Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

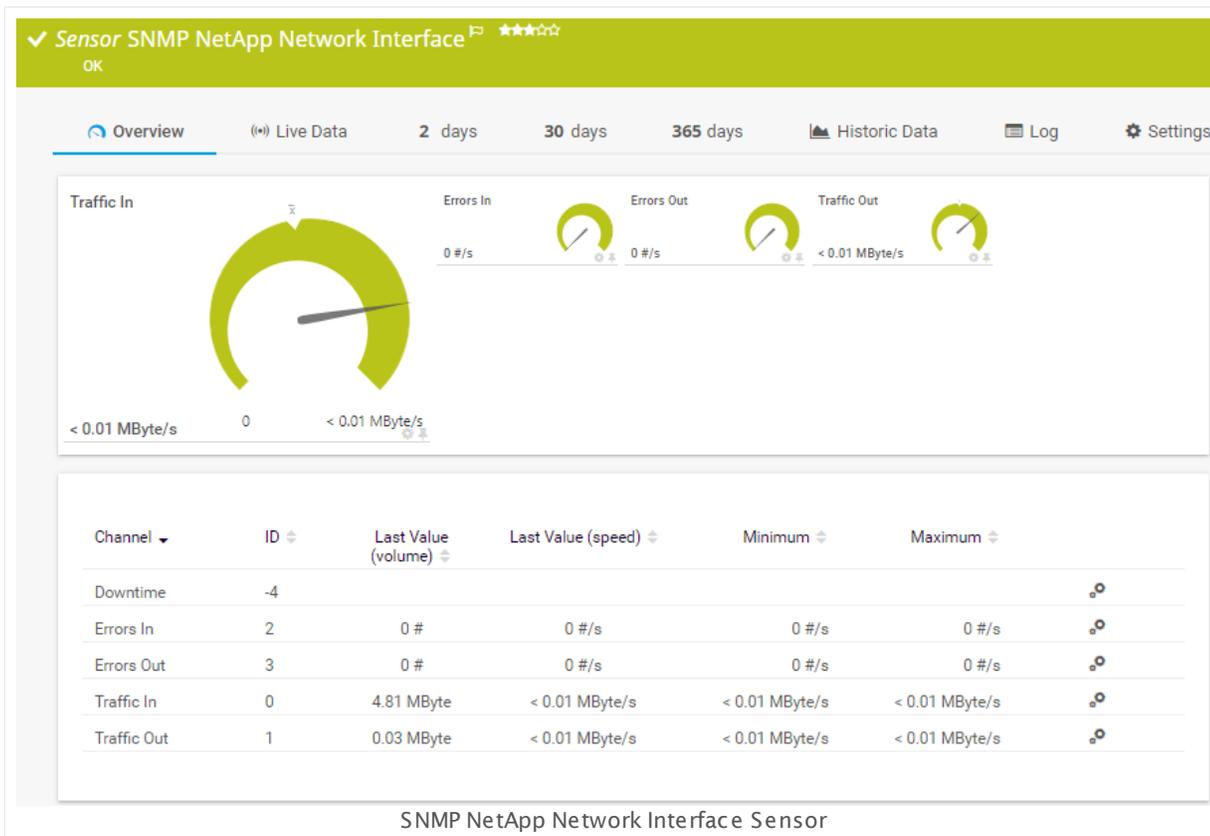

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.178 SNMP NetApp Network Interface Sensor

The SNMP NetApp Network Interface sensor monitors a network card of a NetApp storage system via Simple Network Management Protocol (SNMP).

It can show the following:

- Traffic in
- Traffic out
- Number of errors per second (in and out).

Sensor in Other Languages

Dutch: **SNMP NetApp Network Interface**, French: **Interface réseau NetApp SNMP**, German: **SNMP NetApp Netzwerkschnittstelle**, Japanese: **SNMP NetApp** ? ? ? ? ? ? ? ? ? ? ? ? ? ? , Portuguese: **Interface de rede SNMP NetApp**, Russian: **Сетевой интерфейс NetApp по SNMP**, Simplified Chinese: **SNMP NetApp** ? ? ? ? , Spanish: **SNMP Interface de red NetApp**

Remarks

- This sensor type only supports NetApp versions up to 8.2.
- If you use NetApp cDOT 8.3 or NetApp ONTAP 9.0 or later, we recommend that you use the [NetApp NIC sensor](#) ¹³⁴⁵ instead.

- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the network interfaces on the NetApp you want to monitor. PRTG will create one sensor for each interface you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

NETAPP NETWORK INTERFACE SETTINGS

Network Interface Select the interfaces you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)^[181], as well as in [alarms](#)^[213], [logs](#)^[228], [notifications](#)^[3216], [reports](#)^[3262], [maps](#)^[3270], [libraries](#)^[3235], and [tickets](#)^[230].

Parent Tags Shows [Tags](#)^[139] that this sensor [inherits](#)^[140] from its [parent device, group, and probe](#)^[133]. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

- Tags** Enter one or more [Tags](#)^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.
- You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.
-  It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).
- Priority** Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP NETWORK INTERFACE SETTINGS

- Network Interface** Shows the name of the interface that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

i Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

i This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

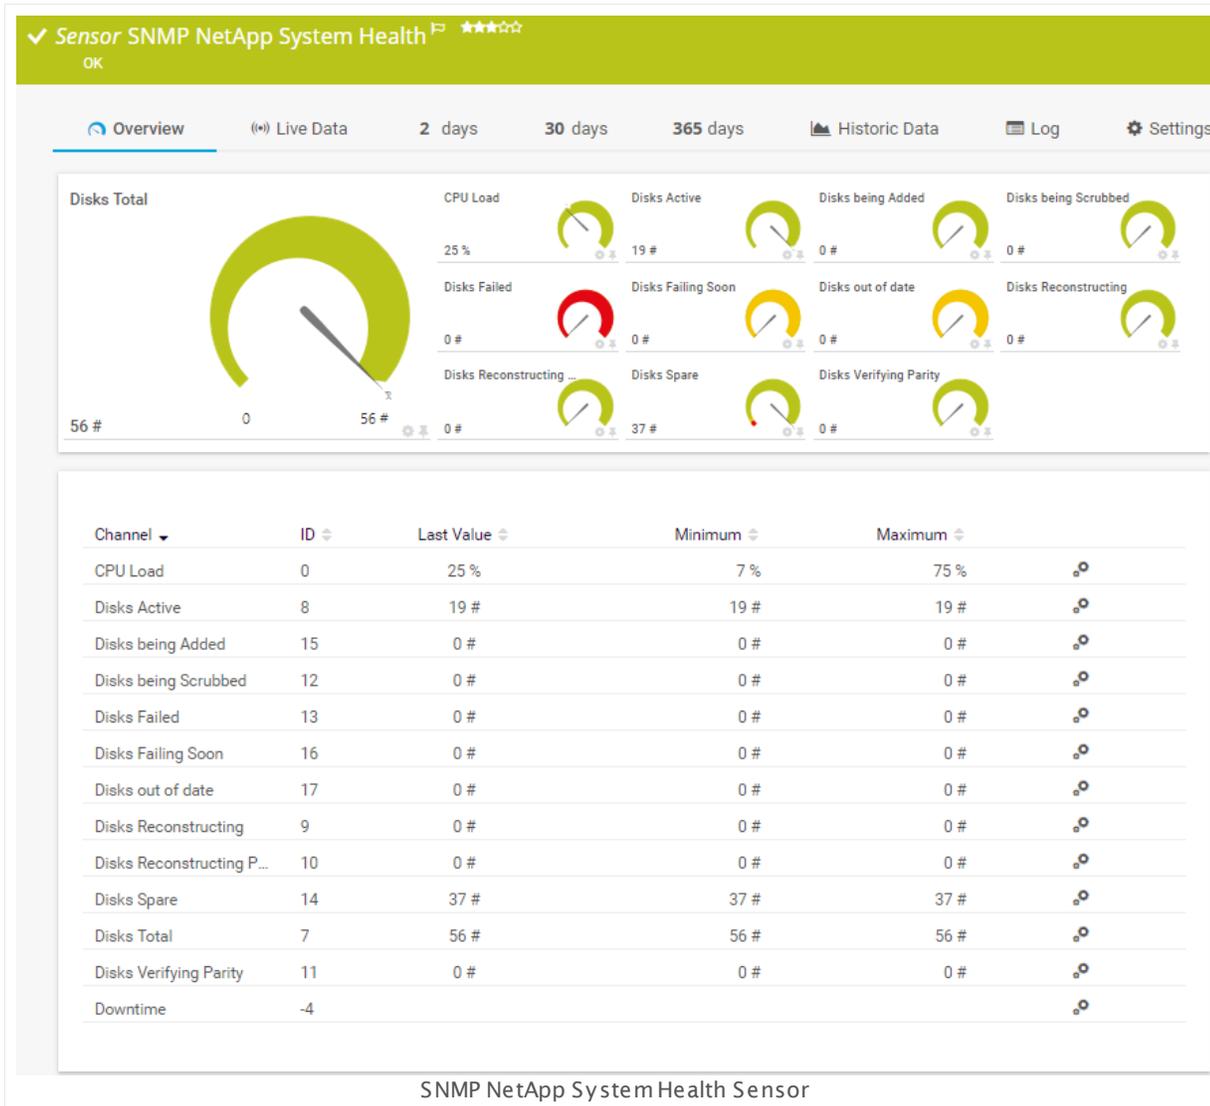

7.8.179 SNMP NetApp System Health Sensor

The SNMP NetApp System Health sensor monitors the status of a NetApp storage system via Simple Network Management Protocol (SNMP).

It can show the following:

- CPU load in percent
- Number of active restores
- Number of current CIFS users
- Number of active disks
- Number of disks being added
- Number of disks being scrubbed
- Number of failed disks
- Number of soon failing disks
- Number of disks being out of date
- Number of reconstructing (parity) disks
- Number of spare disks
- Total number of disks
- Number of verifying (parity) disks
- Number of failed fans
- Number of failed power supplies
- Maximum used disk space in percent
- Maximum used INodes in percent
- If the environment is over temperature

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **SNMP NetApp Systeemstatus**, French: **Intégrité du système Net App SNMP**, German: **SNMP NetApp Systemzustand**, Japanese: **SNMP NetApp ? ? ? ? ? ? ?**, Portuguese: **Funcionamento do sistema SNMP NetApp**, Russian: **Работоспособность системы NetApp по SNMP**, Simplified Chinese: **SNMP NetApp ? ? ? ? ? ? ?**, Spanish: **SNMP Salud de sistema NetApp**

Remarks

- If you use NetApp cDOT 8.3 or NetApp ONTAP 9.0 or later, we recommend that you use the [NetApp System Health sensor](#)¹³⁷⁹ instead.
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)³⁴⁸⁹.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

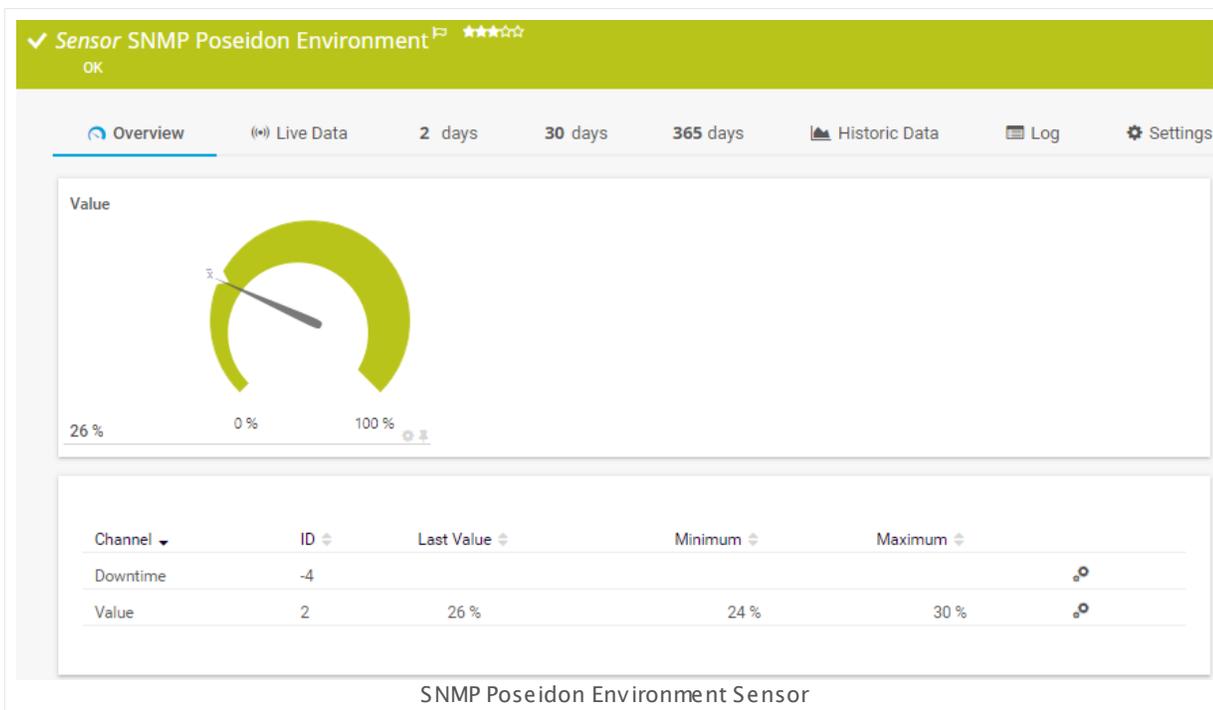

7.8.180 SNMP Poseidon Environment Sensor

The SNMP Poseidon Environment sensor monitors performance counters for environmental measurements on Poseidon hardware via Simple Network Management Protocol (SNMP).

It can show, depending on available measurement components on the hardware device and what measurement you choose:

- Humidity
- Temperature

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **SNMP Poseidon Omgeving**, French: **Environnement Poseidon SNMP**, German: **SNMP Poseidon-Umgebung**, Japanese: **SNMP Poseidon ? ? ? ?**, Portuguese: **Ambiente Poseidon SNMP**, Russian: **Окружающая среда Poseidon по SNMP**, Simplified Chinese: **SNMP Poseidon ? ?**, Spanish: **Entorno Poseidon con SNMP**

Remarks

- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#) 3489.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

To monitor performance counters for environmental measurements on Poseidon hardware, PRTG will create one sensor for each measuring point you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

POSEIDON ENVIRONMENT SPECIFIC

Measuring Point Select the measurements you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags¹³⁹, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited¹⁴⁰ from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

POSEIDON ENVIRONMENT SPECIFIC

Name	Shows further information about the measurement. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Unit	
Measuring Point	

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none">▪ Show channels independently (default): Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#).

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

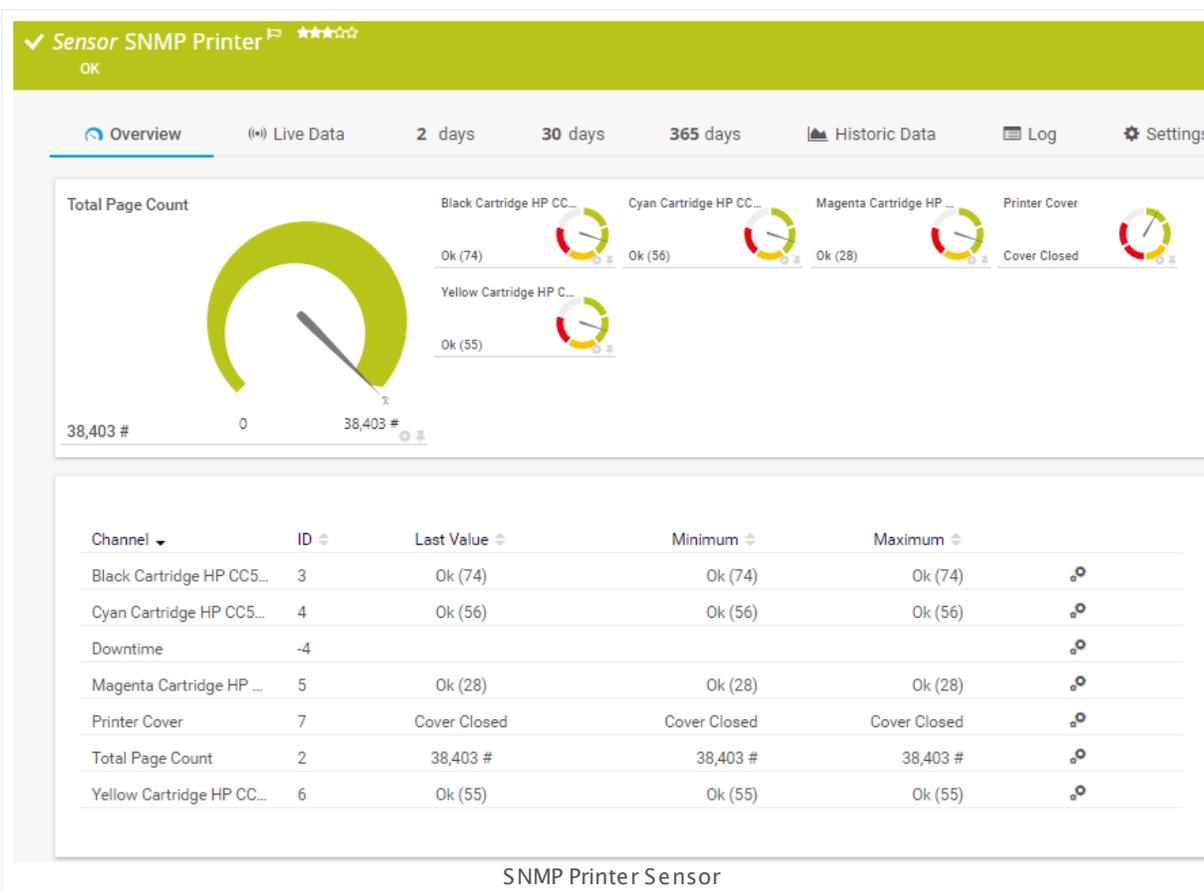

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.181 SNMP Printer Sensor

The SNMP Printer sensor is a generic sensor that monitors various types of printers via Simple Network Management Protocol (SNMP).

It can show the following:

- Total number of printed pages
- Fill level of cartridges and toners
- Status of the printer cover
- Additionally, the sensor shows the printer status as sensor message.

Sensor in Other Languages

Dutch: **SNMP Printer**, French: **Imprimante SNMP**, German: **SNMP-Drucker**, Japanese: **SNMP ? ? ? ?**, Portuguese: **Impressora de SNMP**, Russian: **Принтер по SNMP**, Simplified Chinese: **SNMP ? ? ?**, Spanish: **Impresora de SNMP**

Remarks

- This sensor type supports the following printers, among others: HP OfficeJet printers, HP LaserJet printers, RICOH SP 5200, SP 3410, SP C242DN, MP C3003, MP C2503

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.
- If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:
- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
-  Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
-  If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
-  If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

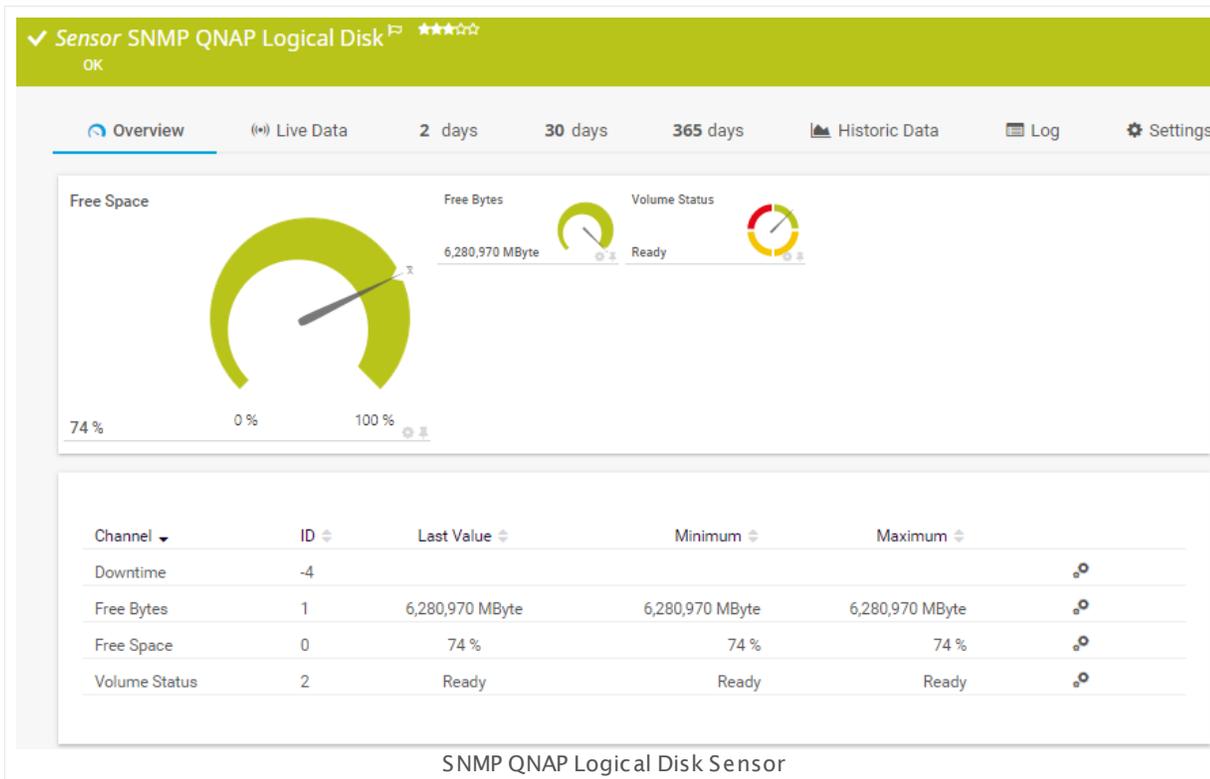

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.182 SNMP QNAP Logical Disk Sensor

The SNMP QNAP Logical Disk sensor monitors a logical disk in a QNAP Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP).

It can show the following:

- Free disk space in percent
- Free disk space in bytes
- Status of the volume
 - **Up status** ¹⁹⁵: ready
 - **Warning** status: rebuilding, in degraded mode, synchronizing
 - **Down** status: failure

Sensor in Other Languages

Dutch: **SNMP QNAP Logische Schijf**, French: **Disque logique QNAP SNMP**, German: **SNMP QNAP Logischer Datenträger**, Japanese: **SNMP QNAP ? ? ? ? ?**, Portuguese: **Disco lógico QNAP SNMP**, Russian: **Логический диск QNAP по SNMP**, Simplified Chinese: **SNMP QNAP ? ? ?**, Spanish: **Disco lógico de QNAP con SNMP**

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the logical disks in the QNAP NAS you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

QNAP NAS SETTINGS

Disk	Select the logical disks you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

QNAP NAS SETTINGS

Disk	Shows further information about the disk that this sensor monitors. Once a sensor is created, you cannot change this value.
Description	It is shown for reference purposes only. If you need to change this, please add the sensor anew.
File System	

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
182 SNMP QNAP Logical Disk Sensor

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

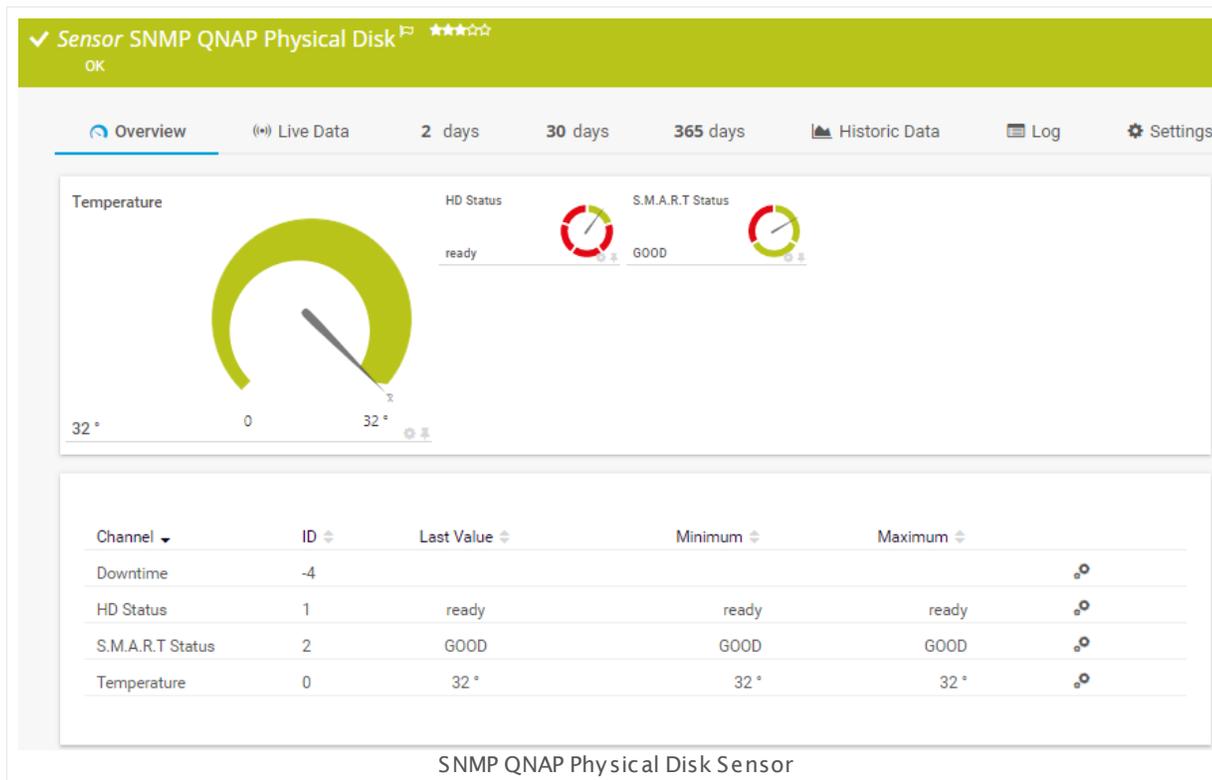

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.183 SNMP QNAP Physical Disk Sensor

The SNMP QNAP Physical Disk sensor monitors a physical disk in a QNAP Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP).

It can show the following:

- Temperature
- Disk status
- Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.) status of the disk.

Sensor in Other Languages

Dutch: **SNMP QNAP Fysieke Schijf**, French: **Disque physique QNAP SNMP**, German: **SNMP QNAP Physikalischer Datenträger**, Japanese: **SNMP QNAP ? ? ? ? ? ?**, Portuguese: **Disco físico QNAP SNMP**, Russian: **Физический диск QNAP по SNMP**, Simplified Chinese: **SNMP QNAP ? ? ? ?**, Spanish: **Disco físico de QNAP con SNMP**

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#) [3693].

- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the physical disks in the QNAP NAS you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. You can also define the unit of the temperature measurement. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

QNAP NAS SETTINGS

Disk	Select the physical disks you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
Unit	Select the unit of the temperature measurement. Choose between Celsius and Fahrenheit .

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

QNAP NAS SETTINGS

Disk	Shows further information about the disk. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Description	
Model	
Capacity	
Unit	

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

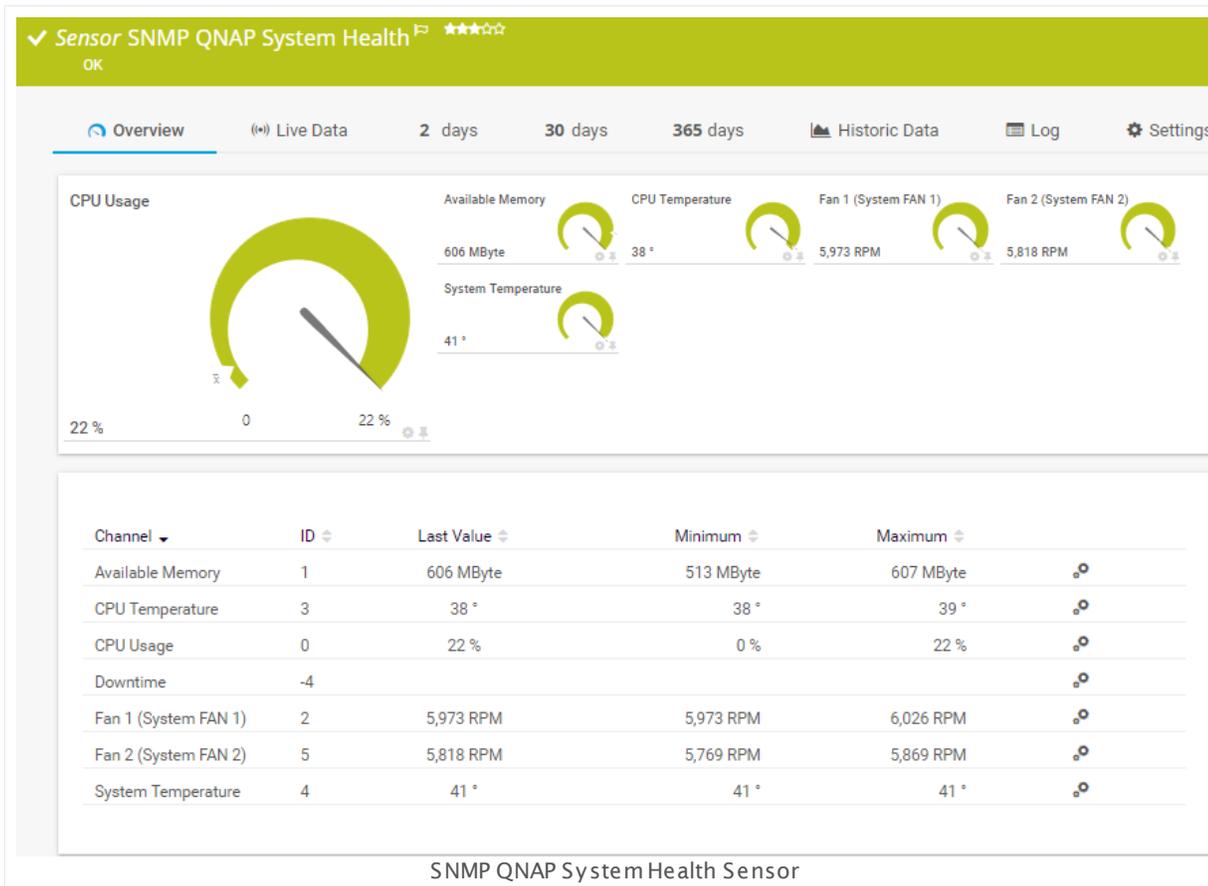

7.8.184 SNMP QNAP System Health Sensor

The SNMP QNAP System Health sensor monitors the system health of a QNAP Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP).

It can show the following, depending on the available measurement components:

- CPU usage in percent
- Available memory in bytes
- Temperature of CPU
- Temperature of system
- Revolutions of fans per minute (RPM)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **SNMP QNAP Systeemstatus**, French: **État du système QNAP SNMP**, German: **SNMP QNAP Systemzustand**, Japanese: **SNMP QNAP ? ? ? ? ? ? ?**, Portuguese: **Funcionamento do sistema QNAP SNMP**, Russian: **Работоспособность системы QNAP по SNMP**, Simplified Chinese:

SNMP QNAP ? ? ? ? ? , Spanish: **Salud del sistema de QNAP con SNMP**

Remarks

- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

To monitor the system health of a QNAP NAS, specify the unit of the temperature measurement.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

QNAP NAS SETTINGS

Unit Select the unit of the temperature measurement. Choose between **Celsius** and **Fahrenheit**.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)^[181], as well as in [alarms](#)^[219], [logs](#)^[228], [notifications](#)^[3216], [reports](#)^[3252], [maps](#)^[3276], [libraries](#)^[3235], and [tickets](#)^[230].

BASIC SENSOR SETTINGS

Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

QNAP NAS SETTINGS

Unit	Shows the unit of temperatures as monitored with this sensor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
------	--

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

184 SNMP QNAP System Health Sensor

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.185 SNMP RMON Sensor

The SNMP RMON sensor monitors traffic on a device using the Remote Monitoring (RMON) standard via Simple Network Management Protocol (SNMP). You can create it on an SNMP compatible device that provides traffic data via RMON. Depending on the data returned by your device, traffic data for each port can be displayed in different channels, allowing detailed analysis. If available, the sensor queries 64-bit counters.

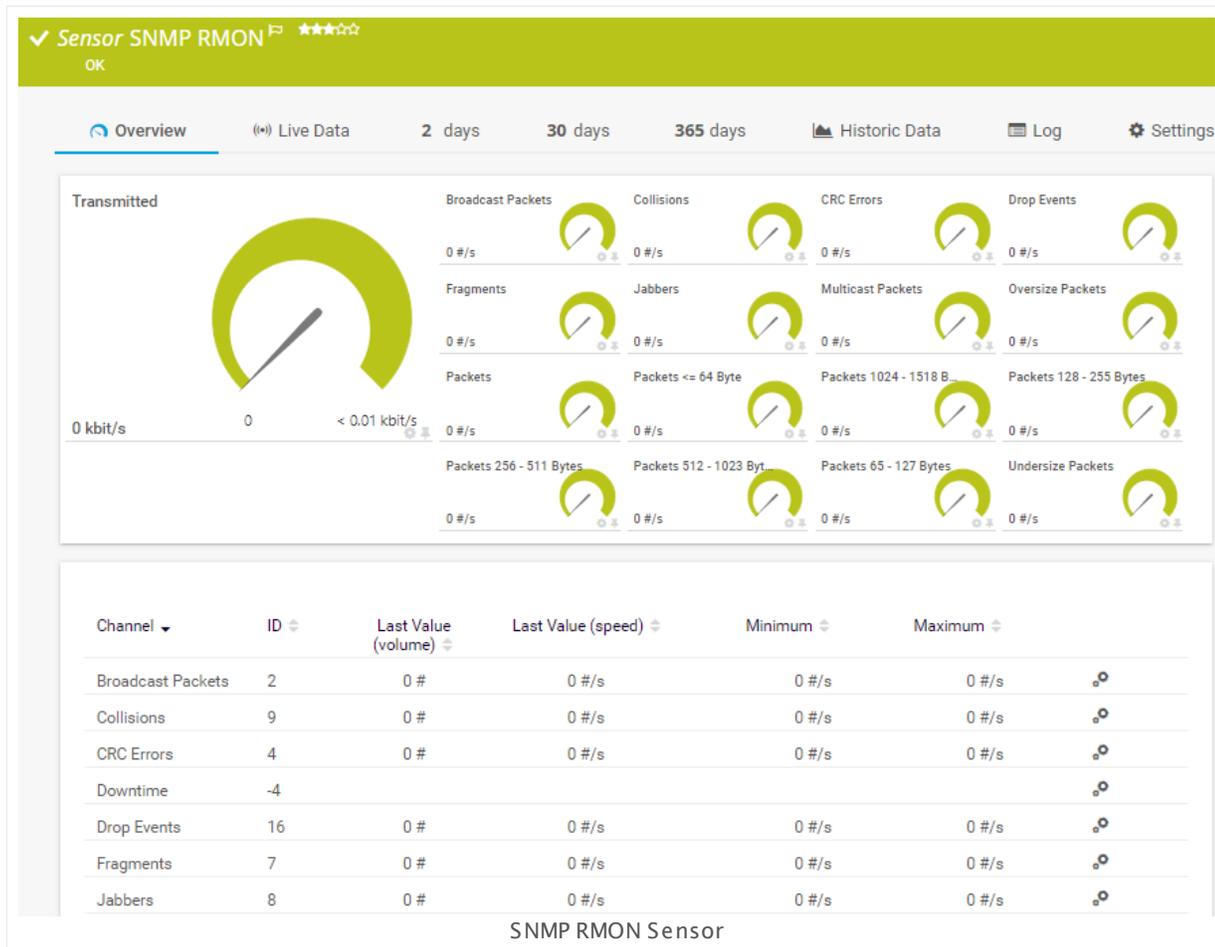

For each port, the sensor can show, for example:

- Transmitted kbit/s
- Packets (#/s)
- Broadcast Packets (#/s)
- Multicast Packets (#/s)
- CRC Errors (#/s)
- Undersize Packets (#/s)
- Oversize Packets (#/s)
- Fragments (#/s)
- Jabbers (#/s)
- Collisions (#/s)
- Packets <= 64 Byte (#/s)
- Packets 65 - 127 Bytes (#/s)
- Packets 128 - 255 Bytes (#/s)
- Packets 256 - 511 Bytes (#/s)
- Packets 512 - 1023 Bytes (#/s)
- Packets 1024 - 1518 Bytes (#/s)
- Drop Events (#/s)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

185 SNMP RMON Sensor

Remarks

- You can define the displayed sensor name with port name templates in the [SNMP Compatibility Options](#)^[416] of the parent device.
- It might not work to query data from a probe device via SNMP (querying `localhost`, `127.0.0.1`, or `:::1`). [Add this device to PRTG](#)^[317] with the IP address that it has in your network and create the SNMP sensor on this device instead.
- Knowledge Base: [What value does the "Transmitted" channel of an RMON sensor show?](#)
- Knowledge Base: [How do PRTG's automatic port name and number updates work for SNMP traffic sensors?](#)
- Knowledge Base: [Where is the volume line in graphs?](#)
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the ports you want to monitor. PRTG will create one sensor for each port you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

RMON SPECIFIC

Ports Select the ports you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags¹³⁹, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited¹⁴⁰ from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

RMON SPECIFIC

Port	<p>Shows the number of the interface port in your physical device that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p>
Channel Mask	<p>Describes which channels are available and might be useful for technical support. This setting is shown for your information only and cannot be changed here.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how to show different channels for this sensor.</p>

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ You cannot use this option in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰). Manual scaling is not possible if you choose this option.
- **Show in and out traffic as positive and negative area chart:** Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way.
 - ⓘ You cannot use this option in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰). Manual scaling is not possible if you choose this option.
 - ⓘ You cannot show a positive/negative chart for a channel if you choose to display its data in percent of maximum (available in the [Sensor Channels Settings](#)³¹⁶⁰).

Stack Unit

This setting is only available if you choose **Stack channels on top of each other** above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

SCANNING INTERVAL

- Scanning Interval** Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#) on PRTG on premises installations.
- If a Sensor Query Fails** Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:
- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

7.8.186 SNMP SonicWall System Health Sensor

The SNMP SonicWall System Health sensor monitors health values of a Dell SonicWall Network Security Appliance (NSA) via Simple Network Management Protocol (SNMP).

It shows the following:

- CPU usage in percent
- Memory usage in percent
- Connection cache usage in percent

Sensor in Other Languages

Dutch: **SNMP SonicWall System Health**, French: **État du système SNMP SonicWall**, German: **SNMP SonicWall Systemzustand**, Japanese: **SNMP SonicWall** ? ? ? ? ? ? ? , Portuguese: **Funcionamento do sistema SonicWall SNMP**, Russian: **Работоспособность системы SonicWall по SNMP**, Simplified Chinese: **SNMP SonicWall** ? ? ? ? ? ? ? , Spanish: **Salud del sistema de SonicWall de SNMP**

Remarks

- Knowledge Base: [Why does PRTG write error messages into my SonicWALL log?](#)
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#) [3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

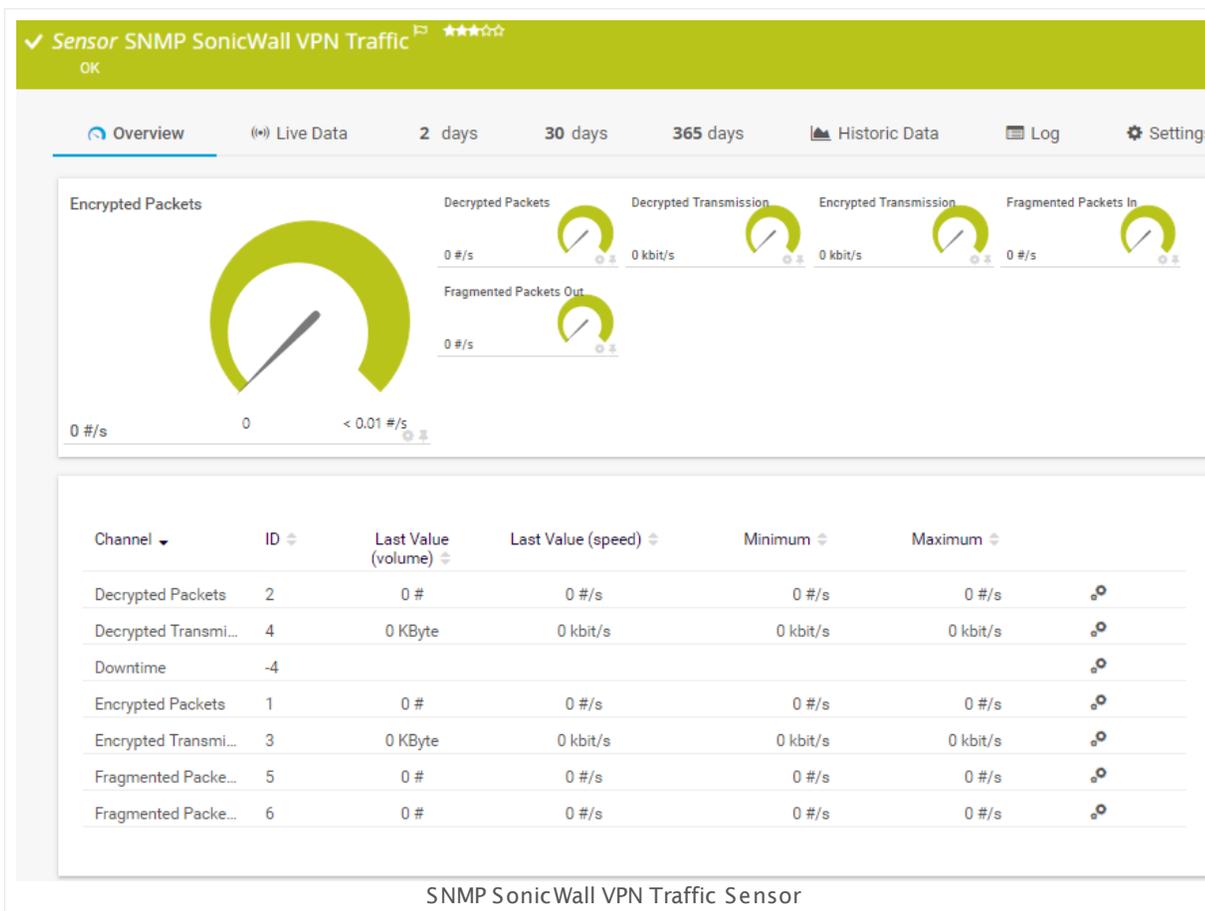

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.187 SNMP SonicWall VPN Traffic Sensor

The SNMP SonicWall VPN Traffic sensor monitors the traffic of an Internet Protocol Security (IPsec) Virtual Private Network (VPN) on a Dell SonicWall Network Security Appliance (NSA) via Simple Network Management Protocol (SNMP).

It can show the following:

- Number of encrypted and decrypted packets per second
- Bytes of encrypted and decrypted transmissions per second
- Number of ingoing and outgoing fragmented packets per second

Sensor in Other Languages

Dutch: **SNMP SonicWall VPN Verkeer**, French: **Traffic VPN SonicWall SNMP**, German: **SNMP SonicWall VPN-Datenverkehr**, Japanese: **SNMP SonicWall VPN** , Portuguese: **Tráfego VPN SonicWall via SNMP**, Russian: **Трафик VPN SonicWall по SNMP**, Simplified Chinese: **SNMP SonicWall VPN** , Spanish: **Tráfico SNMP de VPN SonicWall**

Remarks

- Knowledge Base: [Why does PRTG write error messages into my SonicWALL log?](#)

- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the connections of the SonicWall VPN you want to monitor. PRTG will create one sensor for each connection you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SONICWALL VPN SPECIFIC

Connections	Select the connections you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
Identification Method	Define how you want to identify the connection that you want to monitor. PRTG always uses the first connection found that matches all criteria. Choose between: <ul style="list-style-type: none">▪ By index: Every connection has a unique index. This is the safest method to identify your connection. Though, if the connection is lost and reconnected, a new index will be assigned.▪ By remote IP: If the target of the VPN always has the same IP, you can use this IP to identify the connection.▪ By security policy name: If you use a different security policy for every VPN, you can use its name to identify the connection.▪ By remote IP and security policy name: You can also combine both identification methods.▪ By remote IP, security policy name, and IP ranges: If you use separate connections for specific IP ranges, identify the connection by remote IP, security policy name, and IP ranges.▪ By IP ranges: Use IP ranges only to identify the connection.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SONICWALL VPN SPECIFIC

Security Policy	Shows information about the monitored connection. Once a sensor is created, you cannot change this value. It is shown for reference purposes only.
Remote IP	If you need to change this, please add the sensor anew.
Source IPs	

SONICWALL VPN SPECIFIC

Destination IPs

Index

Identification Method

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ³³⁵ on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to Down status¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none"> ▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request. ▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests. ▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests. ▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests. ▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> <p> If a channel uses lookup³⁶⁹³ values, it will always show a Down status immediately, so no "wait" options will apply.</p> |

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>[3311]</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

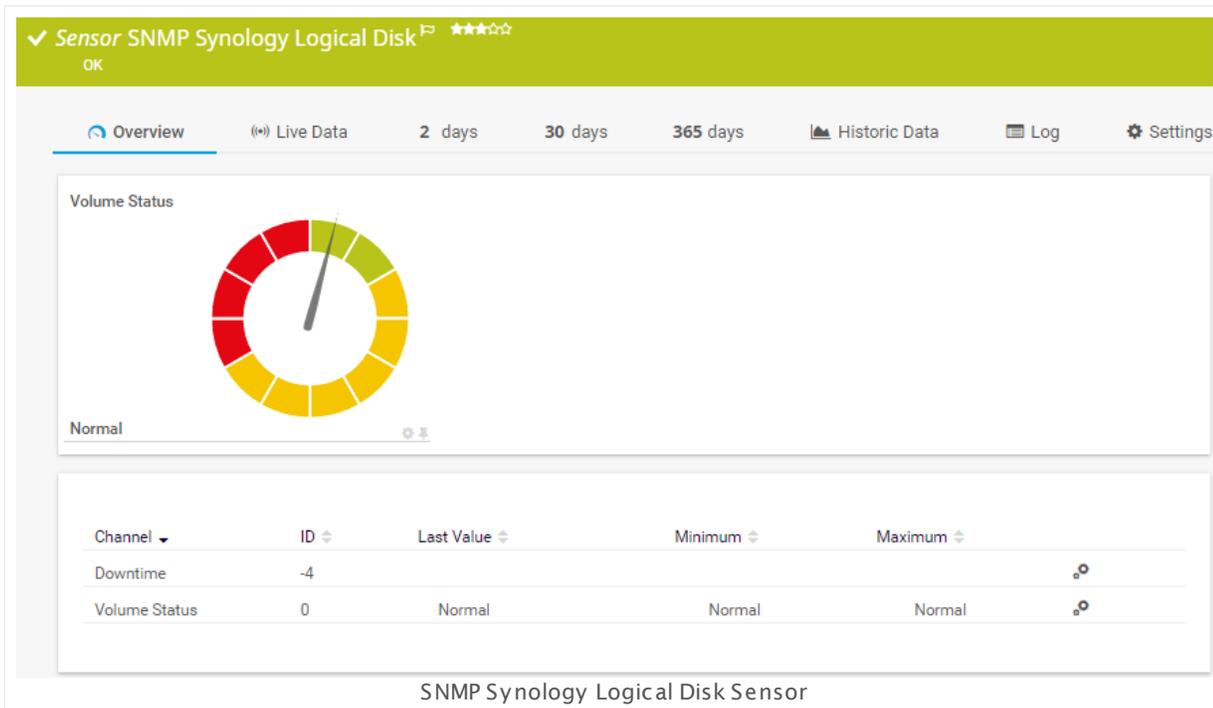

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.188 SNMP Synology Logical Disk Sensor

The SNMP Synology Logical Disk sensor monitors a logical disk in a Synology Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP).

- It can show the status of a volume.

Sensor in Other Languages

Dutch: **SNMP Synology Logische Schijf**, French: **Disque logique Synology SNMP**, German: **SNMP Synology Logischer Datenträger**, Japanese: **SNMP Synology** , Portuguese: **Disco lógico Synology SNMP**, Russian: **Логический диск Synology по SNMP**, Simplified Chinese: **SNMP Synology** , Spanish: **Disco lógico de Synology con SNMP**

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the logical disks in the Synology NAS that you want to monitor. PRTG will create one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SYNOLOGY NAS SETTINGS

Disk Select the logical disks you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) [402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#) [181], as well as in [alarms](#) [219], [logs](#) [228], [notifications](#) [3216], [reports](#) [3252], [maps](#) [3276], [libraries](#) [3235], and [tickets](#) [230].

Parent Tags Shows [Tags](#) [139] that this sensor [inherits](#) [140] from its [parent device, group, and probe](#) [133]. This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#) [139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) [140] from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SYNOLOGY NAS SETTINGS

Disk Shows further information about the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Name

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

i This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#) settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies <small>3209</small> in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

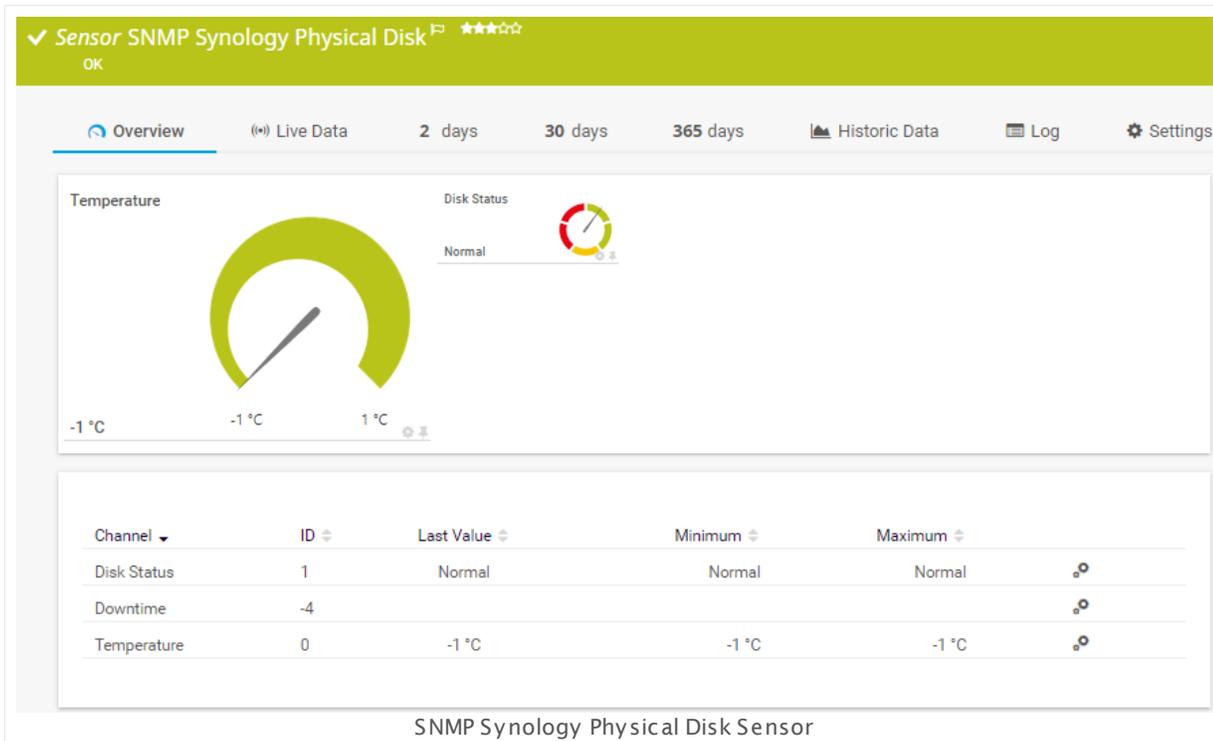

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.189 SNMP Synology Physical Disk Sensor

The SNMP Synology Physical Disk sensor monitors a physical disk in a Synology Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP).

It can show the following:

- Temperature
- Disk status

Sensor in Other Languages

Dutch: **SNMP-Synology Fysieke Schijf**, French: **Disque physique Synology SNMP**, German: **SNMP Synology Physikalischer Datenträger**, Japanese: **SNMP Synology ? ? ? ? ? ?**, Portuguese: **Disco físico Synology SNMP**, Russian: **Физический диск Synology по SNMP**, Simplified Chinese: **SNMP Synology ? ? ? ?**, Spanish: **Disco físico de Synology con SNMP**

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the physical disks in the Synology NAS you want to monitor. PRTG will create one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SYNOLOGY NAS SETTINGS

Disk Select the physical disks you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags¹³⁹, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited¹⁴⁰ from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

SYNOLOGY NAS SETTINGS

Disk	Shows further information about the disk that this sensor monitors. Once a sensor is created, you cannot change this value.
Name	It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Model	
Type	

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.190 SNMP Synology System Health Sensor

The SNMP Synology System Health sensor monitors the system health of a Synology Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP).

It can show the following, depending on the available measurement components:

- Temperature (if available on the target device)
- System status
- Power status
- Fan status
- Memory usage in percent
- CPU load in percent

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

 For more information about the shown memory and CPU load values, see the Knowledge Base: [Why does my Synology System Health sensor show incorrect CPU and memory values?](#)

Remarks

- Knowledge Base: [Why does my Synology System Health sensor show incorrect CPU and memory values?](#)
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3276] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

- Tags** Enter one or more [Tags](#)^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.
- You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.
- i** It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).
- Priority** Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
- i** You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
- i** This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)^[3160] settings).
- Stack Unit** This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

7.8.191 SNMP System Uptime Sensor

The SNMP System Uptime sensor monitors the time a device is running via Simple Network Management Protocol (SNMP).

- It reads the system uptime value of the monitored device and shows it.

Sensor in Other Languages

Dutch: **SNMP System Uptime**, French: **Disponibilité du système SNMP**, German: **SNMP-Laufzeit**, Japanese: **SNMP ? ? ? ? ? ? ? ?**, Portuguese: **Tempo de atividade do sistema SNMP**, Russian: **Время бесперебойной работы системы по SNMP**, Simplified Chinese: **SNMP ? ? ? ? ? ? ? ?**, Spanish: **Disponibilidad SNMP**

Remarks

- It might not work to query data from a probe device via SNMP (querying `localhost`, `127.0.0.1`, or `:::1`). [Add this device to PRTG](#) with the IP address that it has in your network and create the SNMP sensor on this device instead.
- Knowledge Base: [Why does the SNMP System Uptime sensor report wrong values?](#)
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
191 SNMP System Uptime Sensor

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.192 SNMP Traffic Sensor

The SNMP Traffic sensor monitors traffic on a device using Simple Network Management Protocol (SNMP). You can create it on a device that provides traffic data, one traffic sensor for each individual port.

It can show the following:

- Traffic in
- Traffic out
- Traffic total

You can also add additional channels:

- Errors in and out
- Discards in and out
- Unicast packets in and out
- Non unicast packets in and out
- Multicast packets in and out
- Broadcast packets in and out
- Unknown protocols

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

192 SNMP Traffic Sensor

Sensor in Other Languages

Dutch: **SNMP Verkeer**, French: **Traffic SNMP**, German: **SNMP-Datenverkehr**, Japanese: **SNMP ? ? ? ? ?**, Portuguese: **Tráfego SNMP**, Russian: **Трафик по SNMP**, Simplified Chinese: **SNMP ? ?**, Spanish: **SNMP tráfico**

Remarks

- You can define the displayed sensor name with port name templates in the [SNMP Compatibility Options](#) of the parent device.
- We recommend that you choose SNMP v2c (most common) or SNMP v3 in the [Credentials for SNMP Devices](#) of the parent device (if supported by the device that you monitor). SNMP v1 does not support 64-bit counters, which may result in invalid data. For details, see the Knowledge Base: [Querying 64-bit Counters with SNMP Traffic Sensors](#)
- It might not work to query data from a probe device via SNMP (querying `localhost`, `127.0.0.1`, or `:::1`). [Add this device to PRTG](#) with the IP address that it has in your network and create the SNMP sensor on this device instead.
- Knowledge Base: [How do PRTG's automatic port name and number updates work for SNMP traffic sensors?](#)
- Knowledge Base: [Where is the volume line in graphs?](#)
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the ports on SNMP devices with multiple interfaces you want to monitor. PRTG will create one sensor for each port you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

TRAFFIC SPECIFIC

Interface Number You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

 You can see the connection status of an interface in the respective table column.

 You can group-select and deselect interfaces by using the buttons **Select all connected interfaces**, **Select all disconnected interfaces**, and **Deselect all interfaces**.

Description "IN" Channel For the standard channel **Traffic In**, enter the channel name here. The sensor shows it in graphs and tables. You can change this description and the description of all other channels in the sensor [channel settings](#)³¹⁶⁰ later.

Description "OUT" Channel For the standard channel **Traffic Out**, enter the channel name here. The sensor shows it in graphs and tables. You can change this description and the description of all other channels in the sensor [channel settings](#)³¹⁶⁰ later.

Description "TOTAL" Channel For the standard channel **Traffic Total**, enter the channel name here. The sensor shows it in graphs and tables. You can change this description and the description of all other channels in the sensor [channel settings](#)³¹⁶⁰ later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

TRAFFIC SPECIFIC

Interface Number Shows the number and name of the interface in your physical device that this sensor monitors. This value is shown for reference purposes only. We strongly recommend that you only change it if Paessler support explicitly asks you to do so. Wrong usage can result in incorrect monitoring data!

Additional Channels By default, each SNMP Traffic sensor will create the channels **Traffic In**, **Traffic Out**, and **Traffic Total**. Choose additional channels for all selected interfaces. Click on the respective channel name(s) to mark them and monitor their data.

You can choose from the following additional channels:

- **Errors In & Out**: The number of in-/outbound packets that could not be delivered because of errors.
- **Discards In & Out**: The number of discarded in-/outbound packets even though no errors had been detected.
- **Unicast Packets In & Out**: The number of unicast packets that were delivered.
- **Non Unicast Packets In & Out (32-bit only)**: The number of non-unicast packets that were delivered.
- **Multicast Packets In & Out (64-bit only)**: The number of delivered packets that were addressed to a multicast address.
- **Broadcast Packets In & Out (64-bit only)**: The number of delivered packets that were addressed to a broadcast address.
- **Unknown Protocols**: The number of received packets that were discarded because of an unknown or unsupported protocol.

 Channels that are once created cannot be deleted later. You can disable them only.

Connection Status Handling Define how PRTG will react when an interface is operational. An interface that is not operational is, for example, an ethernet port on a switch with no cable plugged in. This setting is valid for all interfaces selected above. Choose between:

- **Show alarm for all "disconnected" states**: The sensor for the interface will always turn into a red **Down status**^[195] for a disconnected interface. This applies if the **ifOperStatus** of the interface is not "up".
- **Show alarm when disconnected, but ignore when deactivated**: The sensor will turn into a **Down status**^[195] for a disconnected interface only if it is not deliberately deactivated in the configuration. This applies if the **ifOperStatus** of the interface is not "up" and the **ifAdminStatus** is "up". So the sensor will keep the **Up status**^[195] when the interface has been deactivated.
- **Ignore all "disconnected" states**: The sensor will not show an alarm and the **Up** status will persist.

 Monitoring will be discontinued without notice.

Alias Availability Shows if an alias is available for automatic **port name updates**^[416]. This value is shown for reference purposes only. We strongly

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how to show different channels for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> i You cannot use this option in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings^[3160]). Manual scaling is not possible if you choose this option. ▪ Show in and out traffic as positive and negative area chart: Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way. <ul style="list-style-type: none"> i You cannot use this option in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings^[3160]). Manual scaling is not possible if you choose this option. i You cannot show a positive/negative chart for a channel if you choose to display its data in percent of maximum (available in the Sensor Channels Settings^[3160]).
Stack Unit	<p>This setting is only available if you choose Stack channels on top of each other above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

- | | |
|-------------------------|--|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ^[336] on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> |

SCANNING INTERVAL

- ❗ If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- ❗ Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- ❗ Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- ❗ To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none">▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below.▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies^[323] in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	<p>This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector^[240] to choose an object on which the current sensor will depend.</p>
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷ section.

Others

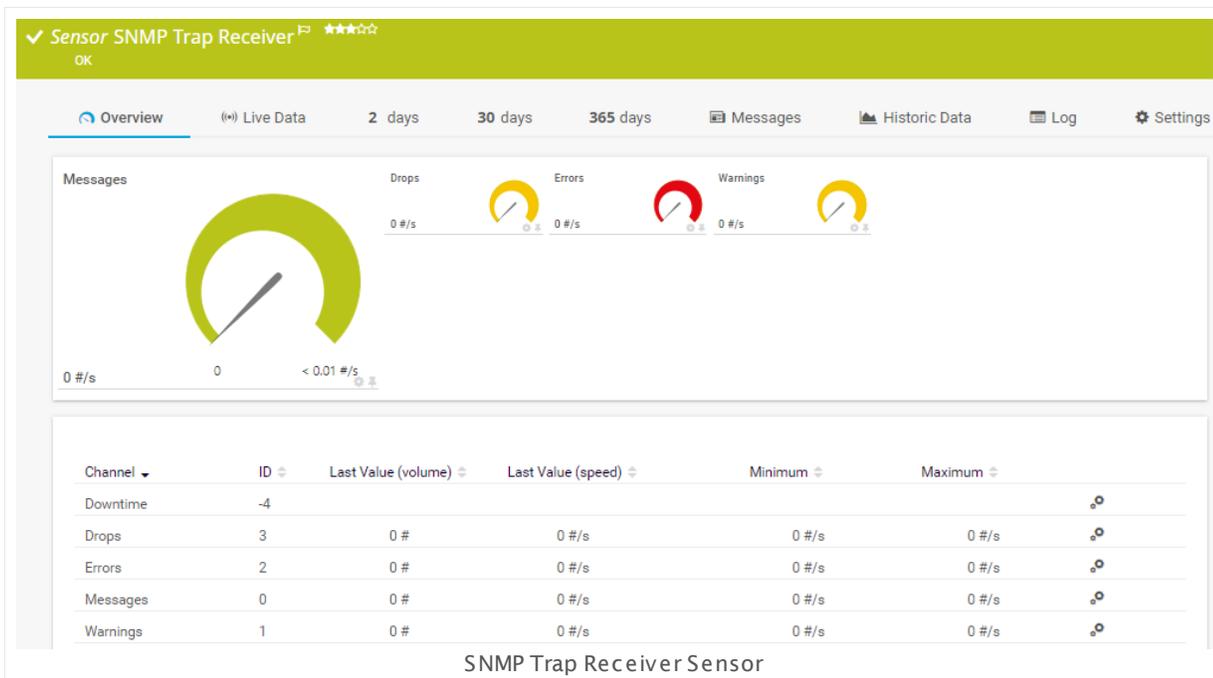

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.193 SNMP Trap Receiver Sensor

The SNMP Trap Receiver sensor receives and analyzes Simple Network Management Protocol (SNMP) traps.

It shows the following:

- Overall number of received traps per second
- Trap messages categorized as "warning" per second
- Trap messages categorized as "error" per second
- Number of dropped trap packets per second
- The actual trap messages

Sensor in Other Languages

Dutch: **SNMP Trap-ontvanger**, French: **Récepteur de trap SNMP**, German: **SNMP-Trap-Empfänger**, Japanese: **SNMP ? ? ? ? ? ?**, Portuguese: **Receptor de trap SNMP**, Russian: **Приемник ловушек SNMP**, Simplified Chinese: **SNMP ? ? ? ? ? ?**, Spanish: **Receptor SNMP Trap**

Remarks

- With the available filter options, you can define individually which types of messages the sensor will consider for monitoring, and which messages it will categorize as warning or error messages. Depending on the filters, received messages are counted in the respective channels.
- Add the sensor to the probe device to receive all messages of the system running the probe.

- Add the sensor to a specific device to receive all messages from this device directly. This makes this sensor type faster than just using source filters.
 - You can use specific placeholders in email [notification templates](#) ^[3316] to see the messages when you receive an email notification. See the Knowledge Base: [What placeholders can I use with PRTG?](#)
 - [Sensor states](#) ^[195] of this sensor type persist for one scanning interval only. If there is no warning or error message in the following scanning interval, the sensor will show an **up** status again. For a workaround, see this Knowledge Base article: [How can I configure sensors using speed limits to keep the status for more than one interval?](#)
 - If you do not add the sensor to a probe device but to another device in PRTG, be careful with the configuration: Ensure that the IP address or DNS name of the parent device matches the proper sender. For example, if you want to receive messages from a Storage Area Network (SAN), you might have to add a device to PRTG using the IP address of a specific array member that sends the messages. Providing a DNS name that points to the IP address of a whole group might not work for SANs.
 - This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
 - For a general introduction to the receiver's configuration, see manual section [Monitoring Syslogs and SNMP Traps](#) ^[3539].
 - This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.
 - In PRTG on premises you can copy the Management Information Base (MIB) file for your traps into the [\MIB subfolder of your PRTG installation](#) ^[3731] to translate the OIDs for the traps into readable messages.
 - This sensor type does not support SNMP v3 traps! Please use SNMP v1 or v2c instead.
 - Knowledge Base: [How do I test an SNMP Trap Receiver Sensor?](#)
 - For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#) ^[3489].
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.
-  PRTG hosted by Paessler does not support the import of MIB files. The SNMP Trap Receiver sensor will only consider the MIBs that PRTG includes by default.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) ^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SNMP TRAP SPECIFIC

Listen on Port	Enter the number of the port on which the sensor waits for SNMP traps. The default port is 162 . Please enter an integer value. We recommend that you use the default value.
Purge Messages After	Define for how long PRTG will store received trap messages for analysis. Choose a period of time from the dropdown list.

