	<p>This field is only visible for sensors that accept push messages via HTTPS. It shows the port number on which this sensor listens for incoming HTTPS requests.</p> <p>Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p>
Request Method	<p>Select the request method of your webhook:</p>

HTTP PUSH

- **ANY:** Do not use any filter for the request method.
- **GET:** Choose this method if your webhook uses GET.
- **POST:** Choose this method if your webhook sends post form data. Postdata has to be **application/x-www-form-urlencoded** with the same parameters as for GET requests.

Identification Token

This is the token that is used to find the matching sensor for the incoming message. When you create the sensor, this token is **{_guid_}**.

This token will be replaced with an automatically generated token after you have completed the sensor creation. If you want to use another identification token, you can edit it while or after sensor creation.

-  The token will not be replaced automatically if you change it already during sensor creation.

Incoming Request

Define what PRTG will do with the incoming messages. Choose between:

- **Discard request:** Do not store the pushed messages.
- **Write request to disk (Filename: "Request for Sensor [ID].txt"):** Store the last message received from the sensor to the **Logs (Sensor)** directory (on the Master node, if in a cluster). File name: **Request for Sensor [ID].txt**. This is for debugging purposes. The file will be overridden with each scanning interval.
 -  For information on how to find the folder used for storage, see section [Data Storage](#) 3734.

HTTP PUSH DATA

No Incoming Data

Define which [status](#)¹⁹⁵ the sensor will attain if no push message has been received for at least two sensor scans. Choose between:

- **Ignore and keep last status (default):** The sensor will remain in the status as defined by the last message received.
 - ⓘ The probe on which this sensor runs must be connected to keep the last status. If the probe is disconnected, the sensor will show the **Unknown** status. If the probe is connected again, the sensor does not automatically return from **Unknown** to the last status before the probe disconnect.
- **Switch to "Unknown" status:** The sensor will show an **Unknown** status if it has not received any message for at least two sensor scans.
- **Switch to "Error" after x minutes:** The sensor will show a **Down** status if it has not received any message within a defined time span. Define the time threshold below.

Time Threshold (Minutes)

This field is only visible if you select the error option above. Enter the time threshold in minutes after which the sensor status will show a **Down** status if it has not received a push message within this time span.

Please enter an integer value. The maximum threshold is **1440** minutes.

Value Type

Define which type the value of the received data has. If this setting does not match, the sensor will go into an **Down** status. Choose between:

- **Integer**
- **Float** (with dot . as delimiter)

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

- ⓘ You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[338] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

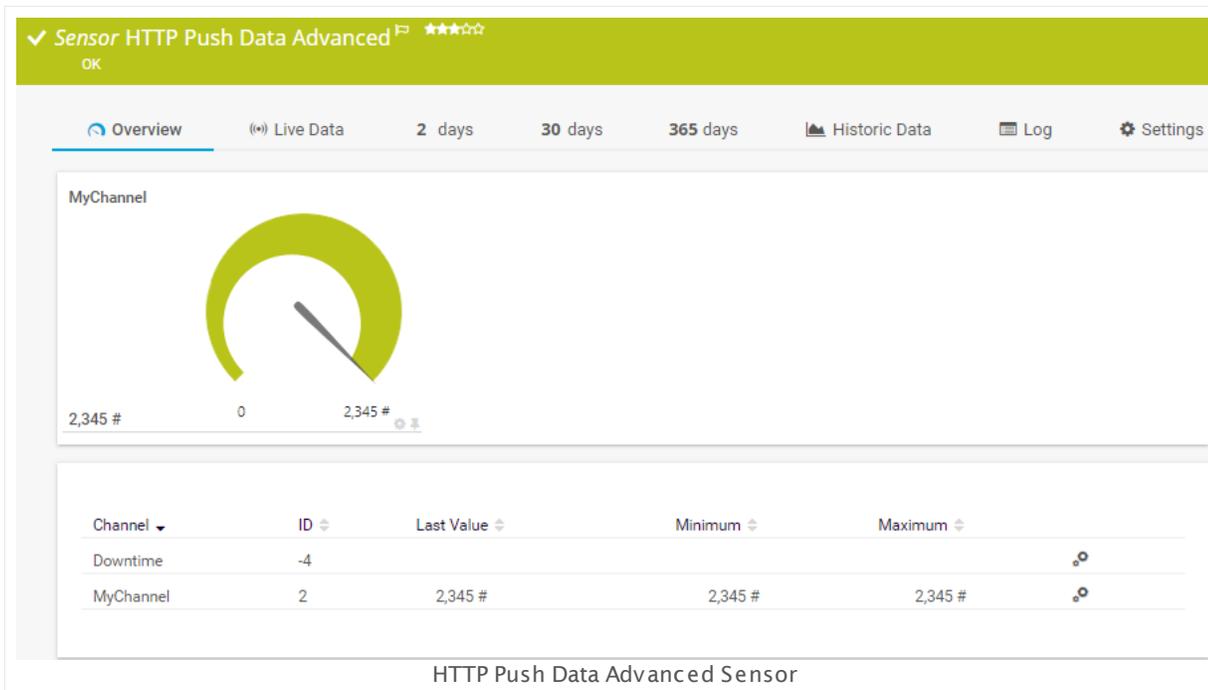

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.59 HTTP Push Data Advanced Sensor

The HTTP Push Data Advanced sensor displays data from received messages that are pushed via a Hypertext Transfer Protocol (HTTP) request to PRTG. It provides a URL that you can use to push messages to the PRTG probe system via HTTP (insecure or TLS 1.2 encrypted).

- This sensor can show received values and a message encoded in valid XML or JSON in multiple channels.

For details about the return value format, see section [Custom Sensors](#)³⁶⁴¹.

Sensor in Other Languages

Dutch: **HTTP Push Data geavanceerd**, French: **Données avancées Push HTTP**, German: **HTTP Push-Daten (Erweitert)**, Japanese: **HTTP プッシュデータ(アドバンスト)**, Portuguese: **Dados HTTP Avançado via Push**, Russian: **HTTP: Данные push-объекта (Расширенный)**, Simplified Chinese: **HTTP** ? ? ? ? ? ? , Spanish: **Datos Push de HTTP avanzandos**

Remarks

- For details about the usage, see manual section [HTTP Push Data Advanced Sensor—How to Use](#)¹⁰⁷¹.
- If you use this sensor with multiple channels, we recommend that you **simultaneously** push the data for **all** your channels to the PRTG server. You can push data to only one of your sensor channels, but in this case all other channels will record the value of **0** for this push message.
- This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.

- For a general introduction to the technology behind push, please see the manual section [Monitoring via Push](#)³⁶⁴⁰.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

How to Use

This function is known as **webhook**. Basically, a webhook works like a **push notification**. Webhooks are usually triggered by some event (for example, a new comment to a blog post) and send according information to a specified URL. The HTTP Push Data Advanced sensor then displays the data of pushed and received messages.

The data that is pushed to this sensor must be valid XML or JSON.

 For details about the return value format, see section [Custom Sensors](#)³⁶⁴¹.

The **HTTP Push Data Advanced Sensor** uses the following URLs depending on the type of HTTP request.

- **GET** requests: `http://<probe_ip>:<port_number>/<token>?content=<valid XML_or_JSON>`

The XML encoded value of the content parameter has to match the format as defined in section [Custom Sensors](#)³⁶⁴¹.

- **POST** requests: `http://<probe_ip>:<port_number>/<token>`

This HTTP request method sends the XML or JSON encoded HTTP body as POST data. The body has to match the format as defined in section [Custom Sensors](#)³⁶⁴¹. We strongly recommend the HTTP content type `application/xml` or `application/json`.

Replace the parameters `<probe_ip>`, `<port_number>`, `<token>`, and `<valid XML_or_JSON>` (for GET requests) with the corresponding values:

- You can define **port number** and **identification token** in the sensor settings.
- The **probe IP** is the IP address of the system on which your PRTG probe with this sensor is running.
- The content of GET requests has to be valid XML or JSON in the PRTG API format.
 -  The content has to be URL encoded (for example, the whitespaces in the sample URL below); most browsers achieve this automatically.

Minimum example for the GET method that returns one static channel value:

```
http://127.0.0.1:5050/XYZ123?content=<prtg><result><channel>MyChannel</channel><value>10</value></result><
```

 By default, values within the `<value>` tags in the returned XML or JSON must be **integers** to be processed. If **float** values are returned, you have to explicitly define this value type as defined in section [Custom Sensors](#)³⁶⁴² with `<float>` tags, otherwise the sensor will show **0** values in affected channels. Example:

```
http://127.0.0.1:5050/XYZ123?content=<prtg><result><channel>MyChannel</channel><value>10.45</value><float>
```

- i** You can use several sensors with the same port and identification token. In this case, the data of push messages will be shown in each of these sensors.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

HTTP PUSH

SSL Settings	Define the security of the incoming HTTP push requests. Choose between: <ul style="list-style-type: none">▪ HTTP (unsafe): Send push messages to the PRTG probe system via insecure HTTP.▪ HTTPS (TLS 1.2 only): Send push messages to the PRTG probe system via secure HTTPS. The sensor only supports TLS 1.2 connections. It will use the SSL certificate that is delivered with PRTG or your own trusted SSL certificate^[3736] that you have imported for the PRTG web server.
Port	This field is only visible if you choose HTTP above. Enter the number of the port on which this sensor listens for incoming HTTP requests. Default is 5050 .
SSL Port	This field is only visible if you choose HTTPS above. Enter the number of the port on which this sensor listens for incoming HTTPS requests. Default is 5051 .