FILTER

Include Filter	<p>Define if you want to filter traps. If you leave this field empty or use the keyword "any", the sensor will process all data. This is the default setting. To include specific types of traps only, define filters using a special syntax.</p> <p> For more information, see section Filter Rules .</p>
Exclude Filter	<p>Define which types of traps the sensor will discard and not process. To exclude specific types of traps, define filters using a special syntax.</p> <p> For more information, see section Filter Rules .</p>
Warning Filter	<p>Define which types of traps count for the Warnings channel. To categorize received traps as warning messages, define filters using a special syntax.</p> <p> For more information, see section Filter Rules .</p> <p> Messages are collected until a scanning interval ends. As long as the scanning interval is running, no status change will happen. By default, the sensor will turn into a Warning status  after a scanning interval has finished and there was at least one warning message (and no error message) during this interval. The status will remain Warning at least until the succeeding scanning interval has finished. If the sensor did not receive any warning or error message in this scanning interval, its status will turn Up again after the interval.</p>
Error Filter	<p>Define which types of traps count for the Errors channel. To categorize received traps as error messages, define filters using a special syntax.</p> <p> For more information, see section Filter Rules .</p> <p> Messages are collected until a scanning interval ends. As long as the scanning interval is running, no status change will happen. By default, the sensor will turn into a Down status  after a scanning interval has finished and there was at least one error message during this interval. The status will remain Down at least until the succeeding scanning interval has finished. If the sensor did not receive any warning or error message in this scanning interval, its status will turn Up again after the interval.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

DEBUGGING

Log Data to Disk Define if the probe will write a logfile of the received data to the data folder (see section [Data Storage](#)³⁷⁴) to the disk for debugging purposes. Choose between:

- **Off (recommended):** Do not write additional logfiles. Recommended for normal use cases.
- **On:** Write logfiles for all data received.

 Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

Filter Rules for Traps

Filter rules are used for the include, exclude, warning, and error definition fields of the Trap Receiver sensor. They are based on the following format:

```
field[filter]
```

You can use various filters suitable to your needs. Include and exclude filters define which traps to monitor. Warning and error filters define how to categorize received traps. Provide these filters in the sensor settings as formulas. Formulas are fields that you can combine with boolean operators (**AND**, **OR**, **NOT**) and brackets.

FIELD	PARAMETER	EXAMPLES
source [ip]	Enter an IP address where the UDPs come from; IP masks and ranges are also possible.	source[10.0.23.50], source[10.0.23.10-50], source[10.0.23.10/255]
agent [ip]	Enter an IP address that specifies the object that creates the SNMP trap. Only v1 is supported.	agent[10.0.0.1]
enterprise [oid]	Enter an OID that specifies the object that originates the trap. Only v1 is supported.	enterprise [1.3.6.1.4.1.2.6.182.1.2.3 1.1.0]
bindings [text]	Enter a substring to match all OIDs and values in the bindings.	bindings[ERROR], bindings [1.3.6.1.4.1.2.6.182.1.2.3 1.1.0], bindings["port blocked"]
<p>i It is not necessary to use quotation marks (") to find strings, they will be internally removed.</p>		
bindings [oid,value]	Enter an OID and a substring to match a value in the given OID. Separate OID and value with a comma.	bindings [1.3.6.1.4.1.2.6.182.1.2.3 1.1.0,error]
gentrap [number]	Enter a number that specifies the generic trap type. Ranges are also possible.	gentrap[3], gentrap[2-6]
spectrap [number]	Enter a number that defines the specific trap code. Ranges are also possible.	spectrap[4], spectrap[0-3]
version [number]	Enter a number (1 or 2) that specifies the SNMP version.	version[1], version[2]
community [text]	Enter a community string for exact, case sensitive match.	community[public], community[private]

Messages Tab: Review and Analyze Traps

PRTG stores received traps as common files in the data folder (see section [Data Storage](#)). To review and analyze all received messages, you can access the most recent data directly in a [table list](#) in the PRTG web interface. You can access this list via the **Overview** tab of the sensors.

i Received traps are only shown after an (automatic) page refresh following to a sensor scan in the table on the **Overview** tab (default for [auto refresh](#) is 30 seconds).

For more details and further filter options, click the **Messages** tab of the SNMP Trap Receiver sensor. You will see all received messages in a [table list](#). On the top, you have display filter options to drill down into the data for specific events of your interest. The filters are the same as available in the sensor settings, but you can define them without using formulas. Provide the desired parameters and PRTG loads the filtered list automatically.

- ❶ Boolean operators are automatically applied to the filters in the following manner: the parameters across all columns are combined with **AND**, and the parameters within a single column are combined with **OR**.
- ❷ The parameters entered into the filters have to match **exactly** the parameters in the message. They are case sensitive!
- ❸ You can automatically add a filter by clicking the content of a column.

Advanced Filter Settings

You can open advanced filter settings with by clicking the gear icon in the **Filter** row. The **Advanced Filter** will appear in a popup window. In the text field, you can define a filter using the syntax as described in section [Filter Rules for Traps](#)²⁴⁸⁸.

If you have provided filter parameters on the **Messages** tab, the advanced filter will already include them as a corresponding formula with the correct syntax. You can adjust this filter to your needs. You can also copy the automatically created and manually adjusted formula for usage in the filter fields of the sensor settings.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

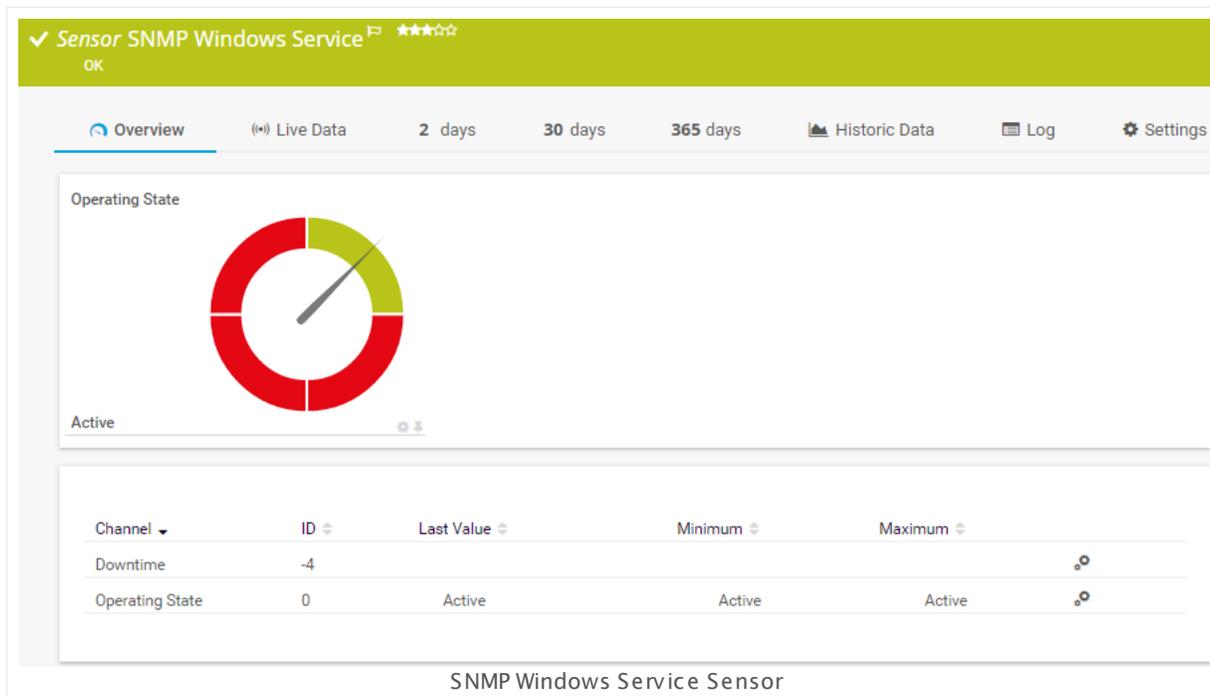

7.8.194 SNMP Windows Service Sensor

The SNMP Windows Service sensor monitors a Windows service via Simple Network Management Protocol (SNMP).

- It shows the operating status of the monitored service.

Operating states can be:

- Active ([sensor status](#)^[195] **Up**)
- Continue-Pending
- Pause-Pending
- Paused (all with sensor status **Down**)

Sensor in Other Languages

Dutch: **SNMP Windows Service**, French: **Service Windows SNMP**, German: **SNMP Windows-Dienst**, Japanese: **SNMP Windows** ? ? ? ? , Portuguese: **Serviço Windows SNMP**, Russian: **Служба Windows по SNMP**, Simplified Chinese: **SNMP Windows** ? ? , Spanish: **Servicio de Windows de SNMP**

Remarks

- This sensor type cannot distinguish the status "not installed" from "not running".
- It might not work to query data from a probe device via SNMP (querying `localhost`, `127.0.0.1`, or `:::1`). [Add this device to PRTG](#)^[31] with the IP address that it has in your network and create the SNMP sensor on this device instead.

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Windows services you want to monitor. PRTG will create one sensor for each service you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SNMP WINDOWS SERVICE MONITOR

Service Select the services you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)^[181], as well as in [alarms](#)^[219], [logs](#)^[228], [notifications](#)^[3216], [reports](#)^[3252], [maps](#)^[3278], [libraries](#)^[3235], and [tickets](#)

BASIC SENSOR SETTINGS

Parent Tags

Shows **Tags** that this sensor inherits from its parent device, group, and probe. This setting is shown for your information only and cannot be changed here.

Tags

Enter one or more **Tags**, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority

Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SNMP WINDOWS SERVICE MONITOR

Service

Shows the Windows service that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

SENSOR DISPLAY

Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> ⓘ This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings^[3160] settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration^[336] on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p>

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

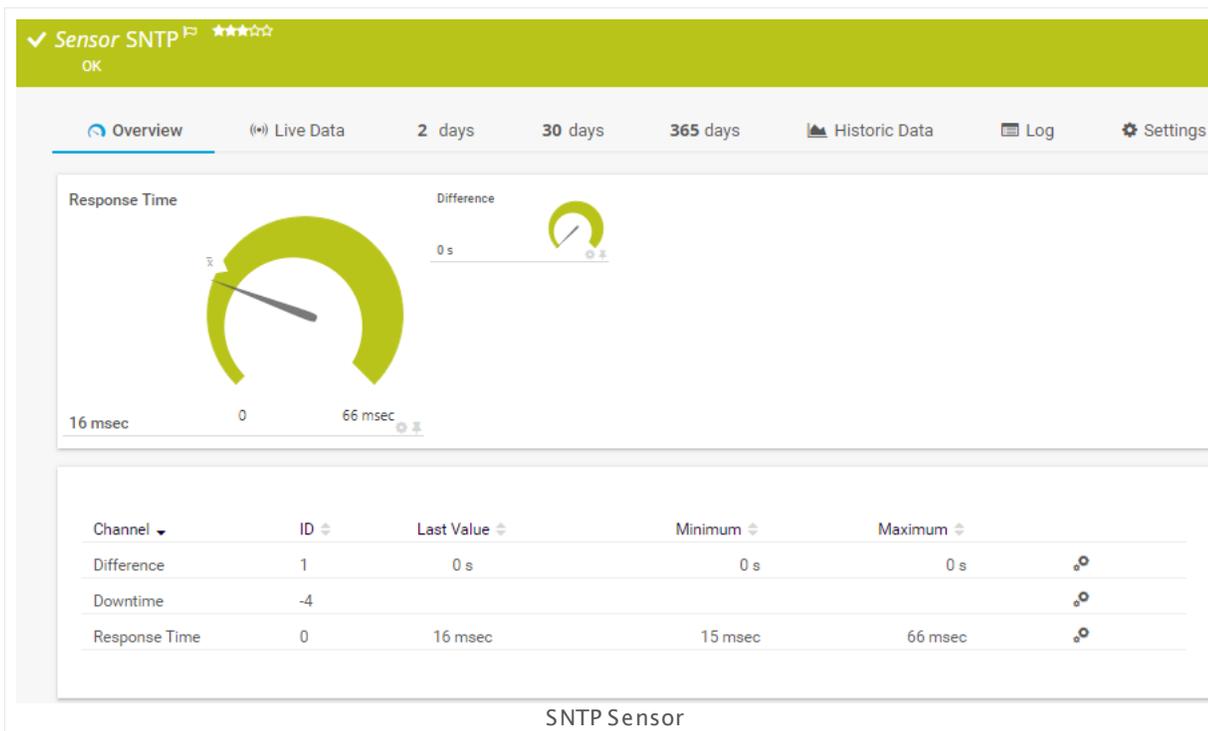

7.8.195 SNTP Sensor

The SNTP sensor monitors a Simple Network Time Protocol (SNTP) server.

It shows the following:

- Response time of the server
- Time difference in comparison to the local system time

The sensor tries to get a valid timestamp from the server up to three times per scan until it reports an error.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
----------------	--

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

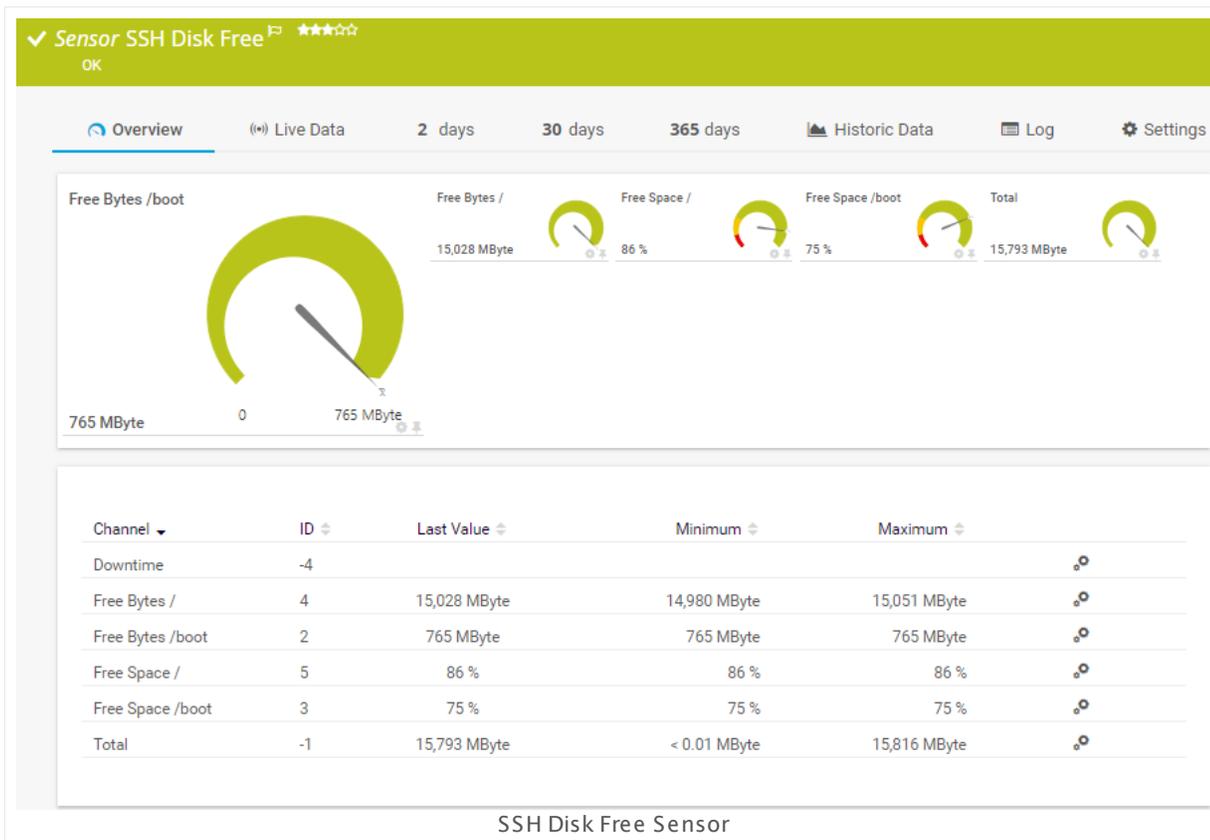

7.8.196 SSH Disk Free Sensor

The SSH Disk Free sensor monitors free space on disks of a Linux/Unix system using Secure Shell (SSH).

It shows the following:

- Free disk space in bytes for every mounted partition
- Free disk space in percent for every mounted partition
- Total disk space

i The free space returned by this sensor type shows the available disk space of the volume, minus a reserve defined for this volume (for example, for redundancy purposes). So, this sensor shows the disk space that is actually available for use. The size of the reserved disk space can be defined with `tune2fs`. For details, see the Knowledge Base: [Why do SSH Disk Free and SNMP Linux Disk Free show different values for my target Linux system?](#)

Sensor in Other Languages

Dutch: **SSH Disk vrij**, French: **Espace disque disponible SSH**, German: **SSH Laufwerkskapazität**, Japanese: **SSH ? ? ? ? ? ? ? ?**, Portuguese: **SSH Disco livre**, Russian: **Свободное пространство диска по SSH**, Simplified Chinese: **SSH ? ? ? ? ? ? ? ?**, Spanish: **SSH disco libre**

Remarks

- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.
- This sensor type cannot support all Linux/Unix and Mac OS distributions.
- For a general introduction to SSH monitoring, please see manual section [Monitoring via SSH](#)³⁵¹⁰.
- Knowledge Base: [SSH and SFTP Sensors in Unknown Status](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the disk(s) you want to monitor. PRTG will create two sensor channels (free space in percent and bytes) for each partition you choose in the **Add Sensor** dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SSH DISK FREE

Disk

Select the partitions that you want to monitor. You see a list with the names of all items that are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates two channels for each selection. You can also select and deselect all items by using the check box in the table head.

i You can select up to 100 disks. If you select more disks, you will not be able to create the sensor. Add the sensor multiple times to monitor more than 100 disks with several sensors.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH SPECIFIC

Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time the sensor will wait to establish a connection to the host. Keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.</p> <p> The sensor types SSH SAN Enclosure, SSH SAN Logical Disk, SSH SAN Physical Disk, SSH SAN System Health have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.</p> <p> Ensure the connection timeout is a higher value than the shell timeout to avoid potential errors.</p>
---------------------------	--

SSH SPECIFIC

Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor will wait for the shell to return a response after it has sent its specific command (for example, <code>cat /proc/loadavg</code>). The maximum value is 300 seconds (5 minutes). Please enter an integer value.</p> <p> The sensor types SSH SAN Enclosure, SSH SAN Logical Disk, SSH SAN Physical Disk, SSH SAN System Health have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.</p> <p> Ensure the shell timeout is a lower value than the connection timeout to avoid potential errors.</p>
SSH Port	<p>Define which port this sensor uses for the SSH connection. Choose between:</p> <ul style="list-style-type: none">▪ Inherit port number from parent device (default): Use the port number as defined in the Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems^[408] section of the device this sensor is created on.▪ Enter custom port number: Define a custom port number below and do not use the port number from the parent device settings.
Use Port Number	<p>This field is only visible if you choose Enter custom port number above. Enter the port number (between 1 and 65535) that this sensor will use for the SSH connection. Please enter an integer value.</p>
SSH Engine	<p>Select the method you want to use to access data with this SSH sensor^[3510]. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between:</p> <ul style="list-style-type: none">▪ Inherit from parent device (default): Use the SSH engine that you have defined in the parent device settings or higher in the object hierarchy^[133]. If you did not change it, this is the recommended default engine.▪ Default: This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the Inherit from parent device (default) option.▪ Compatibility Mode (deprecated): Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

SSH SPECIFIC

 The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).

Result Handling

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error:** Store the last result of the sensor only if it throws an error.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SET LIMITS CHECKED AGAINST ALL DISKS

In this section you can set limits that are valid for all channels and all drives. By entering limits, you can define when the sensor will enter a **Warning** or **Down status**¹⁹⁵, depending on the data provided by all drives that this sensor monitors. If you want to individually define limits for separate channels, please use the limit settings in the [Sensor Channels Settings](#)³¹⁶⁰.

 All limits that you define here are valid in addition to the limits defined in the particular **Channel** settings! The limits are valid simultaneously, so the first limit that is breached applies.

Percentage Limit Check Enable or disable a limit check for the free space in percentage channels of all drives. By default, percentage limits are enabled with lower warning and lower error limit. Choose between:

SET LIMITS CHECKED AGAINST ALL DISKS

- **Only use the limits in the settings of the percentage channels:** Do not define sensor limits that are valid for all percentage channels. The sensor only uses limits that you define in the settings of the particular "free space in percent" channels to determine the status.
- **Use the limits of both the sensor and the channel settings:** Define limits for the sensor that are valid for all drives (percentage channels). Additional fields appear below. The sensor enters a **Warning** or **Down** status when free space limits are undercut or overrun.

Upper Error Limit This field is only visible if you enable percentage limit check above. Specify an upper limit in percent for a **Down** status. If the free disk space of one of your drives overruns this percent value, the sensor switches to **Down**. Please enter an integer value or leave the field empty.

 The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!

Upper Warning Limit This field is only visible if you enable percentage limit check above. Specify an upper limit in percent for a **Warning** status. If the free disk space of one of your drives overruns this percent value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty.

 The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!

Lower Warning Limit This field is only visible if you enable percentage limit check above. Specify a lower limit in percent for a **Warning** status. If the free disk space of one of your drives undercuts this percent value, the sensor switches to warning. Please enter an integer value or leave the field empty.

 The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!

Lower Error Limit This field is only visible if you enable percentage limit check above. Specify a lower limit in percent for a **Down** status. If the free disk space of one of your drives undercuts this percent value, the sensor switches to **Down**. Please enter an integer value or leave the field empty.

SET LIMITS CHECKED AGAINST ALL DISKS

 The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!

Size Limit Check

Enable or disable a limit check for the free bytes channels of all drives. By default, byte size limits are not enabled for drives. Choose between:

- **Only use the limits in the settings of the byte size channels:** Do not define sensor limits that are valid for all byte size channels. The sensor only uses limits that you define in the settings of the particular free space in bytes channels to determine the status.
- **Use the limits of both the sensor and the channel settings:** Define limits for the sensor that are valid for all drives (byte size channels). Additional fields appear below. The sensor enters a **Warning** or **Down** status when free space limits are undercut or overrun.

Upper Error Limit

This field is only visible if you enable byte limit check above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor will switch to **Down**. Please enter an integer value or leave the field empty.

 The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!

Upper Warning Limit

This field is only visible if you enable byte limit check above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty.

 The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!

SET LIMITS CHECKED AGAINST ALL DISKS

- Lower Warning Limit** This field is only visible if you enable byte limit check above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty.
-  The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!
- Lower Error Limit** This field is only visible if you enable byte limit check above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor switches to **Down**. Please enter an integer value or leave the field empty.
-  The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!
- Alarm on Missing/Removed Disk** If a monitored disk is removed or not found, values are set to zero. Select the alarming approach in this case. Choose between:
- **Deactivate alarm (default):** Select this option if you do not want an alarm for a removed disk.
 - **Activate alarm:** Select this option if you want to be alerted if a monitored disk is removed.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#).

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

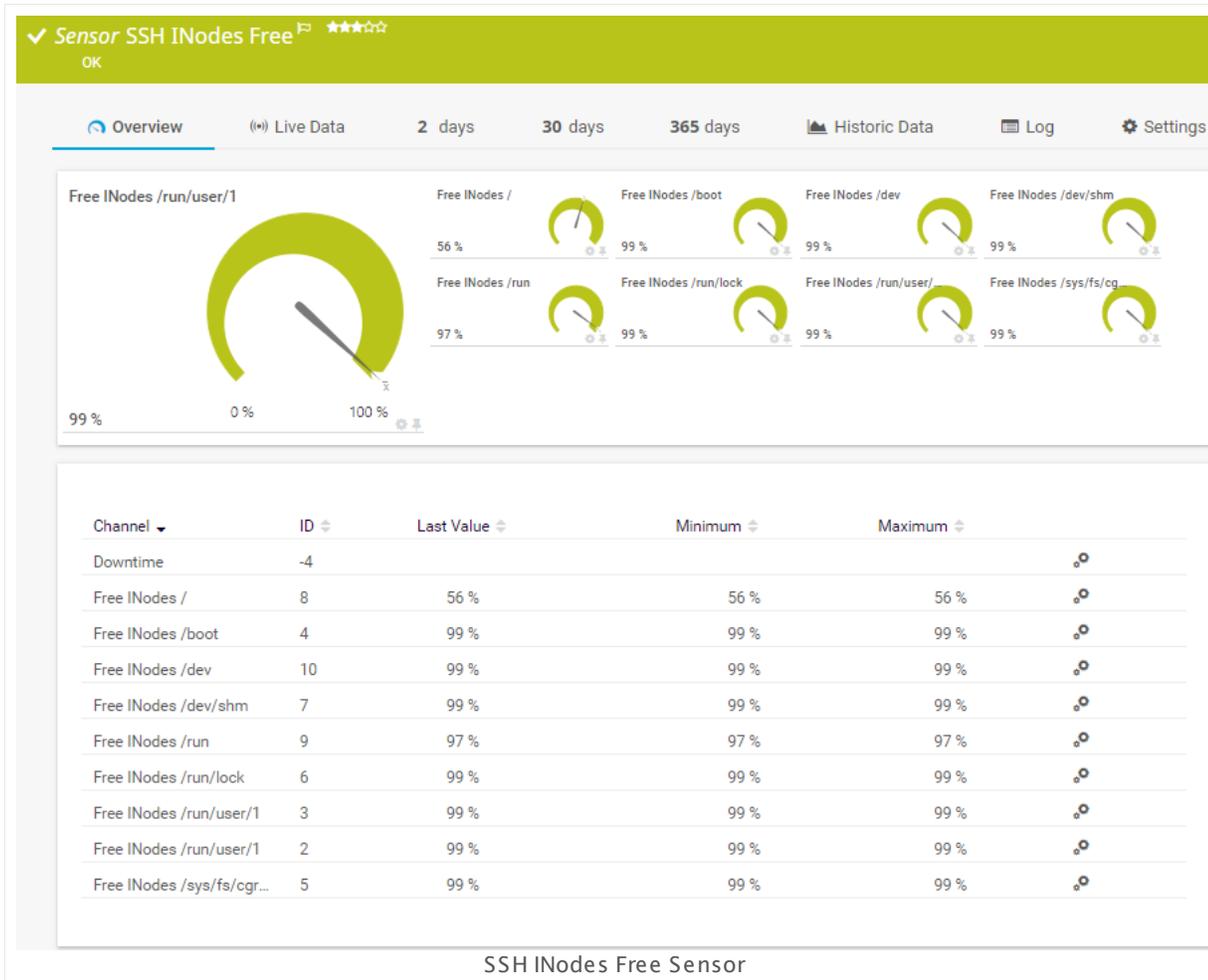

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.197 SSH INodes Free Sensor

The SSH INodes Free sensor monitors the free index nodes on disks of Linux/Unix and Mac OS systems via Secure Shell (SSH).

- It shows free index nodes in percent, for each mount in an individual sensor channel.

UNIX file systems only allow a limited number of index nodes. If the limit is exceeded, no more data can be stored, although there might still be free space available. This sensor can help you to notice early on if one of your drives is running out of INodes.

Sensor in Other Languages

Dutch: **SSH INodes Vrij**, French: **INodes SSH disponibles**, German: **SSH Freie INodes**, Japanese: **SSH I Nodes? ? ? ?**, Portuguese: **SSH INodes livre**, Russian: **Свободные узлы INodes по SSH**, Simplified Chinese: **SSH INode ? ? ? ?**, Spanish: **SSH INodes libres**

Remarks

- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.

- This sensor type cannot support all Linux/Unix and Mac OS distributions.
- For a general introduction to SSH monitoring, please see manual section [Monitoring via SSH](#).
- Knowledge Base: [SSH and SFTP Sensors in Unknown Status](#)
- This sensor type does not support ESX(i) hosts.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH SPECIFIC

Connection Timeout (Sec.) Define a timeout in seconds for the connection. This is the time the sensor will wait to establish a connection to the host. Keep this value as low as possible. The maximum value is **900** seconds (15 minutes). Please enter an integer value.

-  The sensor types **SSH SAN Enclosure**, **SSH SAN Logical Disk**, **SSH SAN Physical Disk**, **SSH SAN System Health** have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.
-  Ensure the connection timeout is a higher value than the shell timeout to avoid potential errors.

Shell Timeout (Sec.) Define a timeout in seconds for the shell response. This is the time in seconds the sensor will wait for the shell to return a response after it has sent its specific command (for example, `cat /proc/loadavg`). The maximum value is **300** seconds (5 minutes). Please enter an integer value.

-  The sensor types **SSH SAN Enclosure**, **SSH SAN Logical Disk**, **SSH SAN Physical Disk**, **SSH SAN System Health** have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.
-  Ensure the shell timeout is a lower value than the connection timeout to avoid potential errors.

SSH Port Define which port this sensor uses for the SSH connection. Choose between:

- **Inherit port number from parent device (default):** Use the port number as defined in the [Credentials for Linux/Solaris/Mac OS \(SSH/WBEM\) Systems](#) ⁴⁰⁸ section of the device this sensor is created on.
- **Enter custom port number:** Define a custom port number below and do not use the port number from the parent device settings.

SSH SPECIFIC

Use Port Number This field is only visible if you choose **Enter custom port number** above. Enter the port number (between 1 and 65535) that this sensor will use for the SSH connection. Please enter an integer value.

SSH Engine Select the method you want to use to [access data with this SSH sensor](#)³⁵¹⁰. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between:

- **Inherit from parent device (default):** Use the SSH engine that you have defined in the parent device settings or higher in the [object hierarchy](#)¹³³. If you did not change it, this is the recommended default engine.
- **Default:** This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option.
- **Compatibility Mode (deprecated):** Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

 The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).

Result Handling Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error:** Store the last result of the sensor only if it throws an error.

SSH SPECIFIC

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ³³⁵ on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none"> ▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request. ▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests. ▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests. ▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests. ▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> <p> If a channel uses lookup³⁶⁹³ values, it will always show a Down status immediately, so no "wait" options will apply.</p> |

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Others

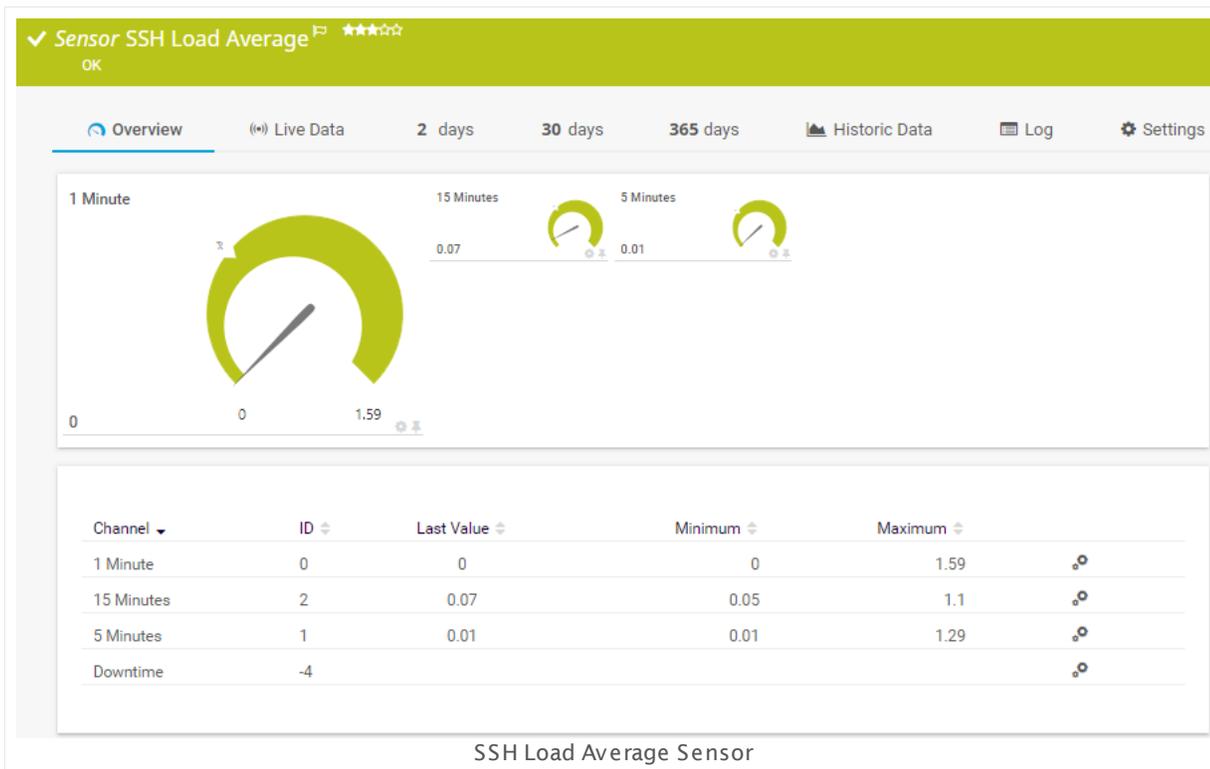

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.198 SSH Load Average Sensor

The SSH Load Average sensor monitors the load average of a Linux/Unix system using Secure Shell (SSH).

It shows the following:

- Average system load within a 1-minute interval
- Average system load within a 5-minute interval
- Average system load within a 15-minute interval

Sensor in Other Languages

Dutch: **SSH Gemiddelde belasting**, French: **Moyenne de la charge SSH**, German: **SSH Durchschnitt l. Last**, Japanese: **SSH ? ? ? ? ? ? ? ?**, Portuguese: **SSH Carga média**, Russian: **Средняя загрузка по SSH**, Simplified Chinese: **SSH ? ? ? ? ?**, Spanish: **SSH carga promedio**

Remarks

- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.
- This sensor type cannot support all Linux/Unix and Mac OS distributions.
- For a general introduction to SSH monitoring, please see manual section [Monitoring via SSH](#).

- Knowledge Base: [SSH and SFTP Sensors in Unknown Status](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH SPECIFIC

Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time the sensor will wait to establish a connection to the host. Keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.</p> <p> The sensor types SSH SAN Enclosure, SSH SAN Logical Disk, SSH SAN Physical Disk, SSH SAN System Health have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.</p> <p> Ensure the connection timeout is a higher value than the shell timeout to avoid potential errors.</p>
Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor will wait for the shell to return a response after it has sent its specific command (for example, <code>cat /proc/loadavg</code>). The maximum value is 300 seconds (5 minutes). Please enter an integer value.</p> <p> The sensor types SSH SAN Enclosure, SSH SAN Logical Disk, SSH SAN Physical Disk, SSH SAN System Health have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.</p> <p> Ensure the shell timeout is a lower value than the connection timeout to avoid potential errors.</p>
SSH Port	<p>Define which port this sensor uses for the SSH connection. Choose between:</p> <ul style="list-style-type: none"> ▪ Inherit port number from parent device (default): Use the port number as defined in the Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems^[408] section of the device this sensor is created on. ▪ Enter custom port number: Define a custom port number below and do not use the port number from the parent device settings.
Use Port Number	<p>This field is only visible if you choose Enter custom port number above. Enter the port number (between 1 and 65535) that this sensor will use for the SSH connection. Please enter an integer value.</p>
SSH Engine	<p>Select the method you want to use to access data with this SSH sensor^[3510]. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between:</p>

SSH SPECIFIC

- **Inherit from parent device (default):** Use the SSH engine that you have defined in the parent device settings or higher in the [object hierarchy](#)¹³³. If you did not change it, this is the recommended default engine.
 - **Default:** This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option.
 - **Compatibility Mode (deprecated):** Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.
-  The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).

Result Handling

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error:** Store the last result of the sensor only if it throws an error.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁸. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷ section.

Others

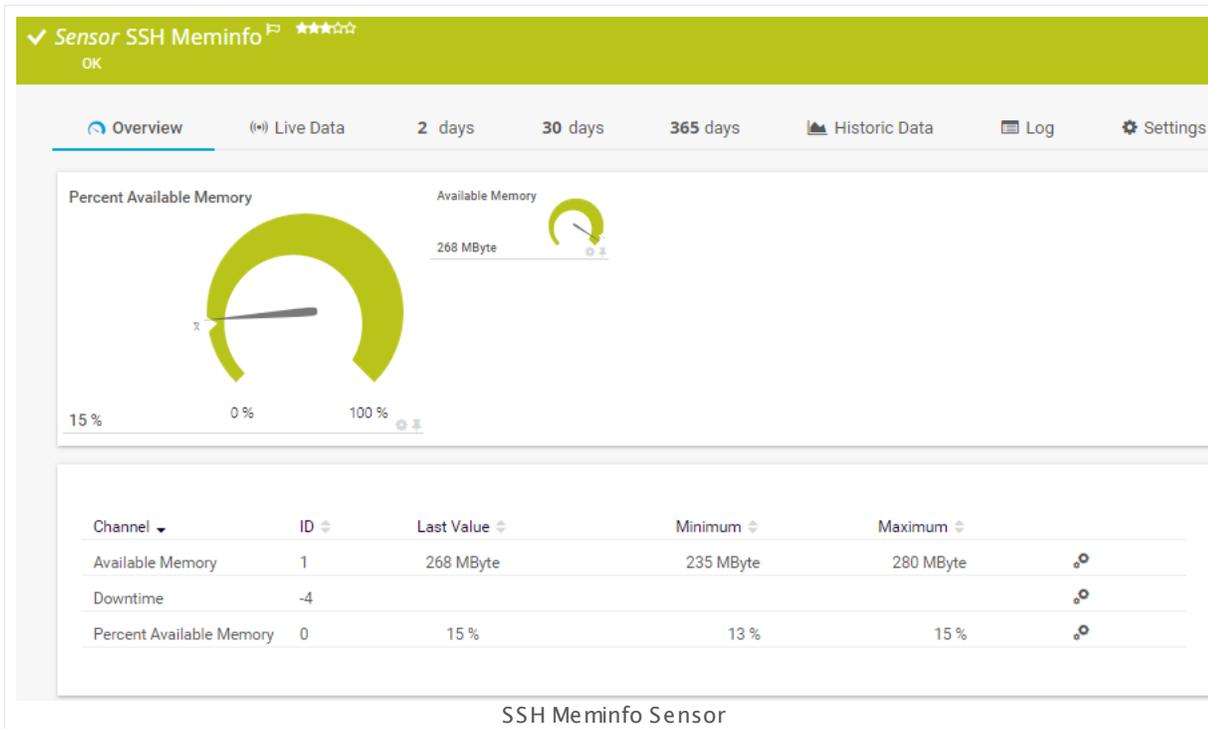

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.199 SSH Meminfo Sensor

The SSH Meminfo sensor monitors the memory usage of a Linux/Unix system using Secure Shell (SSH).

It shows the following:

- Available memory in bytes
- Available memory in percent

Sensor in Other Languages

Dutch: **SSH Meminfo**, French: **Info sur la mémoire SSH**, German: **SSH Speicherinfo**, Japanese: **SSH ? ? ? ? ?**, Portuguese: **SSH Meminfo**, Russian: **Meminfo no SSH**, Simplified Chinese: **SSH ? ? ? ? ?**, Spanish: **SSH información de memoria**

Remarks

- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.
- This sensor type cannot support all Linux/Unix and Mac OS distributions.
- For a general introduction to SSH monitoring, please see manual section [Monitoring via SSH](#).
- Knowledge Base: [SSH and SFTP Sensors in Unknown Status](#)
- This sensor type is not compatible with Mac OS systems.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH SPECIFIC

Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time the sensor will wait to establish a connection to the host. Keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.</p> <p> The sensor types SSH SAN Enclosure, SSH SAN Logical Disk, SSH SAN Physical Disk, SSH SAN System Health have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.</p> <p> Ensure the connection timeout is a higher value than the shell timeout to avoid potential errors.</p>
Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor will wait for the shell to return a response after it has sent its specific command (for example, <code>cat /proc/loadavg</code>). The maximum value is 300 seconds (5 minutes). Please enter an integer value.</p> <p> The sensor types SSH SAN Enclosure, SSH SAN Logical Disk, SSH SAN Physical Disk, SSH SAN System Health have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.</p> <p> Ensure the shell timeout is a lower value than the connection timeout to avoid potential errors.</p>
SSH Port	<p>Define which port this sensor uses for the SSH connection. Choose between:</p> <ul style="list-style-type: none"> ▪ Inherit port number from parent device (default): Use the port number as defined in the Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems^[408] section of the device this sensor is created on. ▪ Enter custom port number: Define a custom port number below and do not use the port number from the parent device settings.
Use Port Number	<p>This field is only visible if you choose Enter custom port number above. Enter the port number (between 1 and 65535) that this sensor will use for the SSH connection. Please enter an integer value.</p>
SSH Engine	<p>Select the method you want to use to access data with this SSH sensor^[3510]. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between:</p>

SSH SPECIFIC

- **Inherit from parent device (default):** Use the SSH engine that you have defined in the parent device settings or higher in the [object hierarchy](#)¹³³. If you did not change it, this is the recommended default engine.
 - **Default:** This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option.
 - **Compatibility Mode (deprecated):** Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.
-  The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).

Result Handling

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error:** Store the last result of the sensor only if it throws an error.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

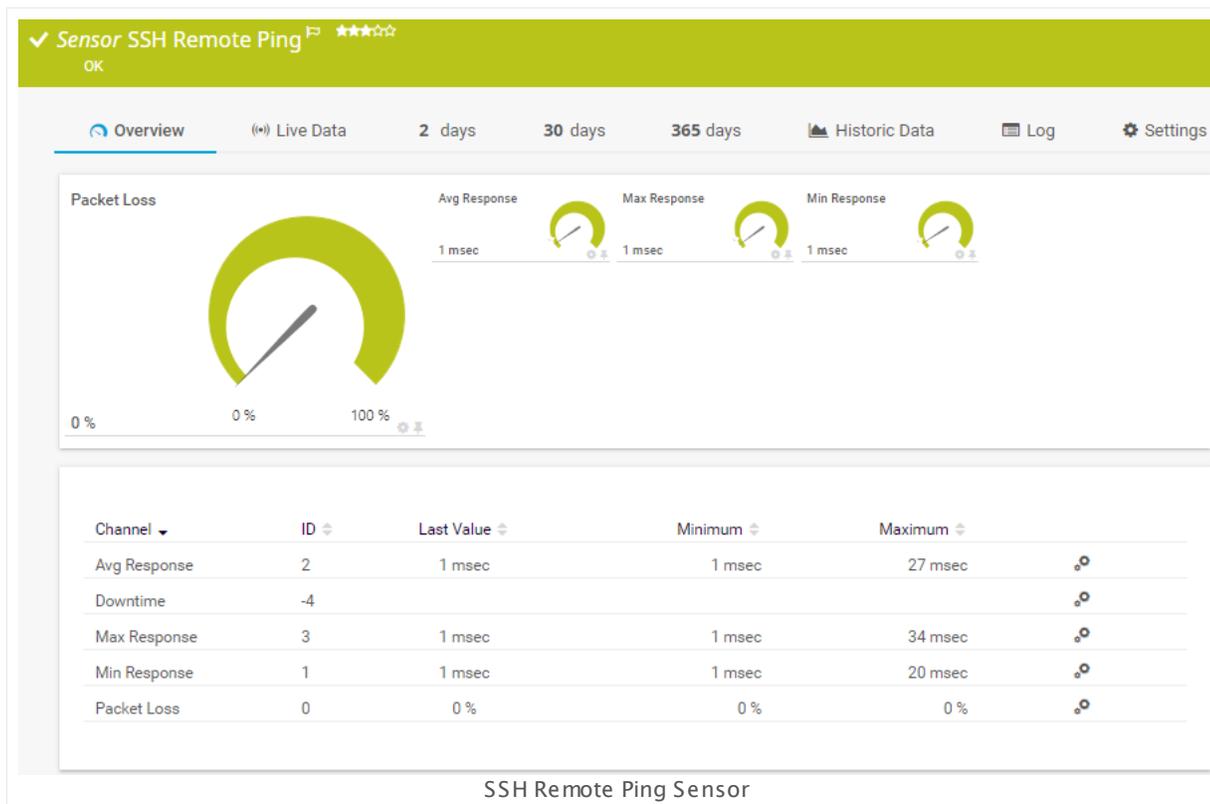

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.200 SSH Remote Ping Sensor

The SSH Remote Ping sensor remotely monitors the connectivity between a system running Linux/OS X and another device, using Internet Control Message Protocol (ICMP) echo requests (Ping) and Secure Shell (SSH).

It can show the following:

- Packet loss in percent
- Minimum, maximum, and average response times measured from the remote device you connect to

Sensor in Other Languages

Dutch: **SSH Remote Ping**, French: **Ping distant SSH**, German: **SSH Remote Ping**, Japanese: **SSH ? ? ? ? PING? ?**, Portuguese: **SSH Ping remoto**, Russian: **Удаленная проверка связи по SSH**, Simplified Chinese: **SSH? ? Ping**, Spanish: **Ping remoto SSH**

Remarks

- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.
- This sensor type cannot support all Linux/Unix and Mac OS distributions.
- For a general introduction to SSH monitoring, please see manual section [Monitoring via SSH](#).

- Knowledge Base: [SSH and SFTP Sensors in Unknown Status](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH REMOTE PING CONFIGURATION

Target	Enter the DNS name or IP address of the target device the ping is sent to. The sensor will remotely connect to the parent device it is created on via SSH, then perform a ping request from this remote device to the target device or server. Please enter a string.
Packet Size (Bytes)	Enter the packet size in bytes for the ping. You can choose any value between 1 and 10000 . Please enter an integer value. We recommend that you use the default value.
Packet Count	Enter the number of packets that is sent with each scanning interval.
Custom Parameter	<p>Optionally enter additional parameters that will be added at the end of the ping command. Please enter a string or leave the field empty.</p> <p> Do not use parameters that change the output format of the result to make sure it can still be parsed. You cannot enter another command here.</p>

SSH SPECIFIC

Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time the sensor will wait to establish a connection to the host. Keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.</p> <p> The sensor types SSH SAN Enclosure, SSH SAN Logical Disk, SSH SAN Physical Disk, SSH SAN System Health have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.</p> <p> Ensure the connection timeout is a higher value than the shell timeout to avoid potential errors.</p>
Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor will wait for the shell to return a response after it has sent its specific command (for example, cat /proc/loadavg). The maximum value is 300 seconds (5 minutes). Please enter an integer value.</p> <p> The sensor types SSH SAN Enclosure, SSH SAN Logical Disk, SSH SAN Physical Disk, SSH SAN System Health have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.</p>

SSH SPECIFIC

- ⚠ Ensure the shell timeout is a lower value than the connection timeout to avoid potential errors.

SSH Port

Define which port this sensor uses for the SSH connection. Choose between:

- **Inherit port number from parent device (default):** Use the port number as defined in the [Credentials for Linux/Solaris/Mac OS \(SSH/WBEM\) Systems](#)^[408] section of the device this sensor is created on.
- **Enter custom port number:** Define a custom port number below and do not use the port number from the parent device settings.

Use Port Number

This field is only visible if you choose **Enter custom port number** above. Enter the port number (between 1 and 65535) that this sensor will use for the SSH connection. Please enter an integer value.

SSH Engine

Select the method you want to use to [access data with this SSH sensor](#)^[3510]. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between:

- **Inherit from parent device (default):** Use the SSH engine that you have defined in the parent device settings or higher in the [object hierarchy](#)^[133]. If you did not change it, this is the recommended default engine.
- **Default:** This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option.
- **Compatibility Mode (deprecated):** Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

- ⓘ The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).

Result Handling

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.

SSH SPECIFIC

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 📁 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 - ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error:** Store the last result of the sensor only if it throws an error.
 - ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
- 📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - 📘 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).
- Stack Unit** This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

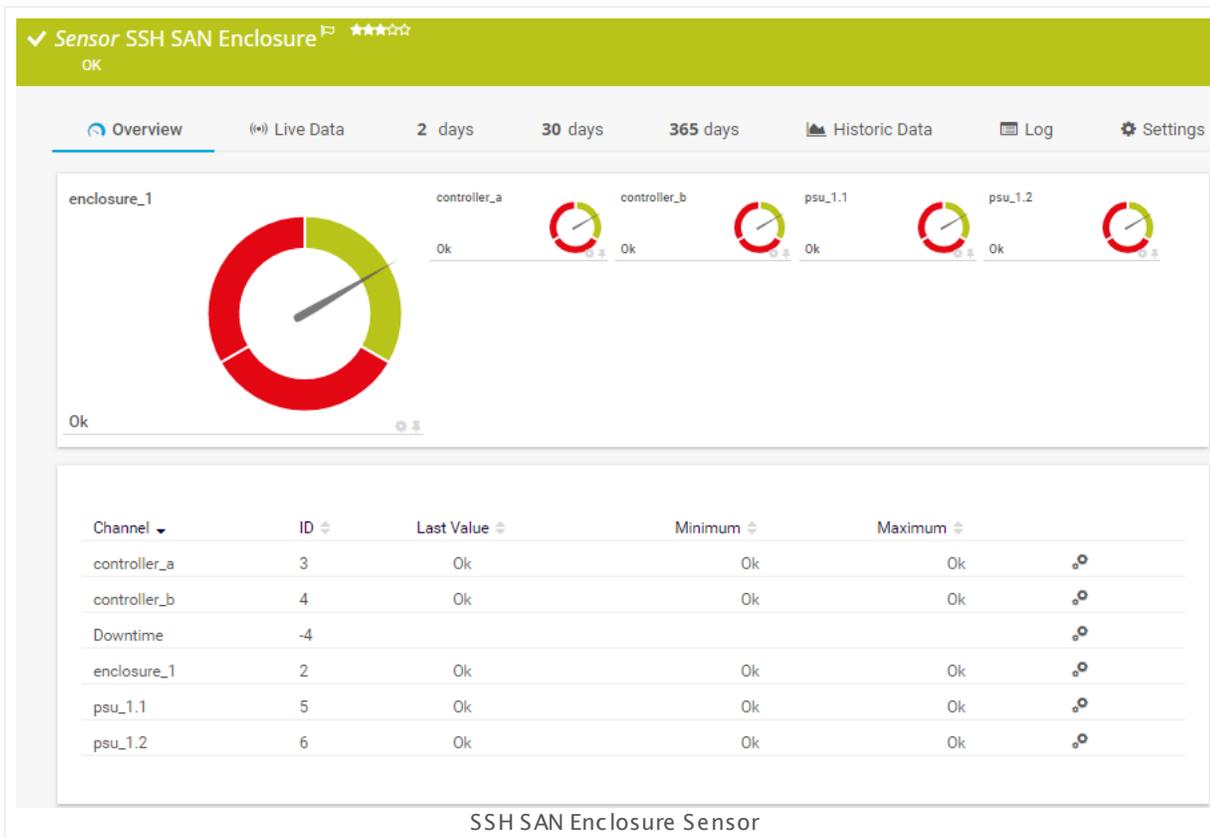

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.201 SSH SAN Enclosure Sensor

The SSH SAN Enclosure sensor monitors a Storage Area Network (SAN) enclosure via Secure Shell (SSH). The SAN has to provide a command-line interface (CLI) for this purpose.

It can show the following:

- Overall status of the enclosure
- Health status of the power supplies
- Health status of the controllers

Sensor in Other Languages

Dutch: **SSH SAN behuizing**, French: **Baie SAN SSH**, German: **SSH SAN Enclosure**, Japanese: **SSH SAN** , Portuguese: **SSH SAN Enclosure**, Russian: **Копнyc SAN нo SSH**, Simplified Chinese: **SSH SAN** , Spanish: **Carcasa de SAN de SSH**

Remarks

- This sensor type does not support every SAN, even if it provides a CLI. The sensor only works with specific devices, for example, with the HP P2000.

- It may happen that the controller of your target device breaks down. The experience shows that this issue strongly depends on the hardware model you monitor. Please increase the scanning interval to discharge the controller and try again.
- Sometimes the devices you monitor with this SSH SAN sensor return status values that are not officially documented so that the shown sensor status in PRTG differs from the "real" device status. For more information on this issue, please see the Knowledge Base: [Why does my SSH SAN sensor show a wrong status?](#)
- After a firmware update of the target device, this sensor might show incorrect channel values. Please add this sensor type anew in this case.
- For this sensor type, you must define corresponding credentials in section **Credentials for Linux/Solaris/Mac OS (SSH/WBEM) System** in the [settings of the device](#)^[402] you want to use the sensor on.
- For a general introduction to SSH monitoring, please see the [Monitoring via SSH](#)^[3510] section.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the SAN enclosures you want to monitor. PRTG will create one sensor for each enclosure you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SSH SAN ENCLOSURE SETTINGS

Enclosure	Select the enclosures you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
-----------	--

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH SAN ENCLOSURE SETTINGS

Enclosure	Shows the identifier of the enclosure that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
-----------	---

SSH SAN ENCLOSURE SETTINGS

Durable ID	Shows the durable identifier of the enclosure that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the enclosure that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WWN	Shows the WWN (World Wide Name) of the enclosure that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SSH SPECIFIC

Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time the sensor will wait to establish a connection to the host. Keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.</p> <p> The sensor types SSH SAN Enclosure, SSH SAN Logical Disk, SSH SAN Physical Disk, SSH SAN System Health have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.</p> <p> Ensure the connection timeout is a higher value than the shell timeout to avoid potential errors.</p>
Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor will wait for the shell to return a response after it has sent its specific command (for example, cat /proc/loadavg). The maximum value is 300 seconds (5 minutes). Please enter an integer value.</p> <p> The sensor types SSH SAN Enclosure, SSH SAN Logical Disk, SSH SAN Physical Disk, SSH SAN System Health have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.</p> <p> Ensure the shell timeout is a lower value than the connection timeout to avoid potential errors.</p>
SSH Port	Define which port this sensor uses for the SSH connection. Choose between:

SSH SPECIFIC

- **Inherit port number from parent device (default):** Use the port number as defined in the [Credentials for Linux/Solaris/Mac OS \(SSH/WBEM\) Systems](#)^[408] section of the device this sensor is created on.
- **Enter custom port number:** Define a custom port number below and do not use the port number from the parent device settings.

Use Port Number

This field is only visible if you choose **Enter custom port number** above. Enter the port number (between 1 and 65535) that this sensor will use for the SSH connection. Please enter an integer value.

SSH Engine

Select the method you want to use to [access data with this SSH sensor](#)^[3510]. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between:

- **Inherit from parent device (default):** Use the SSH engine that you have defined in the parent device settings or higher in the [object hierarchy](#)^[133]. If you did not change it, this is the recommended default engine.
- **Default:** This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option.
- **Compatibility Mode (deprecated):** Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

 The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).

Result Handling

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.

SSH SPECIFIC

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error:** Store the last result of the sensor only if it throws an error.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings.</p> <ul style="list-style-type: none"> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> <p>▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.</p> <p>▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.</p> <ul style="list-style-type: none"> <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

Knowledge Base: Why does my SSH SAN sensor show a wrong status?

- <https://kb.paessler.com/en/topic/60145>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

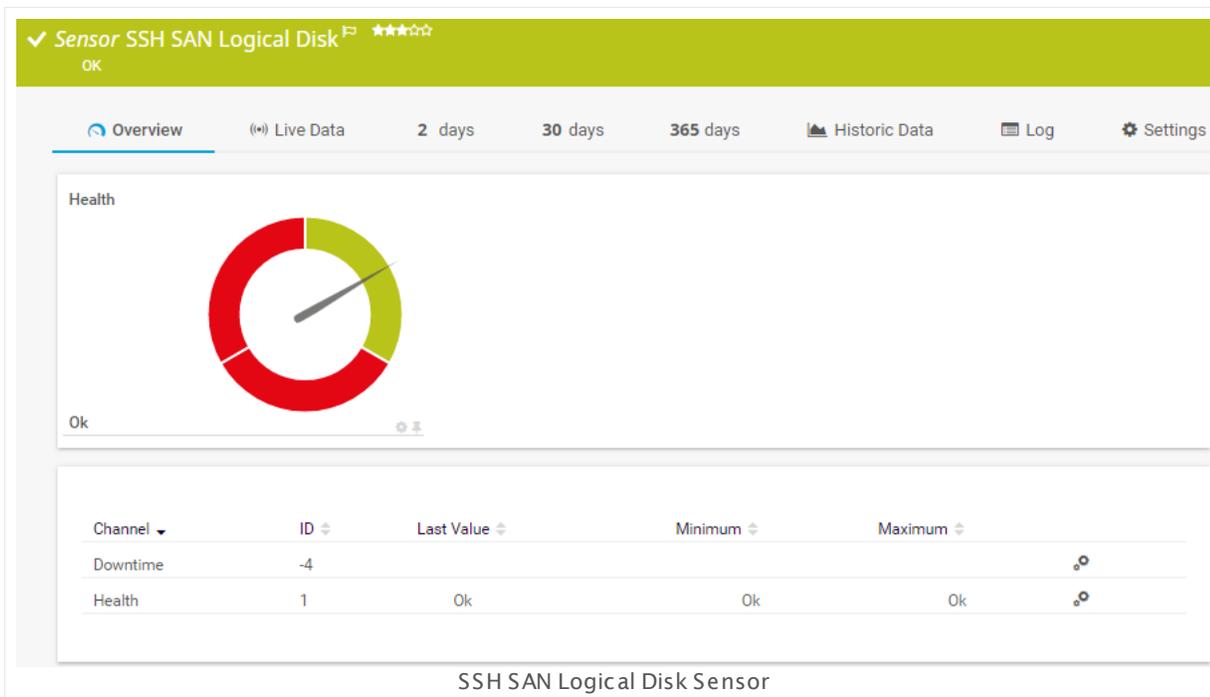

7.8.202 SSH SAN Logical Disk Sensor

The SSH SAN Logical Disk sensor monitors a logical disk on a Storage Area Network (SAN) via Secure Shell (SSH). The SAN has to provide a command-line interface (CLI) for this purpose.

It can show the following:

- Health status of the disk
- Number of I/O operations per second
- Transferred data per second

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **SSH SAN Logische Schijf**, French: **Disque logique SSH SAN**, German: **SSH SAN Logisches Laufwerk**, Japanese: **SSH SAN** ? ? ? ? ? ? , Portuguese: **SSH SAN Disco lógico**, Russian: **Логический диск SAN по SSH**, Simplified Chinese: **SSH SAN** ? ? ? ? , Spanish: **Disco lógico de SAN de SSH**

Remarks

- This sensor type does not support every SAN, even if it provides a CLI. The sensor only works with specific devices, for example, with the HP P2000.
- It may happen that the controller of your target device breaks down. The experience shows that this issue strongly depends on the hardware model you monitor. Please increase the scanning interval to discharge the controller and try again.

- Sometimes the devices you monitor with this SSH SAN sensor return status values that are not officially documented so that the shown sensor status in PRTG differs from the "real" device status. For more information on this issue, please see the Knowledge Base: [Why does my SSH SAN sensor show a wrong status?](#)
- After a firmware update of the target device, this sensor might show incorrect channel values. Please add this sensor type anew in this case.
- For this sensor type, you must define corresponding credentials in section **Credentials for Linux/Solaris/Mac OS (SSH/WBEM) System** in the [settings of the device](#)^[402] you want to use the sensor on.
- For a general introduction to SSH monitoring, please see the [Monitoring via SSH](#)^[3510] section.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the volumes on the SAN device you want to monitor. PRTG will create one sensor for each volume you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SSH SAN LOGICAL DISK SETTINGS

Volume	Select the volumes you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
--------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH SPECIFIC

Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time the sensor will wait to establish a connection to the host. Keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.</p> <p> The sensor types SSH SAN Enclosure, SSH SAN Logical Disk, SSH SAN Physical Disk, SSH SAN System Health have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.</p> <p> Ensure the connection timeout is a higher value than the shell timeout to avoid potential errors.</p>
---------------------------	--

SSH SPECIFIC

Shell Timeout (Sec.) Define a timeout in seconds for the shell response. This is the time in seconds the sensor will wait for the shell to return a response after it has sent its specific command (for example, `cat /proc/loadavg`). The maximum value is **300** seconds (5 minutes). Please enter an integer value.

 The sensor types **SSH SAN Enclosure**, **SSH SAN Logical Disk**, **SSH SAN Physical Disk**, **SSH SAN System Health** have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.

 Ensure the shell timeout is a lower value than the connection timeout to avoid potential errors.

SSH Port Define which port this sensor uses for the SSH connection. Choose between:

- **Inherit port number from parent device (default):** Use the port number as defined in the [Credentials for Linux/Solaris/Mac OS \(SSH/WBEM\) Systems](#)^[408] section of the device this sensor is created on.
- **Enter custom port number:** Define a custom port number below and do not use the port number from the parent device settings.

Use Port Number This field is only visible if you choose **Enter custom port number** above. Enter the port number (between 1 and 65535) that this sensor will use for the SSH connection. Please enter an integer value.

SSH Engine Select the method you want to use to [access data with this SSH sensor](#)^[3510]. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between:

- **Inherit from parent device (default):** Use the SSH engine that you have defined in the parent device settings or higher in the [object hierarchy](#)^[133]. If you did not change it, this is the recommended default engine.
- **Default:** This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option.
- **Compatibility Mode (deprecated):** Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

SSH SPECIFIC

 The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).

Result Handling

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error:** Store the last result of the sensor only if it throws an error.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SSH SAN LOGICAL DISK SETTINGS

Volume

Shows the volume that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Size

Shows the size of the volume that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Command Mode

Define the command set to use on the monitored device to get monitoring data. Choose between:

SSH SAN LOGICAL DISK SETTINGS

- **Basic (recommended):** We recommend that you use the basic command set for best sensor performance. This setting is appropriate for most scenarios.
- **Advanced:** This command set enables you to monitor additional data on the target device like IOs and bandwidth. Because this setting results in higher usage of system resources and so might cause sensor instabilities, we strongly recommend that you choose this option only if this data is crucial for your monitored volume.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none">▪ Show channels independently (default): Show an own graph for each channel.▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: Why does my SSH SAN sensor show a wrong status?

- <https://kb.paessler.com/en/topic/60145>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

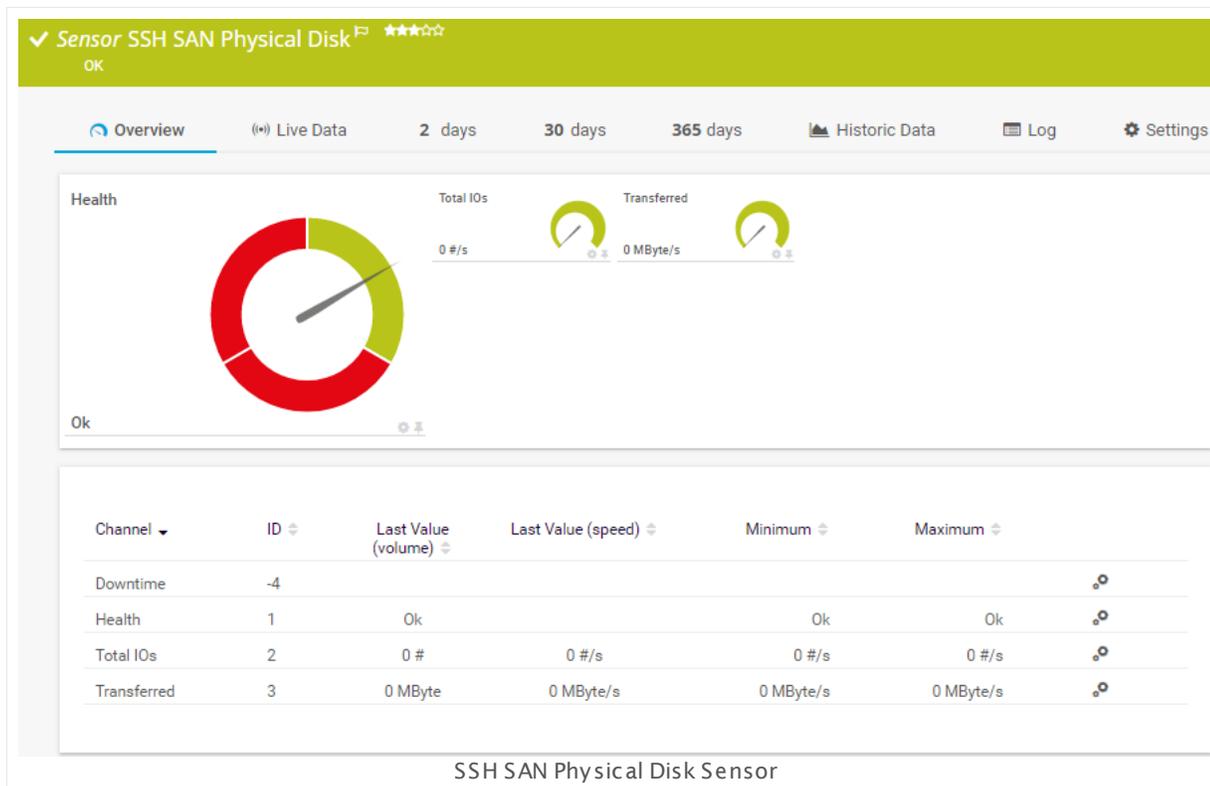

7.8.203 SSH SAN Physical Disk Sensor

The SSH SAN Physical Disk sensor monitors a physical disk on a Storage Area Network (SAN) via Secure Shell (SSH). The SAN has to provide a command-line interface (CLI) for this purpose.

It can show the following:

- Health status of the disk
- Number of I/O operations per second
- Transferred data per second

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **SSH SAN Fysieke Schijf**, French: **Disque physique SSH SAN**, German: **SSH SAN Physikalisches Laufwerk**, Japanese: **SSH SAN** ? ? ? ? ? , Portuguese: **SSH SAN Disco físico**, Russian: **Физический диск SAN по SSH**, Simplified Chinese: **SSH SAN** ? ? ? ? , Spanish: **Disco físico de SAN de SSH**

Remarks

- This sensor type does not support every SAN, even if it provides a CLI. The sensor only works with specific devices, for example, with the HP P2000.

- It may happen that the controller of your target device breaks down. The experience shows that this issue strongly depends on the hardware model you monitor. Please increase the scanning interval to discharge the controller and try again.
- Sometimes the devices you monitor with this SSH SAN sensor return status values that are not officially documented so that the shown sensor status in PRTG differs from the "real" device status. For more information on this issue, please see the Knowledge Base: [Why does my SSH SAN sensor show a wrong status?](#)
- After a firmware update of the target device, this sensor might show incorrect channel values. Please add this sensor type anew in this case.
- For this sensor type, you must define corresponding credentials in section **Credentials for Linux/Solaris/Mac OS (SSH/WBEM) System** in the [settings of the device](#)^[402] you want to use the sensor on.
- For a general introduction to SSH monitoring, please see the [Monitoring via SSH](#)^[3510] section.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the disks on the SAN device you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SSH SAN PHYSICAL DISK SETTINGS

Disk	Select the disks you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH SPECIFIC

Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time the sensor will wait to establish a connection to the host. Keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.</p> <p>i The sensor types SSH SAN Enclosure, SSH SAN Logical Disk, SSH SAN Physical Disk, SSH SAN System Health have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.</p>
---------------------------	--

SSH SPECIFIC

- ⚠ Ensure the connection timeout is a higher value than the shell timeout to avoid potential errors.