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

- i** Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP PUSH

SSL Settings	<p>Shows whether the sensor accepts push messages via HTTP or HTTPS.</p> <p>Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p>
Port	<p>This field is only visible for sensors that accept push messages via HTTP. It shows the port number on which this sensor listens for incoming HTTP requests.</p> <p>Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p>

HTTP PUSH

SSL Port	<p>This field is only visible for sensors that accept push messages via HTTPS. It shows the port number on which this sensor listens for incoming HTTPS requests.</p> <p>Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p>
Request Method	<p>Select the request method of your webhook:</p> <ul style="list-style-type: none">▪ ANY: Do not use any filter for the request method.▪ GET: Choose this method if your webhook uses GET.▪ POST: Choose this method if your webhook sends post form data. Postdata has to be application/x-www-form-urlencoded with the same parameters as for GET requests.
Identification Token	<p>This is the token that is used to find the matching sensor for the incoming message. When you create the sensor, this token is {_guid_}.</p> <p>This token will be replaced with an automatically generated token after you have completed the sensor creation. If you want to use another identification token, you can edit it while or after sensor creation.</p> <p> The token will not be replaced automatically if you change it already during sensor creation.</p>
Incoming Request	<p>Define what PRTG will do with the incoming messages. Choose between:</p> <ul style="list-style-type: none">▪ Discard request: Do not store the pushed messages.▪ Write request to disk (Filename: "Request for Sensor [ID].txt"): Store the last message received from the sensor to the Logs (Sensor) directory (on the Master node, if in a cluster). File name: Request for Sensor [ID].txt. This is for debugging purposes. The file will be overridden with each scanning interval.  For information on how to find the folder used for storage, see section Data Storage³⁷³⁴.

HTTP PUSH DATA

No Incoming Data

Define which [status](#)¹⁹⁵ the sensor will show if it has not received a push message for at least two sensor scans. Choose between:

- **Ignore and keep last status (default):** The sensor remains in the status as defined by the last message that the sensor received.
 - ⓘ The probe on which this sensor runs must be connected to keep the last status. If the probe is disconnected, the sensor will show the **Unknown** status. If the probe is connected again, the sensor does not automatically return from **Unknown** to the last status before the probe disconnect.
- **Switch to "Unknown" status:** The sensor will show an **Unknown** status if it has not received any message for at least two sensor scans.
- **Switch to "Error" after x minutes:** The sensor will show a **Down** status if it has not received any message within a defined time span. Define the time threshold below.

Time Threshold (Minutes)

This field is only visible if you select the error option above. Enter a time threshold in minutes. If this time elapses, the sensor will show a **Down** status if it has not received a push message within this time span.

Please enter an integer value. The maximum threshold is **1440** minutes.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

- ⓘ You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁸⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#).

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

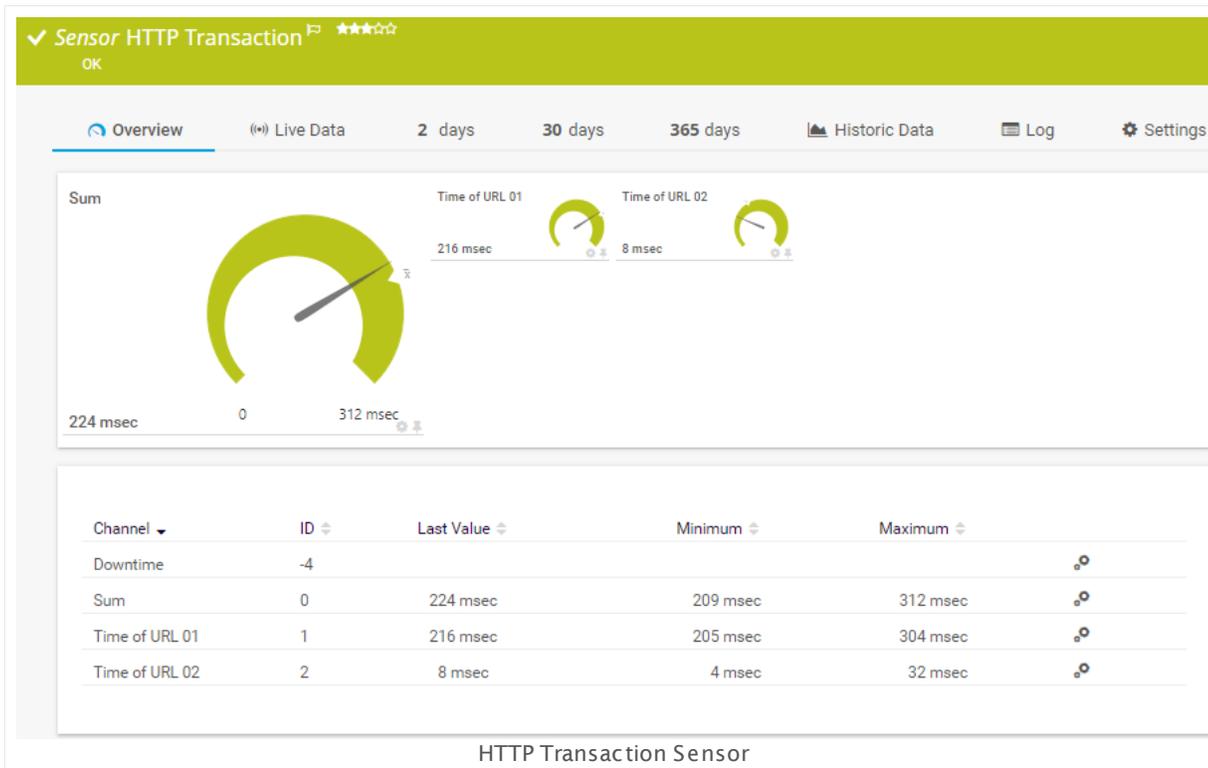

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.60 HTTP Transaction Sensor

The HTTP Transaction sensor monitors an interactive website, such as a web shop, by performing a transaction using a set of Hypertext Transfer Protocol (HTTP) URLs. The sensor monitors whether logins or shopping carts work properly.

- It shows the loading time of single URLs and of the complete transaction.

Sensor in Other Languages

Dutch: **HTTP (Transactie)**, French: **Transaction HTTP**, German: **HTTP (Transaktion)**, Japanese: **HTTP トランザクション**, Portuguese: **Transação HTTP**, Russian: **Транзакция HTTP**, Simplified Chinese: **HTTP ? ?**, Spanish: **HTTP Transacción**

Remarks

- Supports [Smart URL Replacement](#)
- Knowledge Base: [Configuration Tips for HTTP Transaction Sensors](#)
- Knowledge Base: [Which user agent should I use in the HTTP Advanced sensor's settings?](#)
- This sensor type does not support Secure Remote Password (SRP) ciphers.
- If you need to use SRP ciphers, choose the **Alternate/ Compatibility Mode** in the sensor settings.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for all HTTP requests. If the complete transaction takes longer than this value defines, the sensor cancels the request and shows an according error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Single URL Timeout (Sec.)	Enter a timeout in seconds for one single HTTP request. If the reply of any single request takes longer than this value defines, the sensor cancels the transaction and shows an according error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

HTTP ENGINE

Monitoring Engine	<p>If you encounter unexpected errors with the standard method that is used to monitor a URL, try to use the compatibility mode, which is based on .NET. Choose between:</p> <ul style="list-style-type: none">▪ Default/High Performance (recommended): This is the default monitoring method for this sensor type.▪ Alternate/Compatibility Mode: Try this method as an alternative for websites that do not work with the default approach. Using the compatibility mode, this sensor executes an external exe. Because of this, this method needs more resources, but it can be helpful in particular cases.<ul style="list-style-type: none">❗ If you select the compatibility mode, the options for the SSL method will be slightly different. You can also check for trusted certificates. Please see below.⚠ When using the Compatibility Mode, Smart URL Replacement will not work, so this sensor will not use the IP Address/DNS value of the parent device automatically then.
-------------------	---

SSL SPECIFIC (WHEN USING COMPATIBILITY MODE)

SSL Method	<p>When using the compatibility mode, the SSL specific settings are a bit different to the default (automatically used) SSL settings. You can choose between:</p> <ul style="list-style-type: none">▪ SSL 3.0▪ TLS 1.0, TLS 1.1, TLS 1.2
------------	---

SSL SPECIFIC (WHEN USING COMPATIBILITY MODE)

- **SSL 3.0, TLS 1.0, TLS 1.1, TLS 1.2** This is the default setting.
- Check SSL Certificates Specify if the sensor will check the certificate of the monitored URL. Choose between:
- **Do not check used certificates:** Do not consider the certificates of the monitored web pages. This the default setting.
 - **Check if the used certificates are trusted:** Inspect the certificates. If the certificate of the server is not trusted, the sensor shows a **Down** status and displays a corresponding message.

 This sensor type implicitly supports Server Name Identification (SNI), an extension to the TLS protocol.

ADVANCED SENSOR DATA

- Limit Download (kb) Enter a maximum amount of data that is transferred per every single request. If you set content checks below, please be aware that the sensor can only check the content downloaded within this limit for certain search expressions.
- Cookie Management Select if cookies are used for the transaction. Choose between:
- **Use cookies (recommended):** Allow cookies to be set and read during the transaction cycle.
 - **Ignore cookies:** Do not allow cookies. Use this option if you want to test the transaction without the use of cookies.
- We recommend that you use the default value.
- User Agent Choose which user agent string the sensor sends when connecting to the defined URLs. Choose between:
- **Use PRTG's Default String:** Do not enter a specific user agent, use the default setting. Usually, this is: **Mozilla/5.0 (compatible; PRTG Network Monitor (www.paessler.com); Windows)**
 - **Use a Custom String:** Use a custom user agent. Define below.
- Custom User Agent This field is only visible if you enable the **Use a Custom String** option above. Enter a string that the sensor uses as user agent when connecting to the URL specified above.

ADVANCED SENSOR DATA

Result Handling	<p>Define what PRTG will do with the web page loaded at the given URL. Choose between:</p> <ul style="list-style-type: none">• Discard HTML result: Do not store the requested web page.• Store latest HTML result: Store the last result of the requested web page to the Logs (Sensors) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File name: Result of Sensor [ID].txt. This is for debugging purposes, especially in combination with content checks. The file will be overwritten with each scanning interval.<ul style="list-style-type: none">•  For information on how to find the folder used for storage, see section Data Storage³⁷³⁴. <p> This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>
-----------------	---

AUTHENTICATION

Authentication	<p>Define if the web page at the configured URL needs authentication. Choose between:</p> <ul style="list-style-type: none">▪ No authentication needed▪ Web page needs authentication
User	<p>This field is only visible if you enable authentication above. Enter a username. Please enter a string.</p>
Password	<p>This field is only visible if you enable authentication above. Enter a password. Please enter a string.</p>
Authentication Method	<p>This field is only visible if enable authentication above. Select the authentication method the given URL is protected with. Choose between:</p> <ul style="list-style-type: none">▪ Basic access authentication (HTTP): Use simple HTTP authentication. This is the default setting and suitable for most cases.<ul style="list-style-type: none">•  This authentication method transmits credentials as plain text.

AUTHENTICATION

- **Windows NT LAN Manager (NTLM):** Use the Microsoft NTLM protocol for authentication. This is sometimes used in intranets for single sign-on.
- **Digest Access Authentication:** Use digest access authentication that applies a hash function to the password, which is safer than basic access authentication.

We recommend that you use the default value.

TRANSACTION URL

- ✘ You can define up to 10 different transaction URLs, which will all be called in a row. Only if the complete transaction can be completed, the sensor will show an **Up status**¹⁹⁵. Using this mechanism you can set up an extended monitoring with multiple URLs.

Enter settings for at least one transaction URL. You can use as many steps as needed and disable the other steps.

Transaction Step #x This setting is available for URL **#2** through **#10**. Define if you want to use this step for your transaction check. Choose between:

- **Disable step #x:** Do not use this step. Choose this option if you do not need all 10 steps for your transaction check.
- **Enable step #x:** Enable this step. Further options will be viewed, as described below.

URL Enter the URL the sensor will connect to. It has to be **URL encoded!**

If you enter an absolute URL, this address will be independent from the **IP Address/DNS Name** setting of the device this sensor is created on. PRTG uses a smart URL replacement that allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, see section [Smart URL Replacement](#)¹⁰⁹³ below.

Request Method The request method determines how the given URL is requested.

- **GET:** Request the website directly, like browsing the web. We recommend using this setting for a simple check of a web page.
- **POST:** Send post form data to the URL. If this setting is chosen, you must enter the data that will be sent in the **Post data** field below.

TRANSACTION URL

- **HEAD:** Only request the HTTP header from the server; without the actual web page. Although this saves bandwidth since less data is transferred, it is not recommended because the measured request time is not the one experienced by your users and you might not be notified for slow results or timeouts.

Postdata

This field is only active if you choose **POST** in the **Request Method** setting above. Enter the data part for the post request here.

 No XML is allowed here!

Check For Existing Key Words (Positive)

Define whether the result at the configured URL will be checked for keywords. Choose between:

- **Disable:** Do not search for keywords.
- **Enable key word check (positive):** In the result returned at the URL, check if a key word exists.

 The content check is only intended for HTML websites and might not work with other target URLs.

Response Must Include

Define which string must be part of the web at the given URL. If the data does not include this string, the sensor will show an error status and display this string along with the affected URL in the sensor message. Please enter a string.

 Only simple text search is available here. The characters ***** and **?** work here as placeholder, whereas ***** stands for no or any number of characters and **?** stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible.

Check For Existing Key Words (Negative)

Define whether the the result at the configured URL will be checked for keywords. Choose between:

- **Disable:** Do not search for keywords.
- **Enable key word check (negative):** In the result returned at the URL, check if a key word does not exist.

 The content check is only intended for HTML websites and might not work with other target URLs.

Response Must Not Include

Define which string must not be part of the web at the given URL. If the data does include this string, the sensor will show an error status and display this string along with the affected URL in the sensor message. Please enter a string.

TRANSACTION URL

 Only simple text search is available here. The characters `*` and `?` work here as placeholder, whereas `*` stands for no or any number of characters and `?` stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

HTTP Proxy Settings The proxy settings determine how a sensor connects to a given URL. You can enter data for an HTTP proxy server that sensors will use when connecting via HTTP or HTTPS.

-  This setting affects monitoring only and determines the behavior of HTTP sensors. To change proxy settings for the core server, see [System Administration—Core & Probes](#)³³⁶⁸.
-  The [SSL Certificate Sensor](#)²⁶³⁵ and the [SSL Security Check Sensor](#)²⁶⁴⁶ do not support HTTP proxies, but you can configure connections via SOCKS proxies in their sensor settings.

Name Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.

Port Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.

User If the proxy requires authentication, enter the username for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

Password If the proxy requires authentication, enter the password for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either [http:///](#) or [https:///](#) or even a simple slash / as equivalent for [http:///](#)). PRTG will fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically.

Whether this results in a valid URL or not depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** [www.example.com](#) and you add an HTTP sensor to it, you can provide values the following ways:

- Providing the value [https:///](#) in the URL field, PRTG will automatically create the URL [https://www.example.com/](#)

- Using the value `/help` in the URL field, PRTG will automatically create and monitor the URL <http://www.example.com/help>
- It is also possible to provide a port number in the URL field, which will be taken over by the device's DNS name and internally added, for example, <http://:8080/>

 Smart URL replacement does not work for sensors running on the **Probe Device**.

- <https://kb.paessler.com/en/topic/443>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.61 HTTP XML/REST Value Sensor

The HTTP XML/REST Value sensor retrieves an XML file from a given URL and parses it.

- It can show the value of one defined XML node.

Channel	ID	Last Value	Minimum	Maximum
Downtime	-4	-4	-4	-4
Execution Time	1	280 msec	202 msec	1,873 msec
Value	0	0 #	0 #	0 #

Sensor in Other Languages

Dutch: **HTTP XML/REST Waarde**, French: **Valeur HTTP XML/REST**, German: **HTTP XML-/REST-Wert**, Japanese: **HTTP XML/REST値**, Portuguese: **Valor HTTP XML/REST**, Russian: **Значение HTTP XML/REST**, Simplified Chinese: **HTTP XML/REST ?**, Spanish: **Valor HTTP XML/REST**

Remarks

- [Requires](#) ¹⁰⁹⁰ .NET 4.5 or later on the probe system. If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- This sensor can monitor only one single node in an XML file and shows the value in one channel. If you need to monitor more than one node of an XML document, please add the sensor for each target node anew.
- Supports [Smart URL Replacement](#) ¹¹⁰⁸.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Knowledge Base: [HTTP XML/REST Value Sensor: FAQ](#)
- Knowledge Base: [Which HTTP status code leads to which HTTP sensor status?](#)
- This sensor type does not support Secure Remote Password (SRP) ciphers.

- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Limited to 50 Sensor Channels

 PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Channel Name	Enter a name for the channel that will display the value at the given URL.
--------------	--

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

URL	<p>Enter the URL that returns the XML file. It has to be URL encoded! If you enter an absolute URL, the sensor uses this address independently from the IP Address/DNS Name setting of the device on which you create this sensor.</p> <p>PRTG uses a smart URL replacement that allows you to use the parent device's IP address/DNS name setting as part of the URL.</p> <p> For more information, see section Smart URL Replacement below.</p>
-----	--

SENSOR SETTINGS

XML Node (and optional property)	<p>Enter the name of the node that this sensor checks, or enter a node name and a property name to check a property value. To obtain a value from nested tags, enter the tag names separated by a slash symbol, for example, use myTag/myTagInside as XML node value.</p> <p>i You can also check values in JavaScript Object Notation (JSON) notation. See section Checking JSON <small>1108</small> below.</p> <p>i You can try using XPath syntax here but it does not work in all cases and we do not provide any technical support for XPath issues. For further documentation about XPath, see the Knowledge Base: How can I use XPath with PRTG's XML/Rest Value Sensor?</p>
HTTP Username	If the URL requires authentication, enter the username. Please enter a string or leave the field empty.
HTTP Password	If the URL requires authentication, enter the password. Please enter a string or leave the field empty.
Sensor Value	<p>Define what value this sensor shows. Choose between:</p> <ul style="list-style-type: none"> ▪ Use the value of the selected XML node: Return the value that the sensor finds at the specified XML node. If this is non-numeric, the sensor shows 0. ▪ Use the number of occurrences of the selected XML node or its children/siblings: Return the number of occurrences found. Define further below.
Count XML Nodes	<p>This setting is only visible if you enable the return number option above. Define which count the sensor shows. Choose between:</p> <ul style="list-style-type: none"> ▪ Occurrences of the selected XML node: Return how often the defined XML node occurs at the defined URL. ▪ Child nodes of the selected XML node: Return the number of child nodes that exist below the node at the defined URL. ▪ Sibling nodes of the selected XML node: Return the number of sibling nodes that exist next to the node at the defined URL.
Namespaces	<p>Define whether namespaces in the XML document are used or not. Choose between:</p> <ul style="list-style-type: none"> ▪ Use Namespaces: Process the value you enter in the XML Node (and optional property) field including possibly existing namespace information.

SENSOR SETTINGS

- **Remove Namespaces:** Ignore namespace information in the XML document and process the value you enter in the **XML Node (and optional property)** field as node names only.

 For more information see [About Namespaces](#)¹¹⁰⁸ section below.

Content Type in Header

Define what to include in the header of the request sent to the URL defined above. Choose between:

- **Enable (recommended):** This works for most web servers and is the recommended setting.
- **Disable:** Only very few web servers cannot handle this content type and need this setting. Try this if you get an error message with the enabled option.
- **Custom:** You can use a custom content type.

Custom Content Type

This field is only visible when you enable the **Custom** option above. Enter a custom content type like `text/xml` or `text/html`.

HTTP Headers

Optionally enter a list of custom HTTP headers with their respective values that you want to transmit to the URL you define above. The syntax of a list with header-value pairs is `header1:value1|header2:value2|...|headerx:valuex`

 The sensor does not accept header field names that include a dash (-) character. If you want to use such an HTTP header, please leave out the dash of the name. For example, enter `ContentType:value` instead of `Content-Type:value`.