Shell Timeout (Sec.)

Define a timeout in seconds for the shell response. This is the time in seconds the sensor will wait for the shell to return a response after it has sent its specific command (for example, `cat /proc/loadavg`). The maximum value is 300 seconds (5 minutes). Please enter an integer value.

- ℹ The sensor types **SSH SAN Enclosure**, **SSH SAN Logical Disk**, **SSH SAN Physical Disk**, **SSH SAN System Health** have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.

- ⚠ Ensure the shell timeout is a lower value than the connection timeout to avoid potential errors.

SSH Port

Define which port this sensor uses for the SSH connection. Choose between:

- **Inherit port number from parent device (default):** Use the port number as defined in the [Credentials for Linux/Solaris/Mac OS \(SSH/WBEM\) Systems](#)^[408] section of the device this sensor is created on.
- **Enter custom port number:** Define a custom port number below and do not use the port number from the parent device settings.

Use Port Number

This field is only visible if you choose **Enter custom port number** above. Enter the port number (between 1 and 65535) that this sensor will use for the SSH connection. Please enter an integer value.

SSH Engine

Select the method you want to use to [access data with this SSH sensor](#)^[3510]. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between:

- **Inherit from parent device (default):** Use the SSH engine that you have defined in the parent device settings or higher in the [object hierarchy](#)^[133]. If you did not change it, this is the recommended default engine.
- **Default:** This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option.

SSH SPECIFIC

- **Compatibility Mode (deprecated):** Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.
- ❗ The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).

Result Handling

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 📁 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 - ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error:** Store the last result of the sensor only if it throws an error.
 - ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SSH SAN PHYSICAL DISK SETTINGS

Disk

Shows the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SSH SAN PHYSICAL DISK SETTINGS

Disk Name	Shows the label of disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Size	Shows the size of the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Command Mode	Define the command set to use on the monitored device to get monitoring data. Choose between: <ul style="list-style-type: none">▪ Basic (recommended): We recommend that you use the basic command set for best sensor performance. This setting is appropriate for most scenarios.▪ Advanced: This command set enables you to monitor additional data on the target device like IOs and bandwidth. Because this setting results in higher usage of system resources and so might cause sensor instabilities, we strongly recommend that you choose this option only if this data is crucial for your monitored volume.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.
Graph Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none">▪ Show channels independently (default): Show an own graph for each channel.▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies <small>3209</small> in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: Why does my SSH SAN sensor show a wrong status?

- <https://kb.paessler.com/en/topic/60145>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

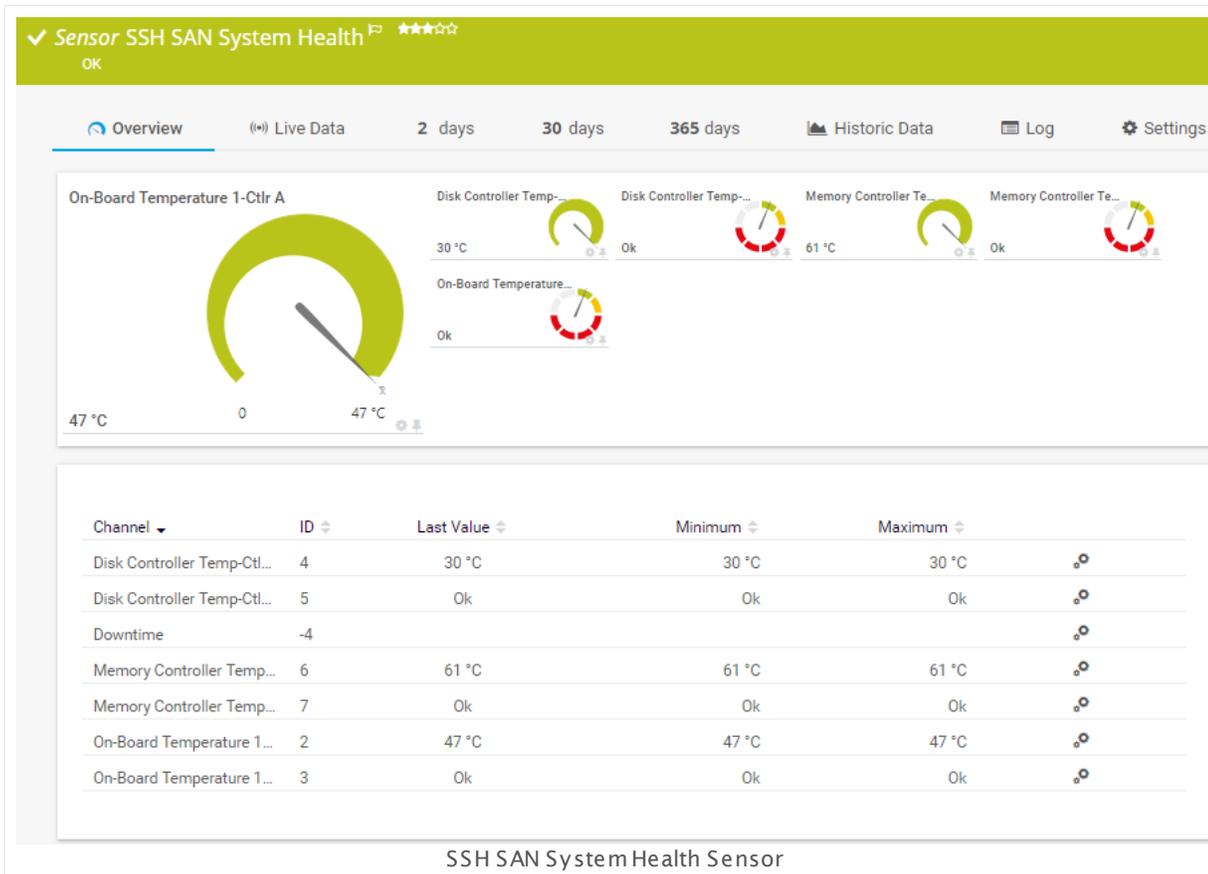

7.8.204 SSH SAN System Health Sensor

The SSH SAN System Health sensor monitors the system health of a Storage Area Network (SAN) via Secure Shell (SSH). The SAN has to provide a command-line interface (CLI) for this purpose.

It can show several metrics of an SAN, depending on the available measurement components on the SAN:

- Overall unit status
- Temperature and temperature states
- Voltage and voltage states
- Capacitor charge and status

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **SSH SAN systeemstatus**, French: **L'état du système SSH SAN**, German: **SSH SAN Systemzustand**, Japanese: **SSH SAN ? ? ? ? ? ? ?**, Portuguese: **SSH SAN Funcionamento do sistema**, Russian: **Работоспособность системы SAN по SSH**, Simplified Chinese: **SSH SAN ? ? ? ?**

?? , Spanish: **Estado del sistema de SAN de SSH**

Remarks

- This sensor type does not support every SAN, even if it provides a CLI. The sensor only works with specific devices, for example, with the HP P2000.
- It may happen that the controller of your target device breaks down. The experience shows that this issue strongly depends on the hardware model you monitor. Please increase the scanning interval to discharge the controller and try again.
- Sometimes the devices you monitor with this SSH SAN sensor return status values that are not officially documented so that the shown sensor status in PRTG differs from the "real" device status. For more information on this issue, please see the Knowledge Base: [Why does my SSH SAN sensor show a wrong status?](#)
- After a firmware update of the target device, this sensor might show incorrect channel values. Please add this sensor type anew in this case.
- For this sensor type, you must define corresponding credentials in section **Credentials for Linux/Solaris/Mac OS (SSH/WBEM) System** in the [settings of the device](#)^[402] you want to use the sensor on.
- For a general introduction to SSH monitoring, please see the [Monitoring via SSH](#)^[3510] section.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the metrics you want to monitor. PRTG will create one sensor for each metric you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SSH SAN SPECIFIC

Metric	Select the metrics you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
--------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH SAN SPECIFIC

Metric	Shows the metric this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
--------	---

SSH SAN SPECIFIC

Monitoring Mode

Define how the sensor requests data from the target device. The required mode depends on the firmware version of the device. Usually, the sensor automatically detects the firmware version and uses the appropriate mode. If you get errors, please explicitly define the firmware version.

Choose between:

- **Automatic Detection:** The sensor automatically detects the firmware version and uses the appropriate mode. We recommend that you use this option and only define the firmware date explicitly if you get errors.
- **Firmware prior to June 2015:** The sensor uses the mode that is appropriate for firmware versions dated before June 2015.
- **Firmware from June 2015 or later:** The sensor uses the mode that is appropriate for firmware versions dated from June 2015 or later.

We recommend that you use the default value.

SSH SPECIFIC

Connection Timeout (Sec.)

Define a timeout in seconds for the connection. This is the time the sensor will wait to establish a connection to the host. Keep this value as low as possible. The maximum value is **900** seconds (15 minutes). Please enter an integer value.

 The sensor types **SSH SAN Enclosure**, **SSH SAN Logical Disk**, **SSH SAN Physical Disk**, **SSH SAN System Health** have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.

 Ensure the connection timeout is a higher value than the shell timeout to avoid potential errors.

Shell Timeout (Sec.)

Define a timeout in seconds for the shell response. This is the time in seconds the sensor will wait for the shell to return a response after it has sent its specific command (for example, `cat /proc/loadavg`). The maximum value is **300** seconds (5 minutes). Please enter an integer value.

 The sensor types **SSH SAN Enclosure**, **SSH SAN Logical Disk**, **SSH SAN Physical Disk**, **SSH SAN System Health** have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.

SSH SPECIFIC

- ⚠ Ensure the shell timeout is a lower value than the connection timeout to avoid potential errors.

SSH Port

Define which port this sensor uses for the SSH connection. Choose between:

- **Inherit port number from parent device (default):** Use the port number as defined in the [Credentials for Linux/Solaris/Mac OS \(SSH/WBEM\) Systems](#)^[408] section of the device this sensor is created on.
- **Enter custom port number:** Define a custom port number below and do not use the port number from the parent device settings.

Use Port Number

This field is only visible if you choose **Enter custom port number** above. Enter the port number (between 1 and 65535) that this sensor will use for the SSH connection. Please enter an integer value.

SSH Engine

Select the method you want to use to [access data with this SSH sensor](#)^[3510]. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between:

- **Inherit from parent device (default):** Use the SSH engine that you have defined in the parent device settings or higher in the [object hierarchy](#)^[133]. If you did not change it, this is the recommended default engine.
- **Default:** This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option.
- **Compatibility Mode (deprecated):** Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

- ⓘ The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).

Result Handling

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.

SSH SPECIFIC

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error:** Store the last result of the sensor only if it throws an error.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ³³⁵ on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: Why does my SSH SAN sensor show a wrong status?

- <https://kb.paessler.com/en/topic/60145>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

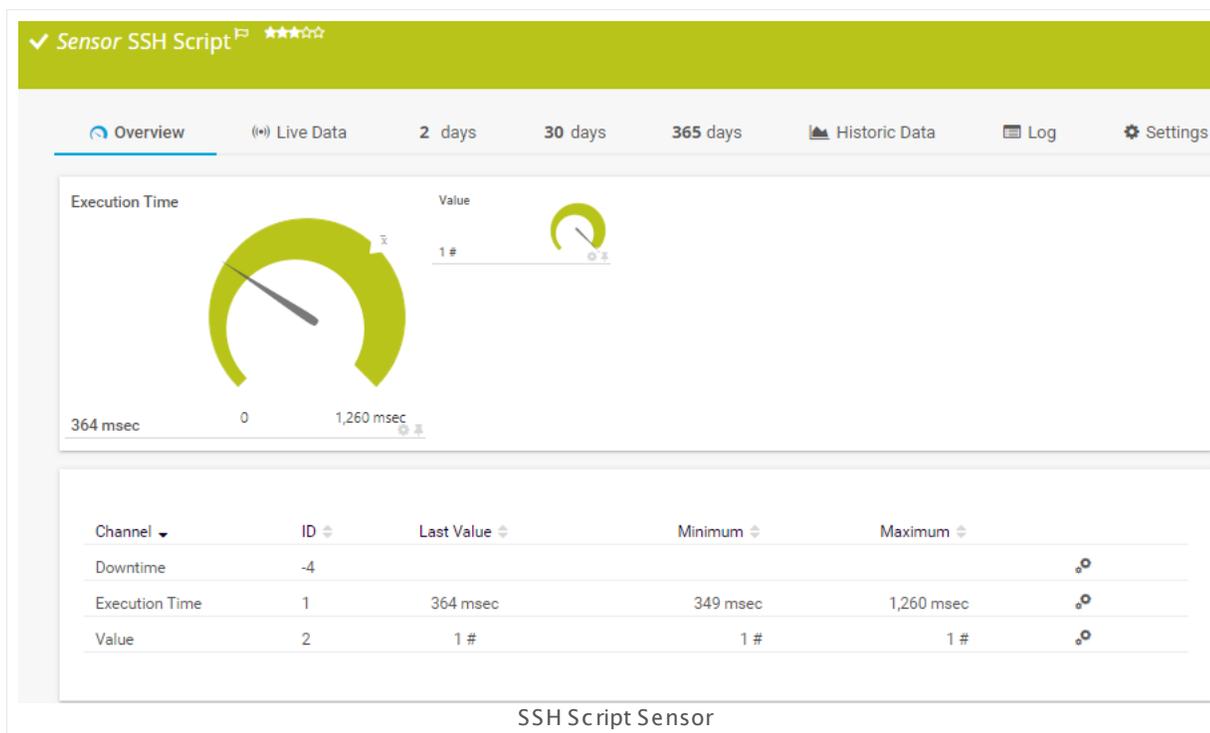

7.8.205 SSH Script Sensor

The SSH Script sensor connects to a Linux/Unix system via Secure Shell (SSH) and executes a script file located on the target system. This option is provided as part of the PRTG Application Programming Interface (API).

It shows the following:

- Execution time
- One value returned by the executable file or script (in one channel only).

 For details about the return value format, see section [Custom Sensors](#) .

Sensor in Other Languages

Dutch: **SSH Script**, French: **Script SSH**, German: **SSH-Skript**, Japanese: **SSH ? ? ? ? ? ? ?**, Portuguese: **SSH Script**, Russian: **скрипт SSH**, Simplified Chinese: **SSH ? ?**, Spanish: **Secuencia de comandos de SSH**

Remarks

- For details about the return value format, see manual section [Custom Sensors](#) .
- For security reasons, you must store your script file on the target system. The file must be located in the directory `/var/prtg/scripts`. Ensure the script has executable rights. If the script is not available or was deleted from the script folder, you will get the error message **Script not found (237)**.

- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.
- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.
- This sensor type cannot support all Linux/Unix and Mac OS distributions.
- For a general introduction to SSH monitoring, please see manual section [Monitoring via SSH](#).
- Knowledge Base: [SSH and SFTP Sensors in Unknown Status](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Script

Select a script file from the list. The dropdown menu will list all script files available in the `/var/prtg/scripts` directory on the target Linux/Unix system. For a script file to appear in this list, store the target file into this directory. Ensure the script has executable rights.

To show the expected sensor value and [status](#), your file must use the correct format for the returned values. In this case it is `exitcode:value:message` to standard output `stdout`. The exit code determines the sensor status.

 For detailed information on the expected return format and on how to build custom sensors, see section [Custom Sensors](#).

 For an example script, see the Knowledge Base: [Is there a shell script example for PRTG's SSH Script Sensor?](#)

Value Type

Define the type of the values that your script returns. Choose between:

- **Integer:** The return values are from the type integer. If the script returns a float, PRTG will show the value `0`.

SENSOR SETTINGS

- **Float:** The return values are from the type float, with a dot (.) between pre-decimal position and decimal places. With this setting, the sensor will also display integer values unless they produce a buffer overflow.
- **Counter:** Your script returns varying integer values. PRTG will show the difference between the values of two sensor scans.
 - ❗ A counter **must** return an integer, float values are not supported.
 - ❗ This sensor type does not support string values.

Channel Name Enter a name for the channel in which the sensor shows returned values. Please enter a string. This is for display purposes only. You can change the name later in the sensor's [channel settings](#).

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

❗ Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)¹⁴⁰¹ from objects further up in the device tree. These are visible above as **Parent Tags**.

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Script Shows the name of the script that the sensor executes with each scan. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Character Encoding Define the character encoding you use in your script to correctly display the sensor message. Choose between:

- **UTF-8 (default)**
- **ASCII**

Parameters If your script file catches command line parameters, you can define them here. You can use placeholders as well.

 For a full list of all placeholders see section [Custom Sensors](#)³⁶⁵⁴.

Please enter a string or leave the field empty.

 You need to escape special characters and whitespaces in your parameters and surround them with double quotes. See section [Escape Special Characters and Whitespaces in Parameters](#)²⁶¹⁹ for details. In Secure Shell (SSH) scripts, you can use alphanumeric characters and the special characters ".", "_", "-", "=", and "/" outside of quoted strings.

Mutex Name Define any desired mutex name for the process. PRTG will run all custom script sensors having the same mutex name serially (not simultaneously). This is useful if you use a lot of sensors and want to avoid high resource usage caused by processes running at the same time. Please enter a string or leave the field empty.

SENSOR SETTINGS

 For more information, see the Knowledge Base: [What is the Mutex Name in the PRTG EXE/Script Sensor settings?](#)

Unit String	Define a unit for the channel value. Please enter a string. This is for display purposes only and will be the default unit for a new channel. You can change the unit after sensor creation in the sensor's channel settings ³¹⁶⁰ .
Value Type	Shows the expected type of the returned value. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between: <ul style="list-style-type: none"> ▪ Ignore changes (default): The sensor takes no action on change. ▪ Trigger 'change' notification: The sensor sends an internal message indicating that its value has changed. In combination with a Change Trigger, you can use this mechanism to trigger a notification ³¹⁷⁰ whenever the sensor value changes.

SSH SPECIFIC

Connection Timeout (Sec.)	Define a timeout in seconds for the connection. This is the time the sensor will wait to establish a connection to the host. Keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value. <p> The sensor types SSH SAN Enclosure, SSH SAN Logical Disk, SSH SAN Physical Disk, SSH SAN System Health have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.</p> <p> Ensure the connection timeout is a higher value than the shell timeout to avoid potential errors.</p>
Shell Timeout (Sec.)	Define a timeout in seconds for the shell response. This is the time in seconds the sensor will wait for the shell to return a response after it has sent its specific command (for example, <code>cat /proc/loadavg</code>). The maximum value is 300 seconds (5 minutes). Please enter an integer value.

SSH SPECIFIC

 The sensor types **SSH SAN Enclosure**, **SSH SAN Logical Disk**, **SSH SAN Physical Disk**, **SSH SAN System Health** have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.

 Ensure the shell timeout is a lower value than the connection timeout to avoid potential errors.

SSH Port

Define which port this sensor uses for the SSH connection. Choose between:

- **Inherit port number from parent device (default):** Use the port number as defined in the [Credentials for Linux/Solaris/Mac OS \(SSH/WBEM\) Systems](#)^[408] section of the device this sensor is created on.
- **Enter custom port number:** Define a custom port number below and do not use the port number from the parent device settings.

Use Port Number

This field is only visible if you choose **Enter custom port number** above. Enter the port number (between 1 and 65535) that this sensor will use for the SSH connection. Please enter an integer value.

SSH Engine

Select the method you want to use to [access data with this SSH sensor](#)^[3510]. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between:

- **Inherit from parent device (default):** Use the SSH engine that you have defined in the parent device settings or higher in the [object hierarchy](#)^[133]. If you did not change it, this is the recommended default engine.
- **Default:** This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option.
- **Compatibility Mode (deprecated):** Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

 The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).

SSH SPECIFIC

Result Handling

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 📖 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 - ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error:** Store the last result of the sensor only if it throws an error.
 - ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

- 📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - 📘 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

i Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#) 3209 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Escape Special Characters and Whitespaces in Parameters

 You need to escape special characters in parameters that you pass to an executable or script and surround them with quotation marks to make sure the characters are interpreted correctly. Especially PowerShell scripts require adequate escaping so that the parameters are passed in a valid PowerShell syntax. To make escaping easy and secure, PRTG automatically does most of the escaping for you.

Please follow these rules to escape special characters and whitespaces in the parameters fields:

- Use quotes for parameters that contain whitespaces.

```
-name "Mr John Q Public"
-name 'Mr John Q Public'
```

- Use double quotes for parameters that contain single quotes.

```
-name "Mr 'John Q' Public"
```

- Use single quotes for parameters that contain double quotes.

```
-name 'Mr "John Q" Public'
```

- Use a backslash (\) to escape and pass a literal double quote.

```
-name pub\"lic
```

- Use double quotes for parameters that contain double **and** single quotes and escape double quotes.

```
-name "pu'b\"lic"
```

In Secure Shell (SSH) scripts, you can use alphanumeric characters and the special characters ":", "_", "-", "=", and "/" outside of quoted strings.

 We recommend that you do not pass passwords in parameters. Use PRTG placeholders instead. See section [Custom Sensors](#)³⁶⁵⁵ for details.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

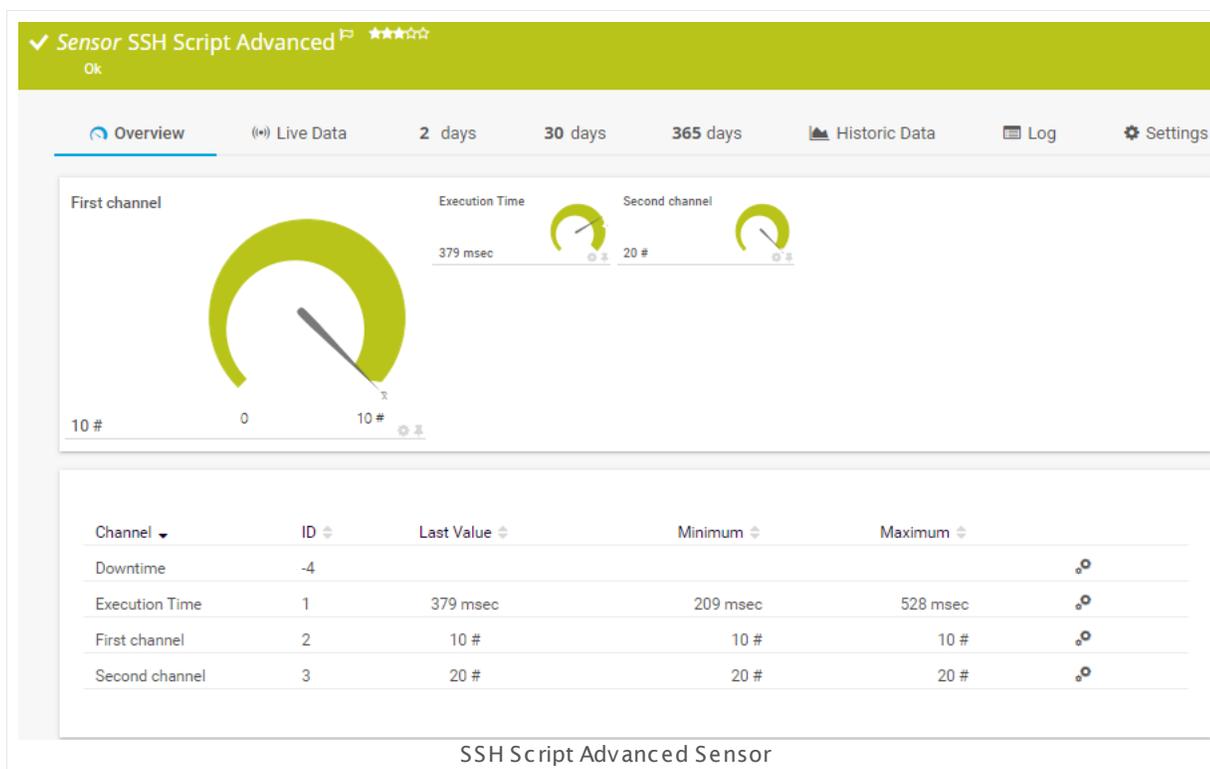

7.8.206 SSH Script Advanced Sensor

The SSH Script Advanced sensor connects to a Linux/Unix system via Secure Shell (SSH) and executes a script file located on the target system. This option is provided as part of the PRTG Application Programming Interface (API).

It can show the following:

- Execution time
- Values returned by the script in multiple channels. The return value of this sensor must be valid XML or JSON.

 For details about the return value format, see section [Custom Sensors](#)³⁶⁴¹.

Sensor in Other Languages

Dutch: **SSH Script Geavanceerd**, French: **Script SSH avancé**, German: **SSH-Skript (Erweitert)**, Japanese: **SSH ? ? ? ? ? (? ? ? ? ? ?)**, Portuguese: **SSH Script Avançado**, Russian: **Расширенный скрипт SSH**, Simplified Chinese: **?? SSH??**, Spanish: **Secuencia de comandos SSH avanzada**

Remarks

- For details about the return value format, see manual section [Custom Sensors](#)³⁶⁴¹.
- For security reasons, the script file must be stored on the target system. Make sure the script has executable rights.

- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.
- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.
- This sensor type cannot support all Linux/Unix and Mac OS distributions.
- For a general introduction to SSH monitoring, please see manual section [Monitoring via SSH](#)³⁵¹⁰.
- Knowledge Base: [SSH and SFTP Sensors in Unknown Status](#)

Limited to 50 Sensor Channels

 PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Script

Select a script file from the list. The dropdown menu will list all script files available in the `/var/prtg/script/xml` directory on the target Linux/Unix system. For a script file to appear in this list, store the target file into this directory. Make sure the script has executable rights.

To show the expected sensor value and [status](#)¹⁹⁵, your files must return the expected XML or JSON format to standard output **stdout**. Values and message must be embedded in the XML or JSON.

 For detailed information on the expected return format and on how to build custom sensors, see section [Custom Sensors](#)³⁶⁴¹

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Script	Shows the script that the sensor executes with each scan. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Parameters	If your script file catches command line parameters, you can define them here. You can use placeholders as well.

SENSOR SETTINGS

 For a full list of all placeholders, see section [Custom Sensors](#)

Please enter a string or leave the field empty.

 You need to escape special characters and whitespaces in your parameters and surround them with double quotes. See section [Escape Special Characters and Whitespaces in Parameters](#) for details. In Secure Shell (SSH) scripts, you can use alphanumeric characters and the special characters ".", "_", "-", "=", and "/" outside of quoted strings.

Mutex Name

Define any desired mutex name for the process. PRTG will execute all custom script sensors having the same mutex name serially (not simultaneously). This is useful if you use a lot of sensors and want to avoid high resource usage caused by processes running at the same time. Please enter a string or leave the field empty.

 For more information, see the Knowledge Base: [What is the Mutex Name in the PRTG EXE/Script Sensor settings?](#)

SSH SPECIFIC

Connection Timeout (Sec.)

Define a timeout in seconds for the connection. This is the time the sensor will wait to establish a connection to the host. Keep this value as low as possible. The maximum value is **900** seconds (15 minutes). Please enter an integer value.

 The sensor types **SSH SAN Enclosure**, **SSH SAN Logical Disk**, **SSH SAN Physical Disk**, **SSH SAN System Health** have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.

 Ensure the connection timeout is a higher value than the shell timeout to avoid potential errors.

Shell Timeout (Sec.)

Define a timeout in seconds for the shell response. This is the time in seconds the sensor will wait for the shell to return a response after it has sent its specific command (for example, `cat /proc/loadavg`). The maximum value is **300** seconds (5 minutes). Please enter an integer value.

 The sensor types **SSH SAN Enclosure**, **SSH SAN Logical Disk**, **SSH SAN Physical Disk**, **SSH SAN System Health** have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.

SSH SPECIFIC

- ⚠ Ensure the shell timeout is a lower value than the connection timeout to avoid potential errors.

SSH Port

Define which port this sensor uses for the SSH connection. Choose between:

- **Inherit port number from parent device (default):** Use the port number as defined in the [Credentials for Linux/Solaris/Mac OS \(SSH/WBEM\) Systems](#)^[408] section of the device this sensor is created on.
- **Enter custom port number:** Define a custom port number below and do not use the port number from the parent device settings.

Use Port Number

This field is only visible if you choose **Enter custom port number** above. Enter the port number (between 1 and 65535) that this sensor will use for the SSH connection. Please enter an integer value.

SSH Engine

Select the method you want to use to [access data with this SSH sensor](#)^[3510]. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between:

- **Inherit from parent device (default):** Use the SSH engine that you have defined in the parent device settings or higher in the [object hierarchy](#)^[133]. If you did not change it, this is the recommended default engine.
- **Default:** This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option.
- **Compatibility Mode (deprecated):** Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

- ⓘ The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).

Result Handling

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.

SSH SPECIFIC

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error:** Store the last result of the sensor only if it throws an error.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Escape Special Characters and Whitespaces in Parameters

 You need to escape special characters in parameters that you pass to an executable or script and surround them with quotation marks to make sure the characters are interpreted correctly. Especially PowerShell scripts require adequate escaping so that the parameters are passed in a valid PowerShell syntax. To make escaping easy and secure, PRTG automatically does most of the escaping for you.

Please follow these rules to escape special characters and whitespaces in the parameters fields:

- Use quotes for parameters that contain whitespaces.

```
-name "Mr John Q Public"
-name 'Mr John Q Public'
```

- Use double quotes for parameters that contain single quotes.

```
-name "Mr 'John Q' Public"
```

- Use single quotes for parameters that contain double quotes.

```
-name 'Mr "John Q" Public'
```

- Use a backslash (\) to escape and pass a literal double quote.

```
-name pub\"lic
```

- Use double quotes for parameters that contain double **and** single quotes and escape double quotes.

```
-name "pu'b\"lic"
```

In Secure Shell (SSH) scripts, you can use alphanumeric characters and the special characters ":", "_", "-", "=", and "/" outside of quoted strings.

 We recommend that you do not pass passwords in parameters. Use PRTG placeholders instead. See section [Custom Sensors](#)³⁶⁵⁵ for details.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.207 SSL Certificate Sensor

The SSL Certificate sensor monitors the certificate of a secure Secure Sockets Layer (SSL)/Transport Layer Security (TLS) connection. It can show the following:

- Days to expiration with predefined lower warning limit (28 days) and lower error limit (7 days)
- Public key length
 - RSA keys: **Warning** [status](#)^[195] for 1024-bit keys (**Weak** security), **Up** status for 2048-bit keys (**Good** security) and longer (**Perfect** security); **Down** status for shorter keys (**Unsafe**)
 - ECC (Elliptic Curve Cryptography) keys: **Up** [status](#)^[195] for 128-bit and 192-bit keys (**Good** security) and longer (**Perfect** security); **Down** status for shorter keys (**Unsafe**)
- If common name or subject alternative names match the host address or SNI (if certificate name validation is enabled)
- If the certificate has been revoked (failing to query the certificate revocation list results in a warning status)
- If the certificate is trusted as root authority
- If the certificate is self-signed
- Certificate common name (sensor message)
- Certificate thumbprint (sensor message)

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

SSL Certificate Sensor

Sensor in Other Languages

Dutch: **SSL Certificaat Sensor**, French: **Capteur de certificat SSL**, German: **SSL-Zertifikatssensor**, Japanese: **SSL ? ? ? ? ? ?**, Portuguese: **Sensor do certificado SSL**, Russian: **Сенсор сертификата SSL**, Simplified Chinese: **SSL ? ? ? ? ?**, Spanish: **Sensor de certificado SSL**

Remarks

- Enter the DNS name in the parent [device settings](#)⁴⁰² exactly as written in your certificate. For example, enter **www.example.com** instead of **example.com**. The short version might not work properly with this sensor.
- To check the revocation status of a certificate, the sensor uses the same proxy settings as configured for the Windows user account on which the PRTG probe runs. This is usually the Windows local "system" user account. If you use a proxy, for example, please edit these settings in the Internet Explorer on this system accordingly (on the computer running the probe; on all nodes if in a cluster).
- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, refer to the manual section [Sensor Channels Settings](#)³¹⁶⁰.

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).
- ⓘ This sensor supersedes the deprecated HTTP Certificate Expiry sensor that is outdated.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

- ⓘ Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSL CERTIFICATE SPECIFIC

Port Enter the number of the port to which this sensor connects. Please enter an integer value. The default port is **443**.

Virtual Host (SNI Domain) Define the host name that the sensor will try to query if your server presents multiple certificates on the same IP address and port combination. Please enter a string.

In case of virtual hosting you need to identify the specific certificate for a specific domain while all domains use the same IP address, you can use Server Name Identification (SNI), which is an extension of Transport Layer Security (TLS).

i If you enable the **Common Name Validation** below, the sensor will compare the common name and optionally alternative names with the SNI defined here. Leave this field empty to validate the common name with the host address of the parent device.

Certificate Name Validation Define if you want the sensor to validate the certificate name. Choose between:

- **Do not compare common name with device address or SNI (default):** The sensor will not check if the certificate name is valid by comparing it with the address of the parent device or the defined SNI.
- **Compare and show 'down' status if common name and address/SNI do not match:** Check the common name to validate the certificate. If you set an SNI domain above, the sensor will compare the common name with this SNI. If you leave the SNI field empty, the sensor will use the host address of the parent device. If common name and the checked address/SNI do not match, the sensor will show a **Down status**¹⁹⁵.

SSL CERTIFICATE SPECIFIC

- **Compare and show 'down' status if common name/alternative names and address/SNI do not match:** Check common name and **Subject Alternative Names (SAN)** to validate the certificate. If you set an SNI domain above, the sensor will compare common name and alternative names with the SNI. If you leave the SNI field empty, the sensor will use the host address of the parent device. If common name or alternative names and the checked address/SNI do not match, the sensor will show a **Down status** ¹⁹⁵.

CONNECTION SPECIFIC

Use SOCKS Proxy (v5 only)

Define if you want to use a SOCKS proxy server for the sensor connection. Choose between:

- **Do not use SOCKS proxy (default):** The sensor will connect directly to the target host without using a SOCKS proxy.
- **Use SOCKS proxy:** The sensors will connect using **SOCKS5**. Provide data for the SOCKS connection below.

 Other SOCKS versions are not supported.

 This sensor type only supports SOCKS5 proxies. HTTP proxies are not supported.

SOCKS Proxy Server

This field is only visible if you choose **Use SOCKS proxy**. Enter the IP address or host name of the SOCKS5 proxy server that the sensor will use to connect.

SOCKS Proxy Server Port

This field is only visible if you choose **Use SOCKS proxy**. Enter the port number of the SOCKS5 proxy server that the sensor will use to connect.

SOCKS Proxy Server User

This field is only visible if you choose **Use SOCKS proxy**. If the SOCKS5 proxy server requires authentication, enter a username.

SOCKS Proxy Server Password

This field is only visible if you choose **Use SOCKS proxy**. If the SOCKS5 proxy server requires authentication, enter the password for the user you specify above.

DEBUG OPTIONS

Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none">  For more information on how to find the folder used for storage, see section Data Storage³⁷³⁴. <p> This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>
---------------	---

 You can use the debug option to get a logfile with information about the certificate chain. Additionally, certificates in the certificate chain are stored in the log folder (**.cer** files). This can help you, for example, if you have issues with the **Root Authority Trusted** channel of this sensor.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)^[336] on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

i Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#) 3209 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.208 SSL Security Check Sensor

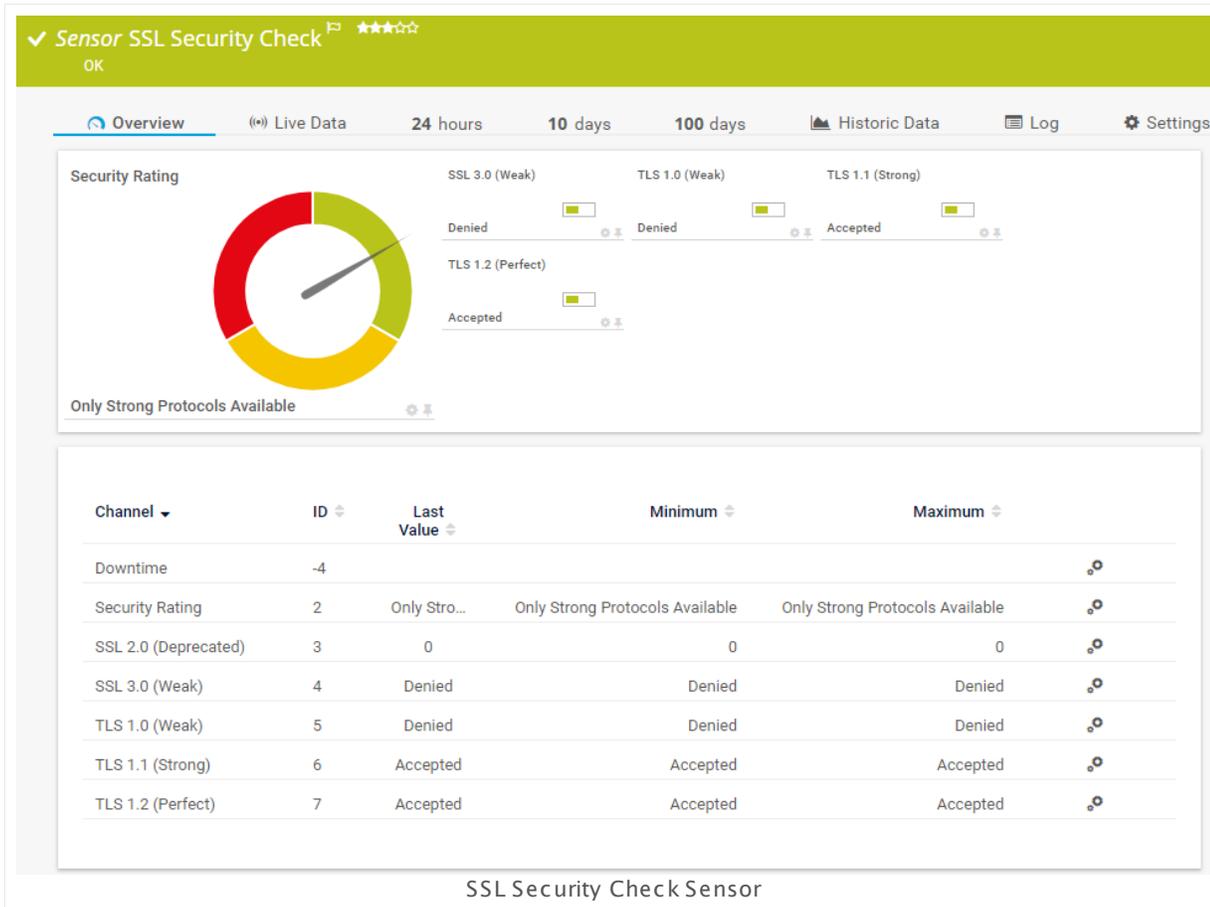

The SSL Security Check sensor monitors the Secure Sockets Layer (SSL) connectivity to the port of a device. It tries to connect to the specified TCP/IP port number of a device with various SSL/TLS protocol versions and shows if a particular protocol is supported.

The sensor checks connectivity with the following protocols in particular [channels](#)^[136] with the possible values **Accepted** (sensor can connect with this protocol) or **Denied** (sensor cannot connect with this protocol):

- **SSL 3.0:** weak security (warning if accepted, up if denied)
- **TLS 1.0:** weak security (warning if accepted, up if denied)
- **TLS 1.1:** strong security (up if accepted, otherwise gray)
- **TLS 1.2:** perfect security (up if accepted, otherwise gray)

The default primary channel **Security Rating** shows the connection security to the defined port with one of the following [states](#)^[195]:

- **Down:** There is no secure protocol available. The sensor cannot connect with one of the given protocols.
- **Warning (weak):** The sensor can connect with at least one of the weak protocols SSL 3.0, or TLS 1.0.
- **Up (strong):** The sensor can connect with a strong protocol only (TLS 1.1, TLS 1.2). Connecting with a weak protocol is not possible.

Sensor in Other Languages

Dutch: **SSL Security Check**, French: **Vérification de sécurité SSL**, German: **SSL-Sicherheit überprüfung**, Japanese: **SSL ? ? ? ? ? ? ? ? ?**, Portuguese: **Verificação de segurança SSL**, Russian: **Проверка безопасности SSL**, Simplified Chinese: **SSL ? ? ? ?**, Spanish: **Comprobación de seguridad SSL**

Remarks

- This sensor only checks accepted protocols, it does not consider the used ciphers.
- Knowledge Base: [How do you determine the protocol security ratings of the SSL Security Check sensor?](#)
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSL SECURITY SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port	Enter the number of the port to which this sensor connects. Please enter an integer value. The default port is 443 .
Virtual Host (SNI Domain)	Enter a host name that the sensor will query. The sensor uses this host to connect if the target server presents multiple certificates on the same IP address and IP port when using Server Name Identification (SNI).

CONNECTION SPECIFIC

Use SOCKS Proxy (v5 only)	<p>Define if you want to use a SOCKS proxy server for the sensor connection. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not use SOCKS proxy (default): The sensor will connect directly to the target host without using a SOCKS proxy. ▪ Use SOCKS proxy: The sensors will connect using SOCKS5. Provide data for the SOCKS connection below. <ul style="list-style-type: none"> ❗ Other SOCKS versions are not supported. ❗ This sensor type only supports SOCKS5 proxies. HTTP proxies are not supported.
SOCKS Proxy Server	This field is only visible if you choose Use SOCKS proxy . Enter the IP address or host name of the SOCKS5 proxy server that the sensor will use to connect.
SOCKS Proxy Server Port	This field is only visible if you choose Use SOCKS proxy . Enter the port number of the SOCKS5 proxy server that the sensor will use to connect.
SOCKS Proxy Server User	This field is only visible if you choose Use SOCKS proxy . If the SOCKS5 proxy server requires authentication, enter a username.
SOCKS Proxy Server Password	This field is only visible if you choose Use SOCKS proxy . If the SOCKS5 proxy server requires authentication, enter the password for the user you specify above.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵⁵ on PRTG on premises installations.</p>
-------------------	---

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

Knowledge Base: How do you determine the protocol security ratings of the SSL Security Check sensor?

- <https://kb.paessler.com/en/topic/71566>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

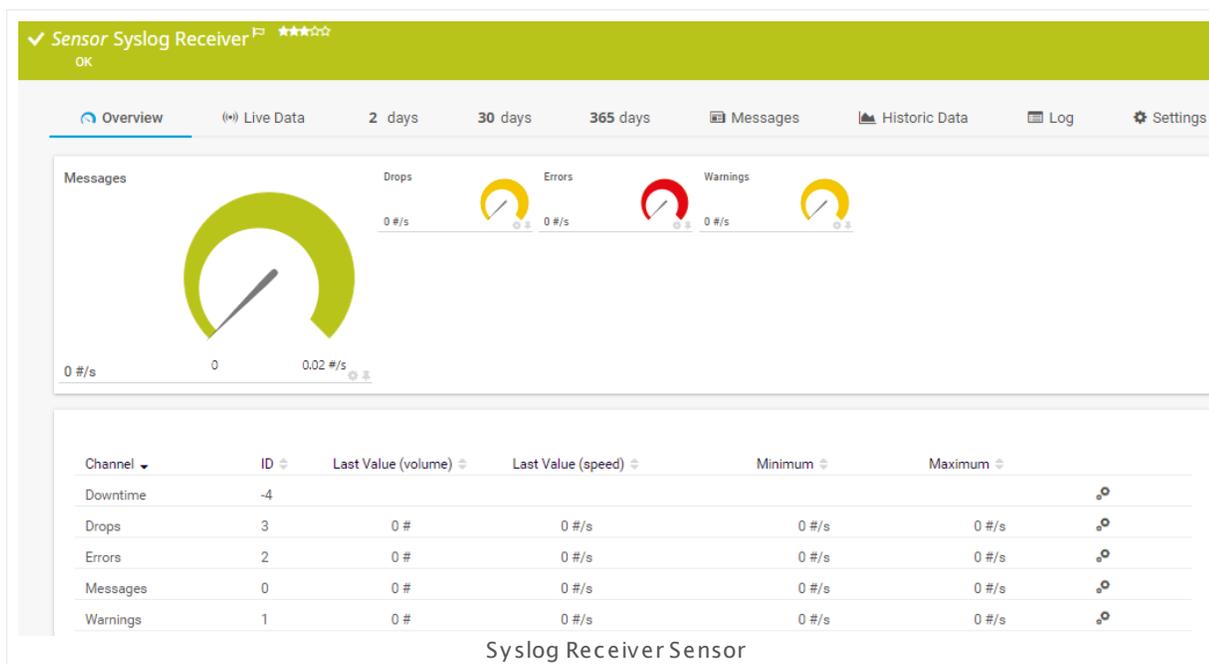

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.209 Syslog Receiver Sensor

The Syslog Receiver sensor receives and analyzes Syslog messages.

It shows the following:

- Number of received syslog messages per second
- Number of messages categorized as "warning" per second
- Number of messages categorized as "error" per second
- Number of dropped packets per second

Sensor in Other Languages

Dutch: **Syslog ontvanger**, French: **Récepteur Syslog**, German: **Syslog-Empfänger**, Japanese: **Syslog** ? ? ? ? ? , Portuguese: **Destinatário de syslog**, Russian: **Приемник Syslog**, Simplified Chinese: ? ? ? ? ? ? ? ? , Spanish: **Receptor Syslog**

Remarks

- With the available filter options, you can define individually which types of messages the sensor will consider for monitoring, and which messages it will categorize as warning or error messages. Depending on the filters, received messages are counted in the respective channels.
- Add the sensor to the probe device to receive all messages of the system running the probe.
- Add the sensor to a specific device to receive all messages from this device directly. This makes this sensor type faster than just using source filters.

- You can use specific placeholders in email [notification templates](#)^[3316] to see the messages when you receive an email notification. See the Knowledge Base: [What placeholders can I use with PRTG?](#)
 - [Sensor states](#)^[195] of this sensor type persist for one scanning interval only. If there is no warning or error message in the following scanning interval, the sensor will show an **up** status again. For a workaround, see this Knowledge Base article: [How can I configure sensors using speed limits to keep the status for more than one interval?](#)
 - If you do not add the sensor to a probe device but to another device in PRTG, be careful with the configuration: Ensure that the IP address or DNS name of the parent device matches the proper sender. For example, if you want to receive messages from a Storage Area Network (SAN), you might have to add a device to PRTG using the IP address of a specific array member that sends the messages. Providing a DNS name that points to the IP address of a whole group might not work for SANs.
 - This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
 - For a general introduction to the receiver's configuration, see manual section [Monitoring Syslogs and SNMP Traps](#)^[3539].
 - This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SYSLOG SPECIFIC

Listen on Port	Enter the number of the port on which the sensor waits for Syslog messages. The default port is 514 . Please enter an integer value. We recommend that you use the default value.
Purge Messages After	Define how long PRTG stores received Syslog messages for analysis. Choose a period of time from the dropdown list.

FILTER

Include Filter Define if you want to filter Syslog messages. If you leave this field empty or use the keyword **any**, the sensor will process all data. To include specific types of messages only, define filters using a special syntax.

 For more information, see section [Filter Rules](#) .

Exclude Filter Define which types of Syslog messages the sensor will discard and not process. To exclude specific types of messages, define filters using a special syntax.

 For more information, see section [Filter Rules](#) .

Warning Filter Define which types of Syslog messages count for the **Warnings** channel. To categorize received messages as warning messages, define filters using a special syntax.

 For more information, see section [Filter Rules](#) .

 Messages are collected until a scanning interval ends. as long as the scanning interval is running, no status change will happen. By default, the sensor will turn into a **Warning** status after a scanning interval has finished and there was at least one warning message (and no error message) during this interval. The status will remain **Warning** at least until the succeeding scanning interval has finished. If in this scanning interval no warning or error message occurred, the status of the sensor will turn **Up** again after the interval.

Error Filter Define which types of syslog messages will count for the **Errors** channel. To categorize received messages as error messages, define filters using a special syntax.

 For more information, see section [Filter Rules](#) .

 Messages are collected until a scanning interval ends. As long as the scanning interval is running, no status change will happen. By default, the sensor will turn into a **Down** status after a scanning interval has finished and there was at least one error message during this interval. The status will remain **Down** at least until the succeeding scanning interval has finished. If the sensor did not receive any warning or error message in this scanning interval, the status of the sensor will turn **Up** again after the interval.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none">▪ Show channels independently (default): Show an own graph for each channel.▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

DEBUGGING

Log Data to Disk Define if the probe will write a logfile of the received data to the data folder (see [Data Storage](#)³⁷³⁴) to the disk for debugging purposes. Choose between:

- **Off (recommended):** Do not write additional logfiles. Recommended for normal use cases.
- **On:** Write logfiles for all data received.

 Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

Filter Rules for Syslog Messages

Filter rules are used for the include, exclude, warning, and error definition fields of the Syslog Receiver sensor. They are based on the following format:

```
field[filter]
```

You can use various filters suitable to your needs. Include and exclude filters define which messages to monitor. Warning and error filters define how to categorize received messages. Provide these filters in the sensor settings as formulas. Formulas are fields that you can combine with boolean operators (**AND**, **OR**, **NOT**) and brackets.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
209 Syslog Receiver Sensor

FIELD	PARAMETER	EXAMPLE
source [ip]	the IP address where the messages will be received from; masks and ranges are also possible	<ul style="list-style-type: none"> ▪ source[10.0.23.50] ▪ source[10.0.23.10-50] ▪ source[10.0.23.10/255]
facility [number]	any number or range from 0 to 23 specifying the type of program sending the message	<ul style="list-style-type: none"> ▪ facility[2] ▪ facility[5-7] ▪ facility[5] OR facility[6]
severity [number]	any number or range from 0 (emergency) to 7 (debug) specifying the type of message	<ul style="list-style-type: none"> ▪ severity[4] ▪ severity[1-3] ▪ severity[1] AND severity [2]
host name [text]	any string specifying the hostname of a device in the message	<ul style="list-style-type: none"> ▪ hostname [www.example.com]
tag [text]	any string specifying the tag of a program or process in the message	<ul style="list-style-type: none"> ▪ tag[su]
appname [text]	any string specifying the appname part of the message	<ul style="list-style-type: none"> ▪ appname[myproc] ▪ appname[demo] AND msgid[m42]
procid [text]	any string specifying the process identifier part of the message	<ul style="list-style-type: none"> ▪ procid[1860]
msgid [text]	any string specifying the message identifier part of the message	<ul style="list-style-type: none"> ▪ msgid[ID47]
message [parttext]	any string specifying the message part of the message (substring will match; case insensitive!)	<ul style="list-style-type: none"> ▪ message[Error]
data [id ,param,value]	checks the SD-ID block of the message's structured data for a parameter matching the given value	<ul style="list-style-type: none"> ▪ data [exampleSDID@12345,eventSource,Application]
data [parttext]	checks if the given substring matches on structured data as displayed in the corresponding table	<ul style="list-style-type: none"> ▪ data [exampleSDID@1234]
data [id,param]	checks if the parameter exists in the given ID element	<ul style="list-style-type: none"> ▪ data [exampleSDID@1234,eventSource]

- ❗ String parameters (except the substring in **message**) have to match **exactly** the particular parts of the message. They are case sensitive!

Messages Tab: Review and Analyze Syslog Messages

PRTG stores received Syslog messages as common files in the data folder (see section [Data Storage](#)³⁷³⁴). To review and analyze all received messages, you can access the most recent data directly in a [table list](#)²³⁷ in the PRTG web interface. You can access this list via the **Overview** tab of the sensors.

- ❗ Received syslog messages are only shown after an (automatic) page refresh following to a sensor scan in the table on the **Overview** tab (default for [auto refresh](#)³³⁰⁴ is 30 seconds).

For more details and further filter options, click the **Messages** tab of the Syslog Receiver sensor. You will see all received messages in a [table list](#)²³⁷. On the top, you have display filter options to drill down into the data for specific events of your interest. The filters are the same as available in the sensor settings, but you can define them without using formulas. Provide the desired parameters and PRTG loads the filtered list automatically.

- ❗ You can automatically add a filter by clicking the content of a column.

Advanced Filter Settings

You can open advanced filter settings by clicking the gear icon in the **Filter** row. The **Advanced Filter** will appear in a popup window. In the text field, you can define a filter using the syntax as given in section [Filter Rules for Syslog Messages](#)²⁶⁶⁵.

If you have provided filter parameters on the **Messages** tab, the advanced filter will already include them as a corresponding formula with the correct syntax. You can adjust this filter to your needs. You can also copy the automatically created and manually adjusted formula for usage in the filter fields of the sensor settings.

209 Syslog Receiver Sensor

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

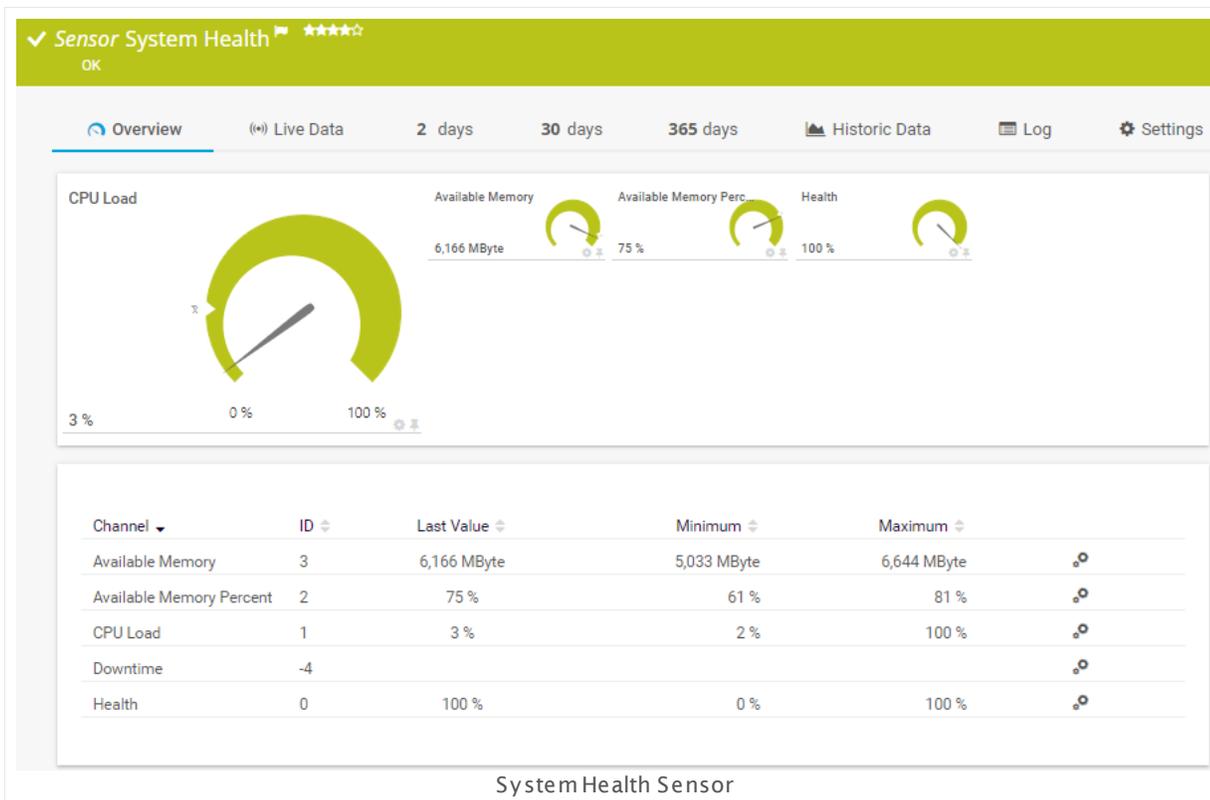

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.210 System Health Sensor

The System Health sensor monitors internal PRTG parameters. It shows the status of the system on which a probe runs. PRTG creates this sensor type automatically and cannot be deleted.

It checks various parameters of your PRTG system that can affect the quality of the monitoring results:

- **Health:** This index value sums up the probe state into a value between 100% (healthy) and 0% (failing). Frequent or repeated health values below 100% should be investigated.
- **Available Memory:** This channel shows the amount of free memory available on the system. This value should not fall below 500 MB. This way, PRTG can still request resources during report generation, auto-discoveries, and other issues.
- **Available Memory Percent:** This channel shows the free memory available on the system in percent.
- **System CPU Load:** This channel shows the current percentage CPU load on the system with the probe. Extensive CPU load can lead to false, incomplete, and incorrect monitoring results. This value should usually stay below 50%.

Sensor in Other Languages

Dutch: **System Status**, French: **État du système**, German: **Systemzustand**, Japanese: ? ? ? ? ? ? , Portuguese: **Funcionamento do sistema**, Russian: **Работоспособность системы**, Simplified Chinese: ? ? ? ? ? ? , Spanish: **Salud del sistema**

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-----------------	--

SENSOR DISPLAY

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

-  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁶⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

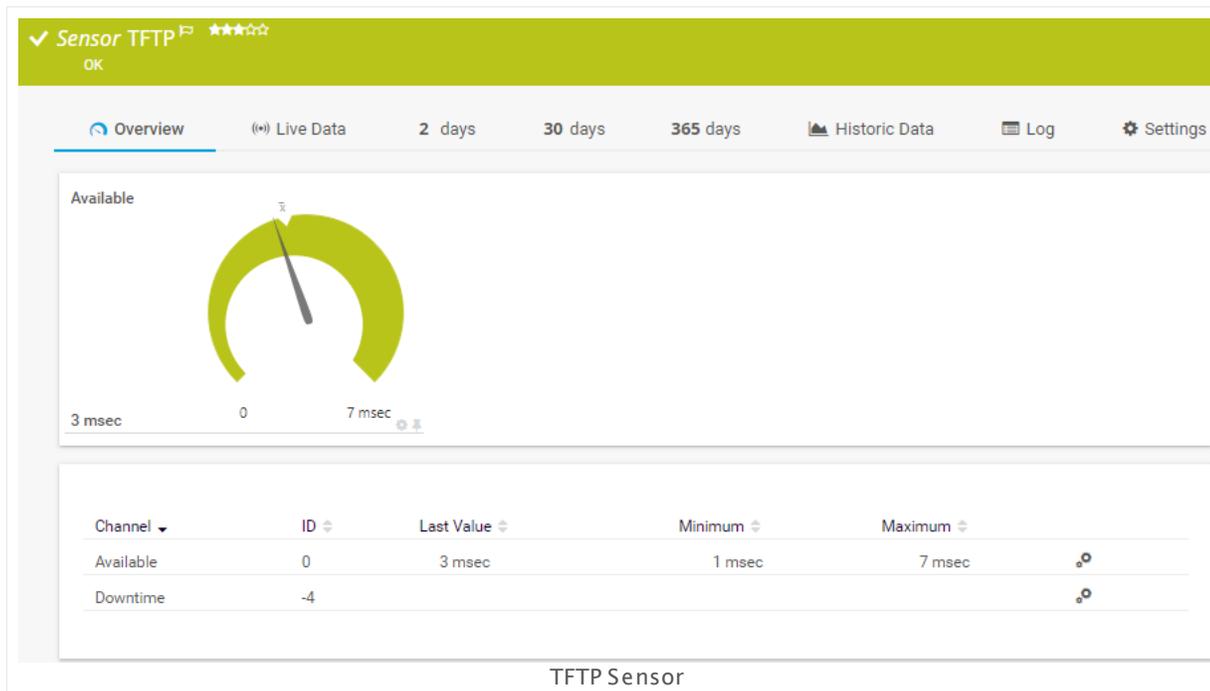

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.211 TFTP Sensor

The TFTP sensor monitors a Trivial File Transfer Protocol (TFTP) server and checks if a certain file is available for download.

- It shows the response time of the server.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port	Enter the number of the port the TFTP service is running on. The sensor connects to this port. Please enter an integer value.
Filename	Enter the name of the file that this sensor checks. If this file name is not available on the server, the sensor shows a Down status ^[195] . Please enter a string.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

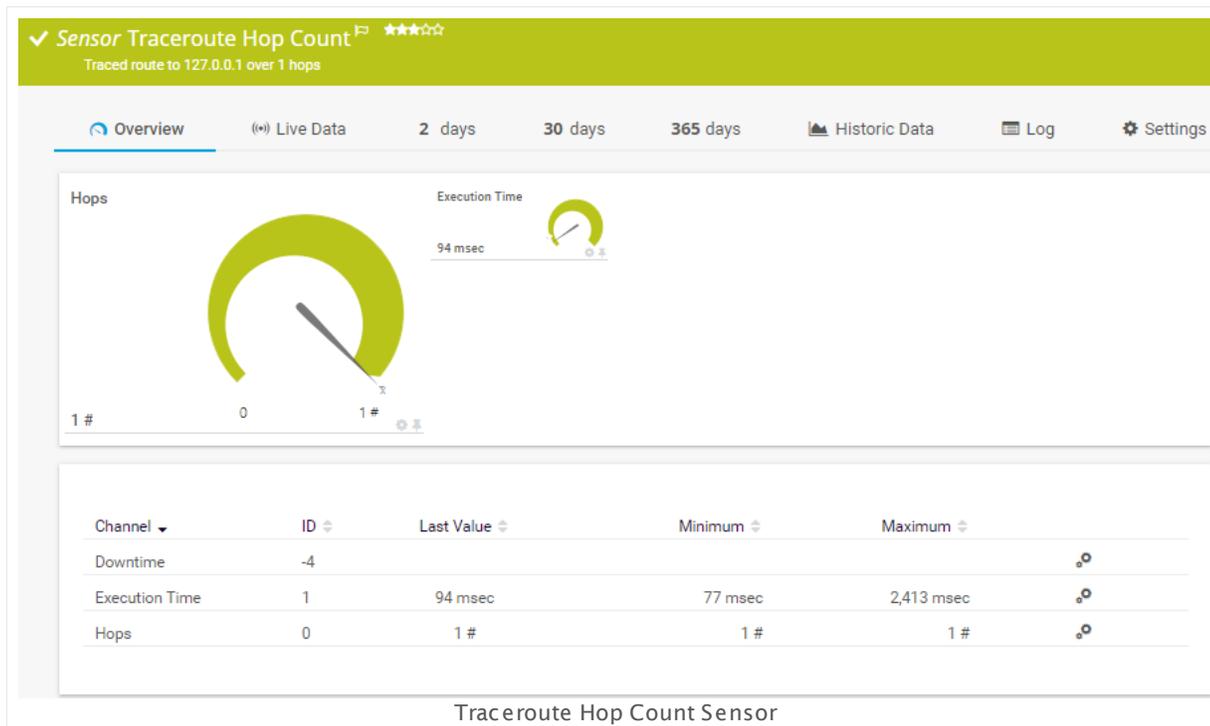

7.8.212 Traceroute Hop Count Sensor

The Traceroute Hop Count sensor traces the number of hops needed from the probe system the sensor is running on to the **IP Address/DNS Name** defined in the sensor's parent device.

It shows the following:

- Execution time
- Number of hops
- If the number of hops (the route) changes, you can additionally define another [sensor status](#)

195.

Sensor in Other Languages

Dutch: **Traceroute Hop Count**, French: **Traceroute Hop Count**, German: **Traceroute Hop Count**, Japanese: **Traceroute Hop Count**, Portuguese: **Rastreo de rotas**, Russian: **Трассировка маршрута**, Simplified Chinese: ? ? ? , Spanish: **Traceroute Hop Count**

Remarks

- [Requires](#) .NET 4.5 or later to be installed on the probe system. If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3276] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags ^[139] , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

If Route Changes Define what to do if the route has changed since the last check. Choose between:

- **Ignore**: Do not perform any action.
- **Set sensor to "Warning"**: The sensor will show a **Warning status**^[195] if the route has changed.
- **Set sensor to "Error"**: The sensor will show a **Down status**^[195] if the route has changed.