Example: `From:johnqpublic@example.com|AcceptLanguage:en-us`

 Ensure that the HTTP header statement is valid! Otherwise, the sensor request will not be successful.

Characters to Remove

This field is only visible if you enable the **Use the value of the selected XML node** option above. Optionally enter a string that the sensor removes from the returned XML value.

Use this to remove any unwanted characters from the result, for example, a thousands separator from numeric values. Please enter a string or leave the field empty.

Decimal Delimiter

This setting is only visible if you enable the **Use the value of the selected XML node** option above. If the sensor value of the selected XML node is of the type `float`, you can define any character here, which is then handled as the decimal delimiter. Enter one character or leave the field empty.

SENSOR SETTINGS

Custom Message	Optionally enter a custom sensor message. Use %1 as a placeholder to automatically fill in the returned XML value. Please enter a string or leave the field empty.
If Channel Value Changes	<p>Define what this sensor will do when the sensor value changes. You can choose between:</p> <ul style="list-style-type: none"> ▪ Ignore changes (default): The sensor takes no action on change. ▪ Trigger 'change' notification: The sensor sends an internal message indicating that its value has changed. In combination with a Change Trigger, you can use this mechanism to trigger a notification ³¹⁷⁰ whenever the sensor value changes. <p> The change notification for this sensor can only be triggered if the returned value is a numerical value. Strings are not supported by this option and cannot trigger a notification.</p>
Unit String	Enter the unit for the values that this sensor returns. Please enter a string. This unit string is used for display purposes and will be shown in graphs, data tables, and gauges. If you want to change the Unit after having created the sensor, you can change it in the sensor's channel settings ³¹⁶⁰ .

DEBUG OPTIONS

Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none">  For more information on how to find the folder used for storage, see section Data Storage ³⁷³⁴. <p> This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>
---------------	--

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>3311</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Checking JSON

With the **XML Node (and optional property)** field you can also check values that are returned in JavaScript Object Notation (JSON) notation under the defined URL.

Example

A JSON notated section may look like the following:

```
{
  "test": "Hello World",
  "object": {
    "value": "content",
    "AnotherValue": "AnotherContent"
  },
  "arraytest": [
    "one",
    "two"
  ]
}
```

Depending on your entries in the **XML Node** field, the sensor will process the respective values:

Entry in Sensor's "XML Node" Field (from Example Above)	Processed Value (from Example Above)
test	Hello World
object/value	content
object/AnotherValue	AnotherContent
object	contentAnotherContent
arraytest[1]	one
arraytest[2]	two

i The sensor converts whitespaces in JSON keys into underscores (_). So, for example, if you look for the node **some node** in the JSON, you need to enter **some_node** into the node field. If you count the number of nodes (for example, **some_node**), both **some node** and **some_node** would be counted if they appear in the JSON.

i If a key exists more than once in the JSON, the value of the first appearance is returned (no difference between whitespace and underscore).

About Namespaces

In an XML document, tags may use namespaces.

Example

A namespace notated section may look like the following:

```
<myNamespace:myNode>
  some information
</myNamespace:myNode>
```

If you set this sensor to **Use Namespaces** (this is the default setting), it will expect the full node name, including the namespace information, in the **XML Node (and optional property)** field. In the example above, this would be `myNamespace:myNode`.

If your node names are unique even without the namespace information, you can simplify the settings by setting this sensor to **Remove Namespaces**. The sensor will then expect the node name only in the **XML Node (and optional property)** field. In the example above, this would be `myNode`.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either `http://` or `https://` or even a simple slash `/` as equivalent for `http://`). PRTG will fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically.

Whether this results in a valid URL or not depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** `www.example.com` and you add an HTTP sensor to it, you can provide values the following ways:

- Providing the value `https://` in the URL field, PRTG will automatically create the URL `https://www.example.com/`
- Using the value `/help` in the URL field, PRTG will automatically create and monitor the URL `http://www.example.com/help`
- It is also possible to provide a port number in the URL field, which will be taken over by the device's DNS name and internally added, for example, `http://:8080/`

 Smart URL replacement does not work for sensors running on the **Probe Device**.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.62 Hyper-V Cluster Shared Volume Disk Free Sensor

The Hyper-V Cluster Shared Volume Disk Free sensor monitors a Microsoft Hyper-V cluster shared volume via PowerShell.

It can show the following:

- Available disk space in percent
- Available disk space in bytes
- Total disk space

Sensor in Other Languages

Dutch: **Hyper-V Cluster Shared Vol. Disk Free**, French: **Disque disponible Hyper-V Cluster Shared Vol.**, German: **Hyper-V Freigegebenes Clustervolumen**, Japanese: **Hyper-V クラスタ共有ボリューム ディスク空き容量**, Portuguese: **Hyper-V Disco Livre de Cluster Shared Vol.**, Russian: **Свободное дисковое пространство общего тома кластера Hyper-V**, Simplified Chinese: **Hyper-V Cluster Shared Vol. ? ? ? ? ?**, Spanish: **Espacio de disco libre de volumen compartido en clúster Hyper-V**

Remarks

- [Requires](#) Remote PowerShell on the target device.
- [Requires](#) WSFC PowerShell Interface on the target device.
- [Requires](#) .NET 4.5 or later on the probe system.

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- The parent device for this sensor must be a Windows server running Hyper-V.
- Knowledge Base: [Why don't my Hyper-V sensors work after changing names?](#)
- Knowledge Base: [PowerShell Sensors: FAQ](#)
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Remote PowerShell

 The Hyper-V Cluster Shared Volume Disk Free sensor uses PowerShell commands. To monitor devices with this sensor **Remote PowerShell** has to be enabled.

 In larger environments, the default memory limit for the remote shell might be insufficient and you might see the error message **The WSMan provider host process did not return a proper response**. In this case, increase the memory limit for Remote PowerShell. For detailed information, see the Knowledge Base article [How can I increase memory for Remote PowerShell?](#)

Requirement: WSFC PowerShell Interface

 This sensor type needs the **WSFC (Windows Server Failover Clustering) PowerShell Interface** to be installed on the target machine. You can list all modules in the PowerShell console with the command **Get-Module -ListAvailable**. Here **FailoverClusters** has to appear. Under Windows Server 2008 (not officially supported) and Windows Server 2012 the interface is part of the **VMM Administrator Console**, or the **VMM 2012 Management Console**.

The interface is available everywhere the WSFC feature is installed: Windows Server 2008 R2 (SP1) Full and Core (not installed by default); Microsoft Hyper-V Server 2008 R2 (SP1); Remote Server Administration Tools (RSAT) for Windows 10, Windows 8.1, Windows 8, Windows 7 (SP1).

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the disks you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

DISK FREE SETTINGS

Disk

Select the disks you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

 Ensure the resource name of your disks do not contain unsupported characters, especially avoid the hash (#) sign. In general, UTF-8 characters are supported. We recommend that you do not rename resource disk names once you have set up monitoring. For detailed information, see the Knowledge Base article [Why don't my Hyper-V sensors work after changing names?](#)

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name

Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)¹⁸¹, as well as in [alarms](#)²¹⁹, [logs](#)²²⁸, [notifications](#)³²¹⁶, [reports](#)³²⁵², [maps](#)³²⁷⁸, [libraries](#)³²³⁵, and [tickets](#)²³⁰.

BASIC SENSOR SETTINGS

Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DISK FREE SETTINGS

Disk	Shows the name of the disk. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none">  For more information on how to find the folder used for storage, see section Data Storage.  This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵⁵ on PRTG on premises installations.</p>
-------------------	---

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
62 Hyper-V Cluster Shared Volume Disk Free Sensor

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

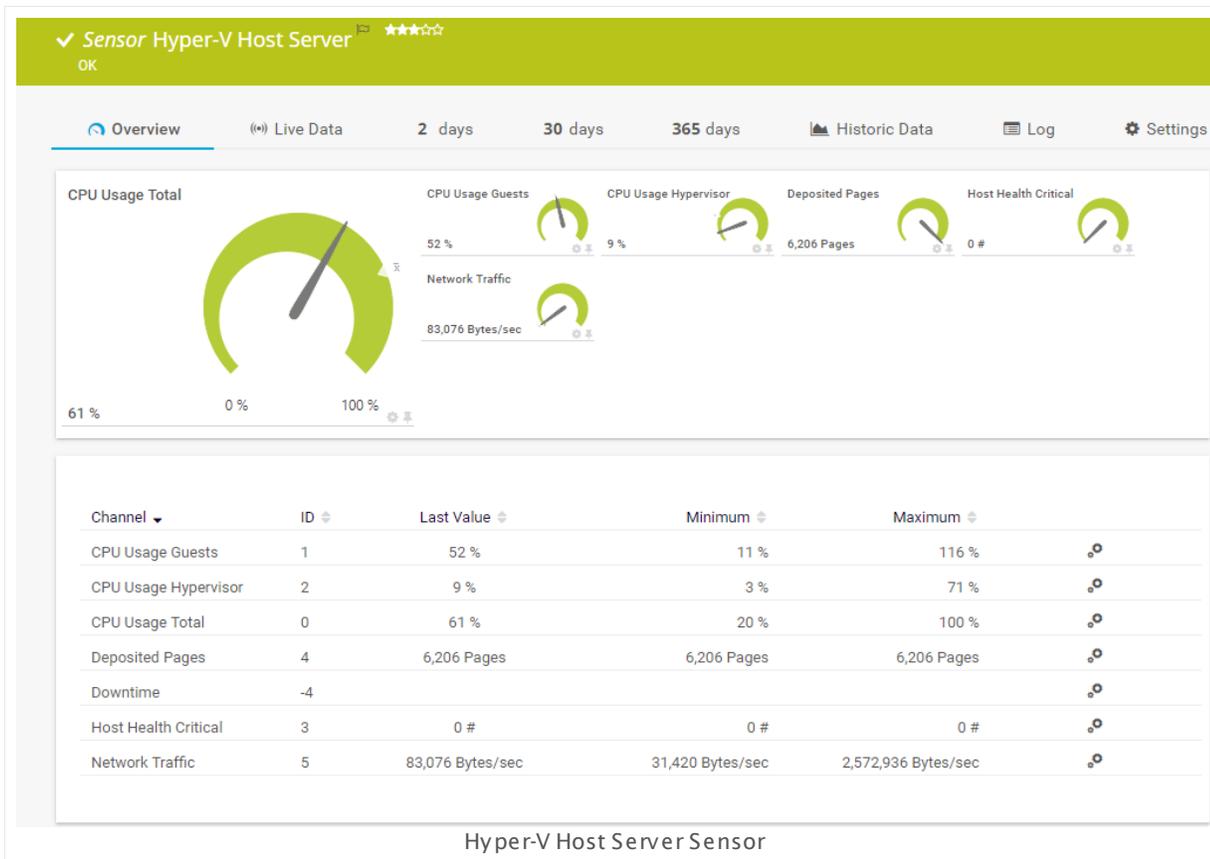

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.63 Hyper-V Host Server Sensor

The Hyper-V Host Server sensor monitors a Microsoft Hyper-V host server via Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

It can show the following:

- CPU usage in percent of guests, hypervisor, total
- Number of host health critical values
- Number of deposited pages
- Network traffic: Sums up the total bytes per second (received and sent) on all ports of your virtual switch.

Sensor in Other Languages

Dutch: **Hyper-V Host Server**, French: **Serveur hôte Hyper V**, German: **Hyper-V Host Server**, Japanese: **Hyper-Vホストサーバー**, Portuguese: **Hyper-V Host**, Russian: **Сервер узла Hyper-V**, Simplified Chinese: **Hyper-V ? ? ? ? ?**, Spanish: **Servidor Hyper-V Host**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
 - [Requires](#) ¹¹²² Windows Server 2008 R2 or later on the probe system.
 - [Requires](#) ¹¹²³ the Remote Registry Windows service to be running on the target computer.
 - The parent device for this sensor must be a Windows server running Hyper-V.
 - Can use a [hybrid approach](#) ¹¹²⁴ with Windows Performance Counters and WMI as fallback to query data. Please stay below 200 WMI sensors per probe!
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

 Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the [parent device's](#) ⁴⁰⁷ **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

 If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

 By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a **hybrid approach** in the **Windows Compatibility Options** of the parent [device's settings](#) ⁴¹⁵ on which you create this sensor: if you choose this option, the sensor will first try to query data via **Windows Performance Counters** and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

 Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#) ¹²⁵. Above this number, please consider using multiple [Remote Probes](#) ³⁷⁰⁹ for load balancing.

 For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#) ³⁵⁰⁷ section.

Requirement: Windows Version

 In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#) ³⁷⁰⁵.

i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the probe service only runs with 32-bit support. Without it, WMI sensors will not work.

Requirement: Remote Registry Service

x In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

- Tags** Enter one or more [Tags](#)¹³⁹, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.
- You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)¹⁴⁰ from objects further up in the device tree. These are visible above as **Parent Tags**.
-  It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).
- Priority** Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result**: Do not store the sensor result.
 - **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

SENSOR DISPLAY

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

-  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁶⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

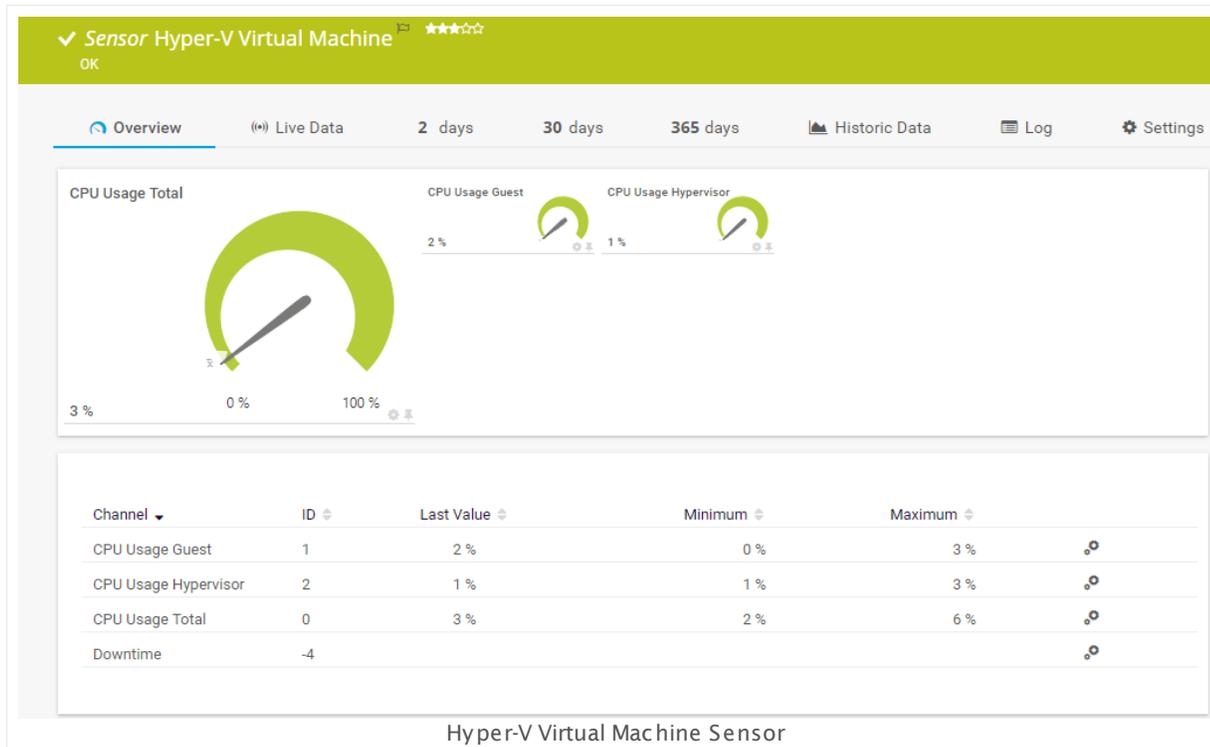

7.8.64 Hyper-V Virtual Machine Sensor

The Hyper-V Virtual Machine sensor monitors a virtual machine running on a Microsoft Hyper-V host server via Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

It can show the following:

- CPU usage in percent of guests, hypervisor, total
- IDE disk read speed (bytes per second)
- IDE disk write speed (bytes per second)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **Virtuele Hyper-V-Machine**, French: **Machine virtuelle Hyper V**, German: **Hyper-V Virtuelle Maschine**, Japanese: **Hyper-V 仮想マシン**, Portuguese: **Hyper-V Máquina Virtual**, Russian: **Виртуальная машина Hyper-V**, Simplified Chinese: **Hyper-V 虚拟机**, Spanish: **Máquina virtual Hyper-V**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.

- [Requires](#) ¹¹³² Windows Server 2008 R2 or later on the probe system.
 - [Requires](#) ¹¹³² the Remote Registry Windows service to be running on the target computer.
 - The parent device for this sensor must be a Hyper-V server.
 - The sensor does not support **Live Migration**.
 - Can use a [hybrid approach](#) ¹¹³¹ with Windows Performance Counters and WMI as fallback to query data. Please stay below 200 WMI sensors per probe!
 - To monitor a virtual machine with this sensor, disable User Account Control (UAC) in the control panel of the Windows operating system that is running on this virtual machine. Otherwise, the sensor might switch into a **Down** status with the error message **The virtual machine is not running or is powered off**.
 - Knowledge Base: [Why don't my Hyper-V sensors work after changing names?](#)
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

 Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the [parent device's](#) ⁴⁰⁷ **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

 If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

 By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a **hybrid approach** in the **Windows Compatibility Options** of the parent [device's settings](#) ⁴¹⁵ on which you create this sensor: if you choose this option, the sensor will first try to query data via **Windows Performance Counters** and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

 Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#) ¹²⁵. Above this number, please consider using multiple [Remote Probes](#) ³⁷⁰⁹ for load balancing.

 For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#) ³⁵⁰⁷ section.

Requirement: Windows Version

X In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)³⁷⁰⁸.

i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the probe service only runs with 32-bit support. Without it, WMI sensors will not work.

Requirement: Remote Registry Service

X In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the virtual machines you want to monitor. PRTG creates one sensor for each VM you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

VIRTUAL MACHINE SETTINGS

Virtual Machine	Select the virtual machines (VMs) you want to add a sensor for, including the ones that are not running. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
-----------------	---

VIRTUAL MACHINE SETTINGS

 Ensure the name of your VMs do not contain unsupported characters, especially avoid the hash (#) sign. We recommend to not rename virtual machines once you have set up monitoring. For detailed information, see the Knowledge Base article [Why don't my Hyper-V sensors work after changing names?](#)

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

VIRTUAL MACHINE SETTINGS

GUID	Shows the Globally Unique Identifier (GUID) of the virtual machine that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the virtual machine that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Description	Shows information about the virtual machine. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Powered Off VMs	Define how to react to a virtual machine that is powered off. Choose between: <ul style="list-style-type: none">• Alarm when powered off: The sensor will change to a Down status ^[195] if the virtual machine is powered off. While in Down status, a sensor does not record any data in any of its channels.• Ignore powered off state: The sensor will not change to a Down status ^[195] if the virtual machine is powered off. It will report zero values instead.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: <ul style="list-style-type: none">▪ Discard sensor result: Do not store the sensor result.▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.<ul style="list-style-type: none">📁 For more information on how to find the folder used for storage, see section Data Storage ^[3734].☁ This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Knowledge Base: Why don't my Hyper-V sensors work after changing names?