DEBUG OPTIONS

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 🔗 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
- ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

- 📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - 📘 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

- <https://kb.paessler.com/en/topic/60543>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

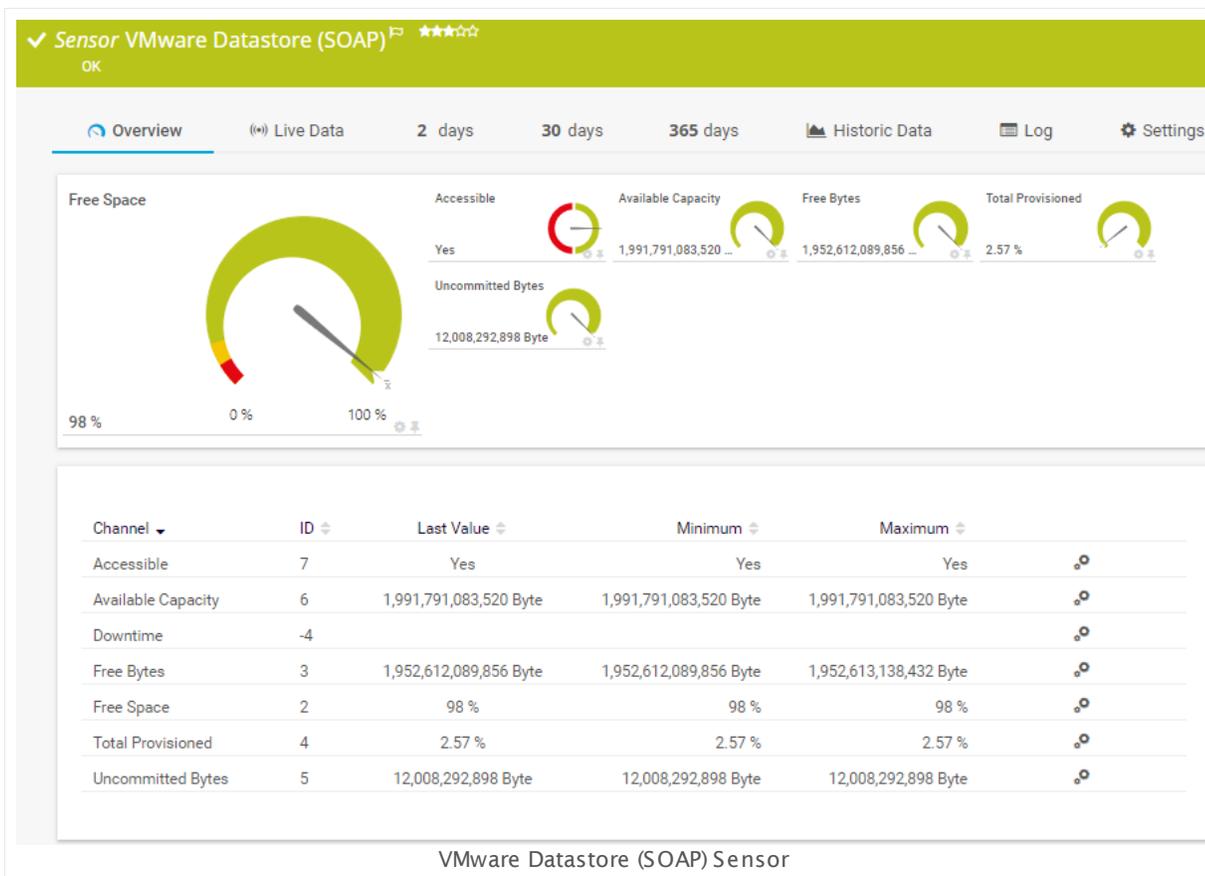

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.213 VMware Datastore (SOAP) Sensor

The VMware Datastore (SOAP) sensor monitors the disk usage of a VMware data store using Simple Object Access Protocol (SOAP). It can show the following:

- Available capacity in bytes: This is the physically or virtually available size of the data store.
- Free space in bytes and percent: This is the disk space that is not used by virtual machines. Used disk space can be either thick-provisioned or used from thin-provisioned virtual disks.
- Uncommitted bytes: This is the disk space that is provisioned for thin-provisioned virtual machines but not used yet.
- Total provisioned disk space in percent: This is the sum of all potentially used disk space of thin-provisioned and thick-provisioned VM hard drives (uncommitted bytes plus used bytes).
- Accessibility of the data store

Sensor in Other Languages

Dutch: **VMware Datastore (SOAP)**, French: **VMware Datastore (SOAP)**, German: **VMware Datastore (SOAP)**, Japanese: **VMware Datastore (SOAP)** , Portuguese: **VMware Datastore (SOAP)**, Russian: **Хранилище данных VMware (SOAP)**, Simplified Chinese: **VMware ? ? ? (SOAP)**, Spanish: **Almacén de datos VMware**

Remarks

- [Requires](#) ²⁶⁹³ .NET 4.5 or later to be installed on the probe system.
 - For this sensor type you must define credentials for VMware servers on the device you want to use the sensor on. Ensure you enter a user with sufficient access rights to obtain statistics (read-only usually works).
 - The parent device must be a VMware ESXi server version 5.0, 5.1, 5.5, 6.0, or 6.5 or vCenter.
 - We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
 - Knowledge Base: [I cannot add VMware sensors because of "wrong" password although it is correct. What can I do?](#)
 - Knowledge Base: [Why are my VMware sensors not working after upgrading to VCSA 6.5 U1?](#)
 - This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#) ³⁶⁹³.
 - This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, refer to the manual section [Sensor Channels Settings](#) ³¹⁶⁰.
-  This sensor type supersedes the outdated SSH VMWare ESX(i) Disk sensor. We recommend that you use this new VMware Datastore (SOAP) sensor to monitor VMware data stores.

Requirement: .NET Framework

- ✘ This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#) ³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

-  For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Settings on VMware Host System

If you set up this sensor on different probes (for example, when using [remote probes](#) ³⁷⁰⁸ or when running a [cluster](#) ¹³⁰¹ setup), you might need to change the settings of your VMware host, so it accepts more incoming connections. Otherwise you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

-  For details about this setting, see the Knowledge Base: [How can I increase the connection limit on VMware systems?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the data stores you want to monitor. PRTG will create one sensor for each data store you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

DATASTORE SETTINGS

Datastore Select all data stores for which you want to add a sensor. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

- Tags** Enter one or more [Tags](#)^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.
- You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.
-  It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).
- Priority** Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DATASTORE SETTINGS

- MoID** Shows the Managed Object ID (MoID) of the data store that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶ section.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
213 VMware Datastore (SOAP) Sensor

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

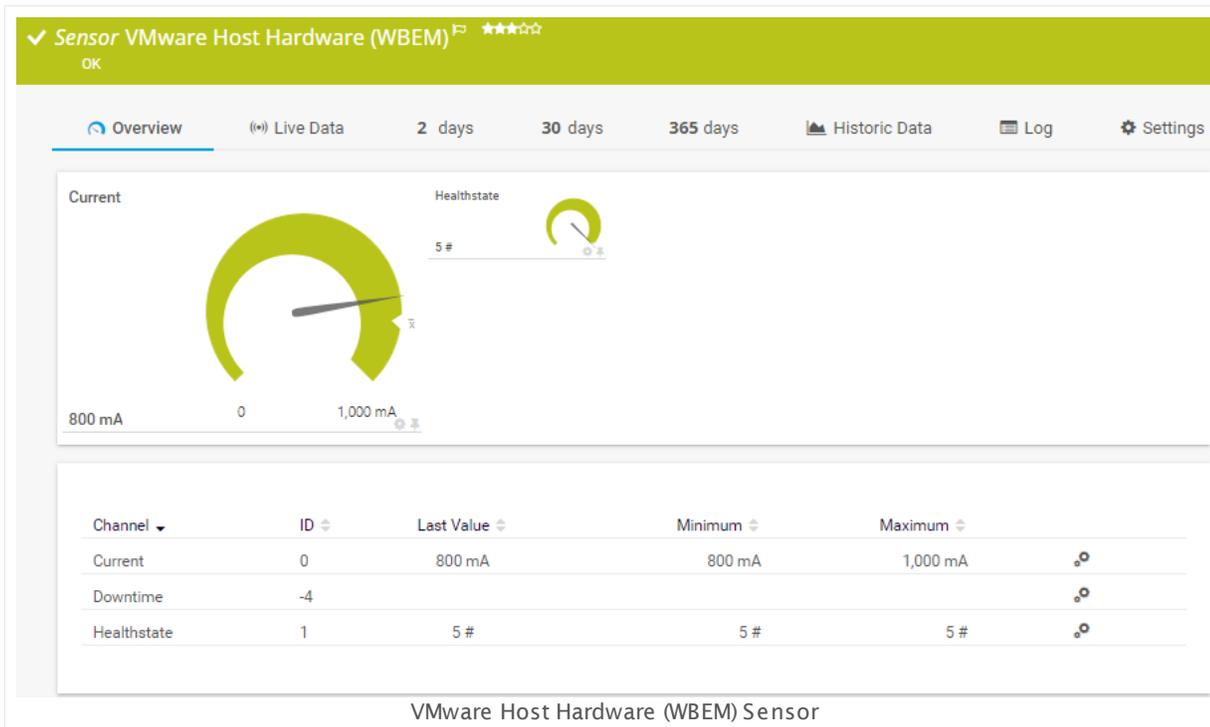

7.8.214 VMware Host Hardware (WBEM) Sensor

The VMware Host Hardware sensor monitors hardware information of an ESX/ESXi server using Web-Based Enterprise Management (WBEM).

It can show the following, depending on the selected ESX component:

- Health status
- Temperature
- Power
- Fan rotations per minute (RPM)
- Battery voltage

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **VMware Host Hardware (WBEM)**, French: **Matériel hôte VMware (WBEM)**, German: **VMware Host Hardware (WBEM)**, Japanese: **VMware? ? ? ? ? ? ? ? (WBEM)** , Portuguese: **VMware Hardware do host (WBEM)**, Russian: **Аппаратные средства узла VMware (WBEM)**, Simplified Chinese: **VMware? ? ? ? (WBEM)**, Spanish: **Hardware de host VMware (WBEM)**

Remarks

- The parent device must be a VMware ESXi server version 5.0, 5.1, 5.5, 6.0, or 6.5.
- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.
- [Requires](#) ²⁷⁰⁴ the CIM interface to be enabled on the ESXi host. On ESXi 6.5 and later you have to manually enable CIM.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Knowledge Base: [Why are my VMware sensors not working after upgrading to VCSA 6.5 U1?](#)
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

Requirement: Enabled CIM Interface on ESXi Host

To access the ESXi host and retrieve monitoring data via WBEM, the Common Information Model (CIM) interface must be enabled on the ESXi host. On ESXi 6.5, CIM is disabled by default so you have to activate it manually.

 For details, see this Knowledge Base article: [How do I enable the CIM interface on VMware ESXi 6.5?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) ³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the ESXi components you want to monitor. PRTG will create one sensor for each hardware element you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

ESXI SERVER ELEMENTS

ESXi Element	Select the hardware elements you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
--------------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

ESX SERVER ELEMENTS

Element	Shows the ESX element that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Automatic Sensor State	<p>Define if the sensor will change its status¹⁹⁵ dependent on the health state reading. Choose between:</p> <ul style="list-style-type: none"> ▪ Set sensor state automatically to 'Warning' or 'Down': Set the sensor to a Warning or Down status when the server returns respective values. The sensor will additionally change to a Down status if the connection to the server fails. ▪ Just report the current reading, ignore Server Health Value: Never change the sensor's status dependent on the values returned by the server. The sensor will only change to a Down status if the connection to the server fails.
Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none">  For more information on how to find the folder used for storage, see section Data Storage³⁷³⁴. <p> This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Knowledge Base: How do I enable the CIM interface on VMware ESXi 6.5?

- <https://kb.paessler.com/en/topic/76255>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
214 VMware Host Hardware (WBEM) Sensor

Others

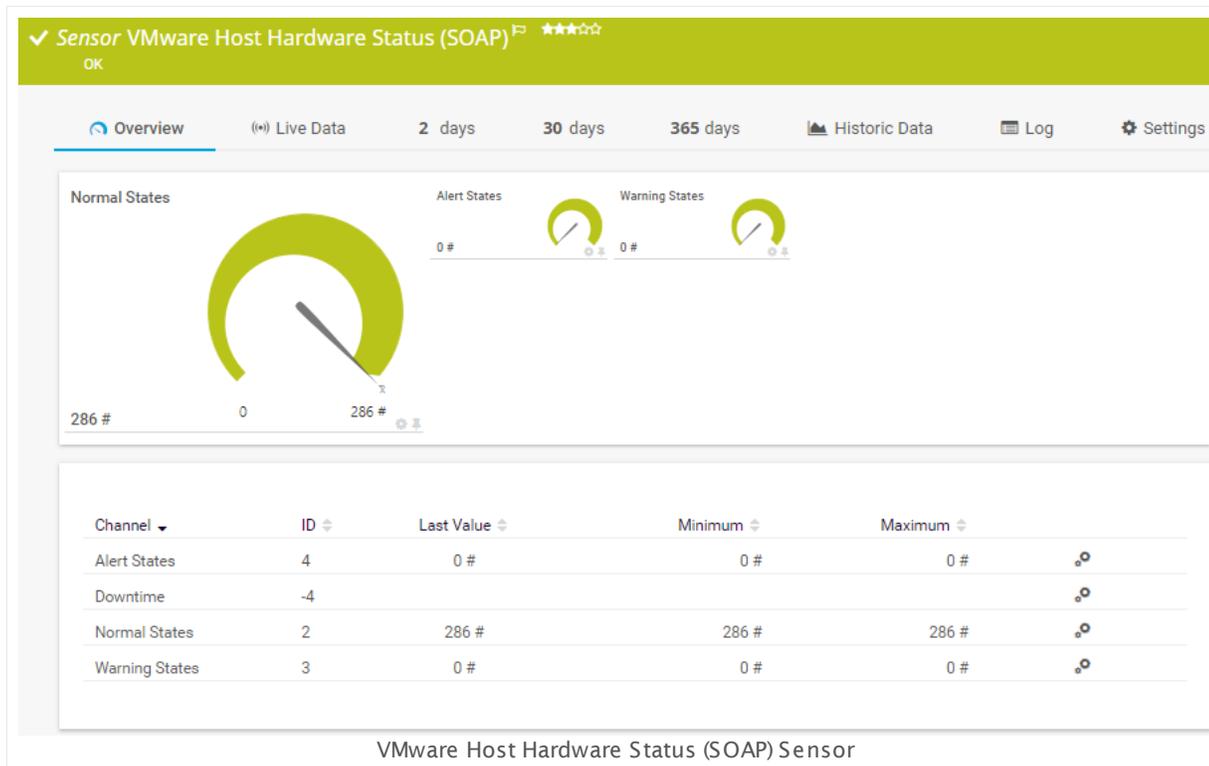

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.215 VMware Host Hardware Status (SOAP) Sensor

The VMware Host Hardware Status (SOAP) sensor monitors the hardware status of a VMware host server using Simple Object Access Protocol (SOAP).

- It shows the total number of items in **normal**, **warning**, and **alert** status, just as the vSphere client reports.

This sensor is intended to give you a general status overview for your host. Any states other than "normal" will be reported in the sensor message.

Sensor in Other Languages

Dutch: **VMware Host Hardware Status (SOAP)**, French: **État du matériel du serveur hôte VMware (SOAP)**, German: **VMware Hostserver Hardware-Zustand (SOAP)**, Japanese: **VMware ? ? ? ? ? ? ? ? ? (SOAP)** , Portuguese: **VMware Status do hardware de host (SOAP)**, Russian: **Состояние аппаратных средств узла VMware (SOAP)**, Simplified Chinese: **VMware ? ? ? ? ? ? (SOAP)**, Spanish: **Estado de hardware de VMware Host (SOAP)**

Remarks

- [Requires](#) ²⁷¹⁴ .NET 4.5 or later to be installed on the probe system.
- For this sensor type you must define credentials for VMware servers on the device you want to use the sensor on. Ensure you enter a user with sufficient access rights to obtain statistics (read-only usually works).

- This sensor only shows items that report an actual status, so you might see more "sensors" in your vSphere client than the number of states available in the channels of this PRTG sensor.
- The parent device must be a VMware ESXi server version 5.0, 5.1, 5.5, 6.0, or 6.5. We recommend that you do not use this sensor type on your vCenter. Reliable hardware information can only be provided when this sensor is created on your physical host server as parent device.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Knowledge Base: [I cannot add VMware sensors because of "wrong" password although it is correct. What can I do?](#)
- Knowledge Base: [Why are my VMware sensors not working after upgrading to VCSA 6.5 U1?](#)
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Settings on VMware Host System

If you set up this sensor on different probes (for example, when using [remote probes](#)^[3706] or when running a [cluster](#)^[130] setup), you might need to change the settings of your VMware host, so it accepts more incoming connections. Otherwise you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

 For details about this setting, see the Knowledge Base: [How can I increase the connection limit on VMware systems?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the VMware hosts you want to monitor. PRTG will create one sensor for each host server you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

VMWARE HOST SETTINGS

Host Server Select the host server you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)^[181], as well as in [alarms](#)^[213], [logs](#)^[228], [notifications](#)^[3216], [reports](#)^[3262], [maps](#)^[3278], [libraries](#)^[3235], and [tickets](#)^[230].

Parent Tags Shows [Tags](#)^[139] that this sensor [inherits](#)^[140] from its [parent device, group, and probe](#)^[133]. This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#)^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

VMWARE HOST SETTINGS

MoID Shows the Managed Object ID (MoID) of the host that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Known Warnings Enter one or more semicolon (;) separated warning messages from the VMware host that you want to ignore. Messages that you enter here will not affect the [sensor status](#)^[195]. Please enter a string or leave the field empty.

i We strongly recommend that you use this filter for known issues only. For example, various systems (mainly HP and IBM systems) return unknown states because of errors in the the vendors' CIM extensions. Because of this, you might not get an [Up status](#)^[195] for this sensor at all although your vSphere client does not show warnings. In this case, use this filter option and enter the known warning message(s), for example, **Power Supply 7;Power Supply 8**

Known Errors Enter one or more semicolon (;) separated error messages from the VMware host that you want to ignore. Messages that you enter here will not affect the [sensor status](#)^[195]. Please enter a string or leave the field empty.

i We strongly recommend that you use this filter for known issues only. For example, various systems (mainly HP and IBM systems) return unknown states because of errors in the the vendors' CIM extensions. Because of this, you might not get an [Up status](#)^[195] for this sensor at all although your vSphere client does not show errors. In this case, use this filter option and enter the known error message(s), for example, **Power Supply 7;Power Supply 8**

DEBUG OPTIONS

- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result:** Do not store the sensor result.
 - **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).
- Stack Unit** This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.216 VMware Host Performance (SOAP) Sensor

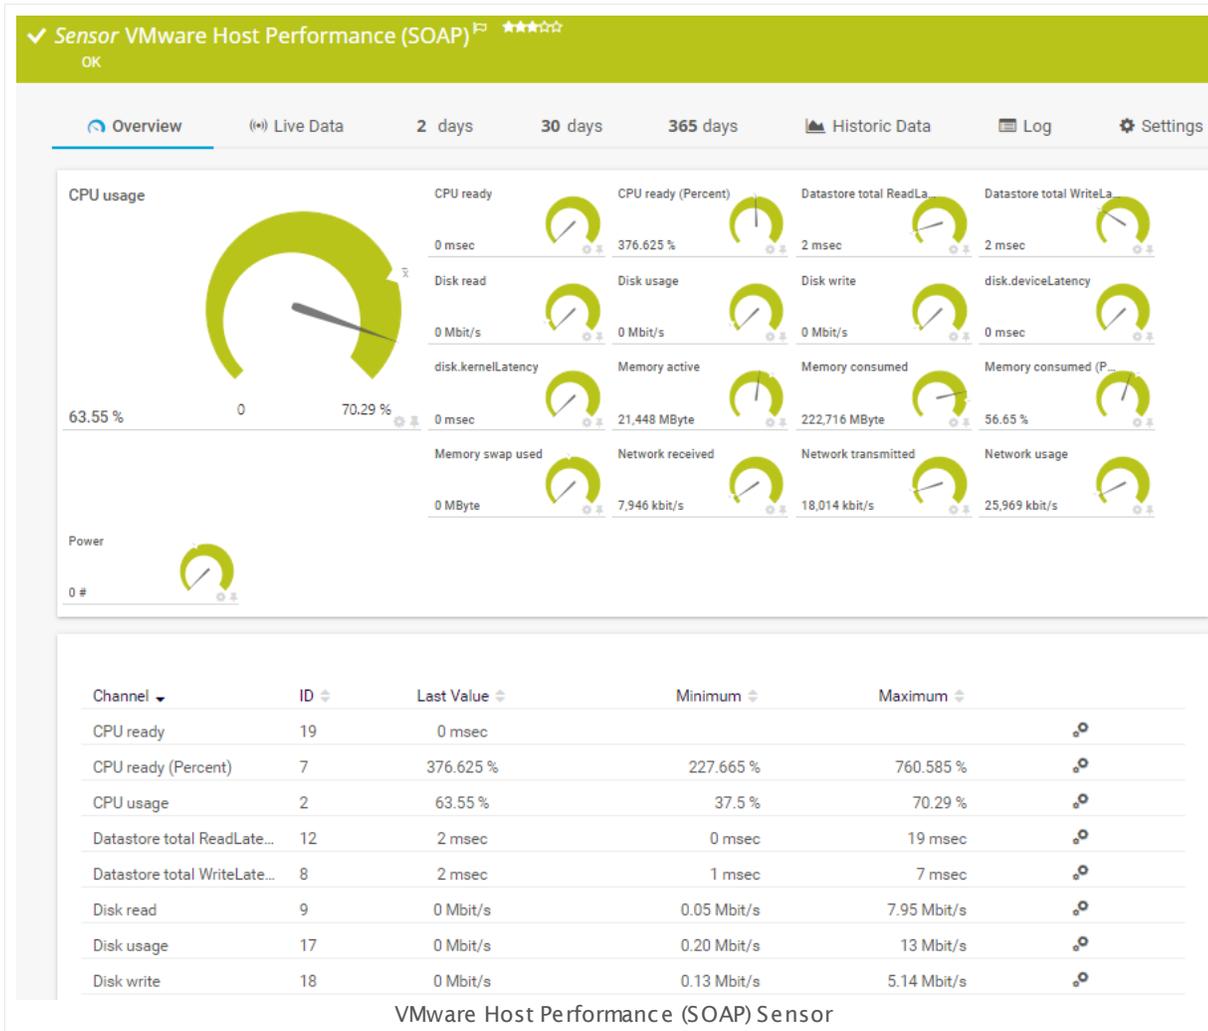

The VMware Host Performance (SOAP) sensor monitors a VMware host server using Simple Object Access Protocol (SOAP).

It can show the following:

- CPU usage in percent
- CPU ready in percent
- Network usage
- Disk usage
- Disk read and write speed
- Active memory in bytes
- Consumed memory in bytes and percent
- Used memory swap
- Disk and data store latency (read and write)
- Network received and transmitted speed
- Power status

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
 216 VMware Host Performance (SOAP) Sensor

Sensor in Other Languages

Dutch: **VMware Host Prestaties (SOAP)**, French: **Performances de l'hôte VMware (SOAP)**, German: **VMware Host server Leistung (SOAP)**, Japanese: **VMware ? ? ? ? ? ? ? ? ? ? (SOAP)**, Portuguese: **VMware Performance do host (SOAP)**, Russian: **Работа узла VMware (SOAP)**, Simplified Chinese: **VMware ? ? ? ? (SOAP)**, Spanish: **Rendimiento de VMware Host (SOAP)**

Remarks

- [Requires](#) .NET 4.5 or later to be installed on the probe system.
- For this sensor type you must define credentials for VMware servers on the device you want to use the sensor on. Ensure you enter a user with sufficient access rights to obtain statistics (read-only usually works).
- The parent device must be a VMware ESXi server version 5.0, 5.1, 5.5, 6.0, or 6.5. We recommend that you do not use this sensor type on your vCenter. Reliable hardware information can only be provided when this sensor is created on your physical host server as parent device.

- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Knowledge Base: [I cannot add VMware sensors because of "wrong" password although it is correct. What can I do?](#)
- Knowledge Base: [Why are my VMware sensors not working after upgrading to VCSA 6.5 U1?](#)
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Settings on VMware Host System

If you set up this sensor on different probes (for example, when using [remote probes](#)^[3709] or when running a [cluster](#)^[130] setup), you might need to change the settings of your VMware host, so it accepts more incoming connections. Otherwise you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

 For details about this setting, see the Knowledge Base: [How can I increase the connection limit on VMware systems?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

VMWARE HOST SETTINGS

MoID	Shows the Managed Object ID (MoID) of the host that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
------	--

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between:
---------------	---

DEBUG OPTIONS

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. 7.8.217 VMware Virtual Machine (SOAP) Sensor

The VMware Virtual Machine (SOAP) sensor monitors a virtual machine on a VMware host server using Simple Object Access Protocol (SOAP).

It shows the following:

- CPU usage in percent
- CPU ready in percent
- Active memory in bytes
- Consumed memory in bytes and percent
- Disk read and write speed
- Read and write latency
- Network usage (total, received, and transmitted bytes per second)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

VMware Virtual Machine (SOAP) Sensor

Sensor in Other Languages

Dutch: **VMware Virtuele Machine (SOAP)**, French: **Machine virtuelle VMware (SOAP)**, German: **VMware Virtual Machine (SOAP)**, Japanese: **VMware? ? ? ? ? (SOAP)** , Portuguese: **VMware Máquina virtual (SOAP)**, Russian: **Виртуальная машина VMware (SOAP)**, Simplified Chinese: **VMware? ? ? (SOAP)**, Spanish: **Máquina virtual VMware (SOAP)**

Remarks

- [Requires](#) .NET 4.5 or later to be installed on the probe system.
- For this sensor type you must define credentials for VMware servers on the device you want to use the sensor on. Ensure you enter a user with sufficient access rights to obtain statistics (read-only usually works).
- We recommend that you use **vCenter** as parent device. When the monitored VM changes the host server via **vMotion**, PRTG can continue monitoring in this case. The sensor can monitor VMware ESXi server version 5.0, 5.1, 5.5, 6.0, or 6.5.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.

- For VMware virtual machines, disk usage channels are only available as of virtual hardware version 8.
- Knowledge Base: [I cannot add VMware sensors because of "wrong" password although it is correct. What can I do?](#)
- Knowledge Base: [Why are my VMware sensors not working after upgrading to VCSA 6.5 U1?](#)
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Settings on VMware Host System

If you set up this sensor on different probes (for example, when using [remote probes](#)^[3708] or when running a [cluster](#)^[130] setup), you might need to change the settings of your VMware host, so it accepts more incoming connections. Otherwise you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

 For details about this setting, see the Knowledge Base: [How can I increase the connection limit on VMware systems?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

 PRTG requests a full list of all virtual machines configured on the device. Because of this, it may take a few seconds before the dialog is loaded.

Select the VMware virtual machines you want to monitor. PRTG will create one sensor for each virtual machine you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

VIRTUAL MACHINE SETTINGS

Virtual Machine You see a list of all virtual machines (VMs) available on the host server on this device, including the ones that are not running. All VMs are listed by name and the OS they are running on.

Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

VMWARE VIRTUAL MACHINE SETTINGS

MoID Shows the Managed Object ID (MoID) of the virtual machine that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Handling of "Powered Off" VM Define the sensor behavior for a virtual machine that is powered off. Choose between:

- **Ignore "powered off" state (default):** The sensor will not change to a **Down status** ¹⁹⁵ if the virtual machine is powered off. It will report zero values instead.
- **Alarm when VM is "powered off":** The sensor will change to a **Down status** ¹⁹⁵ if the virtual machine is powered off.
 While in Down status, a sensor does not record any data in any of its channels.

DEBUG OPTIONS

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 For more information on how to find the folder used for storage, see section [Data Storage](#) ³⁷³⁴.

DEBUG OPTIONS

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ³³⁵ on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to Down status¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none"> ▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request. ▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests. ▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests. ▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests. ▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> <p> If a channel uses lookup³⁶⁹³ values, it will always show a Down status immediately, so no "wait" options will apply.</p> |

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>3311</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

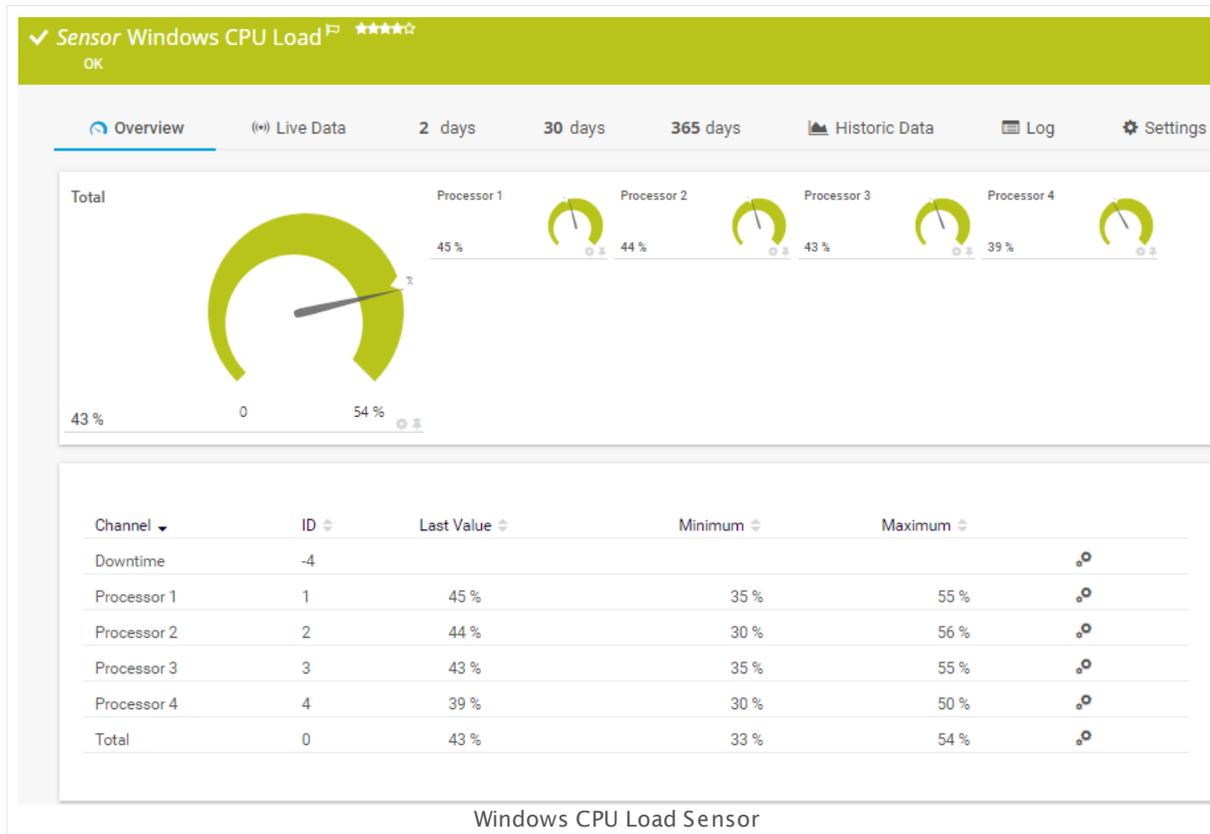

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.218 Windows CPU Load Sensor

The Windows CPU Load sensor monitors the CPU load on a computer via Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

- It shows the CPU usage of all processors and the total load in percent.

Sensor in Other Languages

Dutch: **Windows Processor Belasting**, French: **Charge CPU de Windows**, German: **Windows Prozessorlast**, Japanese: **Windows CPU ? ?**, Portuguese: **Windows Carga de CPU**, Russian: **Загрузка ЦП Windows**, Simplified Chinese: **Windows CPU ? ?**, Spanish: **WMI carga de procesador**

Remarks

- [Requires](#) ²⁷⁴⁵ Windows credentials in the [parent device settings](#) ⁴⁰².
- [Requires](#) ²⁷⁴⁵ Windows 2008 R2 or later on the probe system.
- [Requires](#) ²⁷⁴⁶ the Windows Remote Registry service to be running on the target computer.
- [Requires](#) ²⁷⁴⁵ WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.

- [Can use a hybrid approach](#)^[2745] to query monitoring data: Performance counters as standard approach and WMI as fallback.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

 Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the [parent device's](#)^[407] **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

 If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

 By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a **hybrid approach** in the **Windows Compatibility Options** of the parent [device's settings](#)^[415] on which you create this sensor: if you choose this option, the sensor will first try to query data via **Windows Performance Counters** and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

 Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.

 For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)^[3507] section.

Requirement: Windows Version

 In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)^[3709].

 WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the probe service only runs with 32-bit support. Without it, WMI sensors will not work.

Requirement: Remote Registry Service

X In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags .

BASIC SENSOR SETTINGS

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

WMI ALTERNATIVE QUERY

Errors and Invalid Data This is an extended help field only. WMI sensors in PRTG are equipped with the most efficient and accurate WMI queries. However, Microsoft has changed (and will continue to do so in the future) some WMI classes over the various Windows/ServicePack/patchlevel versions, resulting in errors like **class not valid** or **invalid data**.

Wherever possible, PRTG features an alternative query that might work in your specific configuration. If you keep getting errors for this sensor, please try enabling the alternative query method below.

WMI ALTERNATIVE QUERY

- Alternative Query Choose the method PRTG uses to query via WMI. For compatibility reasons, you can enable an alternative query method. We recommend that you use the default value. You can choose between:
- **Use default (recommended):** Use the PRTG standard method to query WMI. This is the best setting in most cases.
 - **Use alternative (if default does not work):** Use an alternative method to query WMI. If you keep getting errors with the default setting, try this setting.

SENSOR DISPLAY

- Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
-  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#) settings).
- Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Knowledge Base: My Windows sensors do not work when using direct Performance Counter access. What can I do?

- <https://kb.paessler.com/en/topic/47263>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.219 Windows IIS 6.0 SMTP Received Sensor

The Windows IIS 6.0 SMTP Received sensor monitors the number of received emails for a Microsoft Internet Information Services (IIS) 6.0 SMTP service (Exchange 2003) using Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

- It shows the number and bytes of received messages.

Sensor in Other Languages

Dutch: **WMI IIS 6.0 SMTP Ontvangen**, French: **Windows IIS 6.0 SMTP reçu**, German: **WMI IIS 6.0 SMTP Empfangen**, Japanese: **Windows IIS 6.0 SMTP** ? ? , Portuguese: **Windows IIS 6.0 SMTP recebido**, Russian: **Получено пакетов Windows IIS 6.0 SMTP**, Simplified Chinese: ? ? ?
Windows IIS 6.0 SMTP, Spanish: **WMI IIS 6.0 SMTP Recibidos**

Remarks

- [Requires](#) ^[2754] Windows credentials in the [parent device settings](#) ^[402].
- [Requires](#) ^[2755] Windows 2008 R2 or later on the probe system.
- [Requires](#) ^[2755] the Windows Remote Registry service to be running on the target computer.
- [Requires](#) ^[2755] WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- [Can use a hybrid approach](#) ^[2755] to query monitoring data: Performance counters as standard approach and WMI as fallback.
- This service is not used by Exchange Server 2007 and higher. Exchange Server 2007 uses its own SMTP stack implemented in the Microsoft Exchange Transport service.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

 Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the [parent device's](#) ^[407] **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

 If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

i By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a **hybrid approach** in the **Windows Compatibility Options** of the parent [device's settings](#)^[415] on which you create this sensor: if you choose this option, the sensor will first try to query data via **Windows Performance Counters** and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

A Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[370] for load balancing.

i For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)^[357] section.

Requirement: Windows Version

X In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)^[370].

i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the probe service only runs with 32-bit support. Without it, WMI sensors will not work.

Requirement: Remote Registry Service

X In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between:
---------------	---

DEBUG OPTIONS

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings.</p> <ul style="list-style-type: none"> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> <p>▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.</p> <p>▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.</p> <ul style="list-style-type: none"> <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.220 Windows IIS 6.0 SMTP Sent Sensor

The Windows IIS 6.0 SMTP Sent sensor monitors the number of sent emails for a Microsoft Internet Information Services (IIS) 6.0 SMTP service (Exchange 2003) using Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

It shows the following:

- Number and bytes of sent messages
- Number of retries per second for sent messages

Sensor in Other Languages

Dutch: **WMI IIS 6.0 SMTP Verzonden**, French: **Windows IIS 6.0 SMTP envoyé**, German: **WMI IIS 6.0 SMTP Verschickt**, Japanese: **Windows IIS 6.0 SMTP** ? ? , Portuguese: **Windows IIS 6.0 SMTP enviado**, Russian: **Отправлено пакетов Windows IIS 6.0 SMTP**, Simplified Chinese: ? ? ?
Windows IIS 6.0 SMTP, Spanish: **WMI IIS 6.0 SMTP Enviados**

Remarks

- [Requires](#) ^[2763] Windows credentials in the [parent device settings](#) ^[402].
- [Requires](#) ^[2764] Windows 2008 R2 or later on the probe system.
- [Requires](#) ^[2764] the Windows Remote Registry service to be running on the target computer.
- [Requires](#) ^[2764] WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- [Can use a hybrid approach](#) ^[2764] to query monitoring data: Performance counters as standard approach and WMI as fallback.
- This service is not used by Exchange Server 2007 and higher. Exchange Server 2007 uses its own SMTP stack implemented in the Microsoft Exchange Transport service.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

 Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the [parent device's](#) ^[407] **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

 If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

i By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a **hybrid approach** in the **Windows Compatibility Options** of the parent [device's settings](#)^[415] on which you create this sensor: if you choose this option, the sensor will first try to query data via **Windows Performance Counters** and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

A Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[370] for load balancing.

i For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)^[357] section.

Requirement: Windows Version

X In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)^[370].

i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the probe service only runs with 32-bit support. Without it, WMI sensors will not work.

Requirement: Remote Registry Service

X In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between:
---------------	---

DEBUG OPTIONS

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: My Windows sensors do not work when using direct Performance Counter access. What can I do?

- <https://kb.paessler.com/en/topic/47263>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

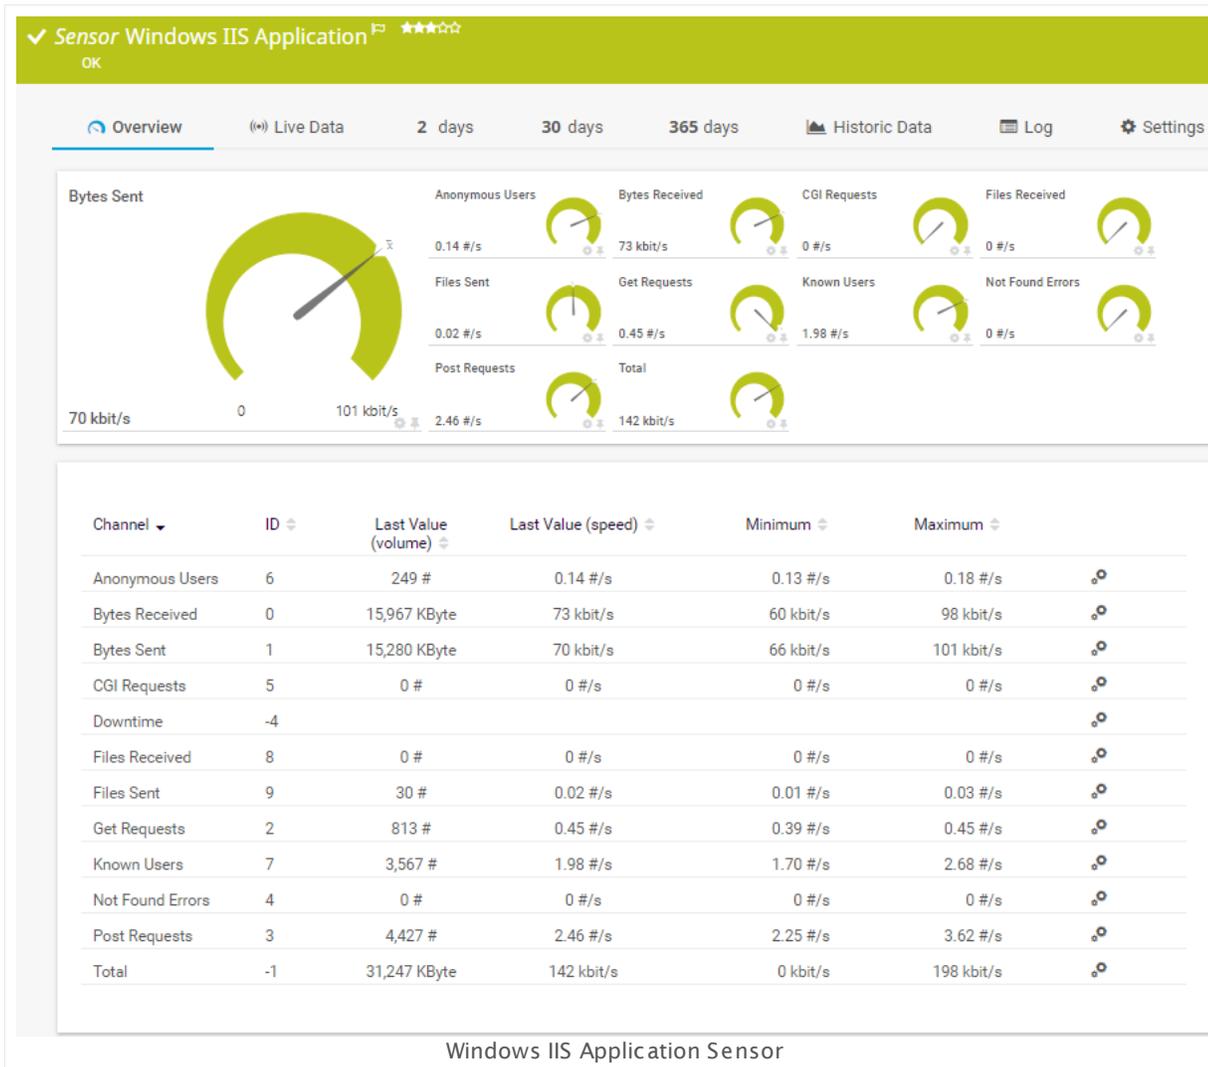

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.221 Windows IIS Application Sensor

The Windows IIS Application sensor monitors a Microsoft Internet Information Services (IIS) server via Windows Management Instrumentation (WMI). It can also monitor applications that use IIS, such as Microsoft SharePoint or Microsoft Reporting Services (SSRS).

It shows the following:

- Sent and received bytes per second
- Number of sent and received files per second
- Number of anonymous and known users per second
- Number of Common Gateway Interface (CGI) requests per second
- Number of GET and POST requests per second
- Number of not found errors per second

Windows IIS Application Sensor

Sensor in Other Languages

Dutch: **Windows IIS Toepassing**, French: **Application Windows IIS**, German: **Windows IIS-Anwendung**, Japanese: **Windows IIS** ? ? ? ? ? ? ? ? , Portuguese: **Windows Aplicação IIS**, Russian: **Приложение Windows IIS**, Simplified Chinese: **Windows IIS** ? ? ? ? , Spanish: **Aplicación IIS WMI**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)¹²⁵. Above this number, please consider using multiple [Remote Probes](#)³⁷⁰⁹ for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)³⁵⁰⁷.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the web service instances you want to monitor. PRTG will create one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI INTERNET INFORMATION SERVICES

Specify Instance	You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
------------------	--

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI INTERNET INFORMATION SERVICES

Instance Shows the name of the web service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 📁 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁸⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#).

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

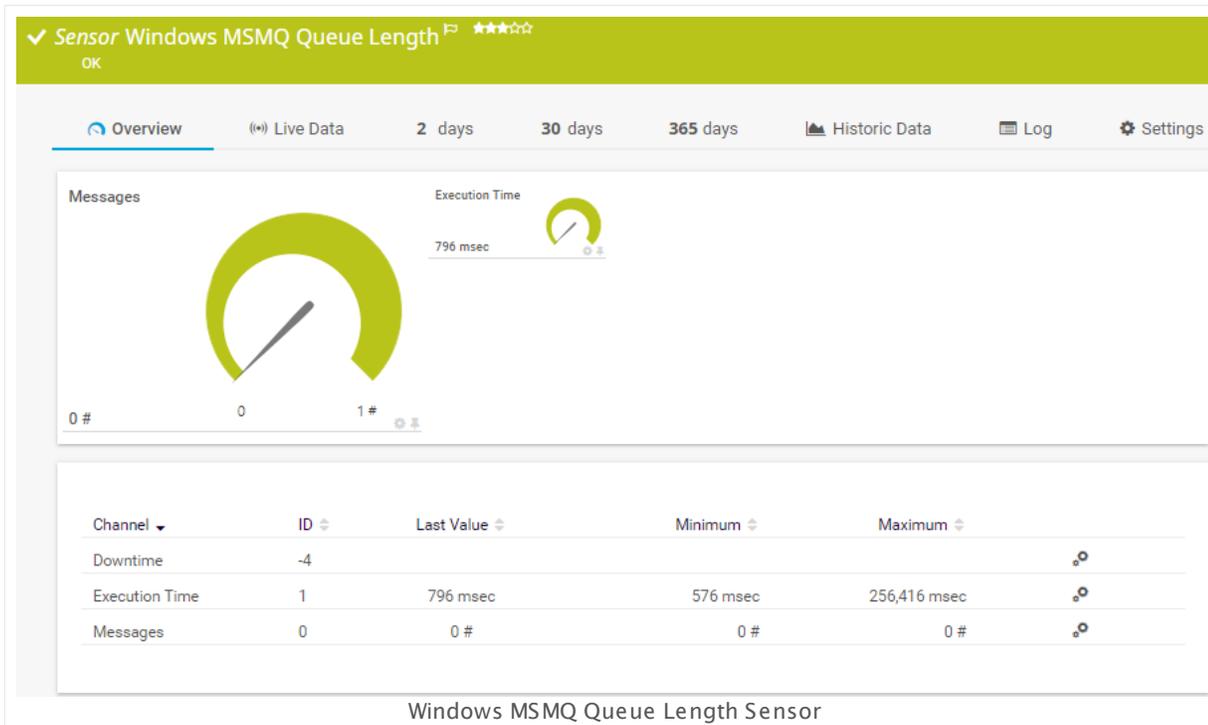

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.222 Windows MSMQ Queue Length Sensor

The Windows MSMQ Queue Length sensor reads the number of messages in a Microsoft Message Queue of the parent device.

It shows the following:

- Total number of messages in the queue
- Execution time

Sensor in Other Languages

Dutch: **Windows MSMQ wachtrijlengte**, French: **Longueur de la file d'attente MSMQ de Windows**, German: **Windows MSMQ Queue-Länge**, Japanese: **Windows MSMQ ? ? ? ? ?**, Portuguese: **Windows Comprimento da fila MSMQ**, Russian: **Длина очереди Windows MSMQ**, Simplified Chinese: **Windows MSMQ ? ? ? ?**, Spanish: **Largo de queue de Windows MSMQ**

Remarks

- [Requires](#)^[2783] .NET 4.5 or later to be installed on the probe system. If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- [Requires](#)^[2783] Windows credentials in the [parent device settings](#)^[402].
- [Requires](#)^[2783] the MSMQ service to be running on both the probe and the target system.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Knowledge Base: [How do I activate Message Queuing in my Windows installation?](#)

- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the [parent device's](#)^[407] **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

 If you use local credentials, please make sure that the same Windows user accounts (with the same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

Requirement: Message Queuing Service

In order for this sensor to work, the **MSMQ** "Message Queuing" service must be started both on the target system and on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. Additionally, the MSMQ "Message Queuing" service must also be started on the target computer.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Depending on your Windows version you may first need to install the **Microsoft Message Queue (MSMQ) Server**.

 When installing Microsoft Message Queue (MSMQ) Server, make sure you install it including the **Directory Service**. Depending on your Windows installation this might have a different name, such as:

- MSMQ Active Directory Domain Service Integration
- Directory Service Integration

- Active Directory Integration

 For details, see the Knowledge Base: [How do I activate Message Queuing in my Windows installation?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the message queues you want to monitor. PRTG will create one sensor for each queue you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Message Queue

You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items. If there are no message queues available, you will see a corresponding message.

 This sensor cannot monitor sub-queues.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Message Queue	Shows the name of the queue that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Message Queue Type	Shows the type of the queue that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Min. Message Age	Optionally define an age in minutes the message has to be old to be counted. If set, messages younger than this age are not regarded. If you leave this field blank, the sensor will not check for the message age. Please enter an integer value or leave the field empty.

SENSOR SETTINGS

If Value Changes

Define what this sensor will do when the sensor value changes. You can choose between:

- **Ignore changes (default):** The sensor takes no action on change.
- **Trigger 'change' notification:** The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to [trigger a notification](#) ³⁷⁷⁰ whenever the sensor value changes.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 📁 For more information on how to find the folder used for storage, see section [Data Storage](#) ³⁷³⁴.
 - ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

- 📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
222 Windows MSMQ Queue Length Sensor

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.223 Windows Network Card Sensor

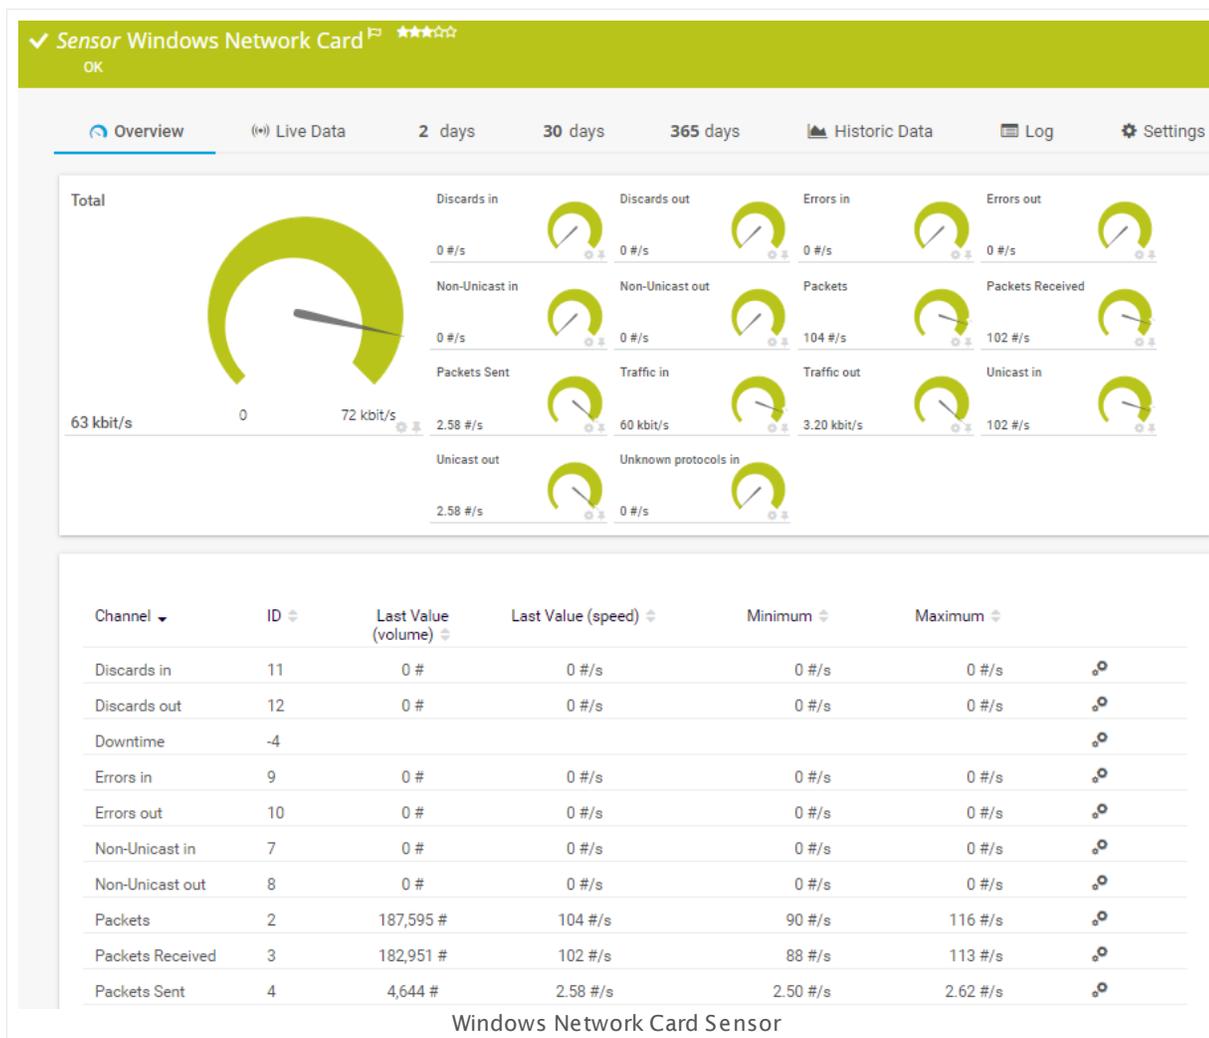

The Windows Network Card sensor monitors bandwidth usage and traffic of a network interface using Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

It can show the following:

- Total traffic on the network card
- Traffic in and traffic out
- Number of received and sent packets
- Total number of packets
- Number of discards (in and out)
- Number of errors (in and out)
- Number of unicast packets (in and out)
- Number of non-unicast packets (in and out)
- Number of unknown protocols (in)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
 223 Windows Network Card Sensor

Sensor in Other Languages

Dutch: **Windows Netwerkaart**, French: **Carte réseau Windows**, German: **WMI Netzwerkadapter**, Japanese: **Windows ? ? ? ? ? ? ? ? ?**, Portuguese: **Windows Adaptador de rede**, Russian: **Сетевой адаптер Windows**, Simplified Chinese: **Windows ? ?**, Spanish: **WMI tarjeta de red**

Remarks

- [Requires](#) ^[2795] Windows credentials in the [parent device settings](#) ^[402].
- [Requires](#) ^[2795] Windows 2008 R2 or later on the probe system to work with Windows Performance Counters.
- [Requires](#) ^[2795] the Windows Remote Registry service to be running on the target computer.
- [Requires](#) ^[2795] WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.

- [Can use a hybrid approach](#)^[2795] to query monitoring data: Performance counters as standard approach and WMI as fallback.
- Requires Windows Server 2008 R2 or Windows 7 or later to be able to monitor 64-bit counters of the class **Network Adapter** (virtual network interfaces). On older target systems the sensor can only monitor 32-bit counters of the class **Network Interface** (the physical interface) and will show less channels.
- This sensor type supports teamed network adapters ("NIC teaming") on Windows Server 2012.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

 Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the [parent device's](#)^[407] **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

 If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

 By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a **hybrid approach** in the **Windows Compatibility Options** of the parent [device's settings](#)^[415] on which you create this sensor: if you choose this option, the sensor will first try to query data via **Windows Performance Counters** and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

 Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.

 For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)^[3507] section.

Requirement: Windows Version

 In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)^[3708].

i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the probe service only runs with 32-bit support. Without it, WMI sensors will not work.

Requirement: Remote Registry Service

x In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the network cards you want to monitor. PRTG will create one sensor for each interface you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SPECIFIC

Network Interface	Select the network card(s) you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
-------------------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SPECIFIC

Selected Interface	Shows the name of the network card that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
--------------------	--

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.

 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.

Chart Type

Define how to show different channels for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 You cannot use this option in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰). Manual scaling is not possible if you choose this option.

SENSOR DISPLAY

- **Show in and out traffic as positive and negative area chart:** Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way.

 You cannot use this option in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰). Manual scaling is not possible if you choose this option.

 You cannot show a positive/negative chart for a channel if you choose to display its data in percent of maximum (available in the [Sensor Channels Settings](#)³¹⁶⁰).

Stack Unit

This setting is only available if you choose **Stack channels on top of each other** above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Knowledge Base: My Windows sensors do not work when using direct Performance Counter access. What can I do?

- <https://kb.paessler.com/en/topic/47263>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

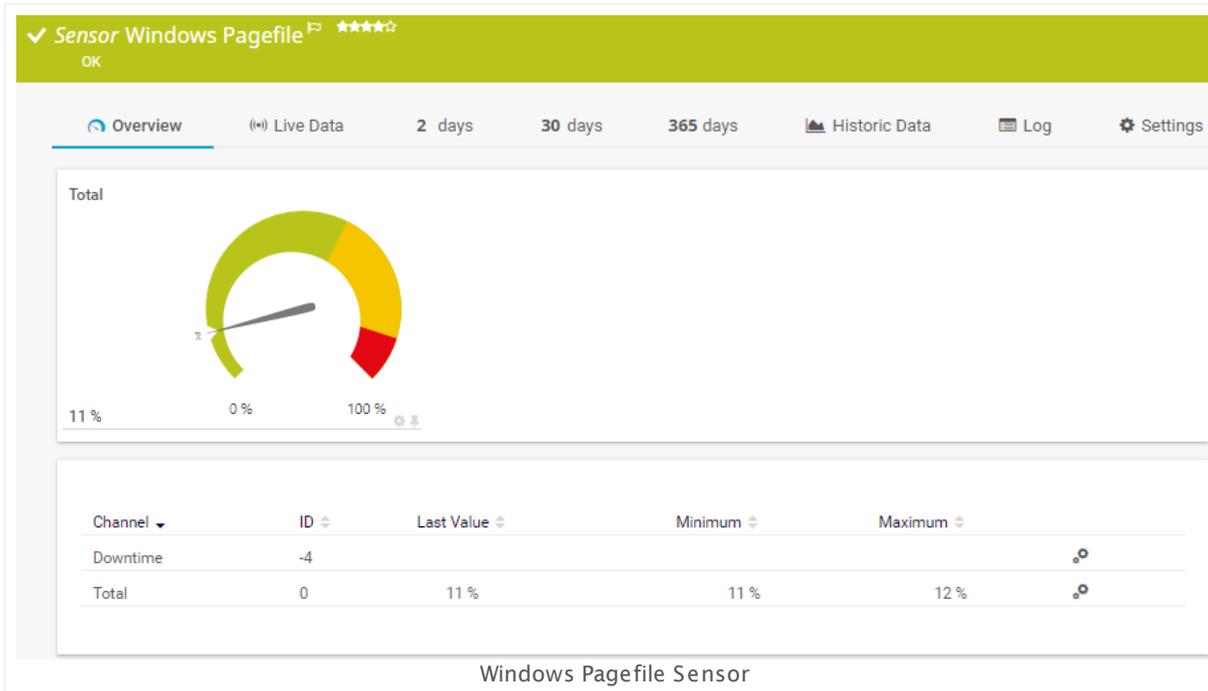

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.224 Windows Pagefile Sensor

The Windows Pagefile sensor monitors the Windows pagefile usage via Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

- It shows the pagefile usage in percent.

Sensor in Other Languages

Dutch: **Windows Wisselbestand**, French: **Fichier d'échange Windows**, German: **WMI Auslagerungsdatei**, Japanese: **Windows** ? ? ? ? ? ? ? , Portuguese: **Windows Arquivo de Paginação (Pagefile)**, Russian: **Файл подкачки Windows**, Simplified Chinese: **Windows** ? ? ? ? ? , Spanish: **Archivo de página Windows**

Remarks

- This sensor does not work with Windows 2000, because the respective WMI class does not exist on this operating system!
- [Requires](#) Windows credentials in the [parent device settings](#).
- [Requires](#) Windows 2008 R2 or later on the probe system.
- [Requires](#) the Windows Remote Registry service to be running on the target computer.
- [Requires](#) WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- [Can use a hybrid approach](#) to query monitoring data: Performance counters as standard approach and WMI as fallback.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

 Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the [parent device's](#)^[407] **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

 If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

 By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a **hybrid approach** in the **Windows Compatibility Options** of the parent [device's settings](#)^[415] on which you create this sensor: if you choose this option, the sensor will first try to query data via **Windows Performance Counters** and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

 Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.

 For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)^[3507] section.

Requirement: Windows Version

 In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)^[3705].

 WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the probe service only runs with 32-bit support. Without it, WMI sensors will not work.

Requirement: Remote Registry Service

 In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 📖 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#).

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- User Group Access
- Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:
- **Inherited:** Use the access rights settings of the parent object.
 - **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
 - **Read:** Users in this group can see the object and review its monitoring results.
 - **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
 - **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

224 Windows Pagefile Sensor

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.225 Windows Physical Disk I/O Sensor

The Windows Physical Disk I/O sensor monitors the input/output parameters of a hard disk on a Windows system via Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

The sensor provides the following information:

- Disk Latency
- Disk Bandwidth
- Disk queue data
- Disk IOs

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Windows Physical Disk I/O Sensor

Sensor in Other Languages

Dutch: **Windows Fysieke Schijf I/O**, French: **E/S du disque physique de Windows**, German: **Windows Physikalischer Datenträger E/A**, Japanese: **Windows I/O**, Portuguese: **Windows E/S do Disco físico**, Russian: **Ввод-вывод физического диска Windows**, Simplified Chinese: **Windows I/O**, Spanish: **Operaciones de E/S de disco físico Windows**

Remarks

- **Requires** Windows credentials in the [parent device settings](#).
- **Requires** Windows 2008 R2 or later on the probe system.
- **Requires** the Windows Remote Registry service to be running on the target computer.
- **Requires** WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- **Can use a hybrid approach** to query monitoring data: Performance counters as standard approach and WMI as fallback.
- Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

 Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the [parent device's Credentials for Windows Systems](#) settings, please prefer using Windows domain credentials.

 If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

 By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a **hybrid approach** in the **Windows Compatibility Options** of the parent [device's settings](#) on which you create this sensor: if you choose this option, the sensor will first try to query data via **Windows Performance Counters** and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

 Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.

 For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)^[3507] section.

Requirement: Windows Version

 In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)^[3705].

 WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the probe service only runs with 32-bit support. Without it, WMI sensors will not work.

Requirement: Remote Registry Service

 In order for this sensor to work with Windows Performance Counters, please make sure the [Remote Registry](#) Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the physical disk(s) you want to monitor. PRTG will create one sensor for each disk you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WINDOWS PHYSICAL DISK SPECIFIC

Physical Disk(s) Select the disk(s) you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WINDOWS PHYSICAL DISK SPECIFIC

Physical Disk(s) Shows the disk this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 📁 For more information on how to find the folder used for storage, see section [Data Storage](#)^[3734].
 - ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

❗ The result of this sensor is only written to disk if you use **WMI only (recommended)** as **Preferred Data Source**, as defined in the [Windows Compatibility Options](#)^[415] of the parent device.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

- ❗ You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: My Windows sensors do not work when using direct Performance Counter access. What can I do?

- <https://kb.paessler.com/en/topic/47263>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.226 Windows Print Queue Sensor

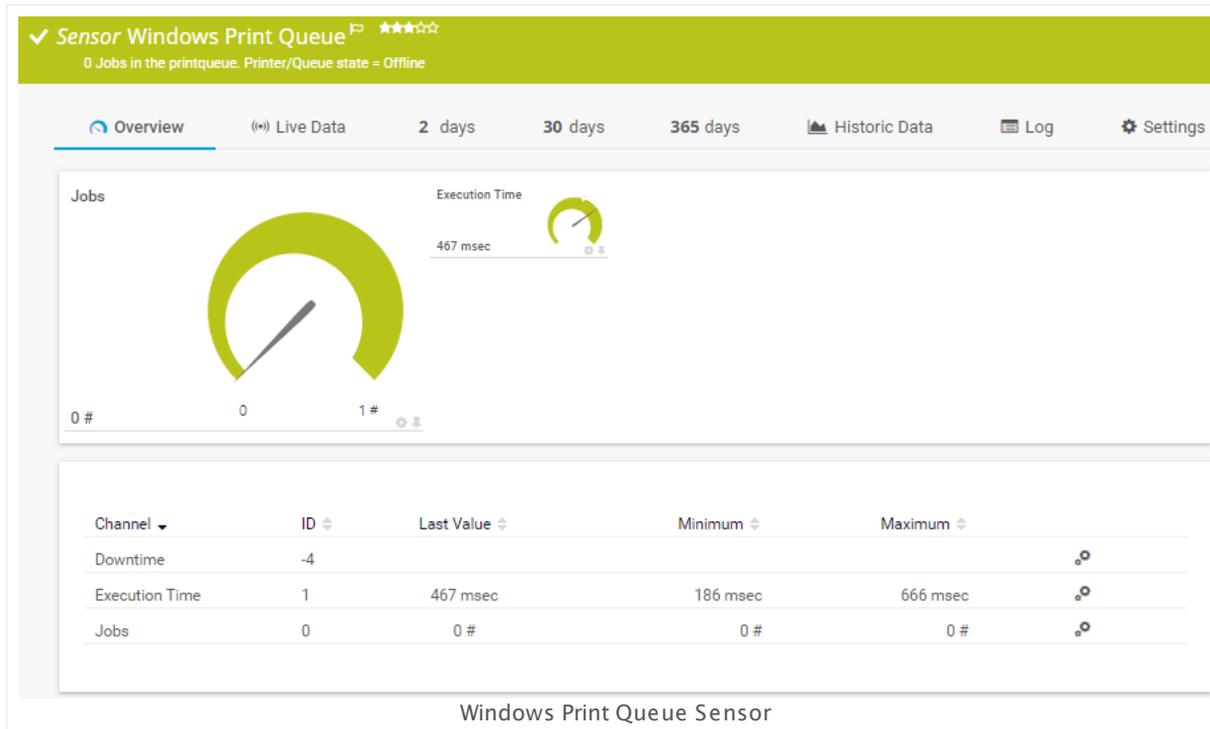

The Windows Print Queue sensor reads the print queue on its parent device and returns the number of jobs in the print queue. It can monitor queues for all printers that are installed locally.

For example, you can use this sensor to monitor all print queues on your Windows print server and retrieve information about all available jobs that are in the queue longer than defined.

It shows the following:

- Number of jobs in the queue
- Execution time

Additionally, this sensor can change to a defined status if there is a printer problem. See section [Sensor Settings](#)²⁸²⁶ for available parameters.

Sensor in Other Languages

Dutch: **Windows Print Queue**, French: **File d'attente d'impression Windows**, German: **Windows Druckwarteschlange**, Japanese: **Windows ? ? ? ? ? ? ?**, Portuguese: **Windows Fila de impressão**, Russian: **Очередь печати Windows**, Simplified Chinese: **Windows ? ? ? ?**, Spanish: **Queue de impresión Windows**

Remarks

- [Requires](#)²⁸²⁷ .NET 4.5 or later to be installed on the probe system. If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.

- [Requires](#) ²⁸²⁷ Windows credentials in the [parent device settings](#) ⁴⁰².
 - [Requires](#) ²⁸²⁷ the Print Spooler Windows service to be running on the target device.
 - We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
 - You can add a ['change' trigger](#) ³³¹⁶ to this sensor to get a notification when the number of jobs in the queue changes.
 - This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#) ³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the [parent device's](#) ⁴⁰⁷ **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

 If you use local credentials, please make sure that the same Windows user accounts (with the same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

Requirement: Print Spooler Service

In order for this sensor to work, the **Spooler** "Print Spooler" service must be started on the target computer.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the print queues you want to monitor. PRTG will create one sensor for each task you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Print Queue

You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items. If there are no print queues available, you will see a corresponding message.

 If a printer name changes after you have created a sensor for its queue, please add the sensor anew.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name

Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)¹⁸¹, as well as in [alarms](#)²¹⁹, [logs](#)²²⁸, [notifications](#)³²¹⁶, [reports](#)³²⁵², [maps](#)³²⁷⁶, [libraries](#)³²³⁵, and [tickets](#)²³⁰.

BASIC SENSOR SETTINGS

Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Print Queue	Shows the name of the task that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Advanced Status Option	<p>You can optionally define specific sensor states for several return messages of the monitored printer. Choose between:</p> <ul style="list-style-type: none">▪ Hide: Do not define sensor states for specific return messages.▪ Show: If you choose this option, you can define sensor states for various messages that the monitored printer reports.
Door Open	<p>These settings are only available if you select the advanced status option above. For each reported problem of the monitored printer, you can define the status that the sensor will show. Choose between:</p> <ul style="list-style-type: none">▪ Ignore: The current sensor status will persist if this message is reported by the printer.