- <https://kb.paessler.com/en/topic/15533>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
64 Hyper-V Virtual Machine Sensor

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

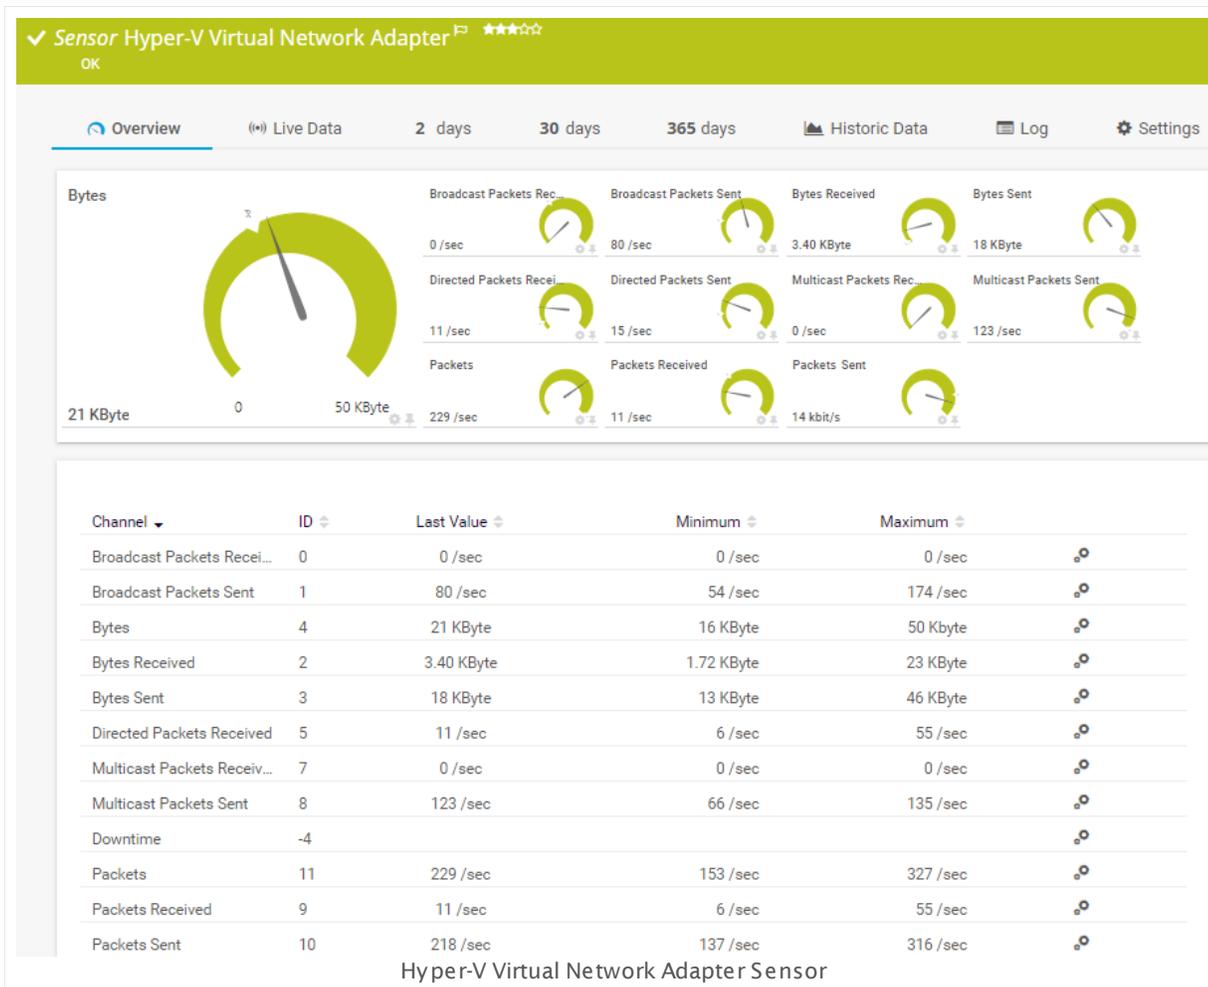

7.8.65 Hyper-V Virtual Network Adapter Sensor

The Hyper-V Network Adapter sensor monitors virtual network adapters running on a Microsoft Hyper-V host server via Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

It can show the following:

- Sent, received, and totally transferred bytes
- Sent and received packets per second
- Sent and received broadcast packets per second
- Sent and received directed packets per second
- Sent and received multicast packets per second

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **Hyper-V Virtuele Netwerk Adapter**, French: **Carte réseau virtuel Hyper-V**, German: **Hyper-V Virtueller Netzwerkadapter**, Japanese: **Hyper-V 仮想ネットワークアダプター**, Portuguese: **Hyper-V Adaptador de Rede Virtual**, Russian: **Виртуальный сетевой адаптер Hyper-V**, Simplified Chinese: **Hyper-V ? ? ? ? ? ? ?**, Spanish: **Adaptador de red virtual Hyper-V**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- [Requires](#)^[1143] Windows Server 2008 R2 or later on the probe system.
- [Requires](#)^[1143] the Remote Registry Windows service to be running on the target computer.
- The parent device for this sensor must be a Hyper-V server.
- Can use a [hybrid approach](#)^[1142] with Windows Performance Counters and WMI as fallback to query data. Please stay below 200 WMI sensors per probe!
- Knowledge Base: [Why don't my Hyper-V sensors work after changing names?](#)

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

 Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the [parent device's](#)^[407] **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

 If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

 By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a **hybrid approach** in the **Windows Compatibility Options** of the parent [device's settings](#)^[415] on which you create this sensor: if you choose this option, the sensor will first try to query data via **Windows Performance Counters** and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

 Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[370] for load balancing.

 For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)^[3507] section.

Requirement: Windows Version

X In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)³⁷⁰⁸.

i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the probe service only runs with 32-bit support. Without it, WMI sensors will not work.

Requirement: Remote Registry Service

X In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵¹ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the network adapters you want to monitor. PRTG creates one sensor for each adapter you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

VIRTUAL MACHINE SETTINGS

Hyper-V Virtual
Network Adapter

Select the virtual network adapters you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

VIRTUAL MACHINE SETTINGS

 We recommend you do not rename virtual machines once you have set up monitoring. Renaming them will also change the internal virtual network adapter names, so monitoring might be interrupted. For detailed information about virtual machine naming, see the Knowledge Base article [Why don't my Hyper-V sensors work after changing names?](#)

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HYPER-V VIRTUAL NETWORK ADAPTER SETTINGS

Virtual Network Adapter Shows the name of the virtual network adapter monitored by this sensor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

i Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

i This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

Knowledge Base: Why don't my Hyper-V Virtual Machine sensors work after changing names?

- <https://kb.paessler.com/en/topic/15533>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

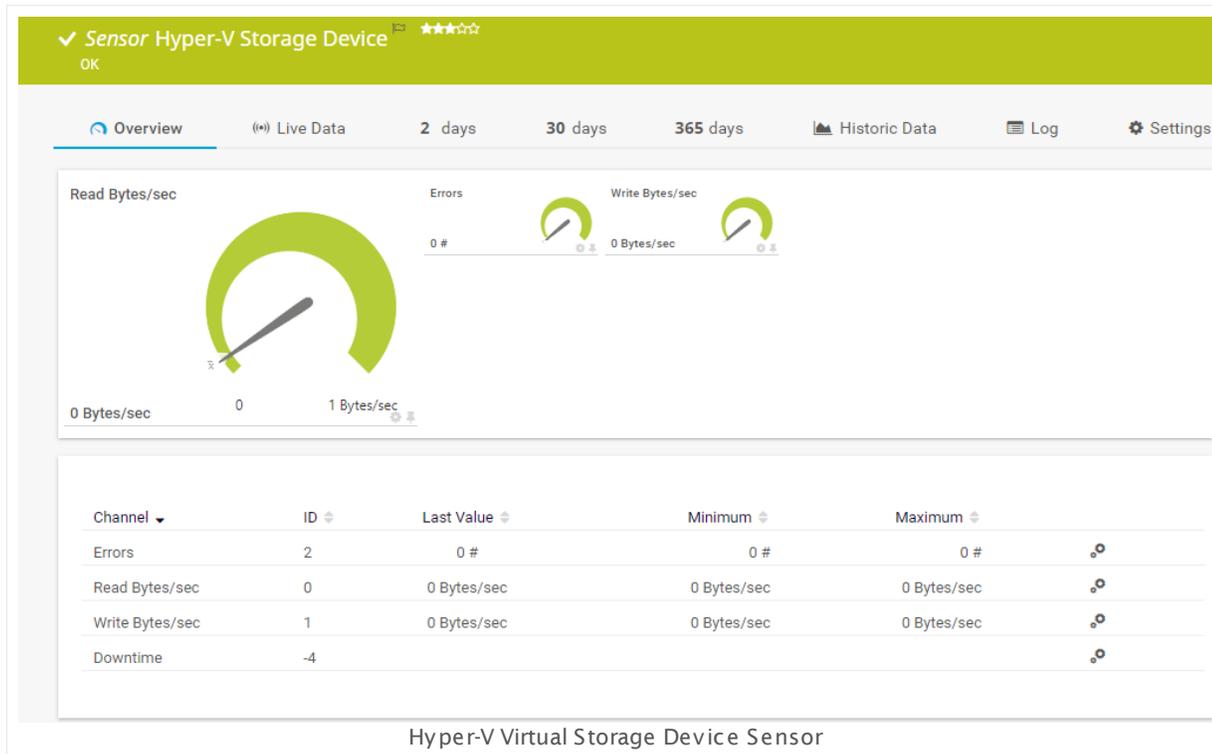

7.8.66 Hyper-V Virtual Storage Device Sensor

The Hyper-V Virtual Storage sensor monitors a virtual storage device running on a Microsoft Hyper-V host server via Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

It can show the following:

- Read speed in bytes per second
- Write speed in bytes per second
- Number of errors

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **Hyper-V Virtueel Opslag Apparaat**, French: **Périphérique de stockage virtuel Hyper-V**, German: **Hyper-V Virtuelles Speichergerät**, Japanese: **Hyper-V仮想ストレージデバイス**, Portuguese: **Hyper-V Dispositivo de Armazenamento Virtual**, Russian: **Виртуальное устройство хранения Hyper-V**, Simplified Chinese: **Hyper-V ? ? ? ? ?**, Spanish: **Dispositivo de almacenamiento virtual Hyper-V**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
 - [Requires](#) ^[1154] Windows Server 2008 R2 or later on the probe system.
 - [Requires](#) ^[1154] the Remote Registry Windows service to be running on the target computer.
 - The parent device for this sensor must be a Hyper-V server.
 - This sensor does not support **Live Migration**.
 - Can use a [hybrid approach](#) ^[1153] with Windows Performance Counters and WMI as fallback to query data. Please stay below 200 WMI sensors per probe!
 - Knowledge Base: [Why don't my Hyper-V sensors work after changing names?](#)
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

 Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the [parent device's](#) ^[407] **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

 If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

 By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a **hybrid approach** in the **Windows Compatibility Options** of the parent [device's settings](#) ^[415] on which you create this sensor: if you choose this option, the sensor will first try to query data via **Windows Performance Counters** and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

 Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#) ^[125]. Above this number, please consider using multiple [Remote Probes](#) ^[3709] for load balancing.