SENSOR SETTINGS

Manual Feed Required	▪ Warning: The sensor will show a Warning status if this message is reported by the printer.
Needs User Intervention	▪ Error: The sensor will show a Down status if this message is reported by the printer.
Offline	
Out of Memory	
Out of Paper	
Paper Jammed	
Paper Problem	
Paused	
Printer Error	
Printer Not Available	
Toner Low	
Toner Out	
Min. Print Job Age (Sec.)	Optionally define the age of the print job in seconds. If set, jobs younger than this value are not regarded. If you leave this field empty, the sensor will not check for the print job age. Please enter an integer value or leave the field empty.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: <ul style="list-style-type: none">▪ Discard sensor result: Do not store the sensor result.
---------------	---

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Knowledge Base: Which .NET version does PRTG require?

- <https://kb.paessler.com/en/topic/60543>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.227 Windows Process Sensor

The Windows Process sensor monitors a Windows process using Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

It shows the following parameters about the process:

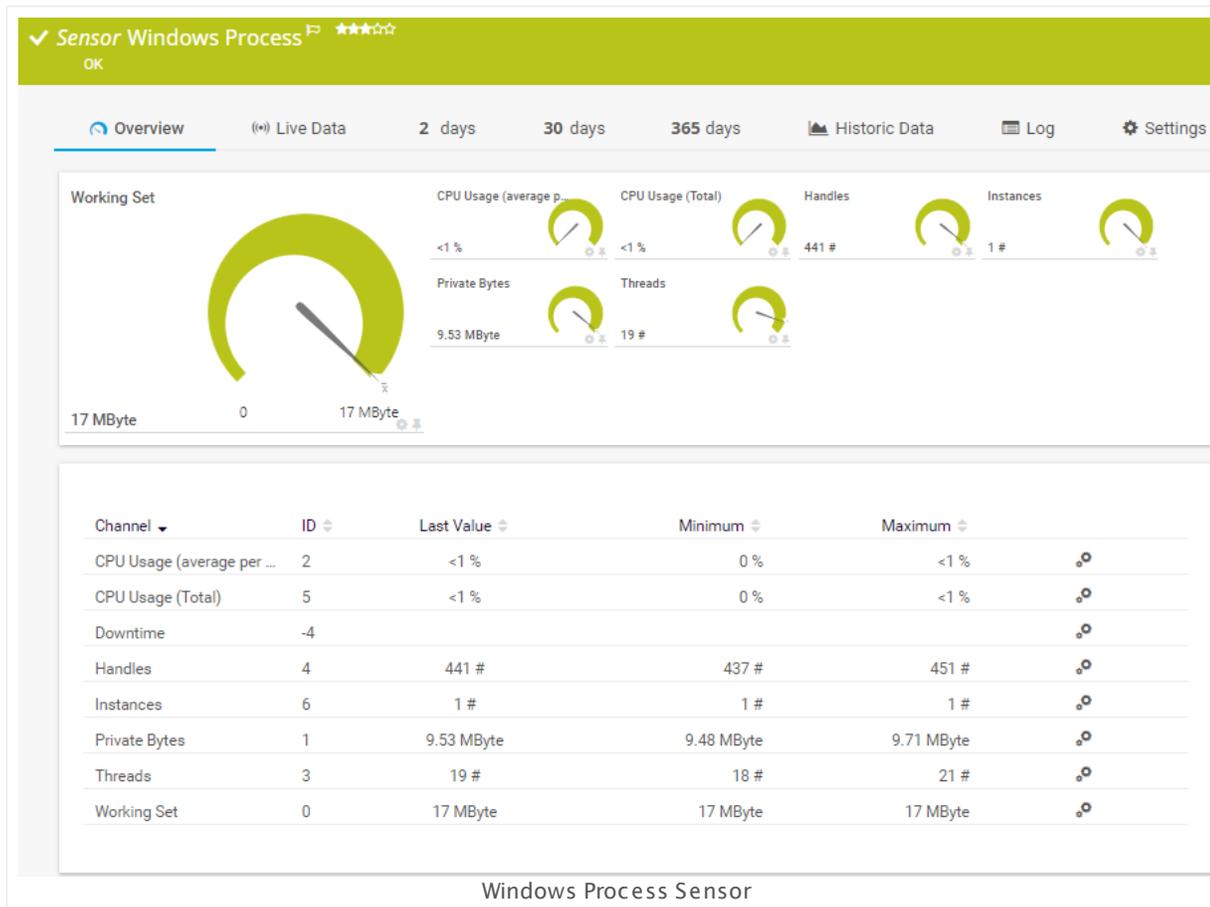

- Absolute working set in bytes
- Private bytes
- Number of threads
- Number of handles
- Number of instances
- Average CPU usage (if there are multiple instances running)
- Total CPU usage

i For the **CPU Usage (Total)** value of a process, all CPU usage values are summed up. The total is divided by the number of all CPUs and the maximum value is 100%. This corresponds to the CPU usage of all instances of this specific process.

i For the **CPU Usage (average per instance)** value, the summed up CPU usage value is divided by the number of all instances. It shows the average CPU usage of a single instance of the process on one CPU.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

227 Windows Process Sensor

Sensor in Other Languages

Dutch: **Windows Proces**, French: **Processus Windows**, German: **Windows Prozess**, Japanese: **Windows ? ? ? ?**, Portuguese: **Windows Processo**, Russian: **Процесс Windows**, Simplified Chinese: **Windows ? ?**, Spanish: **Proceso de Windows**

Remarks

- [Requires](#) ^[2838] Windows credentials in the [parent device settings](#) ^[402].
- [Requires](#) ^[2840] Windows 2008 R2 or later on the probe system.
- [Requires](#) ^[2840] the Windows Remote Registry service to be running on the target computer.
- [Does not support 64-bit processes](#) ^[2839] on devices with the address **localhost**, **127.0.0.1**, **::1**. Use the IP address in the network instead.
- The sensor cannot show values above 4 GB for 64-bit processes if you run the probe on a 64-bit Windows system. Please add this sensor to a probe running on a 32-bit Windows to monitor 64-bit processes.
- [Requires](#) ^[2840] WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.

- [Can use a hybrid approach](#)^[2839] to query monitoring data: Performance counters as standard approach and WMI as fallback.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Monitoring 64-bit Processes

This sensor type does not support 64-bit processes on devices with the address **localhost**, **127.0.0.1** (IPv4 address), or **::1** (IPv6 address) in PRTG. This is the case for probe devices, for example. The sensor works on all other target devices in your network. So if you want to monitor 64-bit processes on your local machine, [add this device](#)^[311] to PRTG with one of the IP addresses under which it is reachable in the local network (for example, 10.0.10.20 instead of 127.0.0.1) and create the sensor on this device.

 This sensor type cannot show values above 4 GB for 64-bit processes if you run the PRTG probe with this sensor on a 64-bit Windows system. The **WoW64 (Windows 32-bit on Windows 64-bit)** emulation layer for 32-bit applications like PRTG limits monitoring values from 64-bit systems or processes to 4 GB and caps off greater values. To avoid this issue that is caused by Windows and to correctly monitor 64-bit processes, please add this sensor to a probe that runs on a 32-bit Windows system.

Requirement: Windows Credentials

 Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the [parent device's](#)^[407] **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

 If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

 By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a **hybrid approach** in the **Windows Compatibility Options** of the parent [device's settings](#)^[415] on which you create this sensor: if you choose this option, the sensor will first try to query data via **Windows Performance Counters** and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

 Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.

 For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)^[3507] section.

Requirement: Windows Version

X In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#).

i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the probe service only runs with 32-bit support. Without it, WMI sensors will not work.

Requirement: Remote Registry Service

X In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

BASIC SENSOR SETTINGS

Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WINDOWS PROCESS MONITOR

Executable	<p>Enter the name of the process that you want to monitor. Provide the name of an executable file without the <code>.exe</code> extension (for example, enter <code>firefox</code> to monitor <code>firefox.exe</code>).</p> <p> The sensor will show a Down status if the process is not active on the device.</p>
------------	---

DEBUG OPTIONS

Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none">▪ Discard sensor result: Do not store the sensor result.
---------------	--

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings.</p> <ul style="list-style-type: none"> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> <p>▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.</p> <p>▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.</p> <ul style="list-style-type: none"> <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: My Windows sensors do not work when using direct Performance Counter access. What can I do?

- <https://kb.paessler.com/en/topic/47263>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

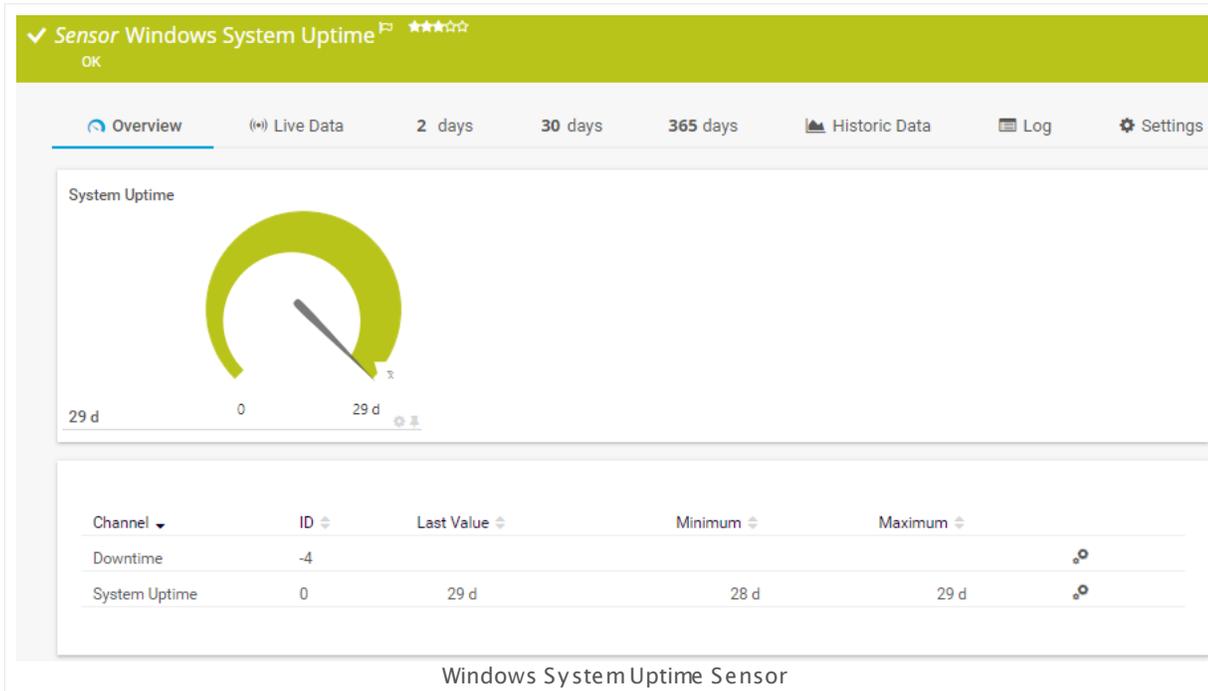

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.228 Windows System Uptime Sensor

The Windows System Uptime sensor monitors the uptime of a Windows system using Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

- It shows the total uptime of the system in days, hours, minutes.

Sensor in Other Languages

Dutch: **Windows System Uptime**, French: **Disponibilité du système Windows**, German: **Windows Systemlaufzeit**, Japanese: **Windows ? ? ? ? ? ? ? ?**, Portuguese: **Windows Tempo de ativação do sistema**, Russian: **Время бесперебойной работы системы Windows**, Simplified Chinese: **Windows ? ? ? ? ? ? ? ?**, Spanish: **Tiempo disponible Windows**

Remarks

- Requires** Windows credentials in the [parent device settings](#).
- Requires** Windows 2008 R2 or later on the probe system.
- Requires** the Windows Remote Registry service to be running on the target computer.
- Requires** WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
- Can use a hybrid approach** to query monitoring data: Performance counters as standard approach and WMI as fallback.

You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

X Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the [parent device's](#) [Credentials for Windows Systems](#) settings, please prefer using Windows domain credentials.

A If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

i By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a **hybrid approach** in the **Windows Compatibility Options** of the parent [device's settings](#) on which you create this sensor: if you choose this option, the sensor will first try to query data via **Windows Performance Counters** and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

A Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#). Above this number, please consider using multiple [Remote Probes](#) for load balancing.

i For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#) section.

Requirement: Windows Version

X In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#).

i WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the probe service only runs with 32-bit support. Without it, WMI sensors will not work.

Requirement: Remote Registry Service

X In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result:** Do not store the sensor result.
 - **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 🔗 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 - ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
- 📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - 📘 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).
- Stack Unit** This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

Knowledge Base: My Windows sensors do not work when using direct Performance Counter access. What can I do?

- <https://kb.paessler.com/en/topic/47263>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.229 Windows Updates Status (Powershell) Sensor

The Windows Updates Status (PowerShell) sensor monitors the status of Windows updates on a computer and counts the available and installed Windows updates—either from Microsoft or from the local Windows Server Update Services (WSUS) server.

It can show the following:

- Elapsed time since the last update
- Installed Windows updates
- Missing Windows updates
- Hidden updates
- All updates are listed with their severity.

You can find the considered updates in [Server Manager \(WSUS\)](#) under **Roles | Windows Server Update Services | Update Services | Computers | Reports**.

Windows Updates Status (Powershell) Sensor

8/14/2018

2857

Sensor in Other Languages

Dutch: **Windows Updates Status (PowerShell)**, French: **Statut de mises à jour Windows (PowerShell)**, German: **Windows Updates Status (PowerShell)**, Japanese: **Windows ? ? ? ? ? ? ? ? ? ? (PowerShell)**, Portuguese: **Windows Status de atualizações (PowerShell)**, Russian: **Статус обновления Windows (PowerShell)**, Simplified Chinese: **Windows ? ? ? ? ? ? ? ? ? ? (PowerShell)**, Spanish: **Estados de actualizaciones de Windows (PowerShell)**

Remarks

- [Requires](#) ²⁸⁵⁸ .NET 4.5 or higher to be installed on the probe system.
 - [Requires](#) ²⁸⁵⁹ Remote PowerShell to be enabled on the target system and PowerShell 3.0 on both the probe system and the target system.
 - Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
 - The minimum scanning interval for this sensor is **1 hour**. It also might take some time to receive data for the first time after starting the sensor.
 - Knowledge Base: [PowerShell Sensors: FAQ](#)
 - If the sensor cannot determine the "Time since last update" (for example, because the list of updates is empty), it will show the value **-1s** and turn into a **Warning status** ¹⁹⁵.
 - We recommend that you set the [scanning interval](#) ²⁸⁶¹ of this sensor to at least 12 hours to limit the load on the server being monitored.
 - In certain cases, it might take some time until the sensor receives data for the first time.
 - This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the **local system** (on every node, if on a cluster probe), or on the system running the [remote probe](#) ³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Requirement: Remote PowerShell

The Windows Updates Status (PowerShell) sensor uses PowerShell commands. To monitor devices with this sensor, **Remote PowerShell** access has to be enabled on the target computer. Also ensure that you have installed **PowerShell 3.0** or later on both your probe machine and target system.

⚠ In larger environments, the default memory limit for the remote shell might be insufficient and you might see the error message "The WSMAN provider host process did not return a proper response". In this case, increase the memory limit for Remote PowerShell. For more details, see this Knowledge Base article: [How can I increase memory for Remote PowerShell?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)¹⁴⁰¹ from objects further up in the device tree. These are visible above as **Parent Tags**.

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SPECIFIC

Port Enter the number of the port to which this sensor connects. Please enter an integer value. The default port is **5985**.

DEBUG OPTIONS

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

 This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in [System Administration—Monitoring](#)³³⁵⁵ are not available for this sensor.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

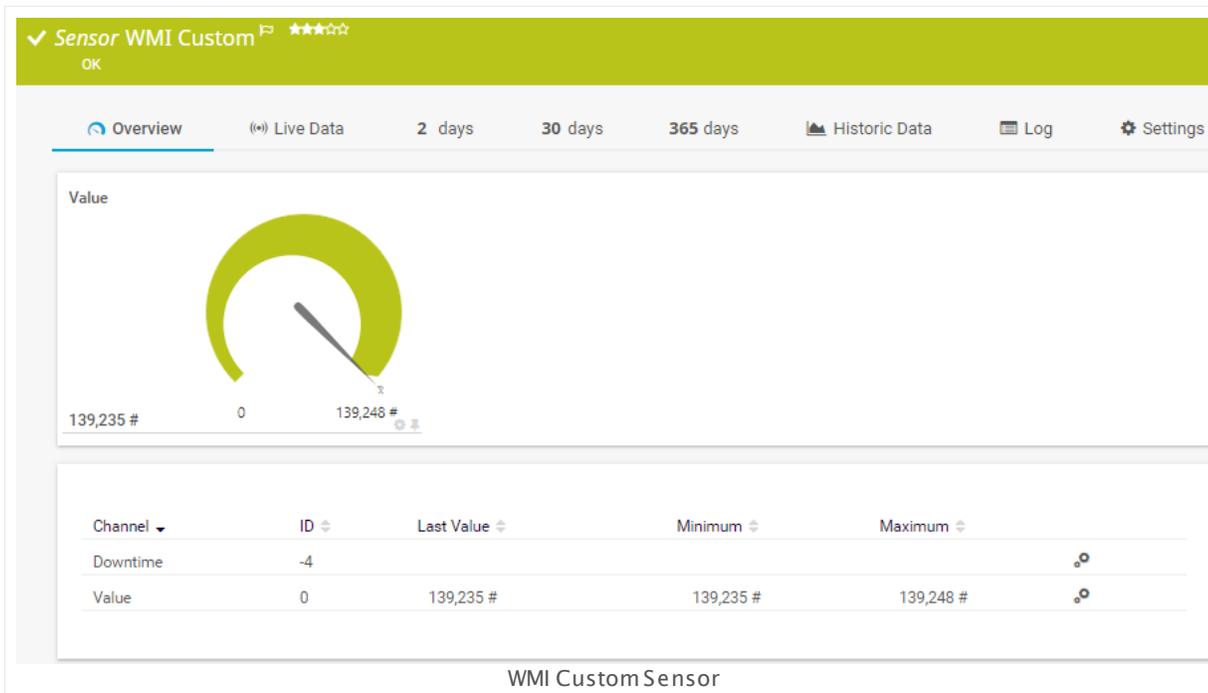

7.8.230 WMI Custom Sensor

The WMI Custom sensor performs a custom query via Windows Management Instrumentation (WMI) and monitors numerical values (integers and floats).

- It shows the retrieved value.

i Your Windows Management Instrumentation Query Language (WQL) query code must be stored in a file on the system of the probe the sensor is created on. If used on a remote probe, the file must be stored on the system running the remote probe. In a cluster setup, please copy the file to every cluster node. Save the file with the query into the **\Custom Sensors\WMI WQL scripts** subfolder of your PRTG installation. See the section [Data Storage](#) for more information about how to find this path.

i If your WQL query returns strings, use the [WMI Custom String Sensor](#).

Sensor in Other Languages

Dutch: **WMI (Klant Specifiek)**, French: **WMI (personnalisé)**, German: **WMI (Benutzerdef.)**, Japanese: **WMI** ? ? ? ? , Portuguese: **WMI customizado**, Russian: **Нестандартный WMI**, Simplified Chinese: **WMI** ? ? ? , Spanish: **WMI personalizado**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.

- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)¹²⁵. Above this number, please consider using multiple [Remote Probes](#)³⁷⁰⁹ for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)³⁵⁰⁷.
- Knowledge Base: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)
- Knowledge Base: [How do I create a WMI Custom sensor?](#)

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

CUSTOM QUERY SPECIFIC

Channel Name Enter a name for the channel in which PRTG shows the received data. This name will be displayed in graphs and tables. Please enter a string.

 You can change the name later in the sensor's [channel settings](#)³¹⁶⁰.

WQL File Select a file from the list that this sensor will use. The sensor executes it with every scanning interval. The menu contains WQL scripts from the **\Custom Sensors\WMI WQL scripts** subfolder of your PRTG installation. Please store your script there.

If used on a remote probe, you must store the file on the system running the remote probe. If used on a cluster probe, you must store the file on all servers running a cluster node. For more information on how to find this path, see section [Data Storage](#)³⁷³⁴.

 Your query must return an integer or float value. Strings are not supported, use the [WMI Custom String Sensor](#)²⁸⁷⁷ in this case.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

CUSTOM QUERY SPECIFIC

Namespace	Enter the namespace for the query.
-----------	------------------------------------

CUSTOM QUERY SPECIFIC

WQL File	<p>Shows the WQL file that this sensor executes with every scanning interval. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p> <p> Your query must return an integer or float value. Strings are not supported, use the WMI Custom String Sensor²⁸⁷⁷ in this case.</p>
Placeholder <#PH1>	<p>In your WQL script, you can use up to three placeholders that you can assign a value to in this field. Enter a string for variable <#PH1> or leave the field empty.</p>
Placeholder <#PH2>	<p>In your WQL script, you can use up to three placeholders that you can assign a value to in this field. Enter a string for variable <#PH2> or leave the field empty.</p>
Placeholder <#PH3>	<p>In your WQL script, you can use up to three placeholders that you can assign a value to in this field. Enter a string for variable <#PH3> or leave the field empty.</p>
If Value Changes	<p>Define what this sensor will do when the sensor value changes. You can choose between:</p> <ul style="list-style-type: none">▪ Ignore changes (default): The sensor takes no action on change.▪ Trigger 'change' notification: The sensor sends an internal message indicating that its value has changed. In combination with a Change Trigger, you can use this mechanism to trigger a notification³¹⁷⁰ whenever the sensor value changes.
Unit String	<p>Enter a unit for the data that the sensor receives from your script. This is for displaying purposes only. The unit will be displayed in graphs and tables. Please enter a string.</p>
Multiplication	<p>Define a multiplier for the received values. The default value is 1 to not change received values. Please enter an integer value.</p>
Division	<p>Define a divisor for the received values. The default value is 1 to not change received values. Please enter an integer value.</p>

DEBUG OPTIONS

- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result:** Do not store the sensor result.
 - **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).
- Stack Unit** This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

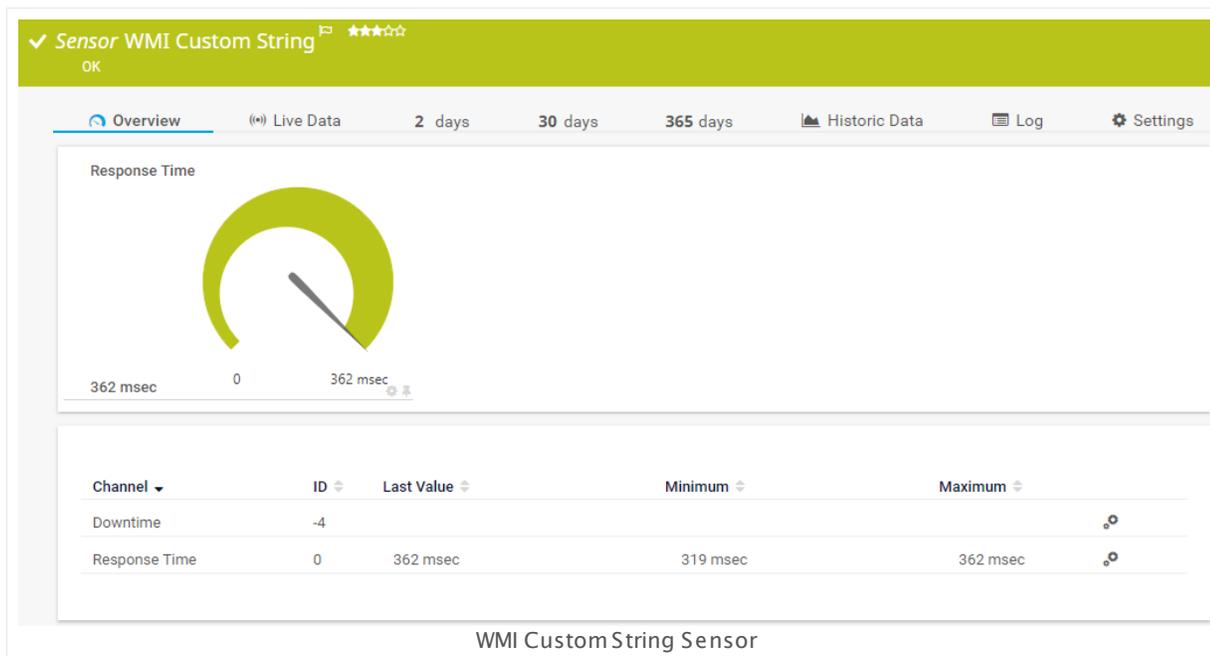

7.8.231 WMI Custom String Sensor

The WMI Custom String sensor performs a custom string query via Windows Management Instrumentation (WMI).

- It shows the retrieved string value in the sensor message.
- It also shows the response time.

i Your Windows Management Instrumentation Query Language (WQL) query code must be stored in a file on the system of the probe the sensor is created on. If used on a remote probe, the file must be stored on the system running the remote probe. In a cluster setup, please copy the file to every cluster node. Save the file with the query into the **\Custom Sensors\WMI WQL scripts** subfolder of your PRTG installation. See the section [Data Storage](#) for more information about how to find this path.

i If your WQL query returns numerical values, use the [WMI Custom Sensor](#).

Sensor in Other Languages

Dutch: **WM Aangepaste Tekenreeks**, French: **Chaîne personnalisée WMI**, German: **WMI Text (benutzerdef.)**, Japanese: **WMI ? ? ? ? ? ?**, Portuguese: **Sequência de caracteres personalizada WMI**, Russian: **Нестандартная строка WMI**, Simplified Chinese: **WMI ? ? ? ? ? ?**, Spanish: **WMI cadena personalizada**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.

- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].
- Knowledge Base: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)
- Knowledge Base: [How do I create a WMI Custom Sensor?](#)

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

CUSTOM QUERY SPECIFIC

WQL File

Select a file that will be used for this sensor from the list. The sensor will execute it with every scanning interval.

The list contains WQL scripts from the **\Custom Sensors\WMI WQL scripts** subfolder of your PRTG installation. Please store your script there. If used on a remote probe, the file must be stored on the system running the remote probe. If used on a cluster probe, you must store the file on all servers running a cluster node! For more information on how to find this path, see section [Data Storage](#)^[3734].

 If your WQL query returns integers or floats, use the [WMI Custom Sensor](#)^[2807] to not only show the returned value in the sensor message, but also monitor the value in a sensor channel.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

CUSTOM QUERY SPECIFIC

Namespace	Enter the namespace for the query.
WQL File	<p>Shows the name of the file that this sensor uses. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p> <p>i If your WQL query returns integers or floats, use the WMI Custom Sensor to not only show the returned value in the sensor message, but also monitor the value in a sensor channel.</p>

CUSTOM QUERY SPECIFIC

Placeholder <#PH1>	In your WQL script, you can use up to three placeholders that you can assign a value to in this field. Enter a string for variable <#PH1> or leave the field empty.
Placeholder <#PH2>	In your WQL script, you can use up to three placeholders that you can assign a value to in this field. Enter a string for variable <#PH2> or leave the field empty.
Placeholder <#PH3>	In your WQL script, you can use up to three placeholders that you can assign a value to in this field. Enter a string for variable <#PH3> or leave the field empty.
Unit String	Enter a unit for the data that will be received by your script. This is for displaying purposes only. The unit will be displayed in graphs and tables. Please enter a string.
If Value Changes	<p>Define what this sensor will do when the sensor value changes. You can choose between:</p> <ul style="list-style-type: none"> ▪ Ignore changes (default): The sensor takes no action on change. ▪ Trigger 'change' notification: The sensor sends an internal message indicating that its value has changed. In combination with a Change Trigger, you can use this mechanism to trigger a notification <small>[3770]</small> whenever the sensor value changes.
Response Must Include	Define which string must be part of the data that is received from the WMI object. You can either enter plain text or a Regular Expression <small>[3704]</small> . If the data does not include the search pattern, the sensor will show a Down status <small>[195]</small> . Please enter a string or leave the field empty.
Response Must Not Include	Define which string must not be part of the data that is received from the WMI object. You can either enter plain text or a Regular Expression <small>[3704]</small> . If the data does include the search pattern, the sensor will show a Down status <small>[195]</small> . Please enter a string or leave the field empty.
For Keyword Search Use	<p>Define the format of the search expression you entered above.</p> <ul style="list-style-type: none"> ▪ Plain Text: Search for the string as plain text. The characters * and ? work here as placeholders, whereas * stands for no or any number of characters and ? stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible with plain text search.

CUSTOM QUERY SPECIFIC

- **Regular Expression:** Handle the search pattern as a [Regular Expression](#)^[3704].

 PRTG supports **PCRE** regex. You cannot use regex options or flags. For more details, see manual section [Regular Expressions](#)^[3704].

Maximum Length of String

Define the maximum allowed length of the string that will be received from the WMI object. If it is longer than this value, the sensor will show a **Down status**^[195]. Please enter an integer value or leave the field empty.

Extract Number Using Regular Expression

Define if you want to filter out a numeric value from the string received from the WMI object. You can convert this into a float value to use it with channel limits (see [Sensor Channels Settings](#)^[3160]).

- **No extraction:** Do not extract a float value. Use the result as a string value.
- **Extract a numeric value using a regular expression:** Use a regular expression to identify a numeric value in the string and convert it to a float value. Define below.
 See also the [example](#)^[2887] below.

Regular Expression

This setting is only visible if number extraction is enabled above. Enter a [Regular Expression](#)^[3704] to identify the numeric value you want to extract from the string returned by the WMI object. You can use capturing groups here.

Make sure the expression returns numbers only (including decimal and thousands separators). The result will be further refined by the settings below.

 PRTG supports **PCRE** regex. You cannot use regex options or flags. For more details, see manual section [Regular Expressions](#)^[3704].

Index of Capturing Group

This setting is only visible if number extraction is enabled above. If your regular expression uses capturing groups, specify which one will be used to capture the number. Please enter an integer value or leave the field empty.

Decimal Separator

This setting is only visible if number extraction is enabled above. Define which character to use as decimal separator for the number extracted above. Please enter a string or leave the field empty.

CUSTOM QUERY SPECIFIC

- Thousands Separator** This setting is only visible if number extraction is enabled above. Define which character to use as thousands separator for the number extracted above. Please enter a string or leave the field empty.
- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result:** Do not store the sensor result.
 - **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 📁 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 - ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
- 📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - 📘 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies <small>3209</small> in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Example: Number Extraction with Regular Expression

 If you want to extract a number in the response string using a regular expression, please note that the index for captures in this sensor is based on **1 (not on 0)**. Furthermore, capturing groups are not created automatically. The example below will illustrate this issue.

Consider the following string as returned by a request for CPU usage:

```
5 Sec (3.49%), 1 Min (3.555%), 5 Min (3.90%)
```

Assuming you would like to filter for the number **3.555**, that is the percentage in the second parentheses. Then enter the following regex in the **Regular Expression** field:

```
(\d+\.\d+).*?(\d+\.\d+).*?(\d+\.\d+)
```

As **Index of Capturing Group** enter **3**. This will extract the desired number **3.555**.

The index has to be 3 in this case because the capturing groups here are the following:

- Group 1 contains 3.49%, 1 Min (3.555), 5 Min (3.90)
- Group 2 contains 3.49
- Group 3 contains 3.555
- Group 4 contains 3.90

Please keep in mind this note about index and capturing groups when using number extraction.

 It is not possible to match an empty string with the PRTG regex sensor search.

 PRTG supports PCRE regex. You cannot use regex options or flags. For more details, see manual section [Regular Expressions](#)³⁷⁰⁴.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

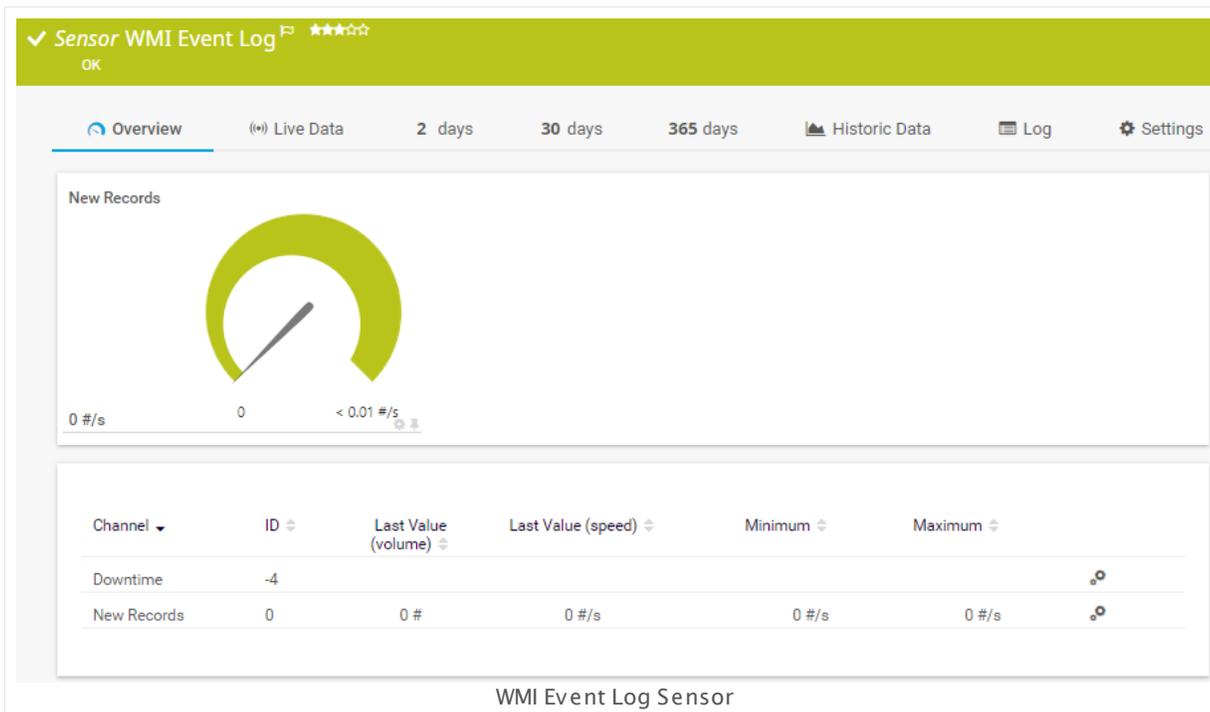

7.8.232 WMI Event Log Sensor

The WMI Event Log sensor monitors a specific Windows logfile using Windows Management Instrumentation (WMI).

- It shows the number of new records per second.

You can set the sensor to a desired status individually according to a new event log entry.

 For details and how to find out the correct filter, see the Knowledge Base: [My Event Log sensor ignores changes in the event log. What can I do?](#)

Sensor in Other Languages

Dutch: **WMI Logboek**, French: **Log des événements WMI**, German: **WMI Ereignisprotokoll**, Japanese: **WMI** ? ? ? ? ? , Portuguese: **Log de eventos WMI**, Russian: **Журнал событий WMI**, Simplified Chinese: **WMI** ? ? ? ? , Spanish: **WMI event log**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.

- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].
- Knowledge Base: [My Event Log sensor ignores changes in the event log. What can I do?](#)
- Knowledge Base: [How can I configure sensors using speed limits to keep the status for more than one interval?](#)
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the logfiles you want to monitor. PRTG will create one sensor for each log you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI EVENT LOG MONITOR

Log File	The Windows event log provides several different logfiles. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
----------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI EVENT LOG MONITOR

Log File	Shows the Windows logfile that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result.

WMI EVENT LOG MONITOR

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

FILTER EVENT LOG ENTRIES

Event Type	<p>Specify the type of event that this sensor processes. Other event types cannot be processed. Choose between the following event types:</p> <ul style="list-style-type: none"> ▪ Any ▪ Error ▪ Warning ▪ Information ▪ Security Audit Success ▪ Security Audit Failure
Filter by Source	<p>Filter all received events for a certain event source. If you enable this option, this sensor only processes messages that match the defined value. Choose between:</p> <ul style="list-style-type: none"> • Off: Do not filter by event source. • On: Enable filtering by event source.
Filter Type	<p>This field is only visible if you enable source filtering above. Choose between:</p> <ul style="list-style-type: none"> • Include Filter: Include the specified value and disregard all other values. • Exclude Filter: Exclude the specified value and regard all other values.

FILTER EVENT LOG ENTRIES

Match String (Event Source)	This field is only visible if you enable source filtering above. Enter an event source that you want to filter for. Depending on the kind of filter, the event source is processed (Include Filter) or not processed (Exclude Filter). Please enter a string.
Filter by ID	<p>Filter all received events for a certain event ID. If you enable this option, this sensor processes only messages that match the defined value(s). Choose between:</p> <ul style="list-style-type: none"> • Off: Do not filter by event ID. • On: Enable filtering by event ID.
Filter Type	<p>This field is only visible if you enable ID filtering above. Choose between:</p> <ul style="list-style-type: none"> • Include Filter: Include the specified value and disregard all other values. • Exclude Filter: Exclude the specified value and regard all other values.
Match Values (Event ID)	<p>This field is only visible if you enable ID filtering above. Enter an event ID that you want to filter for. Depending on the kind of filter, the event ID is processed (Include Filter) or not processed (Exclude Filter).</p> <p> The Event Log (Windows API) Sensor⁷⁶¹ supports more than one event ID. Using this sensor type, you can enter a comma-separated list of event IDs to filter for more than one ID.</p> <p> The WMI Event Log Sensor²⁸⁹³ supports filtering for only one ID.</p>
Filter by Category	<p>Filter all received events for a certain event category. If you enable this option, this sensor only processes messages that match the defined value. Choose between:</p> <ul style="list-style-type: none"> • Off: Do not filter by event category. • On: Enable filtering by event category.
Filter Type	<p>This field is only visible if you enable category filtering above. Choose between:</p> <ul style="list-style-type: none"> • Include Filter: Include the specified value and disregard all other values. • Exclude Filter: Exclude the specified value and regard all other values.

FILTER EVENT LOG ENTRIES

Match String (Event Category)	This field is only visible if you enable category filtering above. Enter a category that you want to filter for. Depending on the kind of filter, the event category is processed (Include Filter) or not processed (Exclude Filter). Please enter a string.
Filter by User	Filter all received events for a certain event user. If you enable this option, this sensor only processes messages that match the defined value. Choose between: <ul style="list-style-type: none">• Off: Do not filter by event user.• On: Enable filtering by event user.
Filter Type	This field is only visible if you enable user filtering above. Choose between: <ul style="list-style-type: none">• Include Filter: Include the specified value and disregard all other values.• Exclude Filter: Exclude the specified value and regard all other values.
Match String (Event User)	This field is only visible if you enable user filtering above. Enter a username that you want to filter for. Depending on the kind of filter, the event user is processed (Include Filter) or not processed (Exclude Filter). Please enter a string.
Filter by Computer	Filter all received events for a certain event computer. If you enable this option, this sensor only processes messages that match the defined value. Choose between: <ul style="list-style-type: none">• Off: Do not filter by event computer.• On: Enable filtering by event computer.
Filter Type	This field is only visible if you enable computer filtering above. Choose between: <ul style="list-style-type: none">• Include Filter: Include the specified value and disregard all other values.• Exclude Filter: Exclude the specified value and regard all other values.
Match String (Event Computer)	This field is only visible if you enable computer filtering above. Enter a computer name that you want to filter for. Depending on the kind of filter, the event computer is processed (Include Filter) or not processed (Exclude Filter). Please enter a string.

FILTER EVENT LOG ENTRIES

Filter by Message	<p>Filter all received events for a certain event message. If you enable this option, this sensor only processes messages that match the defined value. Choose between:</p> <ul style="list-style-type: none">• Off: Do not filter by event message.• On: Enable filtering by event message.
Filter Type	<p>This field is only visible if you enable message filtering above. Choose between:</p> <ul style="list-style-type: none">• Include Filter: Include the specified value and disregard all other values.• Exclude Filter: Exclude the specified value and regard all other values.
Match String (Event Message)	<p>This field is only visible if you enable message filtering above. Enter a message that you want to filter for. Depending on the kind of filter, the event message is processed (Include Filter) or not processed (Exclude Filter). Please enter a string.</p>

i For the **WMI Event Log Sensor**, you can use the percent sign (%) as placeholder for any or no character (as known from the asterisk sign (*) in Windows search) in combination with a substring. For example, you can enter %RAS% for any event source containing the string RAS.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none">▪ Show channels independently (default): Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁸⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#).

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

7.8.233 WMI Exchange Server Sensor

The WMI Exchange Server sensor monitors a Microsoft Exchange Server 2003, 2007, 2010, or 2013 using Windows Management Instrumentation (WMI).

It can show the following:

- Queue size
- Average delivery time
- Logon operations per second
- Sent, delivered, and submitted messages per second
- Messages queued for submission
- Remote Procedure Call (RPC) packets operations per second
- RPC latency, requests, and slow packets
- RPC sent, slow, outstanding, and failed requests (store interface)
- Read and write bytes RPC clients per second
- Number of active and anonymous users
- Database page faults per second
- Log record stalls per second
- Log threads waiting
- Database cache size in bytes and miss in percent
- Current unique users (OWA)
- Average response time (OWA)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

WMI Exchange Server, French: **Exchange Server WMI**, German: **WMI Exchange-Server**, Japanese: **WMI Exchange** ? ? ? , Portuguese: **Exchange Server WMI**, Russian: **WMI Exchange Server**, Simplified Chinese: **WMI Exchange** ? ? ? , Spanish: **WMI servidor Exchange**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[370] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[350].

i Existing former "WMI Exchange Server 2003/2007 Sensors" from previous PRTG versions will continue to monitor your Exchange server in PRTG 9, but newly added Exchange server sensors will be of the "WMI Exchange Server Sensor" type, which is able to monitor Exchange servers regardless of their version.

☁ You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) ³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the performance counters of the Exchange server you want to monitor. PRTG will create one sensor for each performance counter you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

EXCHANGE SERVER DATA READINGS ACCESSIBLE USING WMI

Performance Counter You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

The available options depend on your Exchange server configuration. PRTG shows all possible performance counters with name and instance description (if available).

You might be able to select aspects regarding:

- **SMTP Server:** Queue Lengths
- **MSExchangeIS Mailbox:** Queue Sizes, Delivery Times, Operations, Messages
- **MSExchangeIS Public:** Queue Sizes, Delivery Times, Operations, Messages
- **MSExchangeIS:** Packets, Operations, Clients, Latency, Requests, Users
- **MS Exchange RPC Client Access:** Active User Count, User Count, Connection Count
- **MS Exchange OWA:** Current Unique Users, Average Response Time

 Depending on your Exchange server version, not all counters might be available.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

READINGS ACCESSIBLE USING WMI

Display Name	These fields show the parameters that are used to query data for this sensor from the target device. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Instance	
WMI Class	
Counter	
Time Stamp	
Time Frequency	
Counter Type	
Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none"> ▪  For more information on how to find the folder used for storage, see section Data Storage. <p> This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.234 WMI Exchange Transport Queue Sensor

The WMI Exchange Transport Queue sensor monitors the length of transport queues of a Microsoft Exchange Server 2003, 2007, 2010, or 2013 using Windows Management Instrumentation (WMI). It shows the same information as shown in Windows System Monitor [perfmon](#).

This sensor can show the following:

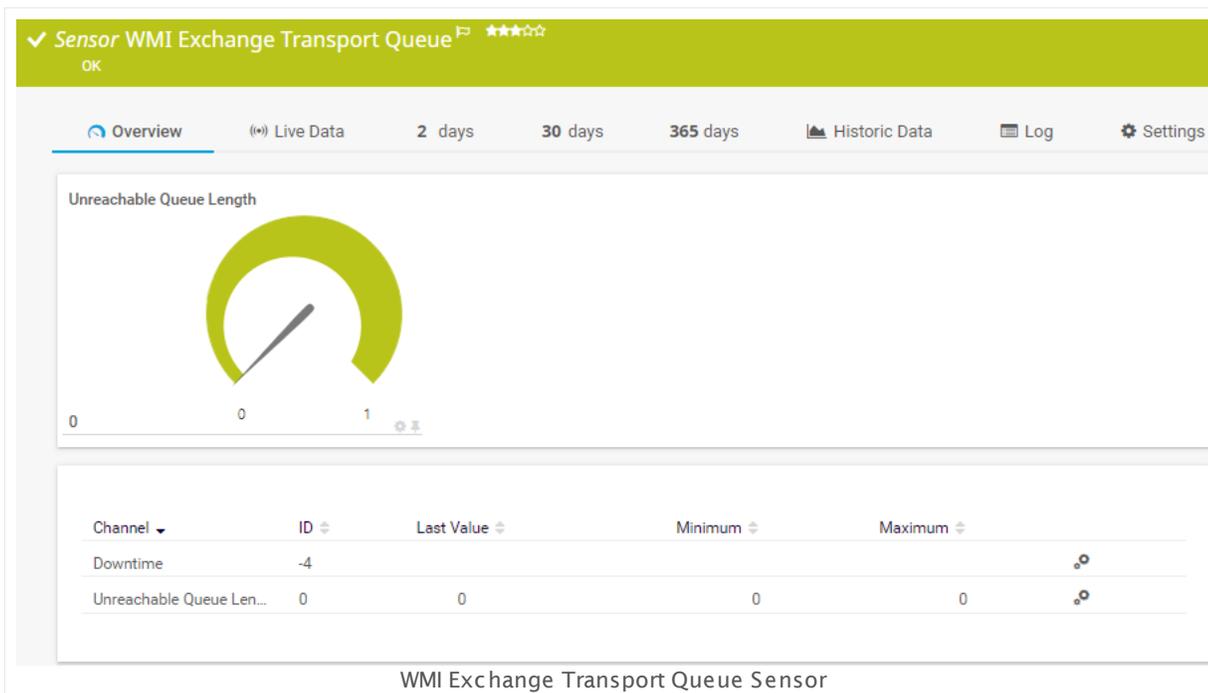

- Active Mailbox Delivery Queue Length
- Active Non-Smtp Delivery Queue Length
- Active Remote Delivery Queue Length
- Aggregate Delivery Queue Length (All Queues)
- Aggregate Shadow Queue Length
- Categorizer Job Availability
- Items Completed Delivery Per Second
- Items Completed Delivery Total
- Items Deleted By Admin Total
- Items Queued For Delivery Expired Total
- Items Queued for Delivery Per Second
- Items Queued For Delivery Total
- Items Resubmitted Total
- Largest Delivery Queue Length
- Messages Completed Delivery Per Second
- Messages Completed Delivery Total
- Messages Completing Categorization
- Messages Deferred Due To Local Loop
- Messages Deferred during Categorization
- Messages Queued For Delivery
- Messages Queued for Delivery Per Second
- Messages Queued For Delivery Total
- Messages Submitted Per Second
- Messages Submitted Total
- Poison Queue Length
- Retry Mailbox Delivery Queue Length
- Retry Non-Smtp Delivery Queue Length
- Retry Remote Delivery Queue Length

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings 234 WMI Exchange Transport Queue Sensor

- Shadow Queue Auto Discards Total
- Submission Queue Items Expired Total
- Submission Queue Length
- Unreachable Queue Length

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

 For an explanation of the transport queue types, see the Knowledge Base: [Types of Transport Queues in Microsoft Exchange](#)

Sensor in Other Languages

Dutch: **WMI Exchange Transport Wachtrij**, French: **File d'attente de transport WMI Exchange**, German: **WMI Exchange Transportwarteschlange**, Japanese: **WMI Exchange ? ? ?**, Portuguese: **Fila de transporte do Exchange WMI**, Russian: **Очередь транспорта WMI Exchange**, Simplified Chinese: **WMI Exchange ? ? ? ?**, Spanish: **Cola de transporte WMI Exchange**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.

- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].
- Knowledge Base: [Types of Transport Queues in Microsoft Exchange](#)

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the transport queues you want to monitor. PRTG will create on sensor for each queue you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI EXCHANGE TRANSPORT QUEUE SPECIFIC

MSExchangeTransport Queues You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

The available options depend on your Exchange server configuration. PRTG shows all possible queues with names and instance descriptions (if available).

 For performance reasons, we recommend that you only select necessary items!

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

READINGS ACCESSIBLE USING WMI

Display Name	These fields show the parameters that are used to query data for this sensor from the target device. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Instance	
WMI Class	

READINGS ACCESSIBLE USING WMI

Counter

Time Stamp

Time Frequency

Counter Type

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#).

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

7.8.235 WMI File Sensor

The WMI File sensor monitors a file using Windows Management Instrumentation (WMI).

It shows the following:

- File size
- Elapsed time since its last modification

Sensor in Other Languages

Dutch: **WMI Bestand**, French: **Fichier WMI**, German: **WMI Datei**, Japanese: **WMI ? ? ? ?**, Portuguese: **Arquivo WMI**, Russian: **Файл WMI**, Simplified Chinese: **WMI ? ?**, Spanish: **WMI archivo**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[370] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI FILE MONITOR

- File Name** Enter the name of the file that you want to monitor with the sensor. Enter the full local path. The file must exist on the computer your local or remote probe is running on. UNC paths are not allowed here. For example, when you create this sensor on a device under the local probe, the file has to be accessible on the local system.
- If Timestamp Changes** Define what to do when the timestamp of the file changes. You can choose between:
- **Ignore changes (default):** The sensor will not take action on change.
 - **Trigger 'change' notification:** The sensor will send an internal message indicating that the timestamp has changed. In combination with a **Change Trigger**, you can use this mechanism to [trigger a notification](#)³¹⁷⁰ whenever the timestamp changes.

DEBUG OPTIONS

- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result:** Do not store the sensor result.
 - **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

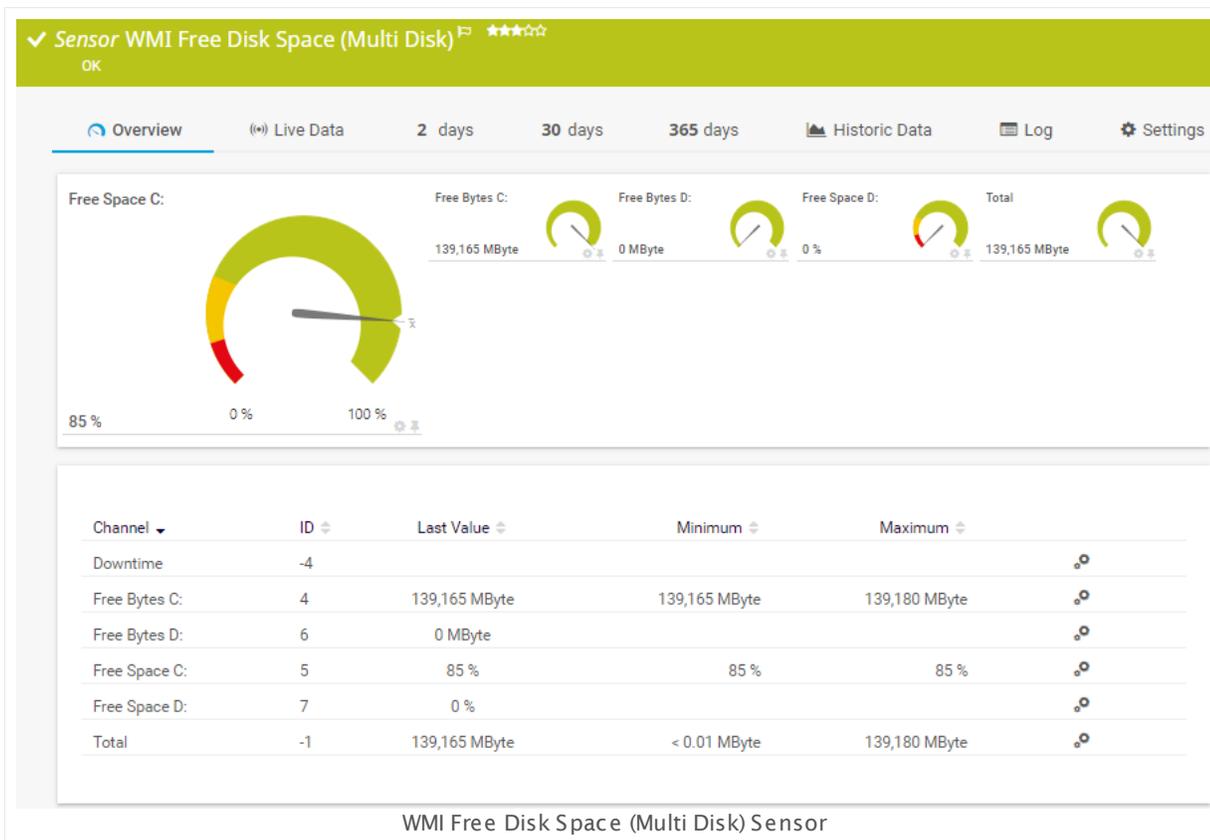

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.236 WMI Free Disk Space (Multi Disk) Sensor

The WMI Free Disk Space (Multi Disk) sensor monitors the free disk space of one or multiple drive(s) using Windows Management Instrumentation (WMI).

It shows the following:

- Free disk space in percent and bytes for each disk
 - Disk space of a system in total
- i** The sensor monitors logical partitions of a hard or fixed disk drive. PRTG identifies logical disks by their drive letter, such as C.

Sensor in Other Languages

Dutch: **WMI Vrije Schijfruimte (Multi Schijf)**, French: **Capacité du disque WMI (plusieurs fois)**, German: **WMI Laufwerkskapazität (mehrf.)**, Japanese: **WMI ? ? ? ? ? ? ? ? (? ? ? ? ? ?)**, Portuguese: **Espaço livre em disco da WMI (vários discos)**, Russian: **Свободное дисковое пространство WMI (на нескольких дисках)**, Simplified Chinese: **WMI ? ? ? ? ? ? (? ? ? ?)**, Spanish: **WMI disco libre (discos múltiples)**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI DISK FREE CONFIGURATION

Drive Select the drive(s) you want to monitor from the dropdown menu. We recommend that you use the default value.

You can choose **All** to monitor all available drives, or you can choose one specific drive letter to monitor a single drive only. The data in the dropdown menu may also contain drive letters that do not exist on your device. The drive setting cannot be changed once the sensor is created.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI DISK FREE CONFIGURATION

Drive	Shows the drive(s) that this sensor monitors. This is either All or a specific drive letter. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
-------	--

SET LIMITS CHECKED AGAINST ALL DISKS

In this section you can set limits that are valid for all channels and all drives. By entering limits, you can define when the sensor will enter a **Warning** or **Down status**^[195], depending on the data provided by all drives that this sensor monitors. If you want to individually define limits for separate channels, please use the limit settings in the [Sensor Channels Settings](#)^[3160].

i All limits that you define here are valid in addition to the limits defined in the particular **Channel** settings! The limits are valid simultaneously, so the first limit that is breached applies.

Percentage Limit Check Enable or disable a limit check for the free space in percentage channels of all drives. By default, percentage limits are enabled with lower warning and lower error limit. Choose between:

- **Only use the limits in the settings of the percentage channels:** Do not define sensor limits that are valid for all percentage channels. The sensor only uses limits that you define in the settings of the particular "free space in percent" channels to determine the status.
- **Use the limits of both the sensor and the channel settings:** Define limits for the sensor that are valid for all drives (percentage channels). Additional fields appear below. The sensor enters a **Warning** or **Down** status when free space limits are undercut or overrun.

Upper Error Limit This field is only visible if you enable percentage limit check above. Specify an upper limit in percent for a **Down** status. If the free disk space of one of your drives overruns this percent value, the sensor switches to **Down**. Please enter an integer value or leave the field empty.

i The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)^[3160]. The limits set here and in the channel settings are valid simultaneously!

Upper Warning Limit This field is only visible if you enable percentage limit check above. Specify an upper limit in percent for a **Warning** status. If the free disk space of one of your drives overruns this percent value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty.

i The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)^[3160]. The limits set here and in the channel settings are valid simultaneously!

SET LIMITS CHECKED AGAINST ALL DISKS

Lower Warning Limit	<p>This field is only visible if you enable percentage limit check above. Specify a lower limit in percent for a Warning status. If the free disk space of one of your drives undercuts this percent value, the sensor switches to warning. Please enter an integer value or leave the field empty.</p> <p> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the Sensor Channels Settings³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!</p>
Lower Error Limit	<p>This field is only visible if you enable percentage limit check above. Specify a lower limit in percent for a Down status. If the free disk space of one of your drives undercuts this percent value, the sensor switches to Down. Please enter an integer value or leave the field empty.</p> <p> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the Sensor Channels Settings³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!</p>
Size Limit Check	<p>Enable or disable a limit check for the free bytes channels of all drives. By default, byte size limits are not enabled for drives. Choose between:</p> <ul style="list-style-type: none">• Only use the limits in the settings of the byte size channels: Do not define sensor limits that are valid for all byte size channels. The sensor only uses limits that you define in the settings of the particular free space in bytes channels to determine the status.• Use the limits of both the sensor and the channel settings: Define limits for the sensor that are valid for all drives (byte size channels). Additional fields appear below. The sensor enters a Warning or Down status when free space limits are undercut or overrun.
Upper Error Limit	<p>This field is only visible if you enable byte limit check above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor will switch to Down. Please enter an integer value or leave the field empty.</p> <p> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the Sensor Channels Settings³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!</p>

SET LIMITS CHECKED AGAINST ALL DISKS

Upper Warning Limit This field is only visible if you enable byte limit check above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty.

 The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!

Lower Warning Limit This field is only visible if you enable byte limit check above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty.

 The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!

Lower Error Limit This field is only visible if you enable byte limit check above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor switches to **Down**. Please enter an integer value or leave the field empty.

 The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!

Alarm on Missing/Removed Disk If a monitored disk is removed or not found, values are set to zero. Select the alarming approach in this case. Choose between:

- **Deactivate alarm (default):** Select this option if you do not want an alarm for a removed disk.
- **Activate alarm:** Select this option if you want to be alerted if a monitored disk is removed.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.

 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings.</p> <ul style="list-style-type: none"> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> <p>▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.</p> <p>▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.</p> <ul style="list-style-type: none"> <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.237 WMI HDD Health Sensor

The WMI HDD Health sensor connects to the parent device via Windows Management Instrumentation (WMI) and monitors the health of IDE disk drives on the target system, using Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.). This is built into most modern IDE hard disk drives.

It can show the following, among others:

- Read Error Rate
- Spin-Up Time
- Start/Stop Count
- Reallocated Sectors Count
- Seek Error Rate
- Power-On Hours
- Spin Retry Count
- Calibration Retry Count
- Power Cycle Count
- Power-off Retract Count
- Load Cycle Count
- Temperature Celsius
- Reallocation Event Count
- Current Pending Sector Count
- Uncorrectable Sector Count
- UltraDMA CRC Error Count
- Write Error Rate
- Transfer Error Rate
- Total LBAs Written
- Total LBAs Read

Which channels the sensor actually shows might depend on the monitored device and the sensor setup. The channel names indicate the ID of the S.M.A.R.T. attribute, followed by a colon, and the typical meaning of the channel. The sensor can also show other attributes that the target device returns, but some channels will have the name **Unknown Channel**. This happens if PRTG cannot match the ID of a found attribute with an internally defined channel name.

 Some vendors do not agree on attribute definitions and define meanings other than the common one.

Every attribute of a disk assumes a value. PRTG shows these attributes as channels with their last, minimum, and maximum value. These channel values change over time and indicate the disk health—higher values correspond to a better health. The disk's attributes come with a threshold, defined by the manufacturer of the drive. If a channel value is lower than this threshold, the sensor will automatically show a **Warning status**^[195]. This indicates that the S.M.A.R.T. status of the HDD might break soon.

⚠ There are no thresholds defined for some attributes and because of this they cannot be categorized for a status other than **Up**. You can **Define Lookups**^[3693] and use them with affected channels to get the desired status for a return value.

WMI HDD Health Sensor

Sensor in Other Languages

Dutch: **WMI HDD Status**, French: **État WMI HDD**, German: **WMI Laufwerkszustand**, Japanese: **WMI HDD ? ? ?**, Portuguese: **Funcionamento do HD WMI**, Russian: **Работоспособность жесткого диска WMI**, Simplified Chinese: **WMI ? ? ? ? ?**, Spanish: **Salud de disco duro WMI**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
 - WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
 - Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)¹²⁵. Above this number, please consider using multiple [Remote Probes](#)³⁷⁰⁹ for load balancing.
 - For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)³⁵⁰⁷.
 - This sensor officially requires Windows 7 or later on the target machine that holds the hard disk drives you want to monitor. The sensor may not work reliably if the target machine runs on Windows 2003, Windows XP, or Windows Vista. Due to a known bug in those systems, the sensor may not be able to detect available hard disk drives.
 - The values that this sensor shows can vary depending on how a vendor handles S.M.A.R.T values. See the vendor's documentation for more information.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the IDE disks you want to monitor. PRTG will create one sensor for each IDE device you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SMART SPECIFIC

IDE Devices

You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

 The items shown in the list are specific to the parent device you create the sensor on.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SMART SPECIFIC

Serial No.	Shows the serial number of the monitored disk. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Size (GB)	Shows the size of the monitored disk in gigabytes. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the monitored disk. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

DEBUG OPTIONS

Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none">▪ Discard sensor result: Do not store the sensor result.▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.  For more information on how to find the folder used for storage, see section Data Storage³⁷³⁴. <p> This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>
---------------	---

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>3311</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.238 WMI Logical Disk I/O Sensor

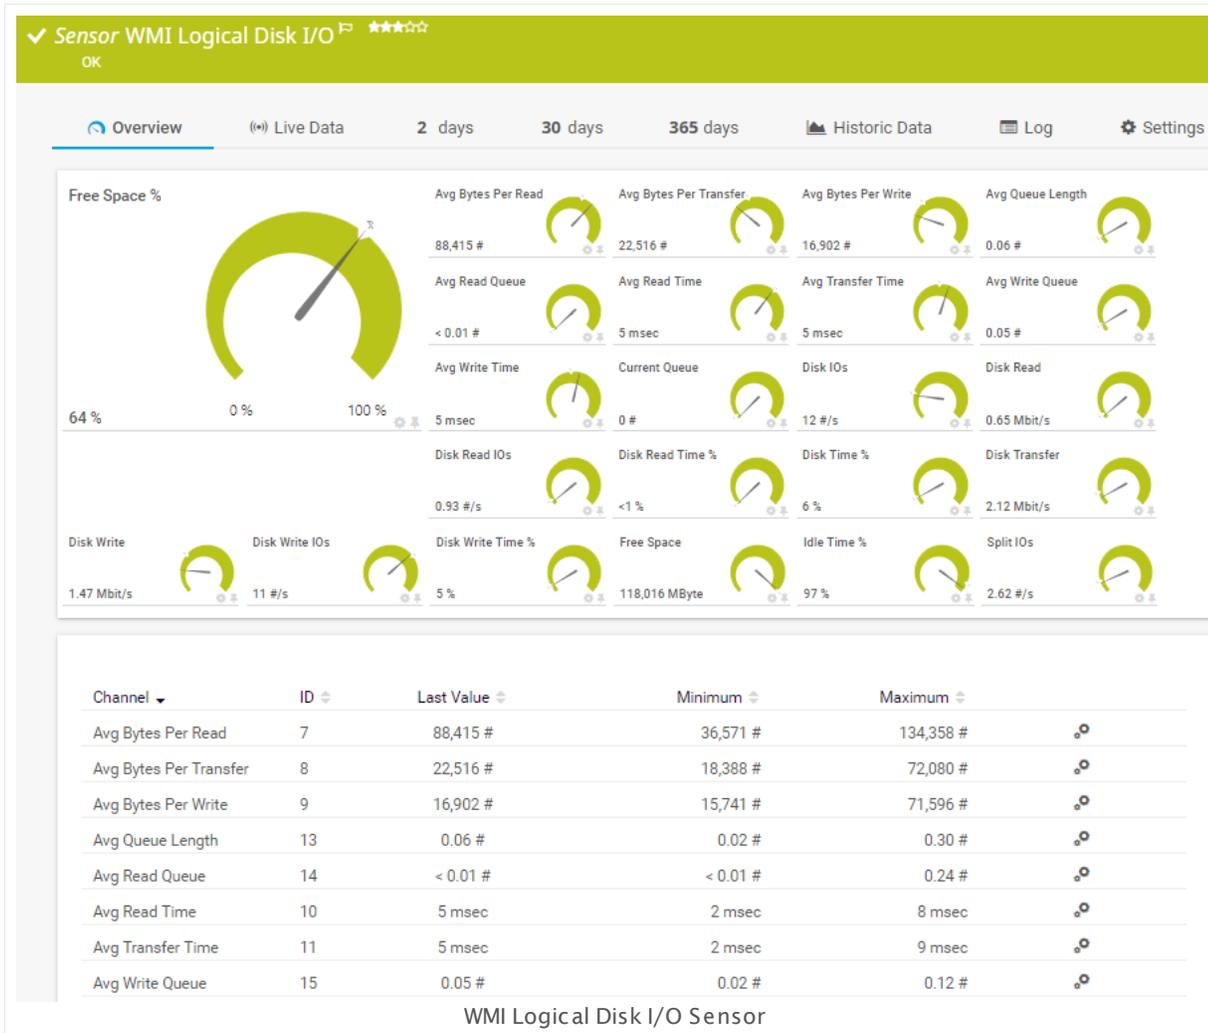

The WMI Logical Disk I/O sensor monitors the disk usage of a logical disk or mount point on a Windows system using Windows Management Instrumentation (WMI).

The sensor provides the following information:

- Free space
- Disk latency
- Disk bandwidth
- Disk queue data
- Disk IOs

 The sensor shows performance data from counters that monitor logical partitions of a hard drive. The system monitor identifies logical disk instances by their identifier, such as **C:**, and the sensor reads the logical disk object in the system monitor and returns the values.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **WMI Logische Schijf I/O**, French: **E/S du disque logique WMI**, German: **WMI Logischer Datenträger E/A**, Japanese: **WMI ? ? ? ? ? I/O**, Portuguese: **E/S do disco lógico de WMI**, Russian: **Ввод-вывод логического диска WMI**, Simplified Chinese: **WMI ? ? ? ? I/O**, Spanish: **E/S WMI de disco lógico**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.

- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].
 - This sensor type supports Windows Server 2008 R2 or later. It will not work on previous Windows versions (Windows Server 2008 or earlier).
 - Currently, this sensor type is in beta status. The methods of operating can change at any **BETA** time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the logical disks and mount points you want to monitor. PRTG will create one sensor for each counter you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI LOGICAL DISK I/O SPECIFIC

Logical Disk(s)

Select the logical disks and mount points you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI LOGICAL DISK I/O SPECIFIC

Logical Disk(s)	Shows the logical disk or mount point that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
-----------------	---

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between:
---------------	---

DEBUG OPTIONS

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

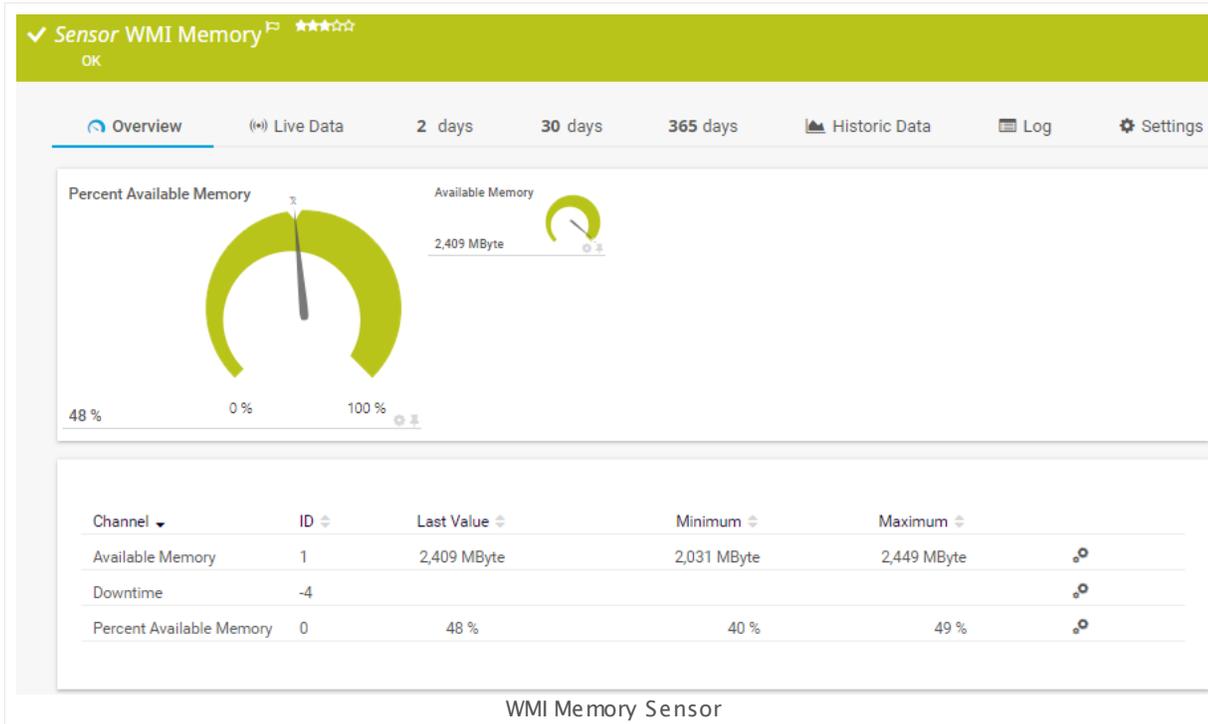

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.239 WMI Memory Sensor

The WMI Memory sensor monitors available (free) system memory on Windows systems using Windows Management Instrumentation (WMI).

- It shows the available memory in percent and bytes.

Sensor in Other Languages

Dutch: **WMI Geheugen**, French: **Mémoire WMI**, German: **WMI Arbeitsspeicher**, Japanese: **WMI** ? ? ? , Portuguese: **Memória de WMI**, Russian: **Память WMI**, Simplified Chinese: **WMI** ? ? , Spanish: **WMI memoria**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none">▪ Discard sensor result: Do not store the sensor result.▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.  For more information on how to find the folder used for storage, see section Data Storage³⁷³⁴. <p> This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>
---------------	---

WMI ALTERNATIVE QUERY

Errors and Invalid Data	<p>This is an extended help field only. WMI sensors in PRTG are equipped with the most efficient and accurate WMI queries. However, Microsoft has changed (and will continue to do so in the future) some WMI classes over the various Windows/ServicePack/patchlevel versions, resulting in errors like class not valid or invalid data.</p> <p>Wherever possible, PRTG features an alternative query that might work in your specific configuration. If you keep getting errors for this sensor, please try enabling the alternative query method below.</p>
Alternative Query	<p>Choose the method PRTG uses to query via WMI. For compatibility reasons, you can enable an alternative query method. We recommend that you use the default value. You can choose between:</p> <ul style="list-style-type: none">• Use default (recommended): Use the PRTG standard method to query WMI. This is the best setting in most cases.• Use alternative (if default does not work): Use an alternative method to query WMI. If you keep getting errors with the default setting, try this setting.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.240 WMI Microsoft SQL Server 2005 Sensor (Deprecated)

IMPORTANT NOTICE

This sensor type is deprecated.

Monitoring of Microsoft SQL Server 2005 using PRTG is discontinued. It cannot be monitored with PRTG anymore with the latest updates of SQL Server 2005. The reason for this is a software update delivered by Microsoft in August 2012. The following updates cause this issue:

- **Security Update for SQL Server 2005 Service Pack 4 (KB2716429)**
- **Security Update for SQL Server 2005 Service Pack 4 (KB2716427)**

We have made reasonable effort to fix this from our side but we were unable to. We do not have instructions to circumvent this issue at this time. Please ask the vendor to fix this.

More

Knowledge Base: [Why does my WMI Microsoft SQL Server 2005 Sensor not work anymore?](#)

The WMI Microsoft SQL Server sensor monitors the performance of a Microsoft SQL Server via Windows Management Instrumentation (WMI). This sensor can monitor **SQL General Statistics**, **Access Methods**, the **Buffer Manager**, the **Memory Manager**, the **Locks Manager**, and **SQL Statistics**. The channels that are actually available for a sensor depend on the performance counters that you choose during setup.

CHANNEL OVERVIEW

User Connections	Number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.
Logins	Total number of logins started per second.
Logouts	Total number of logout operations started per second.
Full Scans	Number of unrestricted full scans per second. These can be either base-table or full-index scans.
Page Splits	Number of page splits per second that occur as the result of overflowing index pages.

CHANNEL OVERVIEW

Table Lock Escalations	Number of times locks on a table were escalated.
Buffer Cache Hit Ratio	<p>Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little.</p> <p>Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.</p>
Database Pages	Number of pages in the buffer pool with database content.
Stolen Pages	Number of pages used for miscellaneous server purposes (including procedure cache).
Page Life Expectancy	Number of seconds a page will stay in the buffer pool without references.
Connection Memory (KB)	Total amount of dynamic memory the server is using for maintaining connections.
Optimizer Memory (KB)	Total amount of dynamic memory the server is using for query optimization.
Total Server Memory (KB)	Total amount of dynamic memory (in kilobytes) that the server is using currently.
Target Server Memory (KB)	Total amount of dynamic memory the server can consume.
SQL Cache Memory (KB)	Total amount of dynamic memory the server is using for the dynamic SQL cache.
Lock Requests	Number of new locks and lock conversions per second requested from the lock manager.
Deadlocks	Number of lock requests per second that resulted in a deadlock.
Average Wait Time	Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.

CHANNEL OVERVIEW

Batch Requests	Number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.
SQL Compilations	Number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles due to recompiles. After SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	Number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.

Remarks

- This sensor can only be added to a device (computer) running a Microsoft SQL database.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.

- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)¹²⁵. Above this number, please consider using multiple [Remote Probes](#)³⁷⁰⁹ for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)³⁵⁰⁷.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the instances of the Microsoft SQL Server you want to monitor. PRTG will create one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SQL SERVER SETTINGS

MS SQL Server Instance	<p>You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.</p> <p> Display name and service name are provided as returned by the SQL Server.</p>
SQL Server Version	Enter the version of the SQL Server. Usually, you can keep the default value.

SQL COUNTER SPECIFIC

SQL Performance Counters	<p>You see a list of different groups of performance counters that the sensor can monitor for the instance(s) that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counters you select here. Choose from:</p> <ul style="list-style-type: none"> ▪ General Statistics: Read general performance counters. This shows the number of user connections, and the number of logins and logouts per second.
--------------------------	--

SQL COUNTER SPECIFIC

- **Access Methods:** Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second).
- **Buffer Manager:** Read buffer manager counters. This shows the buffer cache hit ratio in percent, and the number of database pages and stolen pages.
- **Memory Manager:** Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb).
- **Locks:** Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time.
- **SQL Statistics:** Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second).

Depending on your selection, PRTG creates a sensor with the specified channels.

- ❗ To monitor more than one of the listed groups of performance counters, please add the sensor several times for the instance (s).

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

- ❗ Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags¹³⁹, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited¹⁴⁰ from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

SQL SERVER SETTINGS

Service	<p>Shows the service that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p>
Name	<p>Shows the name of the server instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p>
WMI Class Name	<p>Select whether PRTG selects the name of the WMI class used for monitoring automatically. Choose between:</p> <ul style="list-style-type: none">▪ Automatic: Choose WMI class automatically. We recommend this setting.▪ Manual: Manually enter a WMI class name. Select this option if your server instance returns an error code in automatic mode.
WMI Class	<p>This field is only visible if you enable manual WMI class selection above. This setting is intended for experienced users only. Enter the WMI class name that the sensor uses for monitoring your server instance.</p>

SQL SERVER SETTINGS

- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result:** Do not store the sensor result.
 - **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SQL COUNTER SPECIFIC

- SQL Performance Counters** Shows the performance counter that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.241 WMI Microsoft SQL Server 2008 Sensor

The WMI Microsoft SQL Server sensor monitors the performance of a Microsoft SQL Server via Windows Management Instrumentation (WMI). This sensor can monitor **SQL General Statistics**, **Access Methods**, the **Buffer Manager**, the **Memory Manager**, the **Locks Manager**, and **SQL Statistics**. The channels that are actually available for a sensor depend on the performance counters that you choose during setup.

CHANNEL OVERVIEW

User Connections	Number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.
Logins	Total number of logins started per second.
Logouts	Total number of logout operations started per second.
Full Scans	Number of unrestricted full scans per second. These can be either base-table or full-index scans.
Page Splits	Number of page splits per second that occur as the result of overflowing index pages.
Table Lock Escalations	Number of times locks on a table were escalated.
Buffer Cache Hit Ratio	<p>Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little.</p> <p>Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.</p>
Database Pages	Number of pages in the buffer pool with database content.
Stolen Pages	Number of pages used for miscellaneous server purposes (including procedure cache).
Page Life Expectancy	Number of seconds a page will stay in the buffer pool without references.
Connection Memory (KB)	Total amount of dynamic memory the server is using for maintaining connections.

CHANNEL OVERVIEW

Optimizer Memory (KB)	Total amount of dynamic memory the server is using for query optimization.
Total Server Memory (KB)	Total amount of dynamic memory (in kilobytes) that the server is using currently.
Target Server Memory (KB)	Total amount of dynamic memory the server can consume.
SQL Cache Memory (KB)	Total amount of dynamic memory the server is using for the dynamic SQL cache.
Lock Requests	Number of new locks and lock conversions per second requested from the lock manager.
Deadlocks	Number of lock requests per second that resulted in a deadlock.
Average Wait Time	Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.
Batch Requests	Number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.
SQL Compilations	Number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles due to recompiles. After SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	Number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

241 WMI Microsoft SQL Server 2008 Sensor

Remarks

- This sensor can only be added to a device (computer) running a Microsoft SQL database.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].

☁ You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the instances of the Microsoft SQL Server you want to monitor. PRTG will create one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SQL SERVER SETTINGS

MS SQL Server Instance	<p>You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.</p> <p> Display name and service name are provided as returned by the SQL Server.</p>
SQL Server Version	<p>Enter the version of the SQL Server. Usually, you can keep the default value.</p>

SQL COUNTER SPECIFIC

SQL Performance Counters	<p>You see a list of different groups of performance counters that the sensor can monitor for the instance(s) that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counters you select here. Choose from:</p> <ul style="list-style-type: none">▪ General Statistics: Read general performance counters. This shows the number of user connections, and the number of logins and logouts per second.▪ Access Methods: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second).▪ Buffer Manager: Read buffer manager counters. This shows the buffer cache hit ratio in percent, and the number of database pages and stolen pages.▪ Memory Manager: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb).▪ Locks: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time.▪ SQL Statistics: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second).
--------------------------	---

SQL COUNTER SPECIFIC

Depending on your selection, PRTG creates a sensor with the specified channels.

- ⓘ To monitor more than one of the listed groups of performance counters, please add the sensor several times for the instance (s).

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

- ⓘ Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <ul style="list-style-type: none"> ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SQL SERVER SETTINGS

Service Shows the service that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Name Shows the name of the server instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

WMI Class Name Select whether PRTG selects the name of the WMI class used for monitoring automatically. Choose between:

- **Automatic:** Choose WMI class automatically. We recommend this setting.
- **Manual:** Manually enter a WMI class name. Select this option if your server instance returns an error code in automatic mode.

WMI Class This field is only visible if you enable manual WMI class selection above. This setting is intended for experienced users only. Enter the WMI class name that the sensor uses for monitoring your server instance.

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

SQL SERVER SETTINGS

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SQL COUNTER SPECIFIC

SQL Performance Counters Shows the performance counter that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings.</p> <ul style="list-style-type: none"> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> <p>▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.</p> <p>▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.</p> <ul style="list-style-type: none"> <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.242 WMI Microsoft SQL Server 2012 Sensor

The WMI Microsoft SQL Server sensor monitors the performance of a Microsoft SQL Server via Windows Management Instrumentation (WMI). This sensor can monitor **SQL General Statistics**, **Access Methods**, the **Buffer Manager**, the **Memory Manager**, the **Locks Manager**, and **SQL Statistics**. The channels that are actually available for a sensor depend on the performance counters that you choose during setup.

CHANNEL OVERVIEW

User Connections	Number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.
Logins	Total number of logins started per second.
Logouts	Total number of logout operations started per second.
Full Scans	Number of unrestricted full scans per second. These can be either base-table or full-index scans.
Page Splits	Number of page splits per second that occur as the result of overflowing index pages.
Table Lock Escalations	Number of times locks on a table were escalated.
Buffer Cache Hit Ratio	<p>Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little.</p> <p>Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.</p>
Database Pages	Number of pages in the buffer pool with database content.
Stolen Pages	Number of pages used for miscellaneous server purposes (including procedure cache).
Page Life Expectancy	Number of seconds a page will stay in the buffer pool without references.
Connection Memory (KB)	Total amount of dynamic memory the server is using for maintaining connections.

CHANNEL OVERVIEW

Optimizer Memory (KB)	Total amount of dynamic memory the server is using for query optimization.
Total Server Memory (KB)	Total amount of dynamic memory (in kilobytes) that the server is using currently.
Target Server Memory (KB)	Total amount of dynamic memory the server can consume.
SQL Cache Memory (KB)	Total amount of dynamic memory the server is using for the dynamic SQL cache.
Lock Requests	Number of new locks and lock conversions per second requested from the lock manager.
Deadlocks	Number of lock requests per second that resulted in a deadlock.
Average Wait Time	Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.
Batch Requests	Number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.
SQL Compilations	Number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles due to recompiles. After SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	Number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

242 WMI Microsoft SQL Server 2012 Sensor

Remarks

- This sensor can only be added to a device (computer) running a Microsoft SQL database.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].

☁ You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the instances of the Microsoft SQL Server you want to monitor. PRTG will create one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SQL SERVER SETTINGS

MS SQL Server Instance	<p>You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.</p> <p> Display name and service name are provided as returned by the SQL Server.</p>
SQL Server Version	<p>Enter the version of the SQL Server. Usually, you can keep the default value.</p>

SQL COUNTER SPECIFIC

SQL Performance Counters	<p>You see a list of different groups of performance counters that the sensor can monitor for the instance(s) that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counters you select here. Choose from:</p> <ul style="list-style-type: none">▪ General Statistics: Read general performance counters. This shows the number of user connections, and the number of logins and logouts per second.▪ Access Methods: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second).▪ Buffer Manager: Read buffer manager counters. This shows the buffer cache hit ratio in percent, and the number of database pages and stolen pages.▪ Memory Manager: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb).▪ Locks: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time.▪ SQL Statistics: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second).
--------------------------	---

SQL COUNTER SPECIFIC

Depending on your selection, PRTG creates a sensor with the specified channels.

- ⓘ To monitor more than one of the listed groups of performance counters, please add the sensor several times for the instance (s).

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

- ⓘ Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <ul style="list-style-type: none"> ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SQL SERVER SETTINGS

Service Shows the service that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Name Shows the name of the server instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

WMI Class Name Select whether PRTG selects the name of the WMI class used for monitoring automatically. Choose between:

- **Automatic:** Choose WMI class automatically. We recommend this setting.
- **Manual:** Manually enter a WMI class name. Select this option if your server instance returns an error code in automatic mode.

WMI Class This field is only visible if you enable manual WMI class selection above. This setting is intended for experienced users only. Enter the WMI class name that the sensor uses for monitoring your server instance.

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

SQL SERVER SETTINGS

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SQL COUNTER SPECIFIC

SQL Performance Counters Shows the performance counter that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings.</p> <ul style="list-style-type: none"> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> <p>▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.</p> <p>▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.</p> <ul style="list-style-type: none"> <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.243 WMI Microsoft SQL Server 2014 Sensor

The WMI Microsoft SQL Server sensor monitors the performance of a Microsoft SQL Server via Windows Management Instrumentation (WMI). This sensor can monitor **SQL General Statistics**, **Access Methods**, the **Buffer Manager**, the **Memory Manager**, the **Locks Manager**, and **SQL Statistics**. The channels that are actually available for a sensor depend on the performance counters that you choose during setup.

CHANNEL OVERVIEW

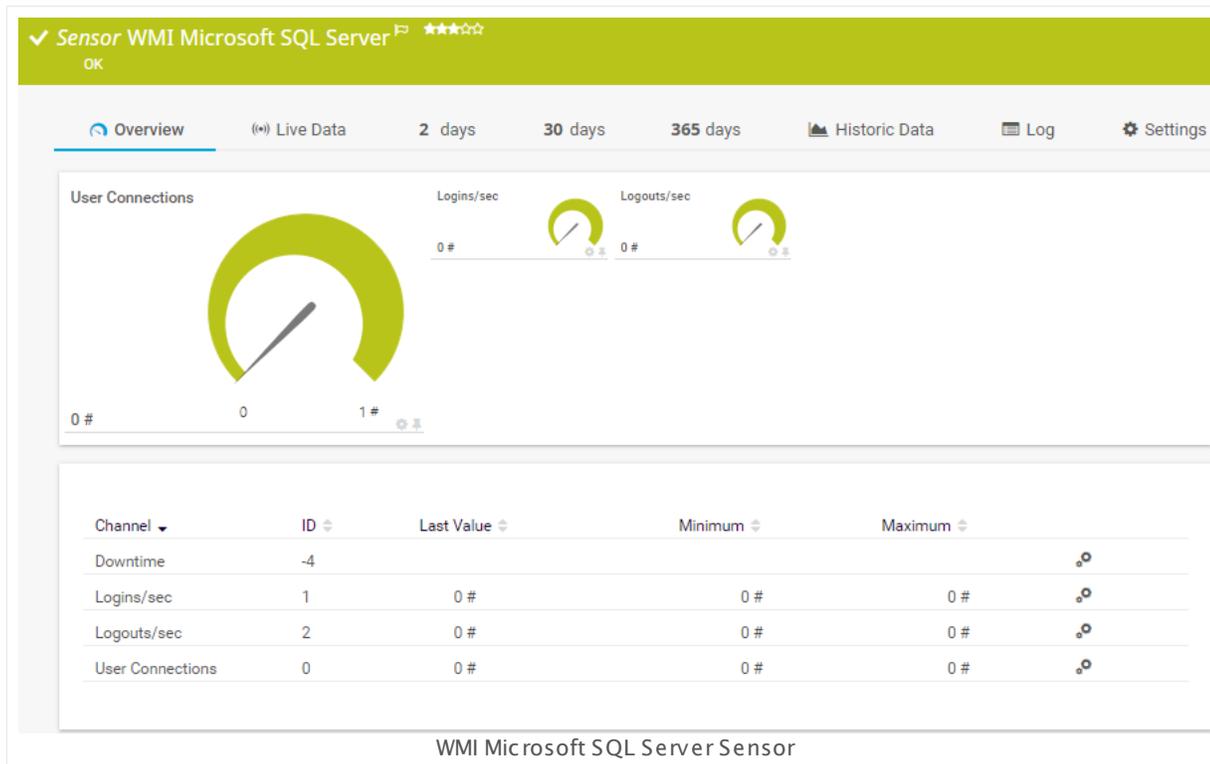

User Connections	Number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.
Logins	Total number of logins started per second.
Logouts	Total number of logout operations started per second.
Full Scans	Number of unrestricted full scans per second. These can be either base-table or full-index scans.
Page Splits	Number of page splits per second that occur as the result of overflowing index pages.
Table Lock Escalations	Number of times locks on a table were escalated.
Buffer Cache Hit Ratio	<p>Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little.</p> <p>Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.</p>
Database Pages	Number of pages in the buffer pool with database content.
Stolen Pages	Number of pages used for miscellaneous server purposes (including procedure cache).
Page Life Expectancy	Number of seconds a page will stay in the buffer pool without references.
Connection Memory (KB)	Total amount of dynamic memory the server is using for maintaining connections.

CHANNEL OVERVIEW

Optimizer Memory (KB)	Total amount of dynamic memory the server is using for query optimization.
Total Server Memory (KB)	Total amount of dynamic memory (in kilobytes) that the server is using currently.
Target Server Memory (KB)	Total amount of dynamic memory the server can consume.
SQL Cache Memory (KB)	Total amount of dynamic memory the server is using for the dynamic SQL cache.
Lock Requests	Number of new locks and lock conversions per second requested from the lock manager.
Deadlocks	Number of lock requests per second that resulted in a deadlock.
Average Wait Time	Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.
Batch Requests	Number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.
SQL Compilations	Number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles due to recompiles. After SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	Number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

243 WMI Microsoft SQL Server 2014 Sensor

Remarks

- This sensor can only be added to a device (computer) running a Microsoft SQL database.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].

☁ You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the instances of the Microsoft SQL Server you want to monitor. PRTG will create one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SQL SERVER SETTINGS

MS SQL Server Instance	<p>You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.</p> <p> Display name and service name are provided as returned by the SQL Server.</p>
SQL Server Version	<p>Enter the version of the SQL Server. Usually, you can keep the default value.</p>

SQL COUNTER SPECIFIC

SQL Performance Counters	<p>You see a list of different groups of performance counters that the sensor can monitor for the instance(s) that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counters you select here. Choose from:</p> <ul style="list-style-type: none">▪ General Statistics: Read general performance counters. This shows the number of user connections, and the number of logins and logouts per second.▪ Access Methods: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second).▪ Buffer Manager: Read buffer manager counters. This shows the buffer cache hit ratio in percent, and the number of database pages and stolen pages.▪ Memory Manager: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb).▪ Locks: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time.▪ SQL Statistics: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second).
--------------------------	---

SQL COUNTER SPECIFIC

Depending on your selection, PRTG creates a sensor with the specified channels.

- ⓘ To monitor more than one of the listed groups of performance counters, please add the sensor several times for the instance (s).

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

- ⓘ Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <ul style="list-style-type: none"> ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SQL SERVER SETTINGS

Service Shows the service that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Name Shows the name of the server instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

WMI Class Name Select whether PRTG selects the name of the WMI class used for monitoring automatically. Choose between:

- **Automatic:** Choose WMI class automatically. We recommend this setting.
- **Manual:** Manually enter a WMI class name. Select this option if your server instance returns an error code in automatic mode.

WMI Class This field is only visible if you enable manual WMI class selection above. This setting is intended for experienced users only. Enter the WMI class name that the sensor uses for monitoring your server instance.

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

SQL SERVER SETTINGS

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SQL COUNTER SPECIFIC

SQL Performance Counters Shows the performance counter that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

My WMI sensors don't work. What can I do?

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.244 WMI Microsoft SQL Server 2016 Sensor

The WMI Microsoft SQL Server sensor monitors the performance of a Microsoft SQL Server via Windows Management Instrumentation (WMI). This sensor can monitor **SQL General Statistics**, **Access Methods**, the **Buffer Manager**, the **Memory Manager**, the **Locks Manager**, and **SQL Statistics**. The channels that are actually available for a sensor depend on the performance counters that you choose during setup.

CHANNEL OVERVIEW

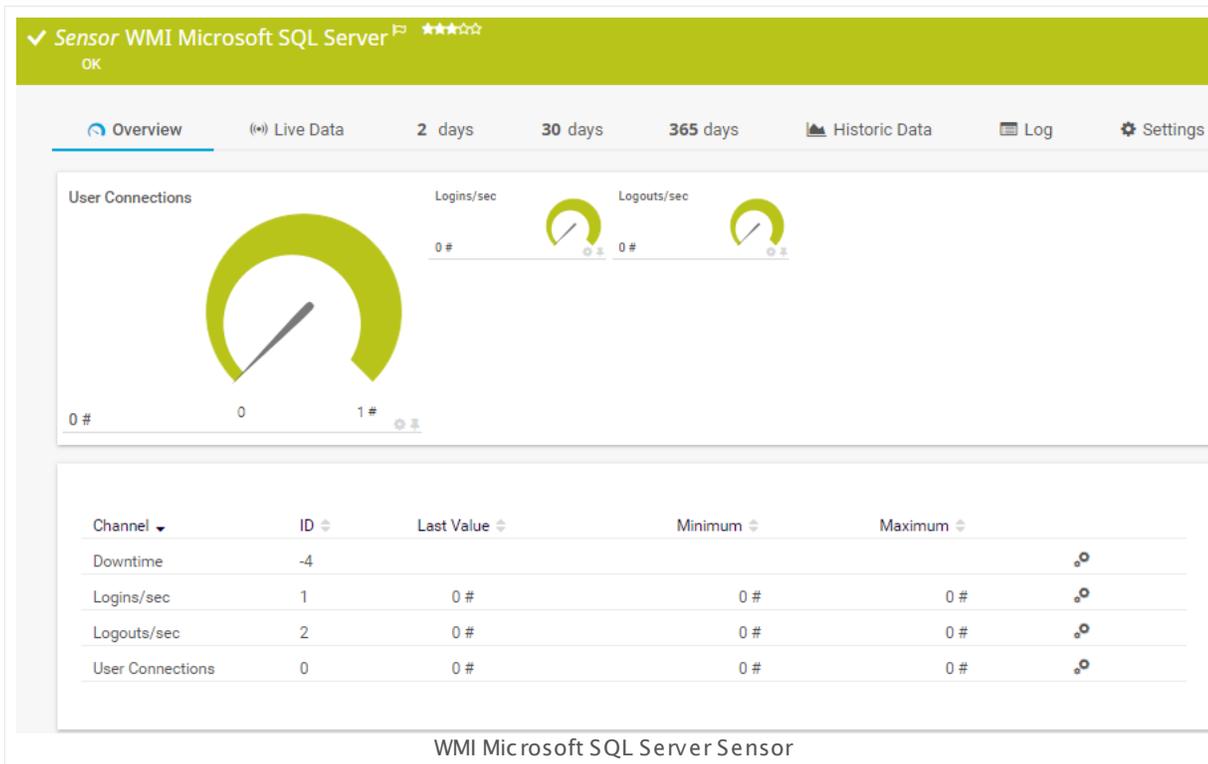

User Connections	Number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.
Logins	Total number of logins started per second.
Logouts	Total number of logout operations started per second.
Full Scans	Number of unrestricted full scans per second. These can be either base-table or full-index scans.
Page Splits	Number of page splits per second that occur as the result of overflowing index pages.
Table Lock Escalations	Number of times locks on a table were escalated.
Buffer Cache Hit Ratio	<p>Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little.</p> <p>Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.</p>
Database Pages	Number of pages in the buffer pool with database content.
Stolen Pages	Number of pages used for miscellaneous server purposes (including procedure cache).
Page Life Expectancy	Number of seconds a page will stay in the buffer pool without references.
Connection Memory (KB)	Total amount of dynamic memory the server is using for maintaining connections.

CHANNEL OVERVIEW

Optimizer Memory (KB)	Total amount of dynamic memory the server is using for query optimization.
Total Server Memory (KB)	Total amount of dynamic memory (in kilobytes) that the server is using currently.
Target Server Memory (KB)	Total amount of dynamic memory the server can consume.
SQL Cache Memory (KB)	Total amount of dynamic memory the server is using for the dynamic SQL cache.
Lock Requests	Number of new locks and lock conversions per second requested from the lock manager.
Deadlocks	Number of lock requests per second that resulted in a deadlock.
Average Wait Time	Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.
Batch Requests	Number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.
SQL Compilations	Number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles due to recompiles. After SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	Number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

244 WMI Microsoft SQL Server 2016 Sensor

Remarks

- This sensor can only be added to a device (computer) running a Microsoft SQL database.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].

☁ You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the instances of the Microsoft SQL Server you want to monitor. PRTG will create one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SQL SERVER SETTINGS

MS SQL Server Instance	<p>You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.</p> <p> Display name and service name are provided as returned by the SQL Server.</p>
SQL Server Version	<p>Enter the version of the SQL Server. Usually, you can keep the default value.</p>

SQL COUNTER SPECIFIC

SQL Performance Counters	<p>You see a list of different groups of performance counters that the sensor can monitor for the instance(s) that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counters you select here. Choose from:</p> <ul style="list-style-type: none">▪ General Statistics: Read general performance counters. This shows the number of user connections, and the number of logins and logouts per second.▪ Access Methods: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second).▪ Buffer Manager: Read buffer manager counters. This shows the buffer cache hit ratio in percent, and the number of database pages and stolen pages.▪ Memory Manager: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb).▪ Locks: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time.▪ SQL Statistics: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second).
--------------------------	---

SQL COUNTER SPECIFIC

Depending on your selection, PRTG creates a sensor with the specified channels.

- ⓘ To monitor more than one of the listed groups of performance counters, please add the sensor several times for the instance (s).

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

- ⓘ Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <ul style="list-style-type: none"> ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SQL SERVER SETTINGS

Service Shows the service that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Name Shows the name of the server instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

WMI Class Name Select whether PRTG selects the name of the WMI class used for monitoring automatically. Choose between:

- **Automatic:** Choose WMI class automatically. We recommend this setting.
- **Manual:** Manually enter a WMI class name. Select this option if your server instance returns an error code in automatic mode.

WMI Class This field is only visible if you enable manual WMI class selection above. This setting is intended for experienced users only. Enter the WMI class name that the sensor uses for monitoring your server instance.

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

SQL SERVER SETTINGS

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SQL COUNTER SPECIFIC

SQL Performance Counters Shows the performance counter that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings.</p> <ul style="list-style-type: none"> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> <p>▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.</p> <p>▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.</p> <ul style="list-style-type: none"> <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.245 WMI Microsoft SQL Server 2017 Sensor

The WMI Microsoft SQL Server sensor monitors the performance of a Microsoft SQL Server via Windows Management Instrumentation (WMI). This sensor can monitor **SQL General Statistics**, **Access Methods**, the **Buffer Manager**, the **Memory Manager**, the **Locks Manager**, and **SQL Statistics**. The channels that are actually available for a sensor depend on the performance counters that you choose during setup.

CHANNEL OVERVIEW

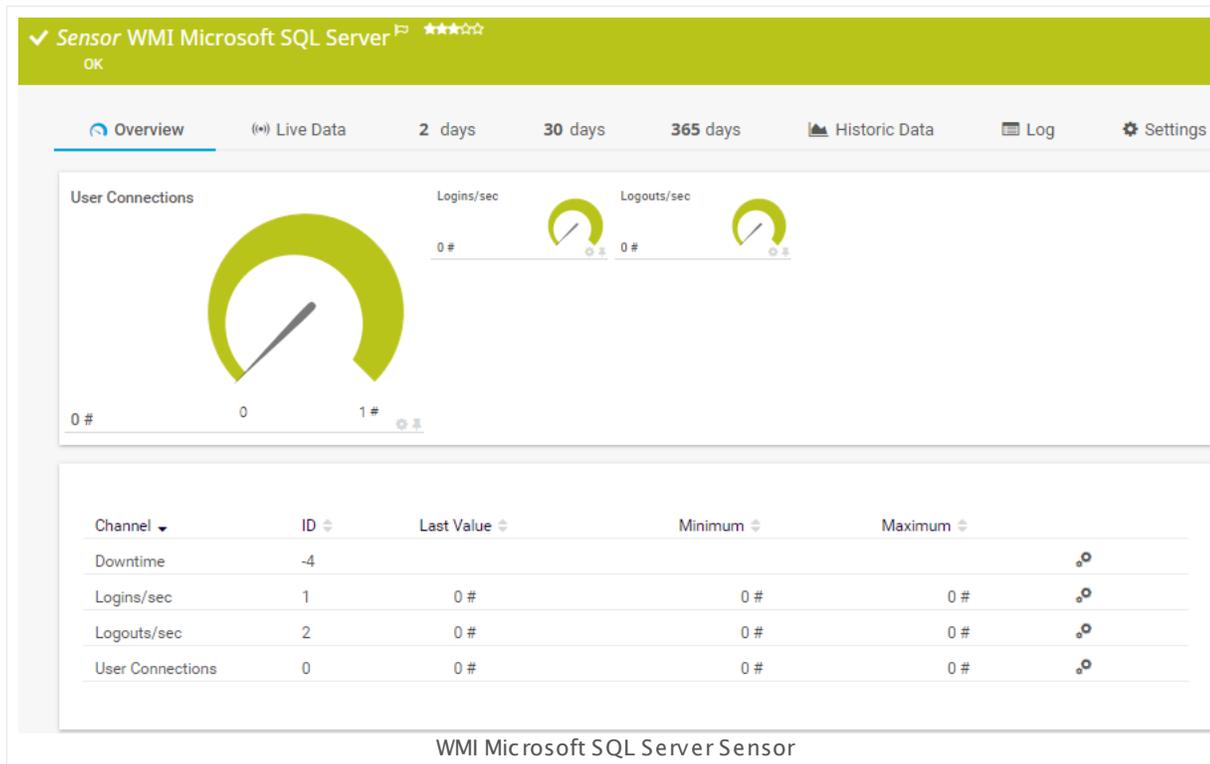

User Connections	Number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.
Logins	Total number of logins started per second.
Logouts	Total number of logout operations started per second.
Full Scans	Number of unrestricted full scans per second. These can be either base-table or full-index scans.
Page Splits	Number of page splits per second that occur as the result of overflowing index pages.
Table Lock Escalations	Number of times locks on a table were escalated.
Buffer Cache Hit Ratio	<p>Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little.</p> <p>Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.</p>
Database Pages	Number of pages in the buffer pool with database content.
Stolen Pages	Number of pages used for miscellaneous server purposes (including procedure cache).
Page Life Expectancy	Number of seconds a page will stay in the buffer pool without references.
Connection Memory (KB)	Total amount of dynamic memory the server is using for maintaining connections.

CHANNEL OVERVIEW

Optimizer Memory (KB)	Total amount of dynamic memory the server is using for query optimization.
Total Server Memory (KB)	Total amount of dynamic memory (in kilobytes) that the server is using currently.
Target Server Memory (KB)	Total amount of dynamic memory the server can consume.
SQL Cache Memory (KB)	Total amount of dynamic memory the server is using for the dynamic SQL cache.
Lock Requests	Number of new locks and lock conversions per second requested from the lock manager.
Deadlocks	Number of lock requests per second that resulted in a deadlock.
Average Wait Time	Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.
Batch Requests	Number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.
SQL Compilations	Number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles due to recompiles. After SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	Number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

245 WMI Microsoft SQL Server 2017 Sensor

Remarks

- This sensor can only be added to a device (computer) running a Microsoft SQL database.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].

☁ You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the instances of the Microsoft SQL Server you want to monitor. PRTG will create one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SQL SERVER SETTINGS

MS SQL Server Instance	<p>You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.</p> <p> Display name and service name are provided as returned by the SQL Server.</p>
SQL Server Version	<p>Enter the version of the SQL Server. Usually, you can keep the default value.</p>

SQL COUNTER SPECIFIC

SQL Performance Counters	<p>You see a list of different groups of performance counters that the sensor can monitor for the instance(s) that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counters you select here. Choose from:</p> <ul style="list-style-type: none">▪ General Statistics: Read general performance counters. This shows the number of user connections, and the number of logins and logouts per second.▪ Access Methods: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second).▪ Buffer Manager: Read buffer manager counters. This shows the buffer cache hit ratio in percent, and the number of database pages and stolen pages.▪ Memory Manager: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb).▪ Locks: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time.▪ SQL Statistics: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second).
--------------------------	---

SQL COUNTER SPECIFIC

Depending on your selection, PRTG creates a sensor with the specified channels.

- ⓘ To monitor more than one of the listed groups of performance counters, please add the sensor several times for the instance (s).

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

- ⓘ Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <ul style="list-style-type: none"> ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SQL SERVER SETTINGS

Service Shows the service that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Name Shows the name of the server instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

WMI Class Name Select whether PRTG selects the name of the WMI class used for monitoring automatically. Choose between:

- **Automatic:** Choose WMI class automatically. We recommend this setting.
- **Manual:** Manually enter a WMI class name. Select this option if your server instance returns an error code in automatic mode.

WMI Class This field is only visible if you enable manual WMI class selection above. This setting is intended for experienced users only. Enter the WMI class name that the sensor uses for monitoring your server instance.

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

SQL SERVER SETTINGS

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SQL COUNTER SPECIFIC

SQL Performance Counters Shows the performance counter that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

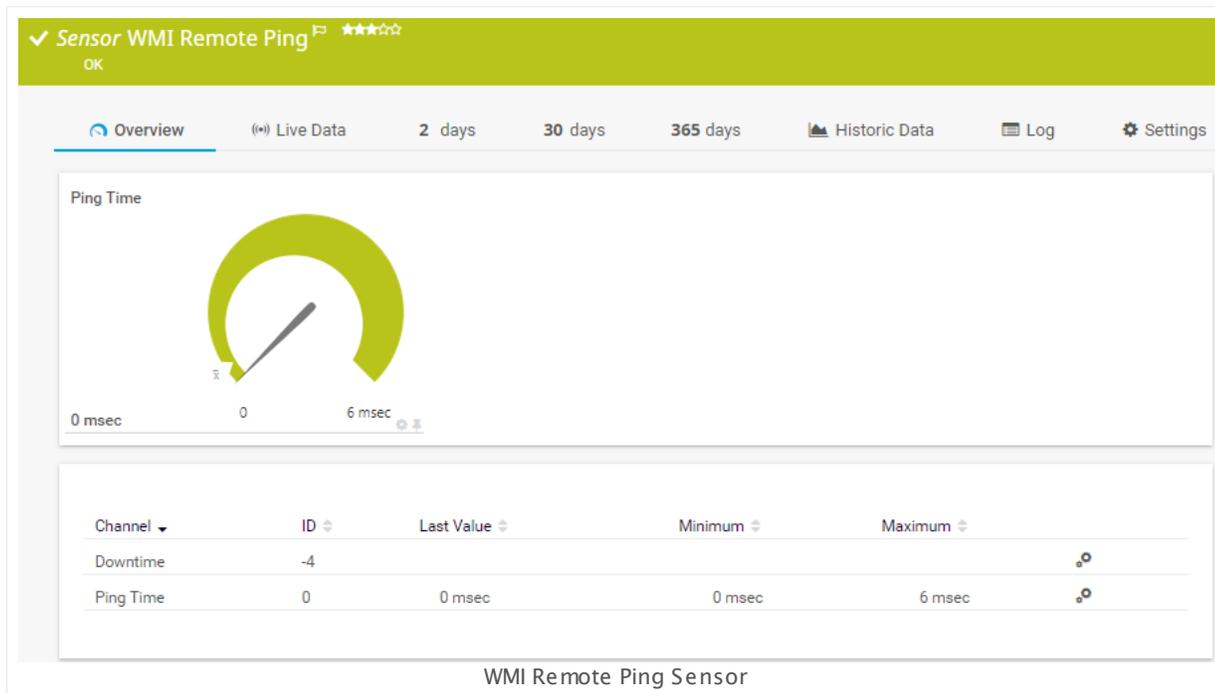

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.246 WMI Remote Ping Sensor

The WMI Remote Ping sensor remotely connects to a Windows system using Windows Management Instrumentation (WMI) and performs an Internet Control Message Protocol (ICMP) echo request ("Ping") from this device to a specified target.

- The sensor shows the Ping time from the remote device to the target device that is being pinged.

Sensor in Other Languages

Dutch: **WMI Remote Ping**, French: **Ping distant WMI**, German: **WMI Remote Ping**, Japanese: **WMI ? ? ? ? P I N G ? ?**, Portuguese: **Ping remoto de WMI**, Russian: **Удаленная проверка связи WMI**, Simplified Chinese: **WMI ? ? Ping**, Spanish: **Ping remoto WMI**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI REMOTE PING CONFIGURATION

Target	Enter the DNS name or IP address of the target device to send the ping to. The sensor remotely connects to its parent device via WMI. Then it performs a ping request from this remote device to the target device or server. Please enter a string.
Timeout (Sec.)	Enter a timeout in seconds for the Ping. If the reply takes longer than this value defines, the sensor cancels the request and triggers an error message. Please enter an integer value. The maximum timeout value is 300 .
Packet Size (Bytes)	Enter the packet size in bytes for the Ping. You can use any value between 1 and 10000 . Please enter an integer value. We recommend that you use the default value.

DEBUG OPTIONS

Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none">▪ Discard sensor result: Do not store the sensor result.▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.  For more information on how to find the folder used for storage, see section Data Storage³⁷³⁴. <p> This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>
---------------	---

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

7.8.247 WMI Security Center Sensor

The WMI Security Center sensor monitors the security status of a Windows client computer using Windows Management Instrumentation (WMI). It can monitor all security products that are controlled by Windows Security Center / Windows Action Center.

- It shows the status code of the monitored product and sets the sensor status accordingly. A [sensor status](#) showing **Up** indicates that the product is up to date and the access scan is running.

Possible return values for status codes are:

Status Code	Meaning: Status of Monitored Security Product Is ...	Will Result in Sensor Status
0	Unknown	Down
1	Not running, Out of date	Down
2	Running, Out of date	Warning
3	Not running, Up to date	Down
4	Running, Up to date	OK

WMI Security Center Sensor

Sensor in Other Languages

Dutch: **WMI Security Center**, French: **Centre de sécurité WMI**, German: **WMI Sicherheits-Center**, Japanese: **WMI** ? ? ? ? ? ? ? ? ? ? , Portuguese: **Centro de segurança WMI**, Russian: **Центр безопасности WMI**, Simplified Chinese: **WMI** ? ? ? ? , Spanish: **Centro de seguridad WMI**

Remarks

- This sensor requires Windows Vista or later on the target computer.
- This sensor type does not run on Windows Server operating systems (Windows Server 2003, 2008, 2012, 2016), because the Windows Security Center / Windows Action Center is only available on client Windows versions.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)¹²⁵. Above this number, please consider using multiple [Remote Probes](#)³⁷⁰⁹ for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)³⁵⁰⁷.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the security center products you want to monitor. PRTG will create one sensor for each product you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI SECURITY CENTER SPECIFIC

Security Center Products You see a list showing the **Name** and **Type** of all security products found in the Windows Security Center on the target device. If there are no products, you see a corresponding message.

Add check marks in front of the respective lines to select the desired items. PRTG will create one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI SECURITY CENTER SPECIFIC

Display Name Shows the name of the product monitored by this sensor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Type Shows the type of the product monitored by this sensor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 🔗 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
247 WMI Security Center Sensor

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.248 WMI Service Sensor

The WMI Service sensor monitors a Windows service using Windows Management Instrumentation (WMI).

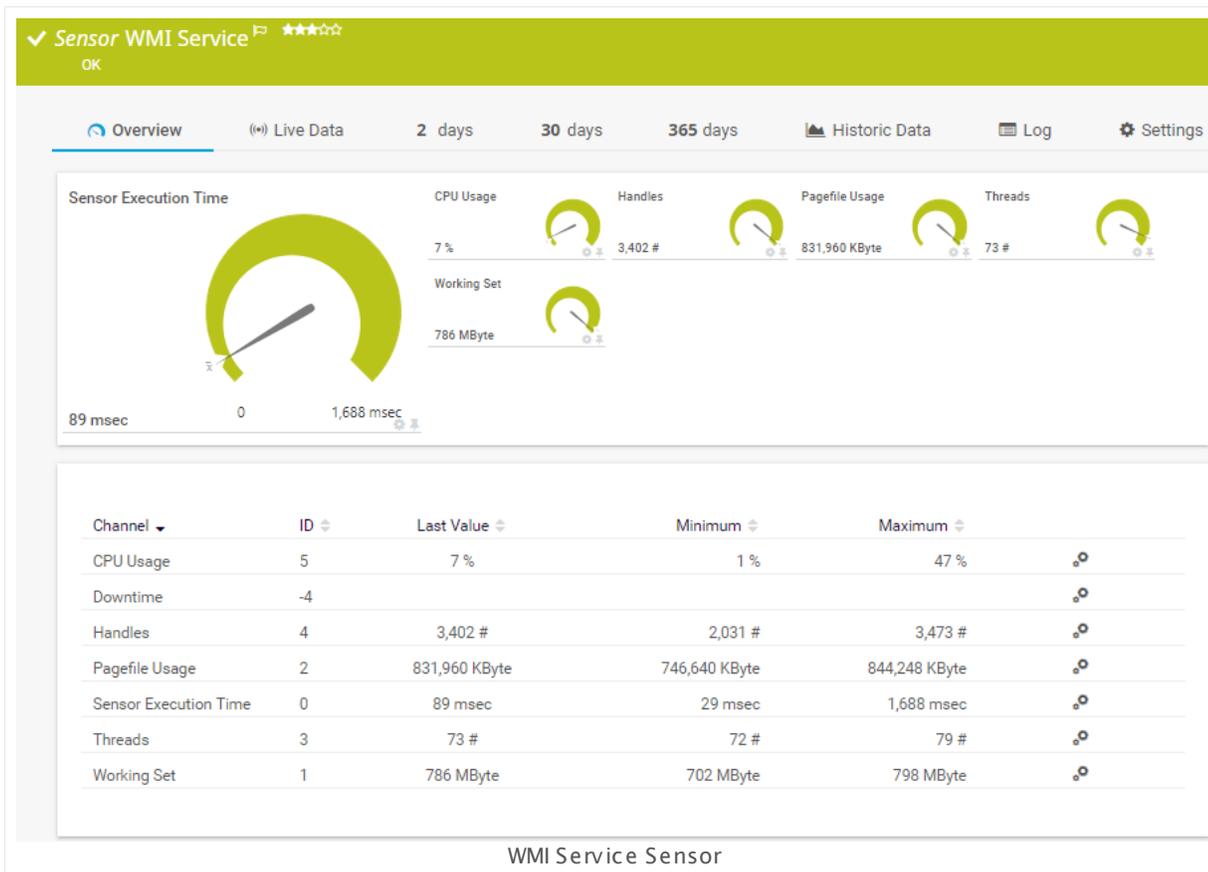

It can show the following:

- Execution time of the monitoring request.

Additionally, if you enable **Monitor extended values** in the sensor settings, it can show these parameters:

- CPU usage in percent
- Pagefile usage in bytes
- Number of handles
- Number of threads
- Working set in bytes

i The "Running (msec)" channel of this sensor shows the execution time of the monitoring request. It does **not** refer to the time the Windows service has been running! As of PRTG version 13, the name of this sensor channel is **Sensor Execution Time**.

Sensor in Other Languages

Dutch: **WMI Service**, French: **Service WMI**, German: **WMI Dienst**, Japanese: **WMI ? ? ? ?**, Portuguese: **Serviço WMI**, Russian: **Служба WMI**, Simplified Chinese: **WMI ? ?**, Spanish: **WMI servicio**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
 - WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
 - Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.
 - For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Windows services you want to monitor. PRTG will create one sensor for each service you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI SERVICE MONITOR

Service

You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items. Name and description are provided in the language of the device's Windows installation.

-  Once set up, the sensor will show a **Down status**^[195] if the service is not running.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI SERVICE MONITOR

If Service is Not Running	Select whether you want PRTG to (re)start the service if it is stopped or paused. Choose between:
---------------------------	---

WMI SERVICE MONITOR

- **Start/Restart service:** PRTG tries to start the service if it is not running when scanning the device. In combination with a **Change Trigger**, you can use this mechanism to [trigger a notification](#)³¹⁷⁰ whenever PRTG (re)starts the service.

- **Do nothing:** PRTG will not start any service on the device automatically.

i If you select the start/restart option and the sensor detects that the monitored service does not run, PRTG will try to restart the service during this scan and postpones the next sensor scan for one interval. With this following scan, the sensor will check if the service now is running. If starting the service was not successful or the service failed again, the sensor will show a **Down status**¹⁹⁵ and not try to start the service again. If the service runs after a (re)start attempt, the sensor will continue monitoring as usual.

If Service is Restarted

This setting is only visible if you select **Start/Restart service** above. Define what to do if PRTG restarts the service. Choose between:

- **Ignore changes:** No action is taken on change.
- **Trigger 'change' notification:** The sensor will send an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to [trigger a notification](#)³¹⁷⁰ whenever the sensor value changes.

Monitoring

Select whether you want to monitor CPU usage and other useful performance counters. Choose between:

- **Just check if service is running:** PRTG only monitors the channel **Sensor Execution Time**.
 - **Monitor extended values:** PRTG also monitors other useful performance counters.
- i** Extended monitoring might cause a **Class not found** error on some Windows systems.

Service

Shows the Windows service this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Description

Shows the description of the service. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

WMI SERVICE MONITOR

- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result:** Do not store the sensor result.
 - **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).
- Stack Unit** This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.249 WMI Share Sensor

The WMI Share sensor monitors a shared resource on a Windows system using Windows Management Instrumentation (WMI).

- It shows the availability of the share.

You can define the sensor to show a **Down status** for different share status messages.

Sensor in Other Languages

Dutch: **WMI Share**, French: **Partage WMI**, German: **WMI Freigabe**, Japanese: **WMI ? ?**,
Portuguese: **Compartilhamento WMI**, Russian: **Ресурс WMI**, Simplified Chinese: **WMI ? ?**,
Spanish: **Recurso compartido WMI**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per **probe**. Above this number, please consider using multiple **Remote Probes** for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI**.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the shares you want to monitor. PRTG will create one sensor for each share you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI SHARED RESOURCE

Share	Select the shares you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
	 To provide any shares, the LanmanServer "Server" Windows service must be running on the target computer. If it is not, there are no shares and you see a No Share available message here.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI SHARED RESOURCE

Shared Resource	
Description	Shows information about the shared resource that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Type	
TypeID	

TRIGGER ERROR STATE ON FOLLOWING CONDITIONS

Select under which conditions the sensor shows a **Down status** from the list below. As long as the share returns OK, the sensor status is **Up**. Add a check mark symbol in front of the according line to choose a **Down** condition. Choose none, one, or several of the following conditions.

While in Down status, a sensor does not record any data in any of its channels.

Error	Set sensor to Down status if the share returns an error status. A share in this status is not operational. This condition is selected by default.
Degraded	Set sensor to Down status if the share returns a degraded status. A share in this status is still operational. This condition is selected by default.
Unknown	Set sensor to Down status if the share returns an unknown status.
Pred Fail	Set sensor to Down status if the share returns a "predicted fail" status. This indicates that an element works properly but predicts a failure (for example, a SMART-enabled hard drive). A share in this status is still operational. This condition is selected by default.
Starting	Set sensor to Down status if the share returns a starting status. A share in this status is not operational.
Stopping	Set sensor to Down status if the share returns a stopping status. A share in this status is not operational.
Service	Set sensor to Down status if the share returns a service status. This can apply during disk mirror-resilvering, reloading a user permissions list, or other administrative work on the monitored device. Not all such work is online, but the managed element is neither OK nor in one of the other states. A share in this status is not operational.
Stressed	Set sensor to Down status if the share returns a stressed status.
Nonrecover	Set sensor to Down status if the share returns a "non recover" status. This condition is selected by default.
NoContact	Set sensor to Down status if the share returns a "no contact" status. This condition is selected by default.
LostComm	Set sensor to Down status if the share returns "lost communication" status. This condition is selected by default.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

i Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#) 3209 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

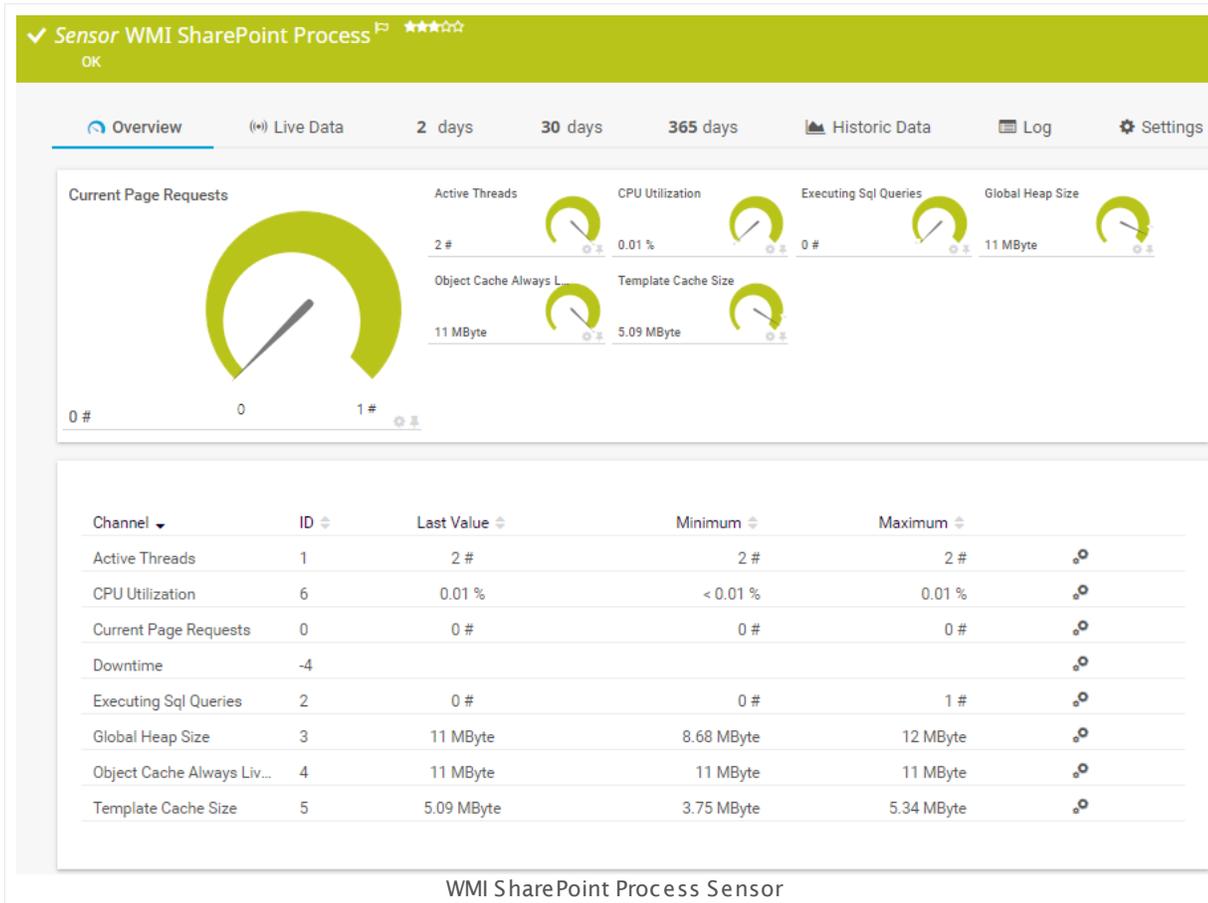

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.250 WMI SharePoint Process Sensor

The WMI SharePoint Process sensor monitors a Microsoft SharePoint server using Windows Management Instrumentation (WMI).

It can show the following:

- Number of current page requests
- Number of active threads
- Number of currently executed SQL queries
- Global heap size
- Object cache always live size
- Template cache size
- CPU utilization in percent

Sensor in Other Languages

Dutch: **WMI SharePoint Proces**, French: **Processus WMI SharePoint**, German: **WMI SharePoint-Prozess**, Japanese: **WMI SharePoint** ? ? ? ? , Portuguese: **Processo WMI SharePoint**,

Russian: **Процесс SharePoint WMI**, Simplified Chinese: WMI Sharepoint ? ? , Spanish: **WMI proceso SharePoint**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the SharePoint processes you want to monitor. PRTG will create one sensor for each process you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI PROCESS MONITOR

SharePoint Processes	You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
----------------------	--

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI PROCESS MONITOR

SharePoint Process	Shows the name of the SharePoint process that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
--------------------	--

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.

 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

7.8.251 WMI Terminal Services (Windows 2008+) Sensor

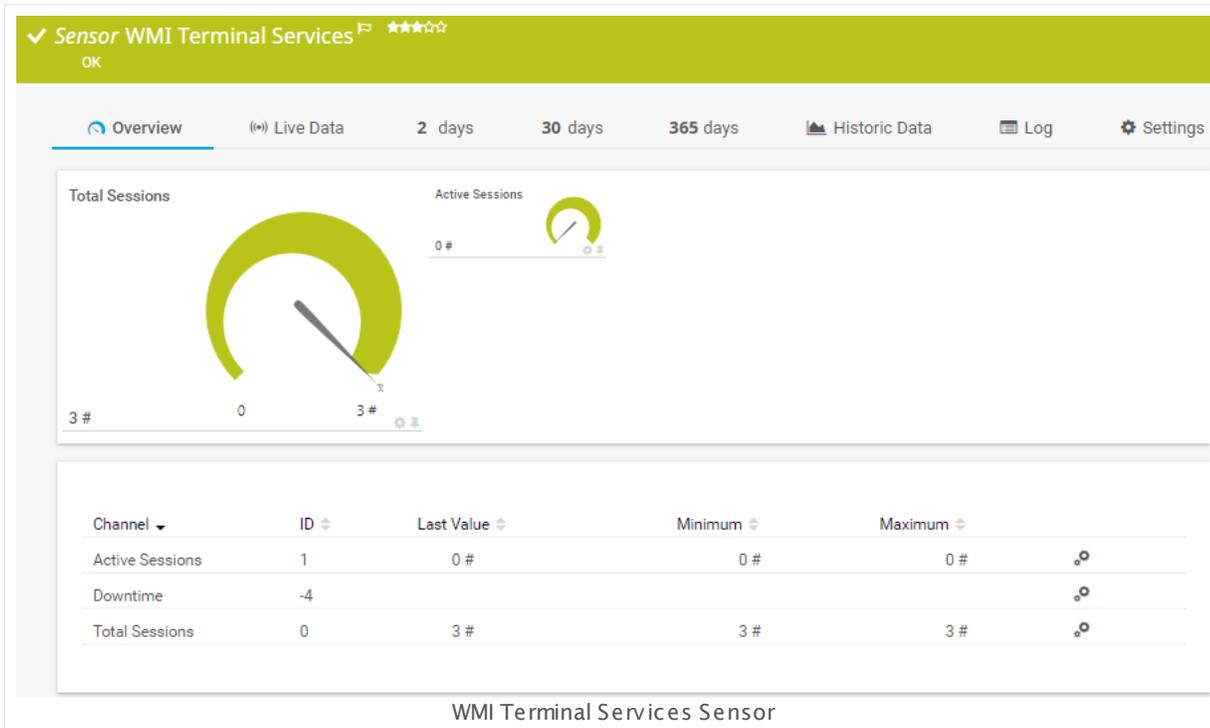

Sensor in Other Languages

Dutch: **WMI Terminal Services (Win2008+)**, French: **Services Terminal WMI (Win2008++)**, German: **WMI Terminaldienst e (Windows 2008+)**, Japanese: **WMI ? ? ? ? ? ? ? ? ?** (**W I ndows 2008+**) , Portuguese: **Serviços de terminal WMI (Win2008+)**, Russian: **WMI служб терминалов (Win2008 и последующая)**, Simplified Chinese: **WMI ? ? ? ? (Win2008+)**, Spanish: **WMI Terminal Services (Win2008+)**

The WMI Terminal Services sensor monitors the number of sessions on a Windows Terminal Services (Remote Desktop Services) server using Windows Management Instrumentation (WMI).

It shows the following:

- Number of active sessions: sessions with a currently logged in user, including used published applications
- Number total sessions (including inactive sessions): inactive sessions can be sessions with a disconnected user that has not logged out, or system services using a session

Remarks

- For the **Total Sessions** channel, the sensor returns the number of active and inactive sessions, plus two additional sessions: one for the console, and another for the services. So, the number of total sessions may actually be higher than expected.
- Depending on the OS that you want to monitor, select either the sensor for Windows XP/ Vista/2003 or the one for Windows 2008 R2 and later.

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags ^[139] , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)¹⁴⁰¹ from objects further up in the device tree. These are visible above as **Parent Tags**.

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority

Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.

 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

SENSOR DISPLAY

Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> ⓘ This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings^[3160] settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration^[336] on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p>

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

7.8.252 WMI Terminal Services (Windows XP/Vista/2003) Sensor

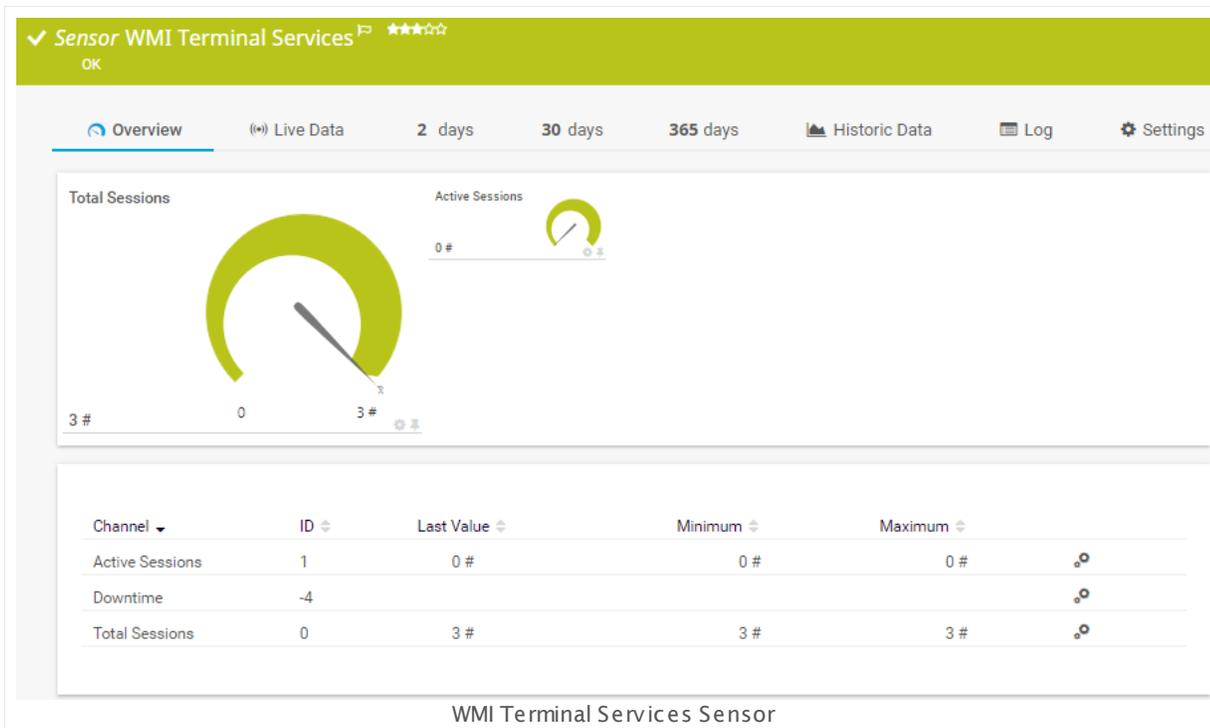

Sensor in Other Languages

Dutch: **WMI Terminal Services XP/Vista/2k3**, French: **Services Terminal WMI XP/Vista/2k3**, German: **WMI Terminaldienst (XP/Vista/2003)**, Japanese: **WMI ? ? ? ? ? ? ? ? ? (XP/VI sta/2003)** , Portuguese: **Serviços de terminal do WMI XP/Vista/2k3**, Russian: **WMI служб терминалов XP/Vista/2k3**, Simplified Chinese: **WMI ? ? ? ? XP/Vista/2k3**, Spanish: **WMI Terminal Services XP/Vista/2k3**

The WMI Terminal Services sensor monitors the number of sessions on a Windows Terminal Services (Remote Desktop Services) server using Windows Management Instrumentation (WMI).

It shows the following:

- Number of active sessions: sessions with a currently logged in user, including used published applications
- Number total sessions (including inactive sessions): inactive sessions can be sessions with a disconnected user that has not logged out, or system services using a session

Remarks

- For the **Total Sessions** channel, the sensor returns the number of active and inactive sessions, plus two additional sessions: one for the console, and another for the services. So, the number of total sessions may actually be higher than expected.
- Depending on the OS that you want to monitor, select either the sensor for Windows XP/Vista/2003 or the one for Windows 2008 R2 and later.

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3276] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags ^[139] , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)¹⁴⁰¹ from objects further up in the device tree. These are visible above as **Parent Tags**.

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority

Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.