 For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#) ^[3507] section.

Requirement: Windows Version

X In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)³⁷⁰⁸.

i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the probe service only runs with 32-bit support. Without it, WMI sensors will not work.

Requirement: Remote Registry Service

X In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the storage devices you want to monitor. PRTG creates one sensor for each storage you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

HYPER-V VIRTUAL STORAGE DEVICE SETTINGS

Virtual Storage Device	Select the virtual storage devices you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
------------------------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HYPER-V VIRTUAL STORAGE DEVICE SETTINGS

Virtual Storage Device	Shows the unique identifier of the device that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none"> 📁 For more information on how to find the folder used for storage, see section Data Storage³⁷³⁴. <p>☁ This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> 📘 This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)^[335] on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies <small>3209</small> in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

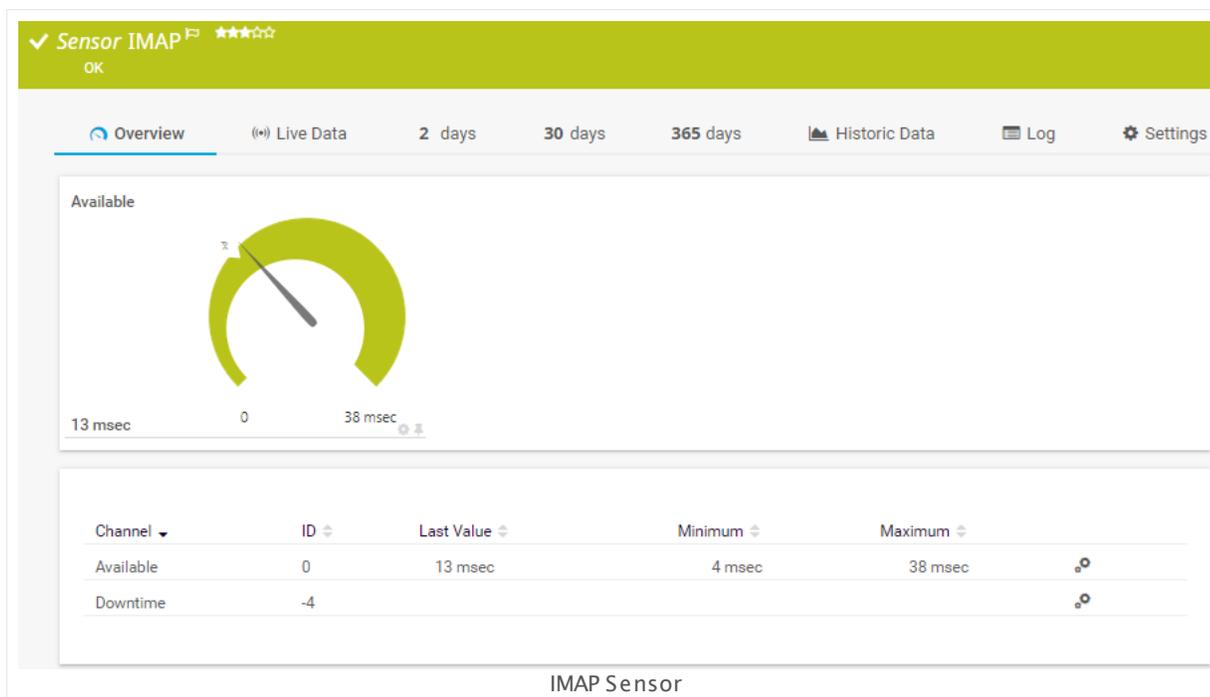

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.67 IMAP Sensor

The IMAP sensor monitors an email server using Internet Message Access Protocol (IMAP).

It can show the following:

- Response time of the email server
- Number of emails in the defined mailbox
- It can also check the content of emails for certain key words. This way, you can use this sensor to monitor backup solutions via emails that are sent out by these solutions. For more information, see the Knowledge Base article [How can I monitor my backup software to be sure backup succeeded last night?](#)

Remarks

- If you use content checks, we recommend using a dedicated IMAP account that is only checked by PRTG. Editing existing mails in the mailbox of the monitored IMAP account can lead to false alarms or malfunctions of this sensor type.
- This sensor type might not work properly when monitoring subfolders of mailboxes. If it has to check subsequent emails with identical subjects, later on incoming emails might not be recognized.
- This sensor type does not support Secure Remote Password (SRP) ciphers.
- Knowledge Base: [My IMAP sensor does not process HTML emails correctly using regex. What can I do?](#)
- Knowledge Base: [How can I monitor my backup software to be sure backup succeeded last night?](#)

- Knowledge Base: [Can I analyze multipart emails using the PRTG IMAP sensor?](#)
- Knowledge Base: [My IMAP sensor does not find emails when I check for message date. What can I do?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

CONNECTIVITY

Timeout (Sec.) Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is **900** seconds (15 minutes).

Port Enter the number of the port that the sensor uses to connect via IMAP. For non-secure connections, usually port 143 is used. For SSL connections it is usually port 993. The actual setting depends on the server you are connecting to. Please enter an integer value. We recommend that you use the default value.

 If you do not get a connection, please try another port number.

Security Define the security level for the sensor connection. Choose between:

- **Use Transport-Level Security if available using StartTLS (default):** Choose this option to try to connect to the server using TLS and StartTLS. If the server does not support this, the sensor will try to connect without encryption.
- **Use Transport-Level Security if available:** Choose this option to try to connect to the server using TLS. If the server does not support this, the sensor will try to connect without encryption.
- **Enforce Transport-Level Security using StartTLS:** Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will show a **Down status**^[195].
- **Enforce Transport-Level Security:** Choose this option to try to connect to the server using TLS. If the server does not support this, the sensor will show a **Down status**^[195].

 If the sensor connects to a server via **StartTLS**, the connection is established unencrypted first. After the connection is established, the sensor sends a certain command (StartTLS) over the unencrypted connection to negotiate a secure connection via the SSL/TLS protocol.

CONNECTIVITY

-  If the sensor uses **TLS without StartTLS**, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If there is no secure connection possible, no communication will take place.

AUTHENTICATION

- Username** Enter a username for IMAP authentication. Please enter a string.
- Password** Enter a password for IMAP authentication. Please enter a string.
- Mailbox Name** Enter the name of the mailbox (for example, the name of the IMAP folder) that the sensor will check. Default value is **Inbox**. Unless you set a last message date check below, the sensor will always look at **all** emails contained in the mailbox.
-  Ensure you do not manually edit emails in this mailbox with another email client because this can result in malfunctions of this sensor's email identification.

SENSOR BEHAVIOR

- General Behavior** This sensor can additionally check the content of all incoming emails. Choose between:
- **Check connectivity only, do not process emails (default):** Only check availability of the IMAP server and check if a login is successful. Do not process any emails in the IMAP email account.
 - **Count emails in this mailbox:** Count the emails in the defined mailbox.
 - **Process emails in this mailbox:** Log in to the IMAP email account and check the emails that it contains. Define further options below.
- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result:** Do not store the sensor result.

SENSOR BEHAVIOR

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 📁 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
- ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

FILTER EMAILS IN INBOX

📘 This settings section is only visible if you choose to process the emails in the mailbox.

Only Include Emails with Matching "From"

Define if you want to check the "From" field of the emails. When using a search, the sensor will scan all emails from the newest to the oldest. Choose between:

- **Do not check (default):** Do not process this field in emails.
- **Check using string search:** Process this field in emails using simple string search.
- **Check using regular expression:** Process this field in emails using a regular expression.

⚠ PRTG supports **PCRE** regex. You cannot use regex options or flags. For more details, see manual section [Regular Expressions](#)³⁷⁰⁴.

📘 The sensor finishes the scan with the first match! This means that after it has found a match in one email, the sensor will not perform any further checks in older emails.

Search for

This field is only visible if you enable a "from" check above. Enter a search string using the method defined above.

Only Include Emails with Matching "Subject"

Define if you want to check the "Subject" field of the emails. When using a search, the sensor will scan all emails from the newest to the oldest. Choose between:

- **Do not check (default):** Do not process the subject of emails.

FILTER EMAILS IN INBOX

- **Check using string search:** Process the subject of emails using simple string search.
- **Check using regular expression:** Process the subject of emails using a regular expression. For more information about syntax, see the [Regular Expressions](#) ³⁷⁰⁴ section.

 PRTG supports **PCRE** regex. You cannot use regex options or flags. For more details, see manual section [Regular Expressions](#) ³⁷⁰⁴.

 The sensor finishes the scan with the first match! This means that after it has found a match in one email, the sensor will not perform any further checks in older emails.

Search for

This field is only visible if you enable a "subject" check above. Enter a search string using the method defined above.