 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

SENSOR DISPLAY

Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> ⓘ This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁶ on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p>

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
252 WMI Terminal Services (Windows XP/Vista/2003) Sensor

Others

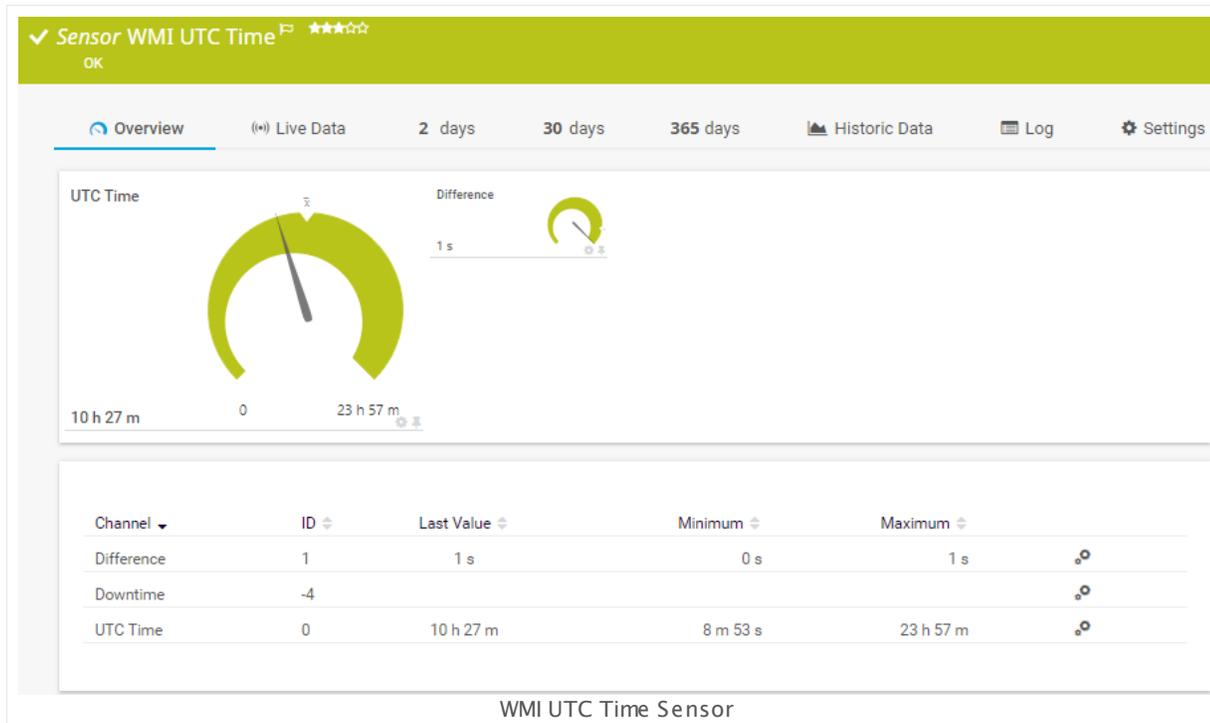

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.253 WMI UTC Time Sensor

The WMI UTC Time sensor monitors the UTC (Coordinated Universal Time) time of a target device using Windows Management Instrumentation (WMI).

It shows the following:

- UTC time of the target device
- Time difference between the PRTG system time and the target device in seconds

Sensor in Other Languages

Dutch: **WMI UTC Tijd**, French: **Heure UTC WMI**, German: **WMI UTC-Zeit**, Japanese: **WMI UTC ? ?**, Portuguese: **Tempo UTC de WMI**, Russian: **Время WMI UTC**, Simplified Chinese: **WMI UTC ? ?**, Spanish: **WMI tiempo UTC**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies <small>3209</small> in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

7.8.254 WMI Vital System Data (V2) Sensor

The WMI Vital System Data sensor monitors vital system parameters (CPU, thread, memory, network, pagefile) using Windows Management Instrumentation (WMI).

It can show the following:

- CPU usage: Processor, privileged, and user time
- CPU queue length
- Thread context switches
- Free physical memory
- Total visible memory
- Memory page faults, reads, and writes per second
- Memory pool paged and nonpaged bytes
- Memory committed bytes
- Network sent, received, and total bytes per second
- Network packets outbound errors
- Pagefile usage in percent
- Physical disk time in percent
- Current physical disk queue length
- Physical disk reads and writes per second
- Server bytes received, transmitted, and total
- CLR memory bytes in all heaps
- Thrown CLR exceptions per second

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **WMI Vitale Systeem Gegevens (V2)**, French: **Données importantes du syst. WMI (V2)**, German: **WMI Wichtige Systemdaten (v2)**, Japanese: **WMI ? ? ? ? ? ? ? ? ? ? (V2)**, Portuguese: **Dados vitais do sistema de WMI (V2)**, Russian: **Важные системные данные WMI (V2)**, Simplified Chinese: **WMI ? ? ? ? ? (V2)**, Spanish: **WMI Datos vitales de sistema (V2)**

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
 - WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
 - Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.
 - For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the performance counters you want to monitor. PRTG will create one sensor for each counter you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

VITAL SYSTEM DATA READINGS ACCESSIBLE USING WMI

Performance Counter You see a list of available vital system data values the sensor can monitor on the target device. The available options depend on your configuration. PRTG shows all possible performance counters with name and instance description (if available).

Add check marks in front of the respective lines to select the desired items. PRTG will create one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

You can choose between the following counters:

- CPU
- Thread
- Memory
- Network
- Pagefile

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

READINGS ACCESSIBLE USING WMI

Display Name	These fields show the parameters that are used to query data for this sensor from the target device. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Instance

READINGS ACCESSIBLE USING WMI

Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none">  For more information on how to find the folder used for storage, see section Data Storage³⁷³⁴. <p> This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>
---------------	---

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/1043>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

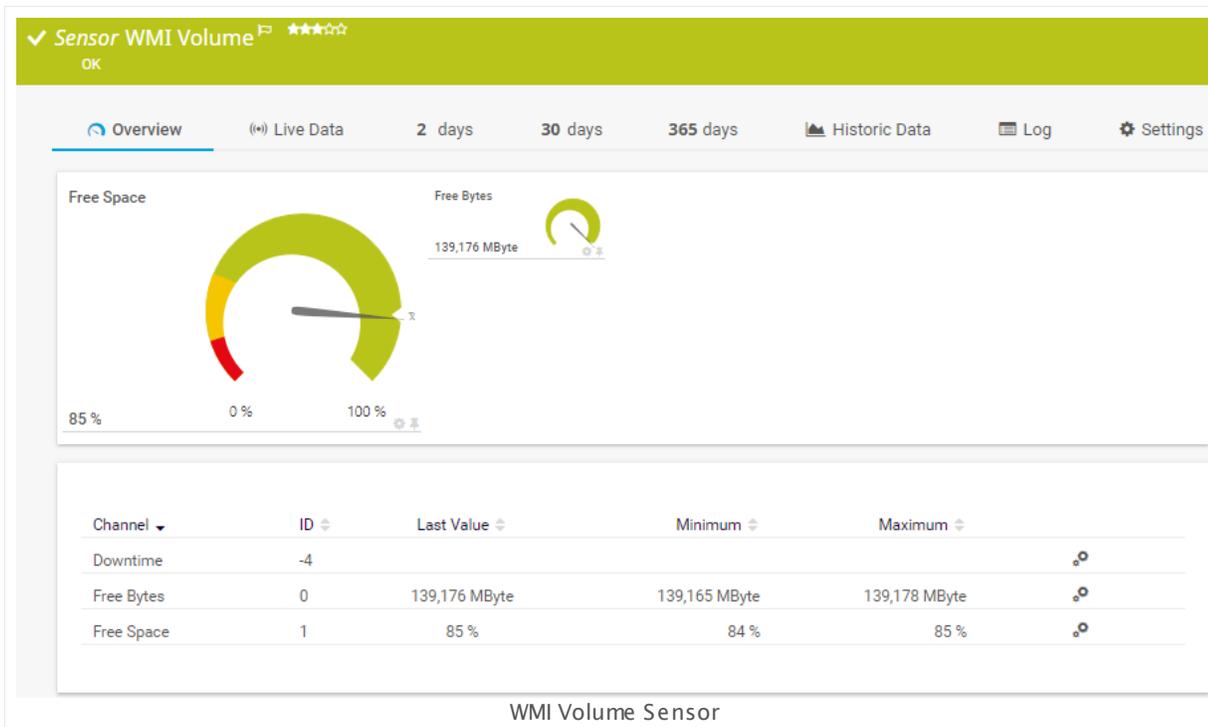

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.255 WMI Volume Sensor

The WMI Volume sensor monitors the free disk space on a drive, logical volume, or mount point using Windows Management Instrumentation (WMI). For each drive, logical volume or mount point, PRTG will use one sensor.

- It shows free space in percent and total.
- ❗ The sensor monitors an area of storage on a hard disk. It can monitor local volumes that are formatted, unformatted, mounted, or offline. A volume is formatted by using a file system, such as File Allocation Table (FAT) or New Technology File System (NTFS), and might have a drive letter assigned to it. One hard disk can have multiple volumes, and volumes can span multiple physical disks.
- ❗ The sensor does not support disk drive management.

Sensor in Other Languages

Dutch: **WMI Volume**, French: **Disque WMI**, German: **WMI Datenträger**, Japanese: **WMI ? ? ?**, Portuguese: **Volume de WMI**, Russian: **Том WMI**, Simplified Chinese: **WMI ?**, Spanish: **WMI Volumen**

Remarks

- This sensor does not support Windows XP and earlier.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.

- WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016.
 - Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[3709] for load balancing.
 - For a general introduction to the technology behind WMI, please see manual section [Monitoring via WMI](#)^[3507].
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the volumes you want to monitor. PRTG will create one sensor for each volume you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI VOLUME SPECIFIC

Volumes	Select the volumes (drives, logical volumes, mount points) you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
---------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI VOLUME SPECIFIC

DeviceID	Shows the unique identifier of the volume that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Drive Type	Shows the type of the disk drive that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
ID Selection	<p>Define how the sensor will identify the volume. Choose between:</p> <ul style="list-style-type: none"> ▪ Use system device ID (recommended): This is usually the best option for this sensor type, because the device ID will not change when the volume is renamed.

WMI VOLUME SPECIFIC

- **Use drive letter:** In a Microsoft cluster environment, the device ID will change when the cluster is switched to another node. In this case, use the drive letter option to avoid issues regarding this.

Drive Letter

This field is only visible if you select the drive letter option above. Enter the letter of the drive you want to monitor followed by a colon, for example, C:

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.

 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

- ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

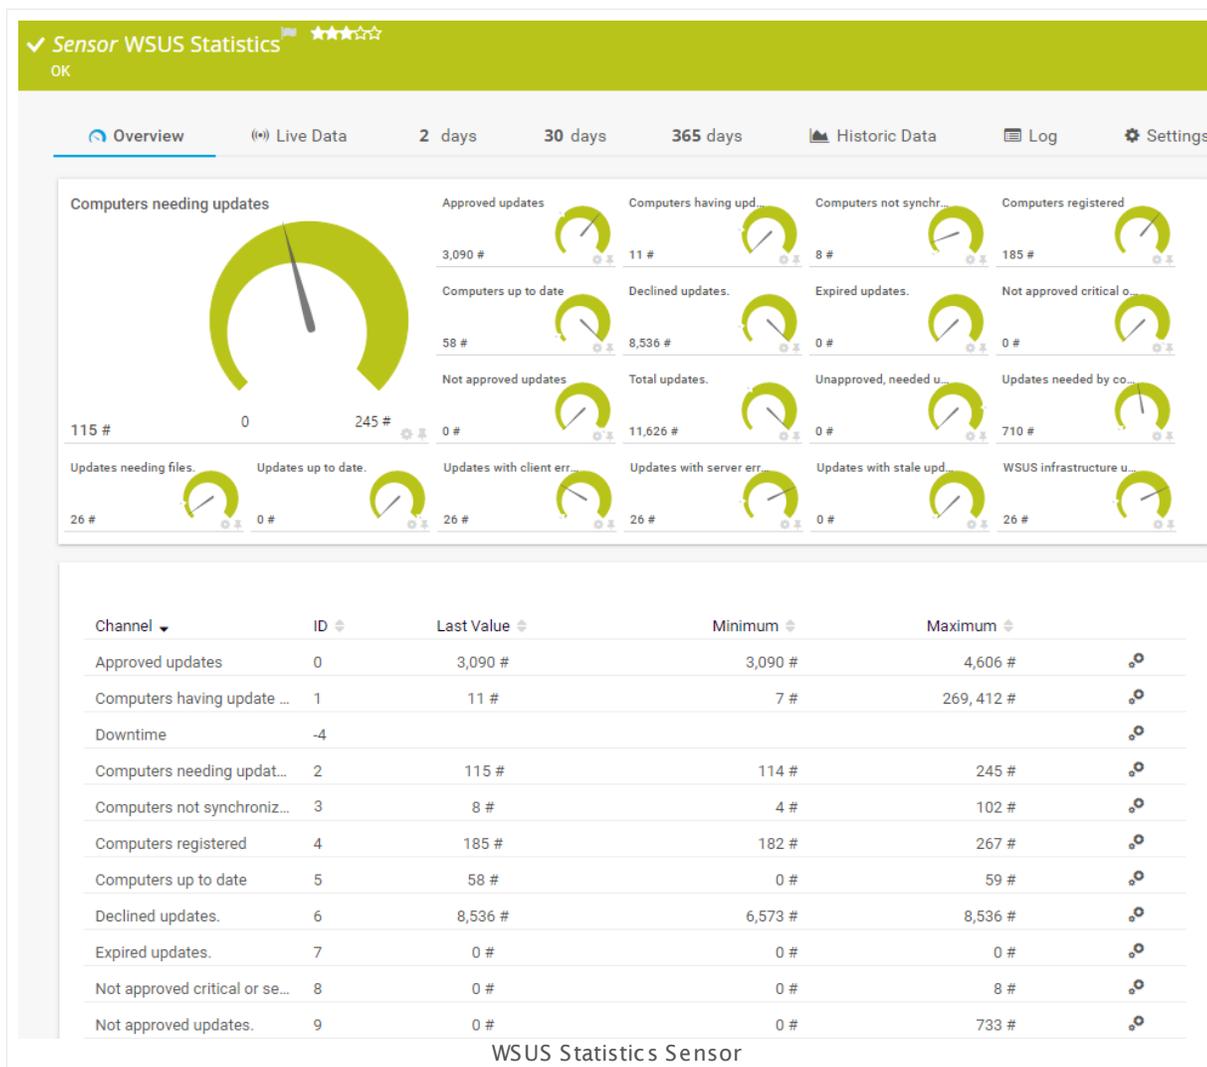

7.8.256 WSUS Statistics Sensor

The WSUS Statistics sensor monitors various statistics on a Windows Server Update Services (WSUS) server using Windows Management Instrumentation (WMI).

It can show the numbers of the following:

- Approved updates
- Computers having update errors
- Computers needing updates
- Computers not synchronized for 7 days
- Computers registered
- Computers up to date
- Declined updates
- Expired updates
- Not approved critical or security updates
- Not approved updates
- Total updates
- Unapproved needed updates
- Updates needed by computers
- Updates needing files
- Updates up to date
- Updates with client errors
- Updates with server errors
- Updates with stale update approvals
- Number of WSUS infrastructure updates not approved for installation

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **WSUS Statistieken**, French: **Statistiques WSUS**, German: **WSUS-Statistiken**, Japanese: **WSUS ? ? ? ?**, Portuguese: **Estatísticas WSUS**, Russian: **Статистика WSUS**, Simplified Chinese: **WSUS ? ? ?**, Spanish: **Estadísticas WSUS**

Remarks

- [Requires](#) ^[3146] .NET 4.5 or later on the probe system. If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- [Requires](#) ^[3146] WSUS 3.0 Administration Console on the probe system.
- [Requires](#) ^[3146] Windows credentials in the [parent device settings](#) ^[402].
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Knowledge Base: [Can I encrypt connections to my WSUS server?](#)

- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the [parent device's](#)^[407] **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

 If you use local credentials, please make sure that the same Windows user accounts (with the same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

Requirement: WSUS 3.0 Administration Console

 In order for this sensor to work, the Microsoft **WSUS 3.0 Administration Console** must be installed on the computer running the PRTG probe: either on the local system (on every node, if on a cluster probe), or on the system running the remote probe.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

WSUS Server Port	Enter the number of the port the WSUS server service runs on. The default value is 8530 . Please enter an integer value.
Connection Security	<p>Define if you want to use SSL encryption for the connection to the WSUS server or if you prefer unencrypted connections. Choose between:</p> <ul style="list-style-type: none"> ▪ Use SSL

SENSOR SETTINGS

- **Do not use any encryption**

 If you want to use SSL encryption, you have to configure your Windows Server Update Services (WSUS) accordingly. For details, see the Knowledge Base: [Can I encrypt connections to my WSUS server?](#)

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.

 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: Which .NET version does PRTG require?

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.9 Additional Sensor Types (Custom Sensors)

You can create and use your own, self-written custom sensors in PRTG Network Monitor to go far beyond the PRTG standard sensor set. You can create your own sensors using Windows Management Instrumentation Query Language (WQL), visual basic scripting, PowerShell, batch scripting, SQL queries, by compiling an EXE or DLL file (using any Windows software development tool), by running Python scripts, or by translating JSON and XML responses of a REST API into sensor values.

 You cannot use custom sensors on hosted probes in PRTG hosted by Paessler (except SSH sensors). If you want to use custom sensors, please add them to a remote probe device.

Basics

For a general introduction, see the sections about EXE/Script sensors and the [API documentation](#)^[3637], which contains details about the necessary return format for these sensors. WMI Custom sensors allow executing WQL requests.

- [EXE/Script Sensor](#)^[834]
- [EXE/Script Advanced Sensor](#)^[847]
- [Python Script Advanced Sensor](#)^[1597]
- [REST Custom Sensor](#)^[1646]
- [SSH Script Sensor](#)^[2607]
- [SSH Script Advanced Sensor](#)^[2622]
- [Application Programming Interface \(API\) Definition](#)^[3606]
- [WMI Custom Sensor](#)^[2967]
- [WMI Custom String Sensor](#)^[2877]

Additionally, some types of SQL sensors execute script files with SQL queries:

- [Microsoft SQL v2 Sensor](#)^[1267]
- [MySQL v2 Sensor](#)^[1284]
- [Oracle SQL v2 Sensor](#)^[1457]
- [PostgreSQL Sensor](#)^[1574]

The [HL7 Sensor](#)^[944] sends messages that are stored in extra files on the probe system.

Custom Sensors Included in PRTG

After installing PRTG Network Monitor, you will already find a selection of custom EXE/Script, Python, and WMI WQL script sensors in the [PRTG program directory](#)^[3734], as well as scripts with SQL queries for specific [database sensors](#)^[3155], REST configuration files in JSON template (*.template) format for the [REST Custom sensor](#)^[1646], and HL7 message files for the [HL7 sensor](#)^[944]. Many of the files are sample projects that you can edit and improve for your needs.

Custom Sensors Included in PRTG—Folder: \Custom Sensors\EXE

- Demo Batchfile - Returns 200.bat
- Demo Batchfile - Set sensorstate to error.bat
- Demo Batchfile - Set sensorstate to warning.bat
- Demo Cmd - Returns 200.cmd
- Demo Dll - Returns a random integer.dll
- Demo EXE - Returns a random integer.exe
- Demo EXE - Returns number of files in folder (parameter).exe
- Demo EXE - Returns user of process.exe
- Demo Powershell Script - Available MB via WMI.ps 1
- Demo Powershell Script - InterruptsPerSec via WMI.ps 1
- Demo Powershell Script - Powershell Version.ps 1
- Demo Powershell Script - Returns a fixed integer value.ps 1
- Demo Powershell Script - Returns a random integer value.ps 1
- Demo Powershell Script - Returns Random Integer and Warnings.ps 1
- Demo VBScript - InterruptsPerSec via WMI.vbs
- Demo VBScript - Multiplies two integers(2 parameters).vbs
- Demo VBScript - Returns a fixed float value.vbs
- Demo VBScript - Returns a fixed integer value.vbs
- Demo VBScript - Returns a random value.vbs
- Demo VBScript - Returns number of svchost processes.vbs
- Demo VBScript - Returns user of process.vbs
- Demo VBScript - Returns warning depending on number of svchost processes.vbs
- Demo VBScript - Timezone via WMI.vbs
- Demo VBScript - UTCTime via WMI.vbs
- Load_Test_CPU_1_Mio_Primes.exe
- Load_Test_CPU_10_Mio_Primes.exe
- Load_Test_Disk_Write_Read_1000_files.exe
- Load_Test_Disk_Write_Read_10000_files.exe
- Load_Test_Memory_Allocate_And_Free_400MB.exe

To create a new sensor based on one of these files, create a new [EXE/Script Sensor](#)⁸³⁴ and choose the respective file from the **EXE/Script** list in the sensor settings.

Custom Sensors Included in PRTG—Folder: \Custom Sensors\EXEXML

- Demo Batchfile - Returns static values in four channels.bat

To create a new sensor based on one of these files, create a new [EXE/Script Advanced Sensor](#)⁸⁴⁷ and choose the respective file from the **EXE/Script** list in the sensor settings.

HL7 Message Files Included in PRTG—Folder: \Custom Sensors\hl7

- ADT_A08.hl7
- ORM_O01.hl7

Each file contains an HL7 message that is conform to the HL7 message format. To create a new sensor based on one of these files, create a new [HL7 Sensor](#)⁹⁴⁴ and choose the respective file from the **HL7 Messages** list in the sensor settings. You can override certain message headers in the files via the sensor settings.

Custom Sensors Included in PRTG—Folder: \Custom Sensors\python

- sensor_example.py

This Python example script just returns fixed values in two channels to demonstrate the usage. To create a new sensor based on this file, create a new [Python Script Advanced Sensor](#)¹⁵⁹⁷ and choose the file from the **Python Script** list in the sensor settings.

Custom Sensors Included in PRTG—Folder: \Custom Sensors\rest

- kemp.loadbalancer.template: maps values returned by the RESTful API of a KEMP load balancer to sensor channels, for example, CPU usage, memory usage, traffic
- prtgsensorstats.template: maps values returned by the API of your PRTG installation to sensor channels that show the count of each sensor status on the local probe
- windows.docker.container.stats.template: maps values returned by the Docker Engine API to sensor channels, for example, CPU usage, memory usage, traffic, I/O
- wunderground.template: maps values returned by the Weather Underground API to sensor channels, for example, temperature, dew point, pressure, wind speed, wind direction

To create a new sensor based on one of these files, create a new [REST Custom Sensor](#)¹⁶⁴⁶ on the device that provides the REST API and choose the file from the **REST Configuration File** list in the sensor settings.

SQL Query Files Included in PRTG—Folder: \Custom Sensors\sql\<dbms>

- Demo Serveruptime.sql

You can find this demo SQL query script in each subfolder for each supported **database management system (dbms)**: \mssql, \mysql, \oracle, \postgres

To create a new sensor that uses one of the scripts in the dbms folders, create the according sensor type ([see above for supported sensors](#)³¹⁵⁸) and choose the respective file from the **SQL Query File** list in the sensor settings.

Custom Sensors Included in PRTG—Folder: \Custom Sensors\WMI WQL scripts

- Demo WQL Script - Get Win32LogicalDiscFreeMB.wql
- Demo WQL Script - Get Win32OsBuildnumber.wql
- Demo WQL Script - Get Win32PercentProcessorIdleTime.wql
- Demo WQL Script - Get Win32PercentProcessorTime.wql

To create a new sensor based on one of these files, create a new [WMI Custom Sensor](#)²⁹⁶⁷ and choose the respective file from the **WQL File** list in the sensor settings.

Downloading Pre-Built Custom Sensors

Good resources to find custom sensors that PRTG users and we from Paessler share are the [PRTG Script World](#) and our Knowledge Base. In the Knowledge Base, search for the tag **custom-script-exe** to find a lot of custom sensors: <https://kb.paessler.com/en/tags/custom-script-exe/>

More

You can find useful scripts for sensors in the **PRTG Script World**:

- <https://www.paessler.com/script-world>

For the other sensor types that work out-of-the-box, see

- [List of Available Sensor Types](#)⁴²⁹

Knowledge Base: Guide for PowerShell Based Custom Sensors

Sensor Settings Overview

For information about sensor settings, see the following sections:

- [Sensor Settings—List of Available Sensor Types](#)
- [Additional Sensor Types \(Custom Sensors\)](#)
- [Sensor Channels Settings](#)
- [Sensor Notification Triggers Settings](#)

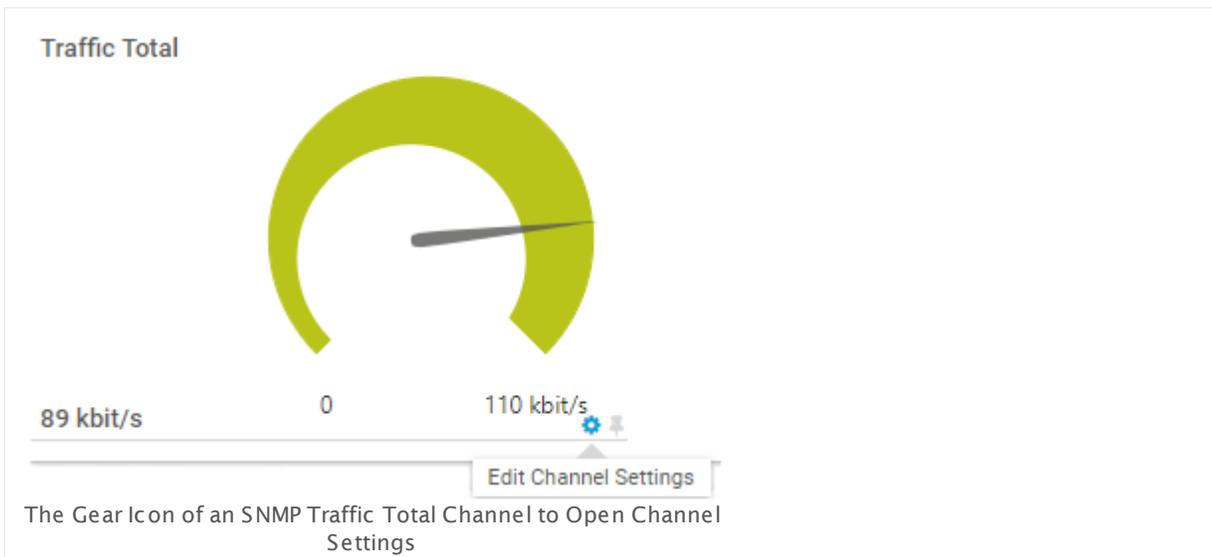

7.10 Sensor Channels Settings

A sensor has one or more channels in which it handles the actual monitoring data. In the channel settings, you can define how to display the data from the sensor's different channels displayed in graphs, gauges, and tables. Additionally, the channel data can determine the [sensor status](#)¹⁹⁵. Use the limit settings to define desired sensor states for values.

On the sensor's **Overview** tab, click the gear icon of a specific channel gauge to change its settings. Click the pin symbol on the right of the gear icon in a gauge to make this channel the primary channel of the selected sensor.

You can also open the settings of a channel by clicking the gear icon in the channels data table.

i For [lookup](#)³⁶⁹³ channels, we recommend that you stay below 120 lookup values to get expressive gauges. For non-primary lookup channels, the upper limit is around 40 lookup values.

The available options are nearly the same for all sensor types. An exception applies to the **Downtime** channel, which is automatically calculated and does not offer all settings. Channels with **absolute** values additionally have an option to define the **Value Mode**. Custom channels have a **Value Lookups and Limits** setting to distinguish between alerting by lookups or numerical limits.

You can quickly choose another channel of the selected sensor via the dropdown list at the top of the channel settings list.

Channel Settings for a Disk Sensor

Available Channel Settings

EDIT CHANNEL	
Name	<p>Enter a meaningful name to identify the channel (not editable for script sensors after sensor creation). The name will appear in graphs and tables.</p> <p>i You can automatically add the sensor's ID to the name by using the placeholder <code>[#id]</code>.</p>
Unit	<p>This field is only visible for custom sensors.</p> <p>Enter the unit for the values that this sensor returns. Please enter a string. This unit string is used for display purposes and will be shown in graphs, data tables, and gauges. If you want to change the Unit after having created the sensor, you can change it in the sensor's channel settings³¹⁶⁰.</p>
Scaling Multiplication	<p>This field is only visible for channels with a custom unit. If you want to multiply the received raw data by a certain value, enter the multiplier here. Otherwise, use the default value 1 to not change the received value. Please enter an integer value.</p> <p>i The following sensor types provide the scaling factor for received values with custom units in their sensor settings.</p> <ul style="list-style-type: none"> ▪ Sensor Factory Sensor¹⁷²² (you can use multiplication and division in the channel definition) ▪ SNMP APC Hardware Sensor¹⁸³¹ ▪ SNMP Custom Sensor¹⁹⁵⁰ ▪ SNMP Dell Hardware Sensor²⁰³⁴ ▪ WMI Custom Sensor²⁸⁶⁹
Scaling Division	<p>This field is only visible for channels with a custom unit. If you want to divide the received raw data by a certain value, enter the divisor here. Otherwise, use the default value 1 to not change the received value. Please enter an integer value.</p> <p>i The following sensor types provide the scaling factor for received values with custom units in their sensor settings.</p> <ul style="list-style-type: none"> ▪ Sensor Factory Sensor¹⁷²² (you can use multiplication and division in the channel definition) ▪ SNMP APC Hardware Sensor¹⁸³¹ ▪ SNMP Custom Sensor¹⁹⁵⁰ ▪ SNMP Dell Hardware Sensor²⁰³⁴

EDIT CHANNEL

	<ul style="list-style-type: none"> ▪ WMI Custom Sensor ²⁶⁶⁹
ID	<p>Shows the ID of the channel. You cannot change the ID. PRTG uses it for unique identification. For example, you need the ID when using Sensor Factory ¹⁷²⁰ sensors.</p> <p>There are a few special, fixed channel IDs.</p> <ul style="list-style-type: none"> ▪ -1 is for sum channels of traffic sensors (for example, of the SNMP Traffic Sensor ²⁴⁶⁷). ▪ -4 is for the Downtime channel (you can use it, for example, for an uptime percentage calculation in a Sensor Factory Sensor ¹⁷²⁰). ▪ -2 (coverage) and -3 (error) are internally used.
Limits	<p>This setting is not available for custom channels.</p> <p>Define if you want to use thresholds for this channel. The channel can affect the status of the sensor ¹⁹⁵¹ it is part of. With limits you can define when the sensor will show a Warning or Down status, depending on the channel data. For example, you can use this function to set a traffic sensor (which is usually never in a down state) to error when the monitored values reach critical limits.</p> <p>Choose between:</p> <ul style="list-style-type: none"> ▪ Disable Limits: Do not use the channel data to control the sensor status. ▪ Enable alerting based on limits: Define limits for numerical values returned by the device. Additional fields appear below. The sensor of this channel will enter a Warning or Down status when limits are undercut or overrun. <p>i The limits option is not available for the Downtime channel.</p> <p>i You can show limits in graphs (highlighted in yellow or red) if you select exactly one channel with a limit in a graph.</p>
Value Lookups and Limits	<p>This setting is only available for custom channels.</p> <p>Define when the channel will show a down status and alert you, either based on the lookup definition or based on thresholds for returned values. Only the option that you choose will apply. For example, if you choose limits as alerting method, an error status defined the lookups will not show up.</p> <p>Choose between:</p>

EDIT CHANNEL

- **Enable alerting based on lookups:** Use the lookup definition of the channel to control the sensor status. Make sure the channel uses a proper **Value Lookup** if you choose this option. Select the lookup file either in the channel settings below or in the sensor settings, depending on the sensor type. If you do not want to use the channel data to control the sensor status, select **None** as **Value Lookup**.
- **Enable alerting based on limits:** Define limits for numerical values returned by the device. Additional fields appear below. The sensor of this channel will enter a **Warning** or **Down** status when limits are undercut or overrun.

 If you choose limit-based alerting, errors and warnings that you have defined in the lookup file will not apply!

Value Lookup

This field is only visible for custom sensors and if you select lookups-based alerting. Select the [lookup](#) file that you want to use with this channel.

 Do not use this option for sensors that provide the unit **Value Lookup** in the sensor settings! The channel setting will be overwritten with the next sensor scan. Please define the lookup file that you want to use with this channel on the **Settings** tab of the sensor. Choose the option **Value Lookup** for the setting **Sensor Channel #x Unit** (where **x** is the number of the channel) and choose the desired lookup file under **Sensor Channel #x Value Lookup**. See manual section [Define Lookups—Requirement: Channel Unit "Custom"](#) for affected sensor types.

 If you choose **None**, alerting by lookups and limits will be disabled and channels will not appear as lookup. If you want to keep the lookup representation without alerting, define the states accordingly in the lookup file.

Upper Error Limit [unit]

This field is only visible if you enable limits above. Specify an upper limit for a **Down status**. If the channel values overrun this value, the sensor will be **Down**. Please enter a valid number into at least one of the limit fields.

 While a sensor shows a **Down** status triggered by a limit, it will still receive data in its channels.

Upper Warning Limit [unit]

This field is only visible if you enable limits above. Specify an upper limit for a **Warning status**. If the channel values overrun this value, the sensor will be **Warning**. Please enter a valid number into at least one of the limit fields.

EDIT CHANNEL

Lower Warning Limit [unit]	This field is only visible if you enable limits above. Specify a lower limit for a Warning status ¹⁹⁵ . If the channel values undercut this value, the sensor will be Warning . Please enter a valid number into at least one of the limit fields.
Lower Error Limit [unit]	<p>This field is only visible if you enable limits above. Specify a lower limit for a Down status ¹⁹⁵. If the channel values undercut this value, the sensor will be Down. Please enter a valid number into at least one of the limit fields.</p> <p>i While a sensor shows a Down status ¹⁹⁵ triggered by a limit, it will still receive data in its channels.</p>
Error Limit Message	This field is only visible if you enable limits above. Enter an additional message. It will be added to the sensor message when showing a Down status ¹⁹⁵ . Please enter a string or leave the field empty.
Warning Limit Message	This field is only visible if you enable limits above. Enter an additional message. It will be added to the sensor message when showing a Warning status ¹⁹⁵ . Please enter a string or leave the field empty.
Graph Rendering	<p>Define if you want to show this channel in data graphs ²⁰¹. Choose between:</p> <ul style="list-style-type: none"> ▪ Show in Graphs: Sensor graphs contain the data of this channel. ▪ Hide from Graphs: Sensor graphs do not contain data of this channel. <p>i If you choose to hide this channel in graphs, it also will not appear in the graph of a Report ³²⁵².</p>
Table Rendering	<p>Define if you want to show this channel in data tables ¹⁹⁸. Choose between:</p> <ul style="list-style-type: none"> ▪ Show in Tables: Sensor data tables contain the data of this channel. ▪ Hide from Tables: Sensor data tables do not contain the data of this channel. This option hides the channel gauge as well, but the channel will still be available in the data table of the sensor's Overview tab. <p>i If you choose to hide this channel in data tables, PRTG also will not use it for the calculation of the "sum" (total) channel of a sensor. It also will not appear in data tables of a Report ³²⁵².</p>

EDIT CHANNEL

Line Color	<p>Define the color of the channel display in graphs. Choose between:</p> <ul style="list-style-type: none">▪ Automatic: PRTG sets the color of this channel in graphs automatically.▪ Manual: Individually define the color of this channel. You can enter the desired color code below.
Color (#rrggbb)	<p>This option is only available if you choose manual line color above. Enter a color in hexadecimal RGB notation as in HTML and CSS, or choose a color from the visual color selector. The field with the hexadecimal color value will change to the selected color automatically.</p>
Line Width	<p>Define the width of the channel line in graphs. Enter an integer value in pixels. The maximum line width is 25 px, but we recommend that you use values between 1 and 7 only to get optimal results.</p>
Data	<p>This setting is available for most channels. Define how to display data. Choose between:</p> <ul style="list-style-type: none">▪ Display actual values in [unit]: Display the values in the shown unit.▪ Display in percent of maximum: Calculate and show percent values based on a maximum value. Provide a maximum below.  If you choose this option, you cannot display the data of traffic sensors as a positive and negative area graph.
Maximum ([unit])	<p>This field is only visible if you choose the percent of maximum setting above. Enter a value to use as maximum. Please consider the given unit. PRTG will calculate all percent values based on this value.</p> <p>Please enter an integer value.</p>
Value Mode	<p>This setting is only available for sensor channels that return absolute values. It is not available for sensors showing difference values, such as traffic channels. Depending on this setting, the channel cannot only show averages, but also minimum or maximum values in the graphs for the respective time spans.</p> <p>Choose between:</p> <ul style="list-style-type: none">▪ Average: The channel shows average values.▪ Minimum: The channel shows minimum values.▪ Maximum: The channel shows maximum values.

EDIT CHANNEL

 See the Knowledge Base for more information about value modes: [What is the Value Mode in channel settings?](#)

Decimal Places

Define how many decimal places of the channel's data to display in graphs and tables. Choose between:

- **Automatic:** PRTG automatically defines how many decimal places are used for optimal viewing results.
 -  Values between 10 and -10 are rounded to two decimal places. Values that are very close to an integer are rounded to the integer, for example, 3.001 is rounded to 3.
- **All:** Display all available decimal places.
- **Custom:** Manually define the number of decimal places. If you choose this option, an additional field will appear. Please enter an integer value.

Spike Filter

You can use a spike filter to correct faulty monitoring data. Sometimes, sensors report enormously high or far too low values. This can be because of an error in data transmission, or because of incompatibilities of the physical device you are monitoring. This can make graphs unreadable. A spike filter can compensate for these flaws.

If you enable a spike filter, values above and below a certain limit are disregarded in the monitoring data for graphs and tables.

Choose between:

- **Disable Filtering:** Display all data as it is received. Do not filter out spikes.
- **Enable Filtering:** Enable a filter to remove spike values. Additional fields appear below.
 -  This does not change monitoring data itself but only the presentation of the data. This setting is valid for all data of this channel, including historic data.
 -  The spike filter option is not available for the channel **Downtime**.

Spike Filter Max. Value
[unit]

This field is only visible if you enable the spike filter above. Enter the maximum value to show in the channel data. PRTG will disregard all data above this value in graphs and tables. Please enter an integer value or leave the field empty.

Spike Filter Min. Value
[unit]

This field is only visible if you enable the spike filter above. Enter the minimum value to show in the channel data. PRTG will disregard all data below this value in graphs and tables. Please enter an integer value or leave the field empty.

EDIT CHANNEL

Vertical Axis Scaling	<p>Define how to display the vertical axis for the channel in graphs. Choose between:</p> <ul style="list-style-type: none"> ▪ Automatic Scaling: PRTG automatically uses the optimum scaling. Usually the scaling ranges from the minimum to the maximum value. PRTG uses one single scale for each unit label only. ▪ Manual Scaling: Define the scaling manually. Additional fields appear below. Defining manual axis scaling can make low values better visible in your graph, but it may result in a graph with multiple vertical axes for the same unit label. <p> Settings for this option are ignored if you enable the Chart Type Stack channels on top of each other or Show in and out traffic as positive and negative area chart (available for traffic sensors) on the sensor's Settings tab.</p>
Vertical Axis Maximum [unit]	This field is only visible if you enable vertical axis scaling above. Enter the maximum value to use on the vertical axis for the channel. Please enter an integer value.
Vertical Axis Minimum [unit]	This field is only visible if you enable vertical axis scaling above. Enter the minimum value to use on the vertical axis for the channel. Please enter an integer value.

 Click **Ok** to save your settings and to close the settings window. Click **Apply** to save the changed settings while the **Edit Channel** window remains open. This functionality is useful if you want to change the settings of other channels of the current sensor as well. You can select another channel via the dropdown menu above the settings. You can close the settings window without saving by clicking **Cancel**.

 If you have changed any settings and click **Cancel** or choose another channel via the dropdown menu without applying the changes, PRTG will ask you to confirm this step. **Discard Changes** will ignore any edits and closes the window or shows the settings of another selected channel. Click **Save** to apply your changes.

Sensor Settings Overview

For information about sensor settings, see the following sections:

- [Sensor Settings—⁴²⁸List of Available Sensor Types⁴²⁹](#)

- [Additional Sensor Types \(Custom Sensors\)](#)  3155
- [Sensor Channels Settings](#)  3160
- [Sensor Notification Triggers Settings](#)  3170

7.11 Sensor Notification Triggers Settings

The status or the data of a sensor can trigger notifications. Using this mechanism, you can configure external alerting tailored to your needs.

Example of Notification Trigger Settings

Although the sensors activate a notification trigger, you can set notification triggers higher in the hierarchy (for example, for groups or devices). Because of this you can define notification triggers for multiple sensors using the [inheritance mechanism](#)^[137]. Monitoring objects with inherited notification triggers show these in section **Triggers That Can Be Inherited From Parent Object(s)** on the **Notification Triggers** tab.

PRTG already includes a default notification trigger for the [Root Group](#)^[133]. This default notification trigger provokes the standard notification **Email and push notification to admin** if there is any [sensor in down status](#)^[195] in your PRTG installation for at least 10 minutes.

You can also define notification triggers in [Libraries](#)^[326]. Sensors that are in a library with defined notification triggers show these notification triggers in section **Triggers That Are Defined in Library Object(s)** on the **Notification Triggers** tab.

Note

This section describes one of four steps to set up the notification system in PRTG. To complete your notification setup, go through all of the following steps:

1. Check and set up the **Notification Delivery** settings to define how and to which recipient PRTG will send messages.
For detailed information, see [System Administration—Notification Delivery](#)³³⁶¹.
2. Check and set up **Notification Contacts** for the PRTG users to define the recipients of notifications.
For detailed information, see [Account Settings—Notification Contacts](#)³³³⁴.
3. Check and set up **Notification Templates** to define the notification methods and their content.
For detailed information, see [Account Settings—Notification Templates](#)³³¹¹.
4. Check and set up **Notification Triggers** for objects to define when notification messages will be sent.
For detailed information, see [Sensor Notification Triggers Settings](#)³¹⁷⁰.

 We recommend that you always set up at least two notifications with different delivery methods for a notification trigger, for example, one [email notification](#)³³¹⁷ and one [SMS notification](#)³³²⁰. If delivery via email fails (due to an email server failure or other reasons), PRTG can still notify you via your smartphone. Simply set your latency setting to a [state trigger](#)³¹⁷² and a notification via a delivery method other than the one for the first trigger. Or set up a second trigger with another notification for the corresponding object.

 For background information, see the [Notifications](#)³²¹⁶ section.

Available Notification Triggers Settings

On an object's detail page, open the **Notification Triggers** tab to change sensor notification triggers. The available options are the same for all objects. When defining triggers for probes, groups, or devices, they can be inherited down to sensor level.

TRIGGERS THAT CAN BE INHERITED FROM PARENT OBJECT(S)

You see a list of all notification triggers that are defined higher in the hierarchy. The list is empty and shows the message (**no triggers defined**) when you have not set any triggers in probes, groups, or devices above the current object in the [Object Hierarchy](#)¹³³¹. You can see the **Type** of trigger and the notification **Rule** that the monitoring object executes once this trigger is activated.

Trigger Inheritance	<p>Define if you want to use the triggers shown above on the current object. Choose between:</p> <ul style="list-style-type: none"> ▪ Inherit all triggers from parent objects and use the triggers defined above: Use the triggers shown above. If the defined condition is met, the corresponding trigger is activated and the notification provoked. Click the notification name to open its settings page³³¹¹. Click the name of the monitoring object in the column Inherited from to open its Overview tab. ▪ Only use triggers defined above: Do not use the triggers shown above. Only use the triggers that you define above in section Notification Triggers for this object.
---------------------	---

TRIGGERS THAT CAN BE INHERITED FROM PARENT OBJECT(S)

This setting is valid for all triggers shown above. It is not possible to only select some of the triggers.

In section **Triggers that are defined in library object(s)** you see all notification triggers that are set for [Libraries](#)³²³⁶ that contain the currently selected sensor.

TRIGGERS THAT ARE DEFINED IN LIBRARY OBJECT(S)

You see a list of all notification triggers that are defined in libraries that include the currently selected sensor. The list is empty and shows the message (**no triggers defined**) when you have not set any triggers in libraries that contain the current sensor. You can see the **Type** of trigger and the notification **Rule** that the sensor executes once this trigger is activated.

Click the notification name to open its [settings page](#)³³¹¹. Click a library name in the column **Inherited from** to view this library.

 You cannot turn off trigger usage for the current sensor from a library here. If you do not want to use any notification triggers from a library for this sensor, open the library and remove this sensor from it or refine the triggers on the [Notification Triggers](#)³²⁵⁰ tab.

You can set up one or more of the following triggers, each with different setting options. Which trigger types are visible depends on the kind of object you edit:

- [Add State Trigger](#)³¹⁷²
- [Add Speed Trigger](#)³¹⁷⁴
- [Add Volume Trigger](#)³¹⁷⁷
- [Add Threshold Trigger](#)³¹⁷⁸
- [Add Change Trigger](#)³¹⁸⁰

You can create all notification triggers by forming sentences in "natural language". There are different options available for every type.

Add State Trigger

Define a trigger that is activated when a sensor changes its current status. This is the most common reason to send out notifications. Hover over  and select **Add State Trigger** from the menu to add a new trigger, or click the **Edit** button next to an existing notification to change it. Define the settings as described below. Every trigger provokes one or more [notification\(s\)](#)³³¹¹ to be executed.

STATE TRIGGER

When sensor state is [...]

Select the condition that will trigger the notification. The trigger will be activated when a sensor enters the selected [status](#)^[195]. Choose from the dropdown menu:

- **Down:** The trigger is activated if a sensor changes to a **Down** status.
- **Warning:** The trigger is activated if a sensor changes to a **Warning** status.
- **Unusual:** The trigger is activated if a sensor changes to an **Unusual** status.
- **Partial Down:** The trigger is activated if a sensor changes to a **Down (Partial)** status (available in a [cluster](#)^[130] configuration).
- **Up:** The trigger is activated if a sensor changes to an **Up** status.
- **Unknown:** The trigger is activated if a sensor changes to an **Unknown** status.

...for at least [...] seconds

Define how many seconds PRTG waits before it sends out a notification (**latency**). This can avoid false alarms if a sensor 'flickers' and, for example, changes to a down status for just a few seconds. If the selected condition (the sensor status) persists after the defined time in seconds, the notification is triggered. Please enter an integer value.

 Do not define a latency that is shorter than the scanning interval of a sensor that uses this trigger! The notification trigger might not work as expected in this case.

...perform [...]

Select a notification that PRTG sends out if the selected condition (the sensor status) is true **and** the latency time defined has elapsed. Choose a notification from the dropdown menu. The menu shows all notifications defined in the [Account Settings—Notification Templates](#)^[331] settings. You can also choose **no notification** to only use other conditions for this trigger.

When sensor state is [...] for at least [...] seconds

Define an escalation latency in seconds. This "escalation" triggers a second notification if the number of seconds you enter here has passed since the sensor status has entered the defined condition. Use this to automatically escalate a notification in case a problem persists for a longer time. Please enter an integer value.

 PRTG automatically takes the status from the first trigger condition above.

STATE TRIGGER

...perform [...]	<p>Select a (second) notification that PRTG sends out if the selected condition (the sensor status) is true and the escalation latency time defined has elapsed. Choose a notification from the dropdown menu. The menu shows all notifications defined in the Account Settings—Notification Templates settings. You can also choose no notification to only use other conditions for this trigger.</p> <p>i Select a notification with another delivery method than above to ensure the delivery in case of technical issues with the first notification.</p>
...and repeat every [...] minutes	<p>Define an interval in minutes in which PRTG sends the escalation notification (defined above) repeatedly. The second (escalation) notification defined will be resent every x minutes that you enter here. Please enter an integer value.</p> <p>i If you enter 0, PRTG will not send repeating escalation notifications.</p>
When condition clears after a notification was triggered perform [...]	<p>Select a notification that PRTG sends out if the selected condition (the sensor status) is not true anymore because the sensor status changed again. Choose a notification from the dropdown menu. The menu shows all notifications defined in the Account Settings—Notification Templates settings. You can also choose no notification to only use other conditions for this trigger.</p> <p>i PRTG sends notifications about cleared conditions if the time for the trigger activation elapsed (defined in the first line) and you choose a notification here. If you select no notification above, you will get the notification about the cleared condition nevertheless if you define it here. The definition of an "escalation" notification does not influence notifications for cleared conditions.</p>
Save	Click Save to confirm your settings.
Cancel	Click Cancel to undo your changes.

Add Speed Trigger

Define a trigger that is activated when the currently monitored speed in a sensor changes (for example, a traffic sensor). Hover over **+** and select **Add Speed Trigger** from the menu to add a new trigger, or click the **Edit** button next to an existing notification to change it. Define the settings as described below. Every trigger provokes one or more [notification\(s\)](#) to be executed.

SPEED TRIGGER

When [...] channel	From the dropdown menu, select the channel whose data PRTG considers for speed comparison. Select Primary to generally use the primary channel of a sensor (you can define this in the sensor settings ⁴²⁸), or choose a specific channel name from the list (there are different channels for every sensor type). All following settings for this trigger are based on the chosen channel.
...is [...]	Select the condition that will trigger the notification. Choose from the dropdown menu: <ul style="list-style-type: none">▪ Above: The trigger is activated if the value of the selected channel exceeds a defined value.▪ Below: The trigger is activated if the value of the selected channel falls below a defined value.▪ Equal to: The trigger is activated if the value of the selected channel is the same as a defined value.▪ Not Equal to: The trigger is activated if the value of the selected channel is different than a defined value.
[value]	Define the value to which PRTG compares the channel data. Please enter an integer value.
[scale]	From the dropdown menu, select the unit in which you entered the [value] above. [scale] and [time] together define the unit for the given value. If the channel data is shown in a different unit, PRTG will automatically convert values internally. Choose from: <ul style="list-style-type: none">▪ bit▪ kbit▪ Mbit▪ Gbit▪ Tbit▪ Byte▪ KByte▪ MByte▪ GByte▪ TByte
[time]	Select the time for the scale (so you create a scale per time unit). Choose from the dropdown menu:

SPEED TRIGGER

- **second**
- **minute**
- **hour**
- **day**

[scale] and **[time]** together define the unit for the given value. If the channel data is shown in a different unit PRTG will automatically convert values internally.

..for at least [...] seconds

Define how many seconds PRTG waits before it sends out a notification (**latency**). This can avoid false alarms if a channel reaches a limit for just a few moments. If the combined channel condition of **[value]**, **[scale]**, and **[time]** persists after the defined time span, the notification will be triggered. Please enter an integer value.

 Do not define a latency that is shorter than the scanning interval of a sensor that uses this trigger! The notification trigger might not work as expected in this case.

...perform [...]

Select a notification that is triggered if the combined channel condition of **[value]**, **[scale]**, and **[time]** is true **and** the latency time defined has elapsed. Choose a notification from the dropdown menu. The menu shows all notifications defined in the [Account Settings—Notification Templates](#)³³¹¹ settings. You can also choose **no notification** to only use other conditions for this trigger.

When condition clears perform [...]

Select a notification that is triggered if the combined channel condition of **[value]**, **[scale]**, and **[time]** is **not** true anymore because the channel value has changed again. Choose a notification from the dropdown menu. The menu shows all notifications defined in the [Account Settings—Notification Templates](#)³³¹¹ settings. You can also choose **no notification** to only use other conditions for this trigger.

 PRTG sends notifications about cleared conditions if the time for the trigger activation elapsed (defined in the first line) and you choose a notification here. If you select **no notification** above, you will get the notification about the cleared condition nevertheless if you define it here.

Save

Click **Save** to confirm your settings.

Cancel

Click **Cancel** to undo your changes.

 No escalation notification and no repeat are available for this trigger type.

Add Volume Trigger

Define a trigger that is activated when a sensor (for example, a traffic sensor) reaches a certain volume limit in a specified time. Hover over  and select **Add Volume Trigger** from the menu to add a new trigger, or click the **Edit** button next to an existing notification to change it. Define the settings as described below. Every trigger provokes one or more [notification\(s\)](#)³³¹¹ to be executed.

VOLUME TRIGGER

When [...] channel From the dropdown menu, select the channel whose data PRTG considers for this comparison. Select **Primary** to generally use the primary channel of a sensor (you can define this in the [sensor settings](#)⁴²⁸), or choose a specific channel name from the list (there are different channels for every sensor type). All following settings for this trigger are based on the chosen channel.

...has reached [value] Define the value to which PRTG compares the channel data. If the channel data exceeds this value, a notification is triggered. Please enter an integer value.

[scale] From the dropdown menu, select the unit in which you entered the **[value]** above. **[scale]** and **[time]** together define the unit for the given value. If the channel data is shown in a different unit, PRTG will automatically convert values internally. Choose between:

- **Byte**
- **KByte**
- **MByte**
- **GByte**
- **TByte**

per [time] Select the time for the scale (so you create a scale per time designation). Choose from the dropdown menu:

- **Hour**
- **Day**
- **Week**
- **Month**

[scale] and **[time]** together define the unit for the given value. If the channel data is shown in a different unit, PRTG will automatically convert values internally.

VOLUME TRIGGER

...perform [...]	Select a notification that is triggered if the [value] in the combined unit of [scale] and [time] is exceeded. Choose a notification from the dropdown menu. The menu shows all notifications defined in the Account Settings—Notification Templates settings. You can also choose no notification to only use other conditions for this trigger.
Save	Click Save to confirm your settings.
Cancel	Click Cancel to undo your changes.

 No escalation notification, no repeat, and no notification when condition clears are available for this trigger type.

Add Threshold Trigger

Define a trigger that is activated when a sensor reaches specific values. Hover over  and select **Add Threshold Trigger** from the menu to add a new trigger, or click the **Edit** button next to an existing notification to change it. Define the settings as described below. Every trigger provokes one or more [notification\(s\)](#) to be executed.

THRESHOLD TRIGGER

When [...] **channel** From the dropdown menu, select the channel whose data PRTG will consider for the comparison. Select **Primary** to generally use the primary channel of a sensor. You can define the primary channel in the [sensor settings](#). Choose a specific channel name from the list to apply the trigger to this sensor channel. There are different channels for every sensor type.

All following settings for this trigger are based on the chosen channel.

 The threshold trigger for a **Total** channel defined on device or group level or defined in [libraries](#) only applies to the sum channel of traffic sensors. This channel has ID -1. The trigger works with the **Total** channel of the following sensors:

- Amazon CloudWatch EBS
- IPFIX
- IPFIX (Custom)
- jFlow V5
- jFlow V5 (Custom)

THRESHOLD TRIGGER

- NetFlow V5
- NetFlow V5 (Custom)
- NetFlow V9
- NetFlow V9 (Custom)
- Packet Sniffer
- sFlow
- sFlow (Custom)
- SMTP&IMAP Round Trip
- SMTP&POP3 Round Trip
- SNMP Traffic
- Windows Network Card

...is [...]

Select the condition that will trigger the notification. Choose from the dropdown menu:

- **Above:** The trigger is activated if the value of the selected channel exceeds a defined value.
- **Below:** The trigger is activated if the value of the selected channel falls below a defined value.
- **Equal to:** The trigger is activated if the value of the selected channel is the same as a defined value.
- **Not Equal to:** The trigger is activated if the value of the selected channel is different than a defined value.

[value]

Define the value PRTG will compare the channel data to. Enter values in the smallest possible (base) unit, for example, in **bytes**, **milliseconds**, or **percent**. Please enter an integer value.

..for at least [...]
seconds

Define how many seconds PRTG waits before it sends out a notification (**latency**). This can avoid false alarms in case a channel reaches a limit for just a few moments. If the defined channel condition persists after the defined time span, the notification is triggered. Please enter an integer value.

 Do not define a latency that is shorter than the scanning interval of a sensor that uses this trigger! The notification trigger might not work as expected in this case.

THRESHOLD TRIGGER

...perform [...]	Select a notification that is triggered if the defined channel condition is true and the latency time defined has elapsed. Choose a notification from the dropdown menu. The menu shows all notifications defined in the Account Settings—Notification Templates settings. You can also choose no notification to only use other conditions for this trigger.
When condition clears perform [...]	Select a notification that is triggered if the defined channel condition is not true any more because the channel value has changed again. Choose a notification from the dropdown menu. The menu shows all notifications defined in the Account Settings—Notification Templates settings. You can also choose no notification to only use other conditions for this trigger.  PRTG sends notifications about cleared conditions if the time for the trigger activation elapsed (defined in the first line) and you choose a notification here. If you select no notification above, you will get the notification about the cleared condition nevertheless if you define it here.
Save	Click Save to confirm your settings.
Cancel	Click Cancel to undo your changes.

 No escalation notification and no repeat are available for this trigger type.

Add Change Trigger

Define a trigger that is activated by an 'on change' trigger. Some sensors offer the option to send such a trigger whenever sensor values have changed. Hover over  and select **Add Change Trigger** from the menu to add a new trigger, or click the **Edit** button next to an existing notification to change it. Then define settings as described below. Every trigger will provoke one or more [notification\(s\)](#) to be executed.

CHANGE TRIGGER

When sensor changes perform [...]

Select a notification that is triggered whenever a compatible sensor sends a 'change notification'. You can enable this option in the [settings](#) of some sensors. The notification trigger is activated immediately whenever a sensor sends an 'on change' trigger. Choose a notification from the dropdown menu. The menu shows all notifications defined in the [Account Settings—Notification Templates](#) settings.

 There are no other options available for this trigger type.

Sensor Settings Overview

For information about sensor settings, see the following sections:

- [Sensor Settings—List of Available Sensor Types](#)

Object Settings Overview

 For more general information about object settings, see section [Object Settings](#).

Part 8

Ajax Web Interface—Advanced Procedures

8 Ajax Web Interface—Advanced Procedures

The PRTG web interface is the feature complete access to PRTG Network Monitor via the web. Use the PRTG web interface as default interface to setup your monitoring and bring it to perfection.

Configure devices and sensors, set up notifications, review monitoring results, create reports, visualize your monitoring on dashboards, and use many more PRTG features to complete your monitoring.

The PRTG web interface is based on Asynchronous Java Script and XML (AJAX) and designed to optimally adjust to your systems by its **responsive design**. It shows all object setting dialogs as pop-up layers, so you never lose the current context. The web interface adjusts to the size of your screen, so you always get information displayed in an optimized way.

While you are [logged in](#)¹⁶⁶, the PRTG web interface continuously refreshes the data on the screen via AJAX calls and you always are up to date on the current monitoring results. You can [set](#)³³⁷⁶ the refresh interval and method individually.

Thanks to **Single Page Application (SPA)** technology, your system will stay highly performant because only single page elements are refreshed when necessary.

The following sections introduce more advanced procedures in the Ajax Graphical User Interface (GUI).

8.1 Toplists

Packet Sniffer and **xFlow** (NetFlow, jFlow, sFlow, IPFIX) sensor types can not only measure the total bandwidth usage, they can also break down the traffic by IP address, port, protocol, and other parameters. The results are shown in so-called **Toplists**. This way PRTG is able to tell which IP address, connection, or protocol uses the most bandwidth.

PRTG looks at all network packets (or streams) and collects the bandwidth information for all IPs, ports, and protocols. At the end of the toplist period, PRTG only stores the top entries of each list in its database.

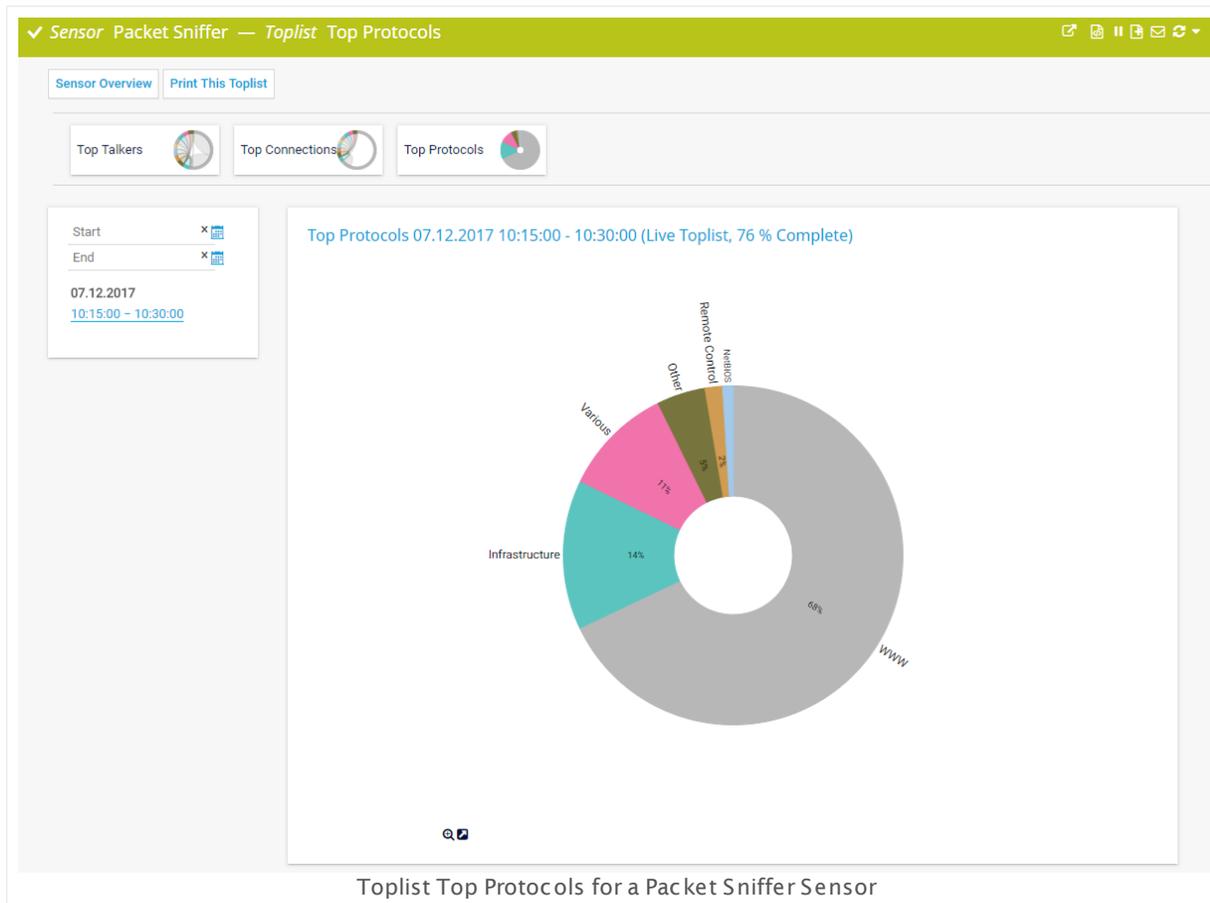

Only Top Entries are Stored

Storing all available analysis data in a database during the analysis process would create a huge amount of data, which would be very slow to transfer between probe and core and also retrieving data would be too slow. By storing only the top 100 entries for short periods of time it is possible to reduce the amount of data to a minimum while still being able to identify devices with huge bandwidth usage.

Toplists Overview

Toplists are available for [xFlow, IPFIX, and Packet Sniffer sensors](#)⁴³⁰ only. Toplist graphs are displayed right on the sensor overview page. By default, there are three different toplist predefined for each sensor:

- **Top Connections:** Shows bandwidth usage by connection.
- **Top Protocols:** Shows bandwidth usage by protocol.
- **Top Talkers:** Shows bandwidth usage by IP address.

- Click one of these items to view a distribution chart and a list of source and destination IP and port, protocols, kind of traffic in different channels, for example. What kind of information is available depends on the list selected.
- Click an entry in the Toplist periods list on the left side to view data for a certain time span. By default, a time span of 15 minutes is set. You can also manually define start and end time of the Toplist period you want to view. Use the date time picker to enter the date and time. Additionally, several [table list options](#)^[237] are available.
- To print a Toplist, click the **Print This Toplist** button to view a printer-friendly version. Use the print option of your browser to send it to your printer.
- With **Sensor Overview** you can return to the current sensor's **Overview** tab. For a quick selection of other Toplists of the current sensor, click one of the Toplist icons at the top of the page.
- You can add or delete new Toplists, or edit existing ones on the sensor's **Overview** tab,

Add

Click the **Add Toplist** button in the sensor overview to create a new Toplist. The available options are the same as for [editing](#)^[318] a list.

Edit

Click the small **gear icon** of a Toplist tile in the sensor overview to modify it.

TOPLIST	
Name	Enter a meaningful name to identify the toplist.
Type	<ul style="list-style-type: none"> ▪ Top Talkers (Which IPs use the most bandwidth?): Shows bandwidth usage by IP address. ▪ Top Connections (Which connections use most bandwidth?): Shows bandwidth usage by connection. ▪ Top Protocols (Which protocols use the most bandwidth?): Shows bandwidth usage by protocol. ▪ Custom (Create your own Toplist): Create your own list by selecting criteria below.
Toplist Fields	<p>This setting is only available if you select a custom type above. Select the fields you want to add to the Toplist by adding a check mark in front of the respective field name. The available options depend on the type of sensor used. They are different for Packet Sniffer, NetFlow v5, v9 (and IPFIX), and sFlow.</p> <p> For performance reasons, only select the fields you really want to monitor.</p> <p> For more information, see Performance Considerations  section below.</p>
Period (Minutes)	<p>Define the interval for the Toplist in minutes. Please enter an integer value. Toplists always cover a certain time span. Once a time span has passed, the top results are stored and a new Toplist is started.</p> <p> To avoid load problems on your probe system, please do not set this interval too long. Default setting is 15 minutes.</p> <p> For more information, see Performance Considerations  section below.</p>
Top Count	<p>Define the length of your Toplist. Only this number of entries will be stored for each period. Please enter an integer value.</p> <p> To avoid load problems on your probe system, please set this value as low as possible. Default setting is 100 to store the top 100 entries for each period.</p>

TOPLIST

 For more information, see [Performance Considerations](#)  section below.

Reverse DNS

Define if you want to do a reverse Domain Name Service (DNS) lookup for IP addresses stored in the Toplist. Choose between:

- **Do a reverse DNS lookup for IPs:** Determine the domain name associated with an IP address and show it in the Toplist.
- **Do no reverse DNS lookup (faster):** Show IP addresses only. Choose this option to increase performance.