Only Include Emails with Matching Email Body

Define if you want to check the email body of the emails. When using a search, the sensor will scan all emails from the newest to the oldest. Choose between:

- **Do not check (default):** Do not process the email body.
- **Check using string search:** Process the email body using simple string search.
- **Check using regular expression:** Process the email body using a regular expression. For more information about syntax, see the [Regular Expressions](#) ³⁷⁰⁴ section.

 PRTG supports **PCRE** regex. You cannot use regex options or flags. For more details, see manual section [Regular Expressions](#) ³⁷⁰⁴.

 The sensor finishes the scan with the first match! This means that after it has found a match in one email, the sensor will not perform any further checks in older emails.

Search for

This field is only visible if you enable checking the email body above. Enter a search string using the method defined above.

Only Include Recent Emails

Define if you want to check all emails in the mailbox, or only mails that were received within the last few hours. Choose between:

- **Do not check message age (default):** Always check all emails that the mailbox contains.
- **Emails must be younger than:** Only check emails that were received in the last few hours. Define below.

FILTER EMAILS IN INBOX

Maximum Age in Hours	This field is only visible if you enable the message age check above. Enter the maximum age in hours. The sensor will only process emails that are younger. Please enter an integer value.
If No Email Matches the Above Filters	Define which status ¹⁹⁵ the sensor will show if it does not find any email in the mailbox that matches the defined filters. Choose between: <ul style="list-style-type: none"> ▪ Set sensor to "Up" status (default) ▪ Set sensor to "Warning" status ▪ Set sensor to "Down" status
Message	This field is only visible if you define a Warning or Down status as no matching behavior above. Define the message that the sensor will show if it did not find any matching emails together with a Warning or Down status as you define above.

VALIDATE LATEST EMAIL

-  This settings section is only visible if you choose to process the emails in the mailbox.
-  The sensor will only validate the latest email that matches the filters above! If the sensor does not find a matching email, it will not perform any email validation.

For the Latest Email that Matches, Set Sensor to "Warning" Status	Define in which cases the sensor will show a Warning status ¹⁹⁵ . Choose between: <ul style="list-style-type: none"> ▪ Never (default): Never set this sensor to a Warning status based on email content. ▪ Always: Always set this sensor to a Warning status in case any emails could be identified. ▪ If subject contains: Set the sensor to Warning if the subject of the found email contains the search text you define below. ▪ If subject does not contain: Set the sensor to Warning if the subject of the found email does not contain the search text you define below. ▪ If email body contains: Set the sensor to Warning if the body of the found email contains the search text you define below.
---	---

VALIDATE LATEST EMAIL

	<ul style="list-style-type: none"> ▪ If email body does not contain: Set the sensor to Warning if the body of the found email does not contain the search text you define below.
Check Method	<p>This setting is only visible if you select an if condition above. Define how you want to check for the above condition. Choose between:</p> <ul style="list-style-type: none"> ▪ String search: Check the email subject or body using simple string search. ▪ Regular expression: Check the email subject or body using a regular expression. For more information about syntax, see Regular Expressions^[3704] section. <p> PRTG supports PCRE regex. You cannot use regex options or flags. For more details, see manual section Regular Expressions^[3704].</p>
Search Text	<p>This setting is only visible if you select an if condition above. Enter a search string using the method defined above.</p>
Warning Message	<p>This setting is only visible if you select a warning condition above. Define the message that the sensor will show for a Warning status^[195].</p>
Based on Message Age, Set Sensor to "Warning" Status	<p>Define if you want to check the age of the latest matching email in the mailbox. Choose between:</p> <ul style="list-style-type: none"> ▪ Never (default): Do not check the age of the email. ▪ If email is older than: Set the sensor to Warning status^[195] if the found email is older than you define below.
Message Age in Hours	<p>This field is only visible if you enable the message age check above. Enter the maximum age in hours. If the processed email is older, the sensor will show a Warning status^[195]. Please enter an integer value.</p> <p> Ensure you do not manually edit emails in this mailbox with another email client because this can result in malfunctions of the message age check.</p>
For the Latest Email that Matches, Set Sensor to "Down" Status	<p>Define in which cases the sensor will show a Down status^[195]. Choose between:</p> <ul style="list-style-type: none"> ▪ Never (default): Never set this sensor to a Down status based on email content.

VALIDATE LATEST EMAIL

- **Always:** Always set this sensor to a **Down** status in case any emails could be identified.
- **If subject contains:** Set the sensor to **Down** if the subject of the found email contains the search text you define below.
- **If subject does not contain:** Set the sensor to **Down** if the subject of the found email does not contain the search text you define below.
- **If email body contains:** Set the sensor to **Down** if the body of the found email contains the search text you define below.
- **If email body does not contain:** Set the sensor to **Down** if the body of the found email does not contain the search text you define below.

Check Method

This setting is only visible if you select an if condition above. Define how you want to check for the above condition. Choose between:

- **String search:** Check the email subject or body using simple string search.
- **Regular expression:** Check the email subject or body using a regular expression. For more information about syntax, see [Regular Expressions](#)^[3704] section.

 PRTG supports **PCRE** regex. You cannot use regex options or flags. For more details, see manual section [Regular Expressions](#)^[3704].

Search Text

This setting is only visible if you enable an if condition above. Enter a search string using the method defined above.

Error Message

This setting is only visible if you select a down condition above. Define the message that the sensor will show for a **Down status**^[195].

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

SENSOR DISPLAY

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

-  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁶⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

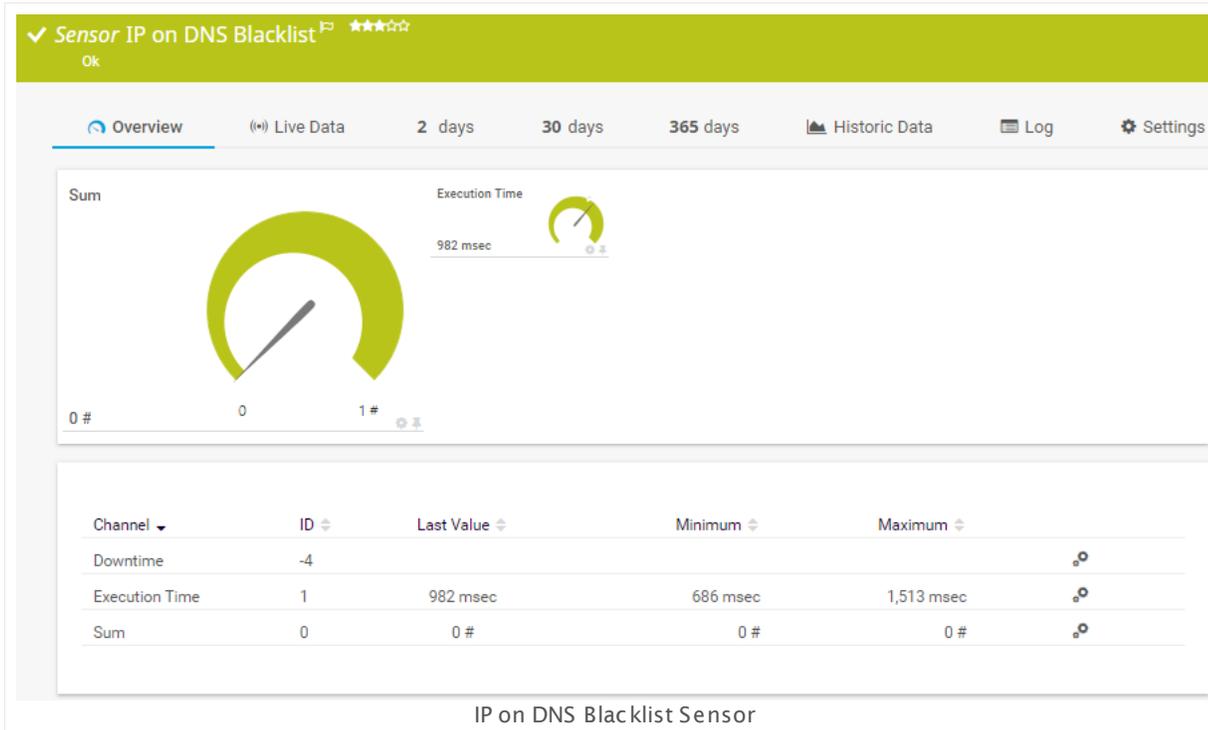

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.68 IP on DNS Blacklist Sensor

The IP on DNS Blacklist sensor checks if the IP address of its parent device is listed on specific blacklist servers.

- The sensor shows the number of blacklist hits it can find.

Sensor in Other Languages

Dutch: **IP op DNS Blacklist**, French: **IP sur liste noire du DNS**, German: **IP auf Schwarzer Liste des DNS**, Japanese: **DNS ブラックリスト記載のIP**, Portuguese: **IP em Blacklist DNS**, Russian: **Черный список IP-адресов на DNS**, Simplified Chinese: **DNS ??? IP**, Spanish: **Blacklist IP sobre DNS**

Remarks

- If a DNS name is used as hostname of the parent device, PRTG will resolve it to an IP address before querying blacklist servers.
- During normal operation, there should be 0 hits and the sensor should show a green **Up status**. If the sensor can find the IP address on at least one of the blacklist servers, it will show a yellow **Warning** status by default. You can set additional thresholds in the **Sensor Channels Settings**.
- **Requires** .NET 4.5 or later on the probe system. If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Knowledge Base: [Is there a list of anti spam black list servers?](#)

- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3276] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

- Tags** Enter one or more **Tags**^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.
- You can add additional tags to the sensor if you like. Other tags are automatically **inherited**^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.
-  It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).
- Priority** Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

- Blacklist Servers** Define the blacklist servers that the sensor uses for the check. You can enter a comma separated list. Default is **bl.spamcop.net**.
-  For a list of servers, see this Knowledge Base article: [Is there a list of anti spam black list servers?](#)
-  With each scanning interval, PRTG will query all servers in the list! We recommend you do not enter more than 10 servers to make sure the check can be completed within the scanning interval of this sensor. If you use too many blacklist servers, the sensor will show the error message **Timeout (code: PE018)**.

DEBUG OPTIONS

- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