Probe/Core Data Transfer

Define how the probe sends the Toplist data set to the core server. Choose between:

- **According to sensor interval (default):** Send data in the interval defined in the settings of the sensor for which you create this Toplist. This can create a lot of bandwidth and CPU load with many sniffer sensors, complex traffic, or long Toplists.
- **Wait until Toplist period ends (less CPU and bandwidth usage):** Send data once a Toplist period has finished. This will create less bandwidth usage and CPU load, but you cannot see the **current** Toplist in the web interface, only Toplists with finished periods.

 For more information, see [Performance Considerations](#)  section below.

Memory Limit (MB)

Define the maximal amount of memory in MB that the probe will use for collecting the different connection information. Every Toplist adds its amount to the probe's memory consumption. Increase this value if the number of captured connections is not sufficient. Please enter an integer value.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Delete

Click the small **trashcan icon** of a Toplist tile in the sensor overview to delete it. Confirm with **Delete** to delete the list.

Details

Click on the **windows symbol** to show details of a Toplist.

Performance Considerations

If you create Toplists for data lines with considerable usage (for example, steady bandwidth over 10 Mbit/s) or if the traffic is very diverse (for example, many IPs or ports with only little traffic each) please consider the following aspects:

- The probe gathers all information needed for the Toplist in RAM memory during each period. Only the top 100 entries are transferred to the core. Depending on the Toplist type and traffic patterns, the required memory can grow into many megabytes.
- Choose periods that are as short as possible (especially important when traffic has a high level of diversity) to minimize memory usage.
- Memory requirements can grow almost exponentially with each field used in the Toplist definition (depending on traffic pattern). Avoid complex Toplists for high and diverse traffic. For example, **Top Connections** (5 fields) needs a lot more memory than **Top Talkers** (1 field).
- If you experience high bandwidth usage between core and probe, try to choose the **Wait until Toplist period ends** option in the [Toplist settings](#)³¹⁸⁸.
- If you experience **Data incomplete, memory limit was exceeded** messages, try to increase the memory limit in the Toplist settings but keep an eye on the memory usage of the probe process.
- To increase the performance of a Toplist, disable the reverse DNS lookup.

Notes

- When working with Toplists, be aware that privacy issues can come up for certain configurations of this feature. Using Toplists you can track all single connections of an individual PC to the outside world and you, as the administrator, must make sure it is legal for you to configure PRTG like this.
- Keep in mind that Toplists can be viewed through the web interface. You may not want to show lists of domains used in your network to others, so restrict [access rights](#)¹⁵⁸ to sensor types having Toplists.
- Note that diagrams, for example, for top connections are not meant to be used for detailed analysis. Rather they should indicate if there is an uncommon bigger change in this Toplist.

- [Monitoring Bandwidth via Flows](#)³⁵¹⁴
- [Monitoring Bandwidth via Packet Sniffing](#)³⁵¹²

8.2 Arrange Objects

There are several options to move objects within the device tree, or to move objects from one probe or group to another.

Manage Tab in Device Tree

While viewing the device tree (or parts of it), click the **Management** tab to switch to a tree view where you can move monitoring objects using drag&drop in your browser window. For more information, see section [Manage Device Tree](#) [329].

Device Details View: Arrange Sensors

When you view the **Overview** tab of a device, you see a list of all sensors on this device.

The screenshot shows the 'Device Probe Device' overview page. At the top, there are navigation tabs for 'Overview', '2 days', '30 days', and '365 days'. Below this, there are sections for 'Status: OK', 'Sensors: 22 (of 28)', 'DNS/IP: 127.0.0.1', and 'Dependency: Ping'. A 'Graph' section shows four gauges for 'Core Health', 'Probe Health', 'System Health', and 'Ping', all at 100% health. Below the gauges is a table of sensors:

Pos	Sensor	Status	Message	Graph	Priority
1.	Core Health	Up	OK	Health 100%	★★★★★
2.	Probe Health	Up	OK	Health 100%	★★★★★
3.	System Health	Up	OK	Health 100%	★★★★★
4.	Disk Free	Up	OK	Free Space C: 70%	★★★☆☆
5.	Common SaaS Check	Up	OK	Available Sen. 100%	★★★☆☆
6.	Surface Ethernet Adapter	Up	OK	Total 179 kbit/s	★★★☆☆
7.	Sensor Factory	Up	OK	Local Probe 100%	★★★☆☆
8.	IPFIX	Unknown	No data since startup	Total No data	★★★☆☆

At the bottom of the screenshot, the text 'Arrange Sensors on a Device' is visible.

Click the column headers **Pos**, **Sensor**, **Status**, or **Priority** to re-sort the sensor list. To change a sensor's position, click the small grip at the beginning of the row, drag it to the position you like, and drop it. Changes take effect immediately.

Context Menu: Move

You can also right-click any object in the device tree to show the [context menu](#)²⁴⁷. Select the **Move** entry to move sensors, devices, or groups up and down, or to move groups or devices into other groups or on other probes.

8.3 Clone Object

If you want to duplicate an object with the same settings, you can clone it. Cloning is available for groups, devices, and sensors. Unlike the results when using the [Create Device Template](#) ³²⁰³ option, a cloned device contains all objects of the original device, regardless of whether they bring about working sensors or not. This often depends on the settings of the cloned device.

The new object takes over all settings of the original object. This means, for example, that an [Auto-Discovery](#) ²⁸²¹ will start automatically on a cloned device (as soon as you resume it) if this option is set on the original device.

To start, right-click an object in your device tree, and from the [context menu](#) ²⁴⁷¹, select **Clone...** to open an assistant.

Clone Sensor Business Process 1

Duplicating Sensor by Cloning

To duplicate a sensor by creating a clone of this sensor choose a parent device and a new name for the sensor.

Note: After creation the new sensor is paused so you can edit its settings before monitoring is actually started.

[Continue](#)

- ❗ You cannot clone **fixed** objects, such as the root group, a probe device, or PRTG system internal sensors.
- ❗ If you want to clone a **sensor**, a faster way is to use the [Manage Device Tree](#)^[329] function.
- ❗ The [user account](#)^[3376] that clones an object must have at least [read access](#)^[158] to this object and all objects underneath in the [hierarchy](#)^[133]. The user group of this account must have the [permission to create all sensor types](#)^[3384] that run on the device or group that is going to be cloned.

Clone Object Settings

OBJECT TO BE CLONED

Object Several fields show information about the object that you are cloning. The available information varies depending on whether you clone a group, device, or sensor.

NAME OF NEW OBJECT

New Object Name Enter a meaningful name for the new object to identify it later in, for example, the device tree or lists. By default, PRTG uses the old name with a preceding **Clone of**.

New IP Address/DNS Name This field is only available when you clone a device. Enter the IP address or DNS name for the new device.

Service URL This field is only available when you clone a device. Specify a URL you would like to open directly when you select **Device Tools | Go To Service URL** from the [context menu](#)^[254] of the device. For example, you can configure this option to call the address <http://www.example.com/service.html>. Enter a valid URL or leave the field empty.

PARENT GROUP/DEVICE FOR NEW OBJECT

Use the [object selector](#)^[240] to choose the object that you want to add the object clone to. If you clone a group or device, select a group. If you clone a sensor, select the device you want to add it to.

Save your settings. If you leave the current page, all changes to the settings will be lost!

✔ Results

- If you have cloned a sensor, the [overview](#)^[198] tab of the new sensor (the clone) will open.
- If you have cloned a group or device, you will stay on the current page.
- By default, all sensors are initially [paused](#)^[245] so you can change settings before monitoring starts. Please check the [settings](#)^[217] of the new objects and [resume](#)^[245] monitoring.

8.4 Multi-Edit

Device and sensor table lists, as well as some other lists, offer multi-edit functionality. With this, you can bulk edit the properties of many objects at a time. Multi-edit is also available in the **Management** tab if you select multiple objects by holding down the **Ctrl** key (see [Manage Device Tree](#)³³⁰).

- ❗ You cannot change every setting type with multi-edit. PRTG only displays settings that all selected objects have in common.
- ❗ You cannot multi-edit the standard [user groups](#)³³⁸ "PRTG Administrators" and "PRTG Users Group".

Example of a Table List

Start Multi-Edit in Lists

Start with viewing a table list. For example, choose **Sensors | By Type | ...** or **Devices | Device List | ...** from the [main menu bar](#)²⁶³. Table lists are also available in the **Overview** tab of [Libraries](#)³²³⁵, [Maps](#)³²⁷⁸, [Reports](#)³²⁵², [Notifications](#)³²¹⁶, and [Schedules](#)³³³⁸.

In a table list, start multi-edit by selecting objects using the check boxes on the right. You can also select all objects of the current page at once by clicking the check box in the table header. Use the **Items** option to view more items per page. As soon as you select one or more objects, the multi-edit menu appears at the top of the table. Chosen objects are marked by a blue line.

Depending on the object type, different functions are available. For example, for sensor lists, some frequently used functions are available as quick buttons, such as **Delete**, **Pause**, **Resume**, **Scan Now**, and **Settings**. Click one of the buttons to apply the respective function to all selected objects.

The options in this menu vary depending on the kind of objects selected. Choose an entry to apply the according function to all selected objects.

Once you have selected the objects you want to change settings for, click the wrench symbol to enter the edit settings mode. For available settings, see below.

Start Multi-Edit in Management Tab

In the device tree, start by clicking the **Management** tab.

You can use Multi-Edit for object settings:

- Hold down the **Ctrl** key and select multiple groups, devices, or sensors (one of a kind).
- In the appearing dialog, select the settings you want to edit, change the according values, and click **Save**. The changes will be applied to all selected objects.

For available settings, see below.

Edit Settings—Settings

The **Edit Multiple Objects** dialog box shows most of the settings that the selected sensors respective devices have in common. For example, you can edit the name, tags, priority, scanning interval, and access rights.

To change a property, add a check mark in front of the respective line and then change the settings. The new setting(s) will be applied to all objects you selected for multi-edit. All properties that are not activated with a check mark remain unchanged.

Click **OK** to store your settings. If you close the dialog box via the **X**, all changes to the settings will be lost!

Edit Settings—Channel Settings

The **Channel Settings** tab in the **Edit Multiple Objects** dialog box is only available when editing sensors. You can edit settings of all channels that the selected sensors have in common. Select a channel name from the **Channel** list. You can then edit display settings, colors, scaling, and limits, for example.

Editing 2 Objects
✕

Edit Multiple Objects

This page allows to edit one or more settings for a selection of objects (groups, devices, sensors, etc.). First enable the checkbox in the first column for each setting that you want to change for all selected objects. Then enter/select your new value.

You are editing 2 objects (Show all objects):

Example of Sensor Channel Settings in Multi-Edit Mode

The available options depend on the selected sensors and vary according to your selection. It may be useful to only choose one certain sensor type from the list, so that there are as many channel settings as possible available for multi-edit.

To change a property, add a check mark in front of the respective line and then change the channel settings. The new setting(s) will be applied to all sensors you selected for multi-edit. All properties that are not activated with a check mark remain unchanged.

Click **OK** to store your settings. If you close the dialog box via the **X**, all changes to the settings will be lost!

8.5 Create Device Template

If you want to add a certain device several times, you can create a device template from an existing device in your device tree. When creating a device template, PRTG will save information for nearly all sensors on this device to a template file that you can later use in combination with [Auto-Discovery](#)^[282] ([restrictions](#)^[3205] apply for a few sensor types). There are also custom device templates available in the [PRTG Script World](#).

From the sensors, all relevant settings are saved, except settings that refer to other objects, such as [schedules](#)^[142], [notification triggers](#)^[3216], and [access rights](#)^[158]. PRTG will automatically revert them to **Inherit**.

To start, right-click a device in your device tree. From the [context menu](#)^[247], select **Create Device Template...** An assistant appears.

Create Device Template for Probe Device
✕

Creating Device Templates

To create a template that you can use for auto-discovery you have to provide a file name and a clear text name. PRTG uses the clear name in the select box for device templates in the auto-discovery assistant. A template contains an entry for every sensor of the selected device. This entry contains all relevant sensor settings except settings that refer to other objects like schedules, triggers, access rights. These settings will revert to 'inherited' when you create a sensor via a template.

Note: There are sensor types that you cannot save into a device template. For a list of these sensor types, see [PRTG Manual: Create Device Template](#)

Choose Template Name

File Name [?]

This field is required.

Template Name [?]

This field is required.

You can exclude sensors from the template by setting the check mark in the list below.

Note: Sensors that cannot be saved into device templates do not appear in this list.

Note: Sensor types that dynamically scan for available monitoring items when you add the sensor to a device do not appear in this list. PRTG includes these sensors automatically into the template if they support template functionality and you cannot exclude them.

Exclude Sensors

Q

Sensors

<input type="checkbox"/>	<input checked="" type="checkbox"/> Disk Free_Local
<input type="checkbox"/>	<input checked="" type="checkbox"/> Free Disk Space (Multi Drive) 3
<input type="checkbox"/>	<input checked="" type="checkbox"/> HTTP Data Advanced 2
<input type="checkbox"/>	<input type="checkbox"/> ...

Cancel
Continue >

Create Device Template Assistant

i Device templates only save the sensors on the device and the sensors' settings, including channels. The device itself and its settings are not saved. For successful device template creation, sensors must be added to the device (either [manually](#)^[325] or via [Auto-Discovery](#)^[282]) and must be [device template-capable](#)^[326].

Device Template Settings

CHOOSE TEMPLATE NAME

File Name	<p>Enter a name under which PRTG will store the file. Template files have the extension .odt in the \PRTG Network Monitor \devicetemplates sub-directory of your PRTG core installation ³⁷³⁴ (of the Master node, if in a cluster ^{130b}). If a file with this name already exists in this directory, you will see an according error message.</p> <p> The device templates folder is not accessible on PRTG hosted by Paessler.</p>
Template Name	Enter a meaningful display name for the template as it will appear in the web interface.
Exclude Sensors	<p>Select sensors that you do not want to include into the device template. Mark the corresponding check boxes of the sensors that you do not want to include into the device template.</p> <p> Sensors that cannot be saved into templates ³²⁰⁵ will not appear in this list.</p> <p> Sensor types that dynamically scan for available monitoring items when you add the sensor to a device will not appear in this list. PRTG includes these sensors automatically into the template if they support template functionality. You cannot exclude them from the device template that you create.</p>

Save your settings. If you leave the current page, all changes to the settings will be lost!

If your template file was saved successfully, you will see an according message and can review the sensors that were added. Click **OK** to finish. The device template is now stored in the program path of your PRTG core installation. Your device template file contains all sensors, including their settings, of the original device.

During your next auto-discovery, choose the **Automatic sensor creation using specific device template(s)** option and select the name of your newly created device template from the list. PRTG will then try to discover the stored sensor types on the new (or existing) device. If the physical device answers to a sensor request, the sensor is added to the PRTG device.

 For detailed information, see section [Auto-Discovery](#) ²⁸².

Settings That Are Not Saved

There are a few settings that you cannot save into a device template, so PRTG will set them to default, for example:

- the **Dependency Type** setting **Master object for parent** (in **Schedules and Dependencies** section)
- **Result Handling** setting **Write result to disk** because this is intended for debugging purposes only.
- Settings in the **Access Rights** section are not saved to avoid security flaws.

i In general, you cannot save all [Sensor Settings](#)^[428] and [Sensor Channels Settings](#)^[3160] (for example, channel limits) of sensor types that dynamically scan for available monitoring items when you add the sensor. This affects, for example, **traffic sensors** where you can choose interfaces that you want to monitor in the [Add Sensor](#)^[325] [dialog](#)^[325].

Furthermore, due to internal restrictions, the following sensor types will not be saved into a device template:

- **Amazon CloudWatch sensors**
- **Business Process**
- **Core/Probe/Cluster Health**
- **DHCP**
- **DICOM Bandwidth**
- **DICOM C-ECHO**
- **DICOM Query/Retrieve**
- **Docker Container Status**
- **Dropbox**
- **Enterprise Virtual Array**
- **Exchange Backup (PowerShell)**
- **Exchange Database (PowerShell)**
- **Exchange Database DAG (PowerShell)**
- **Exchange Mail Queue (PowerShell)**
- **Exchange Mailbox (PowerShell)**
- **Exchange Public Folder (PowerShell)**

- **REST Dell EMC Pool**
- **REST Dell EMC System Health**
- **Sensor Factory**
- **sFlow**
- **sFlow (Custom)**
- **SNMP Trap Receiver**
- **Syslog Receiver**
- **WMI Security Center**

No Update of Device Templates

Once a device template is created, it is not possible to add additional sensors to it via the PRTG web interface. If you want to create a template with an extended set of sensors, please create a new one.

 When saving a new device template, all internal IDs of the sensors in this template are updated. Because of this, when you apply a new template to an existing device, PRTG will newly create all sensors that this template contains on this device, even if these sensors were previously created using another device template!

 You cannot directly delete device templates.

 You cannot edit existing template files on PRTG hosted by Paessler.

- [Manage Device Tree](#)  329

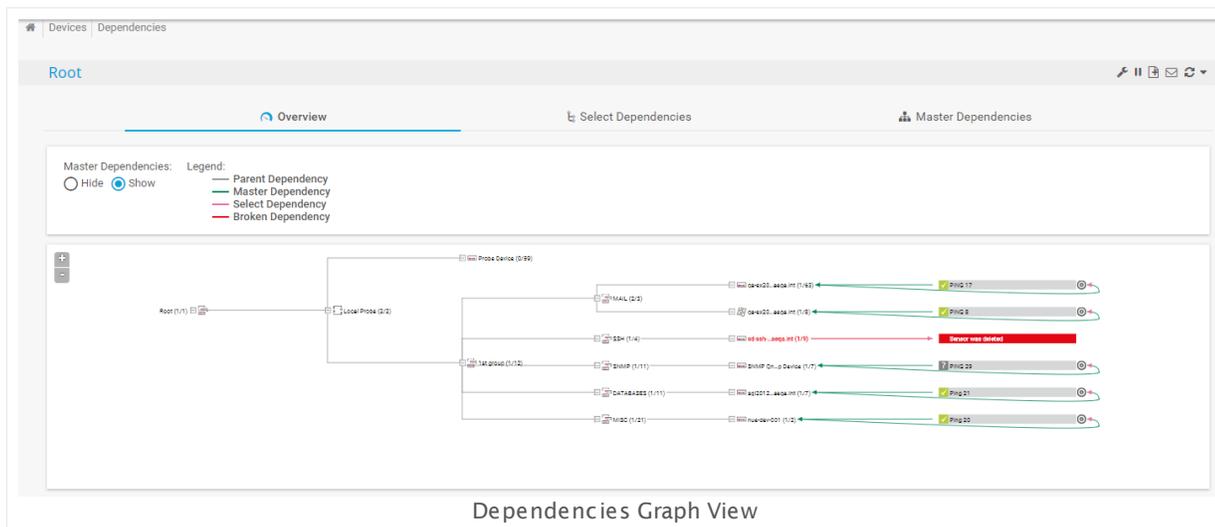

8.6 Show Dependencies

This function shows an overview of the dependencies configured for the objects in your setup.

For a general introduction, see the [Dependencies](#) section.

In the [main menu bar](#), hover over **Devices | Dependencies** to show other menu items. Follow the menu path (it is specific to your setup) to view dependencies of the objects in a specific probe or group only.

- **Selected Dependencies** shows a table of manually set dependencies (section [Select object](#) in any object's settings).
- **Master Dependencies** shows a table of master dependencies.
- **Dependencies Graph** shows a visualization of device, group, and sensor dependencies. See [below](#).

Dependencies Graph

Click **Dependencies Graph** to see the device tree in the dependencies graph view with lines of different color connecting objects. Hover over **Dependencies Graph** to show other menu items for the dependency graph (probes and groups). Click a probe or group menu item to show its dependencies directly. The lines in the dependencies graph symbolize dependencies between the monitoring objects in the device tree. Additionally, a [color code](#) is used for the dependencies.

To show the Dependencies Graph, you need to access the PRTG web interface as a **PRTG System Administrator** user.

- Above the graph header bar, you can switch the dependencies view to tables of the currently selected object with the **Select Dependencies Table** and **Master Dependencies Table** tabs. The **Overview tab** shows an overview of the currently selected object.

- Mark the radio buttons in the header bar to **Show** or **Hide** master dependencies. By default, **Hide** is selected and only **parent**, **selected**, and **broken** dependencies are shown.
 - ❗ These buttons are not available in Internet Explorer for technical reasons. Please use Google Chrome 67 or later (recommended) or Mozilla Firefox 61 or later.
- Click the **+** or **—** buttons on the left in the header bar to zoom in or out of the graph.
- Click probe and group nodes to show the respective dependencies.
- Click device or sensor nodes to open the corresponding overview tab.
- Click the **+** or **—** boxes to expand or collapse probe and group nodes.
- Numbers in parentheses indicate how many child nodes of an object are shown.

Color Code of Dependencies Graph

The line's colors show the kind and source of a dependency. This represents the **Dependency Type** as defined in the **Schedule, Dependencies, and Maintenance Window** [settings of a probe, group, device, or sensor](#)^[280].

- ❗ You can find the color legend also in the graph header bar.
- **Gray**
Gray lines show a dependency by inheritance (**Use parent**). The source of the dependency is the parent object on the left end of the line, for example, **Root** is the parent of **Local Probe**.
- **Green**
Green lines show a master dependency for a device (**Master object for parent**). The sensor that is set as the master points to the dependent device with a green arrow head at the line's end. The arrow head from the dependent device to its master object is pink.
- **Pink**
Pink lines show a dependency that was set manually (**Select object**). The source of the dependency points to the dependant with a pink arrow at the line's end.
- **Red**
Red lines indicate broken dependencies, for example, if the master is not available.

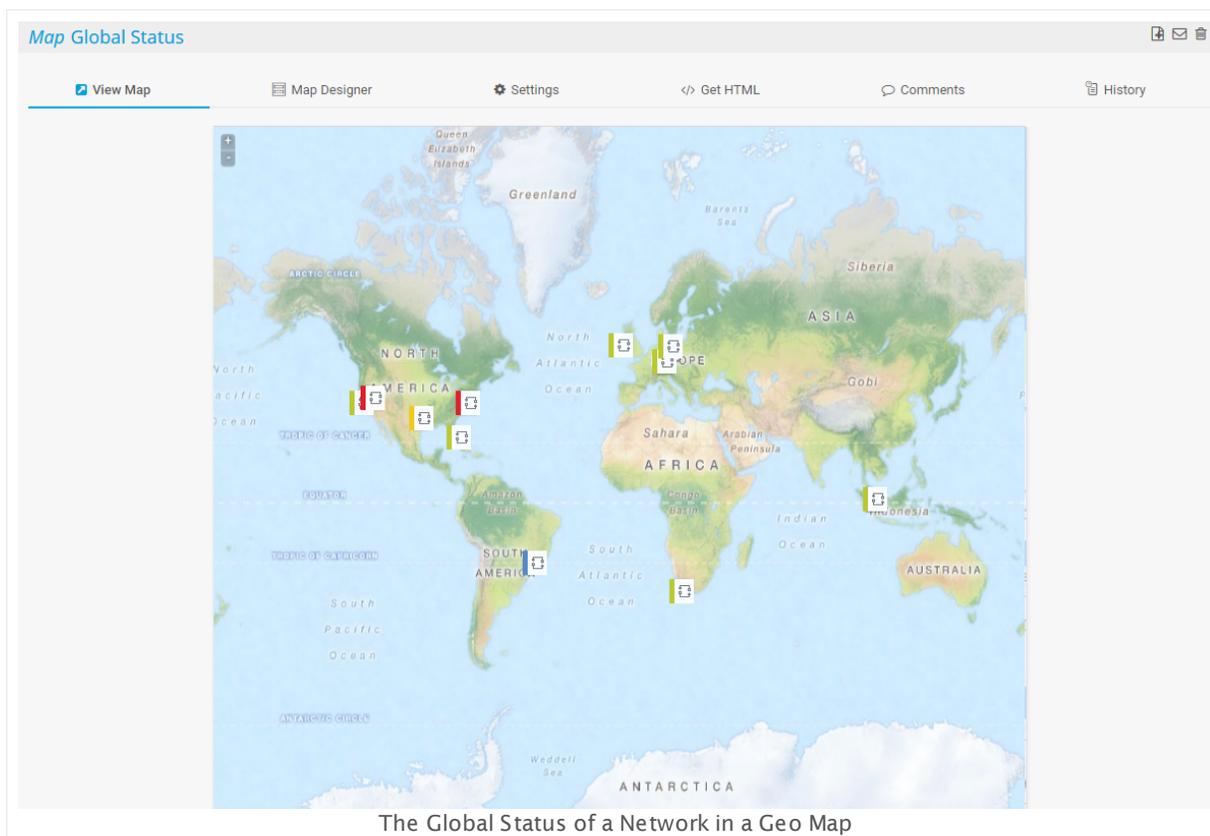

8.7 Geo Maps

With the PRTG Geo Maps feature you can visualize geographical information about your monitored objects. You can display the location of **probes**, **groups**, and **devices** in a graphical map on the details page of an object, or on PRTG [Maps](#)^[3276]. This feature is especially useful when you monitor networks that are spread over several different locations. Devices located in a few cities of a country or various continents can all easily be visualized.

You can enter **Location** information for each probe, group, and device. PRTG uses the first line of this information to query a geographical map that shows your objects. Your location specification is resolved to global geographical coordinates by the PRTG core server with the help of an external map service provider.

PRTG connects to the specified maps provider to get **map tiles**. The map tiles provide the (geo) graphical "background". Then PRTG marks the defined locations with the corresponding object icons and their **status**^[3213] on the map. You can select your favorite map tiles provider in [System Administration—User Interface](#)^[3346] (setting **Geo Maps**).

You can display geographical maps on the device tree. PRTG adjusts the zoom of a map automatically so that it can show all locations of a selected object. You can also add geographical maps to PRTG [Maps](#)^[3276]. To do so, open the PRTG [Map Designer](#)^[3267] (either in an existing map or create a new one) and click **Geo Maps** in the properties menu on the right.

Using Geo Maps

To use geographical maps within the PRTG [web interface](#)^[166] or [Enterprise Console](#)^[3430], please ensure the following:

1. In the system administration in the PRTG web interface, select the maps provider and type you want to view. There, you will also find an option to disable geo maps integration if you do not want to use it. See section [System Administration—User Interface](#)^[3346] (setting **Geo Maps**) for detailed information.
2. In the [settings of a monitoring object](#)^[217] (probe, group, device), add a city name, address, or coordinates in the first line of the **Location** field. When you view the details of this object, PRTG will show a geographical map. PRTG uses the **Location** information also when you view objects in the [Enterprise Console](#)^[3430] or add **Geo Maps** objects to PRTG [Maps](#)^[3276].
3. Make sure your PRTG core server has access to the internet to obtain map tiles. If a proxy is mandatory in your network, configure proxy settings accordingly.
 -  For details, see [System Administration—Core & Probes](#)^[3368].
 -  For details about tile server domains, see this Knowledge Base article: [Which domains and ports does the GeoMaps feature use?](#)

Labeling Locations

You can define your own labels for locations of objects. To do so, enter the desired label in the first line of the **Location** settings and provide the geo coordinates of the location in the second line. This object will appear with the defined label in PRTG geo maps.

For example, add the following to the location field:

```
Big Apple
40.712778,-74.005833
```

Location

 inherit from

Location (for Geo Maps) ⓘ

```
Big Apple
40.712778,-74.005833
```

Defining Location New York City with Geo Coordinates and Label Big Apple

The location New York City appears with the label Big Apple:

Geo Map for Root

Big Apple

Device	!!	!!	!	✓	W	II
SSH	13			15		
avocado	12			2	1	
DNS/ADS	4			38		
Cluster Probe Device	3			14	1	
DHCP	3			15	1	
Exchange	2			3	2	
Gateway	2			2		
Probe Device	2			10	1	

Location New York City with Label Big Apple

It is also possible to define the same label for different locations. For example, imagine your company's headquarter is spread over several different locations. For each object representing a dedicated headquarter in the PRTG device tree, enter its coordinates in the second line of the respective **Location** settings and the label "Headquarter" in the first line. All corresponding objects will be displayed as "Headquarter".

This way, you can easily find your desired objects on the map.

Map Icon Colors

On the geographical maps the different location icons show the overall [status](#) at this location by using a color code. Following, you can see all possible location states in order of their hierarchy:

Flag	Flag Color	Location Status	Meaning
	Red	Down	At least one sensor at this location shows a red Down status. Hover the circle with the letter symbol in the legend to view the total number of alarms at this location.
	Bright-Red	Down (Acknowledged)	At least one sensor at this location is Down and a PRTG user acknowledged this status with the Acknowledge Alarm function. The Down states of all sensors at this location must be acknowledged—if at least one sensor is unacknowledged down, this location will be displayed as Down .
	Yellow	Warning	At least one sensor at this location shows a yellow Warning status. There is no sensor in a Down or Down (Acknowledged) status at this location.
	Orange	Unusual	At least one sensor at this location shows an orange Unusual status. There is no sensor in a Down , Down (Acknowledged) , or Warning status at this location.
	Green	Up	All sensors at this location are in a green Up status. There is no sensor in a Down , Down (Acknowledged) , Warning , Paused , or Unusual status at this location.
	Blue	Paused	All sensors at this location show a blue Paused status. There is no sensor in a Down , Down (Acknowledged) , Warning , Unusual , or Up status at this location.
	Black (Grey)	Unknown	All sensors at this location have an Unknown status. There is no sensor in a Down , Down (Acknowledged) , Warning , Unusual , Paused , or Up status at this location.

 For detailed information about sensor states, see the section [Sensor States](#) ¹⁹⁵.

Geo Tracking of Your Mobile Device

It is possible to show the location of an Android device and track its movements on PRTG Geo Maps. PRTG can draw the route a device has taken directly into geo maps. For this feature, you need the [PRTG Mobile Probe for Android](#).

 For details, see this Knowledge Base article: [How can I track geo data of my Mobile Probe device?](#)

8.8 Notifications

PRTG uses notifications to send you alerts whenever PRTG discovers a defined status, such as slow or failing sensors, or when sensor channels breach threshold values. You can define an unlimited number of notifications allowing to use one, or more, of several communication channels like [email](#)³³¹⁷, [text messaging](#)³³²⁰, [push notifications](#)³³¹⁹ to Android and iOS devices, and [many more](#)³³¹⁶. PRTG sends notifications to the desired user's [Notification Contacts](#)³³³⁴ that you can define for each user account of your PRTG installation.

 See also our video tutorials for notifications:

- [Video Tutorial: Use Cases for Notifications](#)
- [Video Tutorial: How to Set Up and Use Notifications in PRTG](#)

Overview

PRTG sends a notification when a defined event evokes it. The following events can trigger notifications:

- **Sensor status changes**
For example, when a sensor changes its status from **Up** to **Down** or **Warning**, because responses are slow, or when a sensor status changes to **Unusual**.
- **Sensor value threshold breaches**
For example, when a sensor shows a request time higher than 1,000 ms for more than 30 minutes, or when free disk space is below 10%.
- **Speed threshold breaches**
For example, when a traffic sensor shows more than 1 Mbit/s for more than 5 minutes.
- **Volume threshold breaches**
For example, when a traffic sensor shows more than 1 Gbyte transferred in 24 hours.
- **Sensor value changes**
For some sensors you can trigger a notification whenever the value changes, for example, when monitoring files on a hard disk drive.

A notification can be one of these actions:

- [Send Email](#)³³¹⁷
- [Send Push Notification](#)³³¹⁹
- [Send SMS/Pager Message](#)³³²⁰
- [Send Slack Message](#)³³²¹
- [Send Microsoft Teams Message](#)³³²³
- [Add Entry to Event Log](#)³³²⁵
- [Send Syslog Message](#)³³²⁶
- [Send SNMP Trap](#)³³²⁷
- [Execute HTTP Action](#)³³²⁷
- [Execute Program](#)³³²⁸

- [Send Amazon Simple Notification Service \(SNS\) Message](#)  3329
- [Assign Ticket](#)  3331

 For details, see section [Account Settings—Notification Templates](#)  3316.

 Usually there are three successive attempts to deliver a notification. If all of these attempts fail, the notification is lost. To never miss a notification, we recommend that you always add two different ways to get a notification. For example, use the latency setting of a [state trigger](#)  3172 to choose a notification with another delivery method than in the first trigger condition, or set up a second trigger with another notification for the corresponding object.

Notifications can contain valuable sensor information, such as:

- Last error message
- Last good/failed request
- Total downtime
- Total uptime
- Recent sensor history
- A direct link to the web interface

 For available placeholders, see this Knowledge Base article: [What placeholders can I use with PRTG?](#)

Notifications Setup

Overall, you have to go through four steps to use notifications with PRTG. Please go through all of them for a first setup:

1. Check and set up the **Notification Delivery** settings if you use PRTG on premises. These define how PRTG will send messages.
 For detailed information, see [System Administration—Notification Delivery](#)  3361.
2. Check and set up **Notification Contacts** for the users of your PRTG installation. These define where to send notifications.
 For detailed information, see [Account Settings—Notification Contacts](#)  3334.
3. Check and set up several **Notification Templates**. These define the kind of message and its content.
 For detailed information, see [Account Settings—Notification Templates](#)  3311.
4. Check and set up **Notification Triggers** for objects. These provoke the defined notifications.
 For detailed information, see [Sensor Notification Triggers Settings](#)  3170.

 We recommend that you always set up at least two notifications with different delivery methods for a notification trigger, for example, one [email notification](#)³³¹⁷ and one [SMS notification](#)³³²⁰. If delivery via email fails (due to a email server outage or for other reasons), PRTG can still notify you via your smartphone in this case as a fallback. You can achieve this, for example, by using the latency setting in a [state trigger](#)³¹⁷² and selecting a notification with another delivery method than for the first trigger condition.

 See the sections [Setting Up Notifications Based on Sensor Limits: Example](#)³²¹⁹ and [Setting up Notifications Based on Libraries: Example](#)³²²⁹ for a step-by-step guide that describes a potential notifications setup.

 There are also custom notification scripts available in the [PRTG Script World](#).

8.8.1 Setting up Notifications Based on Sensor Limits: Example

 This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

This section shows you exemplarily how to set up a notification for exceeded disk free limits. We provide the approach for this specific use case step by step so you can adapt it to define limits and corresponding notifications for other sensor types.

You have to take several steps to set up notifications based on limits:

- [Step 1:](#)³²¹⁹ Provide necessary information about the delivery of notifications (SMTP and SMS).
- [Step 2:](#)³²¹⁹ Specify recipients for notifications for each user account of your PRTG installation.
- [Step 3:](#)³²²⁰ Create notifications, specifying the type of notification and its content.
- [Step 4:](#)³²²¹ Define thresholds that change a sensor's status (this is not necessary for every kind of notification).
- [Step 5:](#)³²²⁵ Add suitable triggers to objects that evoke notifications if something is going wrong in your network.
- [Step 6:](#)³²²⁶ Test if the created notification is triggered and delivered correctly.

 When you set up your own notifications, you do not necessarily need to go through all the steps we describe here. In this section, our main goal is to give you a general idea of the notifications concept.

Step 1: Setting up the Notification Delivery

Before creating your actual notifications, you first have to define how those notifications are delivered to your email account, mobile phone, or pager. To do so, select **Set up | System Administration | Notification Delivery** from the PRTG main menu bar. Specify the mechanism of SMTP delivery, sender email and name, as well as the HELO ident. For SMS delivery, select your service provider and provide the corresponding credentials.

 You can find details about notification delivery in section [System Administration—Notification Delivery](#)³³⁶¹.

 This only applies to PRTG on premises instances, not to PRTG hosted by Paessler.

Step 2: Setting up Notification Contacts

Create notification contacts to define where you want to receive notifications. Recipients can be email addresses, phone numbers (PRTG on premises only), or push devices (Android or iOS devices with the corresponding [PRTG smartphone app](#)³⁴⁸⁹). You can define as many recipients as you want for each user account in your PRTG installation. By default, the recipient "Primary Email Address" is available—this is the email address you provide in [your account settings](#)³³⁰⁴. This is sufficient for a first setup of notifications. Later on, when you see how it works, you can define more contacts. When you add a notification to a device, you just have to select a user or user group as recipient and PRTG uses the according contacts you define here.

 For details, see section [Account Settings—Notification Contacts](#)³³³⁴.

Step 3: Setting up the Notification's Content

To get an informative message when a disk is running out of capacity, create a corresponding notification. Select **Setup | Account Settings | Notification Templates** from the PRTG main menu bar, hover over  and click **Add Notification Template** from the menu. Give the notification an explanatory name; in our case you could use **Disk Free Limit Notification**. However, if you want to trigger this notification on a global level (for example, for a probe or group) such that it would not only apply to breached disk free limits, a general name would be more suitable (like the predefined notification "Email to Admin"). If you leave the default text of the newly created notification, it already contains all necessary information, for example:

- which sensor is affected,
- since when the sensor is affected,
- last value of this sensor.

 See section [More](#)³²²⁷ for the other options you have here.

After providing this basic information, select the delivery method. In our case, we choose **Send Email** for this notification by marking the corresponding check box. Specify who will receive the notification (select a specific user, for example, and PRTG sends the notification to all contacts of this user you specified in [step 2](#)³²¹⁹), its subject, the format, and its priority. By default, the email notification contains several information parameters about the evoking sensor: its name, status, time, message, location in the device tree, etc.

 You can choose any other notification method, of course. For more information, see [Account Settings—Notification Templates](#)³³¹⁶.

Send Email

Sender ? Default
 Custom

The three recipient settings below (user, user group, email address) work independently. So every contact and address selected by any of these settings will receive the notification.

Send to User ? ▼

Send to User Group ? ▼

Send to Email Address ?

Format ? HTML
 Text
 Text with custom content

Priority ? ▼

Creating an Email Notification

Once you set up the notification completely, click **Save**. PRTG opens the notifications overview page again. You can now use this notification for every trigger on every object in your device tree.

Step 4: Define Limits

Before creating triggers that evoke notifications, first specify the limits that you want to apply to your disks. For example, if you want to get a notification when a disk has exceeded 80% of its capacity, force the sensor into a **Warning** status at this utilization. You have several options to set limits for disk free sensors:

- Set limits checked against all disks in the settings of multi-drive sensors: [WMI Free Disk Space](#)²⁸³³, [SNMP Linux Disk Free](#)²²⁵¹, [SSH Disk Free](#)²⁵⁰⁷
- Enable limits in [Sensor Channels Settings](#)³¹⁶⁰ of single sensors.
- You can achieve both with [Multi-Edit](#)³¹⁹⁷.

Step 4.1: Define Limits in Sensor Settings (Multi-Disk Free Sensors Only)

You can set limits for sensors monitoring multiple disks directly via the **Settings** tab on a sensor's details page. [Multi-Edit](#)³¹⁹⁸ for existing sensors is also possible. Open the settings of the selected sensor(s) and go to section **Set limits checked against ALL disks**. There, for example, enable **Percentage Limit Check**. In the field **Lower Warning Limit**, enter the percentage that suits your needs. In our example, this would be **20**. Alternatively, you can use bytes to define a limit. However, we recommend using percentage values for more flexibility. This limit applies to all channels of this sensor that represent disks.

Setting Limits for All Disks

ⓘ This sensor setting is only available for multi-drive sensors. You can omit step 4.1 for all sensors that are not of the type "disk free".

Step 4.2: Define Limits for Sensor Channels

To set specific limits for single disks, use the sensor's **Channel** settings. You can open channel settings via the gear icon in the respective channel gauge or in the channels table. **Enable Limits** at the bottom of the channel settings dialog and specify your desired limits in the **Lower Warning Limit** field. This limit only applies to the respective channel.

i If you define channel limits when using the sensor's limit setting in the sensor's **Settings** tab at the same time, the first limit that applies will be considered. This way, you can individually define harder limits for single disks in a multi-disk sensor. All defined limits are valid side by side.

You **have** to take the approach via channel settings for sensor types that monitor only one (logical) disk, for example, the [SNMP Disk Free Sensor](#)²⁰⁶³. For these sensor types, you can use [Multi-Edit](#)³²⁰⁰ if you want to apply the same limits for each of these sensors automatically.

- To see all sensors of this type at a glance, just filter for it: From the main menu bar, select **Sensors | By Type | SNMP Disk Free**.
- Mark the check boxes of the sensors you want to add a limit for.
- Click the wrench symbol in the menu.
- Open the **Channel Settings** tab.
- Select the channel you want to add a limit for; in this case it would be most likely the channel **Free Space**.
- Then **Enable Limits** at the bottom of the dialog and enter the number in the correct field as described above.

When you are done, save these settings—the new limit applies to all channels with this name of the multi-edited sensors.

Setting Limits for Channels with Multi-Edit

Step 5: Setting up the Notification Trigger

You specified limits to define when a sensor will go into a **Warning** (or **Error**) status. Now you can create the according notification triggers. The notification trigger we use in this example is the **State Trigger**.

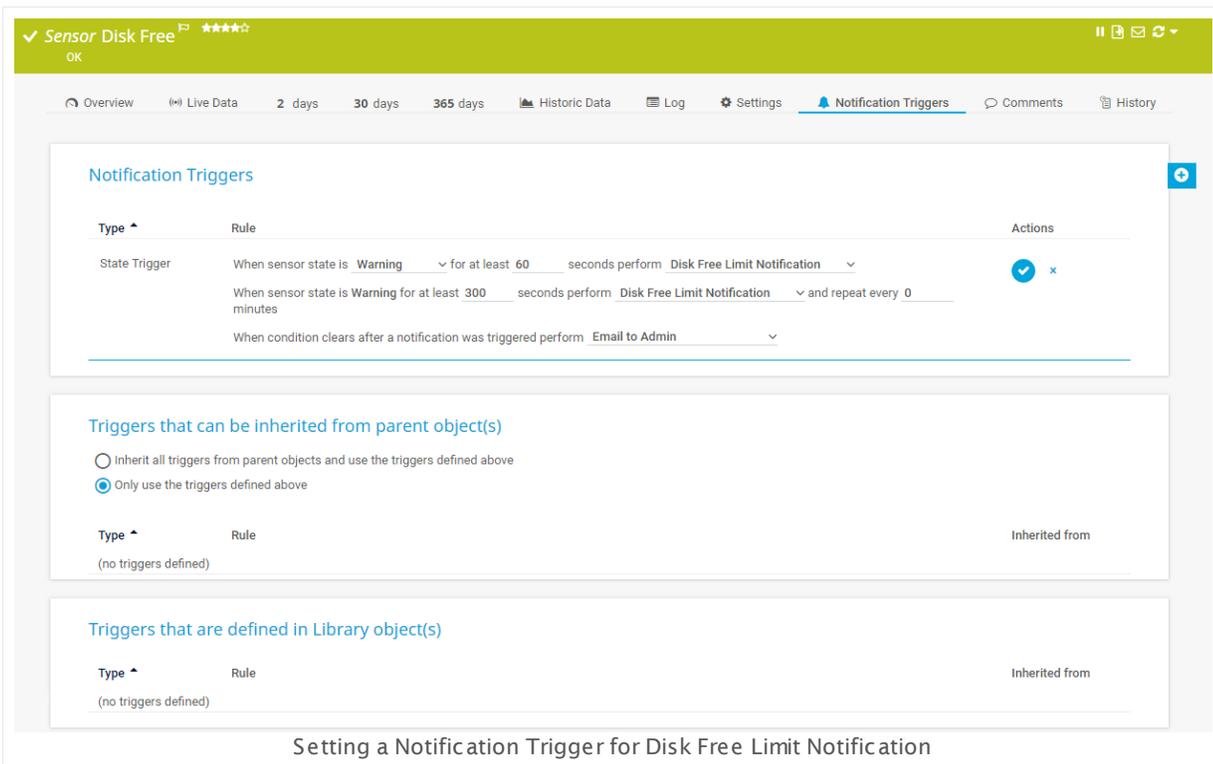

Part 8: Ajax Web Interface—Advanced Procedures | 8 Notifications

1 Setting up Notifications Based on Sensor Limits: Example

 For details about other possible notification triggers, see section [More](#)³²²⁷.

- You can set up a **State Trigger** on any level in your device tree. For example, open a group containing the device(s) representing your disks.
- Open the **Notification Triggers** tab.
- Hover over  and select a notification trigger from the menu.
- Set the notification trigger to "When sensor is Warning" and choose the notification template you created before ("Disk Free Limit Notification" or a more general one) from the dropdown list.
- Adjust the other notification trigger settings to your needs and save this new notification trigger.

Now you receive a notification immediately when the capacity of one of your disks falls below the defined limit, in this case 20% free disk space.

The screenshot shows the 'Notification Triggers' configuration page for the 'Sensor Disk Free' sensor. The interface includes a navigation bar with tabs for Overview, Live Data, 2 days, 30 days, 365 days, Historic Data, Log, Settings, Notification Triggers (active), Comments, and History. The main content area is titled 'Notification Triggers' and contains a table with columns for Type, Rule, and Actions. The table lists three triggers:

Type	Rule	Actions
State Trigger	When sensor state is Warning for at least 60 seconds perform Disk Free Limit Notification	 
	When sensor state is Warning for at least 300 seconds perform Disk Free Limit Notification and repeat every 0 minutes	
	When condition clears after a notification was triggered perform Email to Admin	

Below the table, there are two sections for inheritance:

- Triggers that can be inherited from parent object(s)**: Two radio buttons are present. The first is 'Inherit all triggers from parent objects and use the triggers defined above' (unselected). The second is 'Only use the triggers defined above' (selected).
- Triggers that are defined in Library object(s)**: A table with columns for Type, Rule, and Inherited from, showing '(no triggers defined)' in the Type and Rule columns.

At the bottom of the screenshot, the text 'Setting a Notification Trigger for Disk Free Limit Notification' is displayed.

Step 6: Testing the Notification

Finally, test the notification that you created. You can immediately trigger this notification for test purposes:

- From the [main menu bar](#)²⁶³, select **Setup | Account Settings | Notification Templates**.
- For the respective notification template, click the **Edit** button and then **Send test notification**.

Then, check if the notification was triggered and delivered correctly, depending on the delivery method you defined before. If you do not get a notification (or a defined action is not executed) at all, check the notification logs: From the main menu bar, select **Logs | System Events | Notifications**. Look for the triggered notification in the table list (verifying that the notification delivery is set up correctly in general) and consider the corresponding message.

 See section [Logs](#)^[228] for more information.

More

This section provides information about additional options you have when working with notifications.

▪ Notification Settings:

You can create schedules to activate notifications only at specific times, for example, only on weekdays. In section **Notification Summarization** you can choose between various options to avoid message floodings. Furthermore, define which user groups will have access to edit this notification. For details about notification settings, refer to section [Account Settings—Notification Templates](#)^[331].

▪ Content of Emails:

You can individually adjust the subject, header, and footer of emails to your needs. See section [Account Settings—Notification Templates](#)^[331] for details about editing the subject. The article **How can I include my own logo into HTML emails?** in the Knowledge Base explains how to edit the header and footer of emails: <https://kb.paessler.com/en/topic/65782>

▪ Other Triggers:

An alternative to the state trigger would be to add a **Threshold Trigger**; then you would not need to set up limits explicitly, though, this trigger type would only be suitable for disk free sensors when using the trigger for single sensors, one by one. Free disk sensors have free space **in percent** as primary by default, other sensors have primary channels with the units bytes or seconds. However, threshold triggers only apply to the primary or total channel. General notification triggering by threshold might not work as expected for sensors of the "percentage" type. You can find all available triggers in section [Notifications](#)^[321].

▪ Add a Threshold Trigger to a sensor **directly**:

Go on a sensor's detail page and select the **Notification Triggers** tab. Click **Add Threshold Trigger**, select the desired channel, and provide the condition when this notification will be sent. In this example for free disk space, the setting would be "**When Free Bytes C: (%) channel is Below 20 for at least 60 seconds perform Disk Free Limit Notification**".

▪ Notifications with Libraries:

If your disk devices are spread over many groups, we recommend that you [use a PRTG library](#)^[325] for your disks. Choose **Libraries | All disk space sensors** from the main menu bar, go on the **Notification Triggers** tab, and add a state trigger as described above.

 Not all disk free sensor types might appear. You can add them to this library in the settings of the library node. There you can [filter by type or tag](#)^[325] and add missing sensors. You can also filter by priority and other sensor properties.

Settings of a Library with Diskspace Sensors

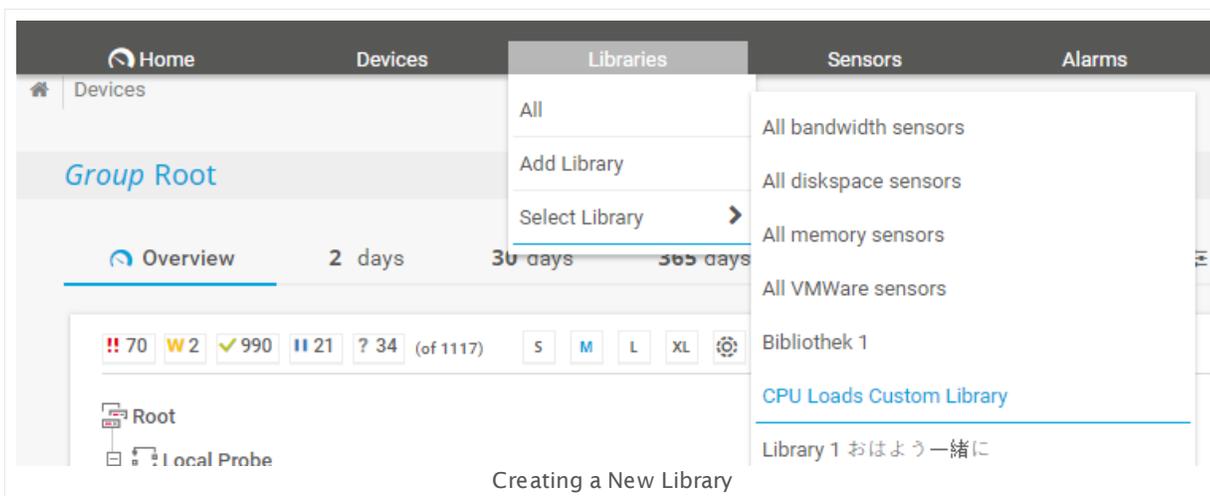

8.8.2 Setting up Notifications Based on Libraries: Example

What's so special about notifications set to whole libraries instead of single sensors? How do I set up libraries, and how do I get the most out of my library notifications?

This section describes how you can reorganize your devices or sensors by their function, and thereby create a new customizable view. This way you can monitor entire sections of your network with a single set of [notifications](#)³²¹⁶.

You can personalize these views and their notifications for your own use. Furthermore, you can grant and restrict permission to this view to other PRTG users or PRTG user groups, to give them direct access to some of the information in PRTG. By using libraries, you can make your notification management faster, easier, more powerful, and more refined.

Step 1: Setting up a New Library

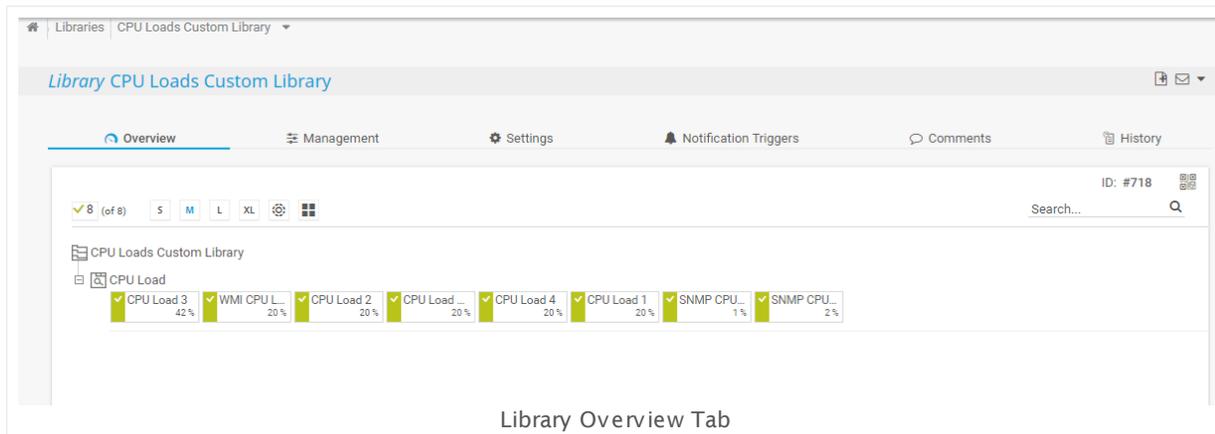

Create a new library:

- Hover over **Libraries** in the main menu bar and select **Add Library**.
- Give the library a meaningful name and assign it a [security context](#)³²⁴⁵. Possibly add some [Tags](#)¹³⁹¹ for easier organization.
- Optionally, assign access rights to your predefined user groups.
- Click **Create** to create the new library.
- The **Management** tab of the library opens.

Part 8: Ajax Web Interface—Advanced Procedures | 8 Notifications

2 Setting up Notifications Based on Libraries: Example

Add objects to your library:

- Click the **Add Library Node** button.
- The **Add Library** dialog opens.
- Define the **Node Display Settings**:
 - Choose a node from which the sensors will be taken (predefined: **Root**).
 - Select **Show a collection of filtered sensors in the library (max. 1000)** to filter (the subtree) further.

Choose from the following filter criteria:

- **Show specific sensor types only**: Add check marks to sensor types you want to include.
- **Show sensors with a specific sensor status only**: Choose from up, warning, down, or unusual.
- **Show objects with specific tags only**: Enter tags to include certain sensors.
- **Show objects with a specific priority only**: Priority "1" through "5" is possible.

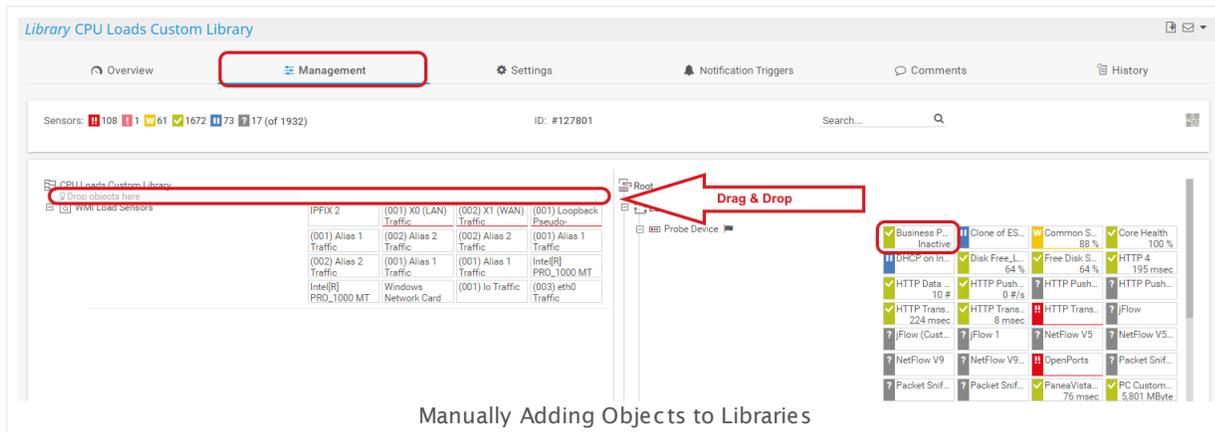

i The libraries are dynamic not static. When you add or remove sensors to your device tree that are of a type already specified here, the library will automatically update the displayed sensors. The same is true for the other three categories.

- Confirm via **OK**.
- The new library node appears.

i You can rearrange the nodes in any sequence you require. To manually add objects from the device tree, proceed as follows: Select the **Management** tab, click and hold an object from the right-hand device tree, then drag over to the **Drop objects here** area. This will transfer the entire content of the object to a new library node.

Part 8: Ajax Web Interface—Advanced Procedures | 8 Notifications

2 Setting up Notifications Based on Libraries: Example

Step 2: Specify Notification Triggers

You can use library notifications very much the same way as notifications for sensors or devices.

- In your library, click the **Notification Triggers** tab.
- Choose one of the various notification trigger types and configure it:
- **Add State Trigger** to send notifications about [sensor states](#) over a specified time period.
- **Add Speed Trigger** to send notifications when having too little or too much traffic over a specified time period.
- **Add Volume Trigger** to send notifications when a predefined amount of data in the specified interval is accumulated.
- **Add Threshold Trigger** to send notifications if a sensor channel value goes beyond or below a certain limit.
- **Add Change Trigger** to send change messages sent by your sensor (only certain sensors provoke change triggers).

Example: Library Notification

You monitor hundreds of servers and want to keep an eye on CPU utilization. Using the channel limits within the sensors would cause an overwhelming amount of alerts, because CPUs can easily spike to 100% load for one scanning interval, without necessarily indicating a problem.

Using libraries, it only takes you a couple of minutes to create a notification setup that will notify you when a CPU runs at more than 90% load for more than 5 minutes.

We recommend the following steps:

1. Create a custom library.
2. Add CPU sensors (via tag or type).
3. Add a threshold-based notification.

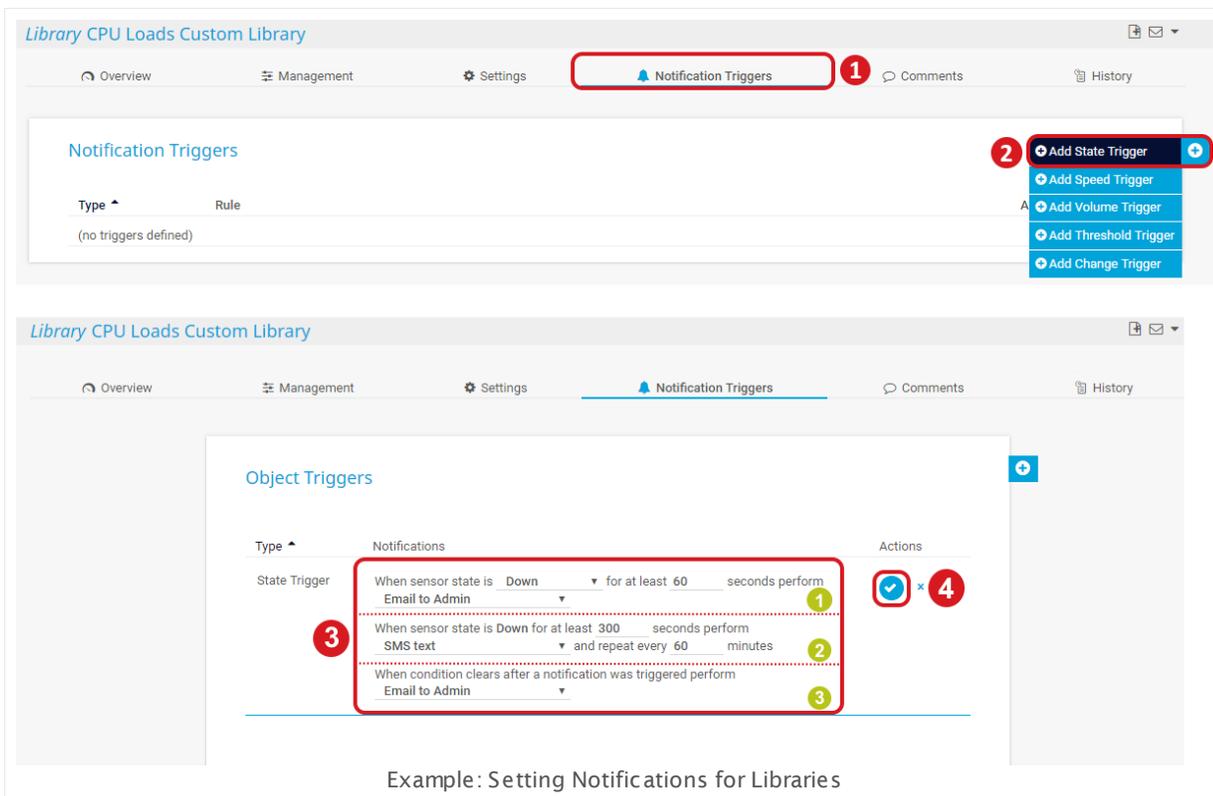

Part 8: Ajax Web Interface—Advanced Procedures | 8 Notifications

2 Setting up Notifications Based on Libraries: Example

4. Enjoy complete peace of mind!

Add a state trigger to your library:

- Select the **Notification Triggers** tab (1).
- Hover over  and select **Add State Trigger** (2) from the menu.
- Enter the desired notification specifications in the definition box (3), including:
 - initial parameters (triggering state, triggering state duration, notification type triggered), 
 - escalation parameters (triggering state is always the same, ongoing duration that triggers escalation, the type of the escalation notification triggered, and how often it is repeated), 
 - if the trigger parameters no longer apply, enter the type of notification to be triggered. 

The screenshot shows the PRTG Network Monitor interface. The top navigation bar includes 'Overview', 'Management', 'Settings', 'Notification Triggers' (highlighted with a red box and callout '1'), 'Comments', and 'History'. Below this, the 'Notification Triggers' section is shown with a table of triggers. A red box highlights the 'Add State Trigger' button (callout '2') and the 'Add State Trigger' button in the 'Object Triggers' configuration screen (callout '4'). The 'Object Triggers' configuration screen shows a table with three rows of triggers, each with a red box and a callout (3, 2, 3) indicating the configuration area.

Type	Notifications	Actions
State Trigger	When sensor state is Down for at least 60 seconds perform Email to Admin	 
	When sensor state is Down for at least 300 seconds perform SMS text and repeat every 60 minutes	
	When condition clears after a notification was triggered perform Email to Admin	

Example: Setting Notifications for Libraries

- An overview of all currently defined triggers appears.

On top of that, you may want PRTG to keep sending you **Tickets** when a lower load threshold is periodically exceeded. This low priority notification will remind you to keep an eye on a certain part of your network. Proceed likewise via the **Add Threshold Trigger** button.

 You are completely free to set multiple triggers of the same type, so you can define increasingly serious notifications, as well progressing through different notification actions (email, SMS text, etc.). For system-critical network components, we recommend that you always define two different notification triggers (for example, email and escalation SMS text message).

The next steps will be to review the notifications settings, summarization, and notification actions in the main menu under **Setup | Account Settings | Notification Templates**.

Step 3: Test, Troubleshooting, and Customization

To make sure the notification system works as desired, you can trigger test notifications out of PRTG.

- Click the **Edit** button next to a notification and select **Send test notification** under **Setup | Account Settings | Notification Templates**.
- Check if the test email and/or SMS text has arrived.

 In test notification messages, placeholders will not be resolved.

Troubleshooting: if you suspect a notification might not arrive, proceed as follows:

- Select **Setup | Account Settings | Notification Templates** from the main menu bar.
- Go to the notification action you have assigned in the library and click **Edit**.
- Review the notification setting so that:
 - The notifications are in the **Active** status.
 - The notifications have a [schedule](#)  that does not conflict with the library you just set up or currently pauses the notification.
 - The summarization method collects alarms for a certain period. Also consider the **Timespan for Summarizing Messages** value.
 - The user email addresses (phone numbers) specified for each user account are correct.
- Check the [Notification Delivery Settings](#)  under **Setup | System Administration | Notification Delivery**.

 This only applies to PRTG on premises instances, not to PRTG hosted by Paessler.

- Review the [logs](#)  for system events of the type "Notification" and the respective notification's name.
- Repeat these steps for all your notifications.

 Sensors can perform simulated errors. Go to the library's **Overview** tab, right-click a sensor, and select **Simulate Error Status** from the context menu. You will see that the sensor status quickly changes and sends the following message: **Simulated error (code: PE034)**. This also triggers the notification.

 You can have the overall status of your library displayed as custom object on a map. See this Knowledge Base article: [How can I use a status icon of a device in Maps which only considers specific sensors?](#)

Part 8: Ajax Web Interface—Advanced Procedures | 8 Notifications
2 Setting up Notifications Based on Libraries: Example

8.9 Libraries

With the **Libraries** feature in PRTG you can create special views of your device tree with up-to-the-minute monitoring status information, arranged the way you want it.

Example of a Library

In this section:

- [Introduction](#) ³²³⁵
- [Start Libraries](#) ³²³⁶
- [Libraries List](#) ³²³⁷
- [Working with Libraries](#) ³²³⁷

See also this video tutorial: [PRTG Network Monitor – Libraries](#)

Introduction

Libraries are a powerful feature that enables you to create additional views of your device tree. These views are updated with the same scanning interval as your device tree, showing the same monitoring data, but arranged the way you want. This is useful if you want to display data in different ways, like depending on target groups or a specific use case.

For example, you can create a library that contains an overview of all your bandwidth monitoring sensors, regardless of the device they are running on.

The library features include:

- Create libraries containing nodes with monitoring objects from all over your configuration.

- Show data from different PRTG probes in one library.
- Show different branches of your device tree right next to each other.
- Arrange sensors in a tree-like view regardless of the device they are running on.
- Filter your entire tree (or parts of it) for sensor type, state, or tag, showing only matching sensors.

You can create libraries easily, using **drag&drop**.

PRTG comes with several pre-configured standard libraries, which you can use right away. You can also change or delete them, if you like. The following libraries are automatically created when you install PRTG for the first time (visible for the PRTG Administrator user). Some of them will initially be empty, but as you add more sensors, they will be filled automatically according to the filter settings defined for the nodes of the libraries:

- All bandwidth sensors
- All CPU load sensors
- All disk space sensors
- All memory sensors
- All VMware sensors
- Sensors grouped by priority
- Sensors grouped by state

 Sensors that are added to libraries are not counted against the maximum number of sensors of your license.

Start Libraries

Click **Libraries** in the [main menu](#)²⁶⁷ to view or add custom views of your network's status and monitoring data. Hover over **Libraries** to show menu items. Choose between:

LIBRARIES	
All	Open the Libraries overview list where you can view or add custom device tree views of your network status and monitoring data.
Add Library	Open an assistant to create ³²³⁸ a new library.
Select Library >	Open an existing library. Hover over Select Library to show more options. Follow the alphabetical menu path (it is specific to your setup) to view your libraries. Click a library to open it.

Libraries List

In the **All** view, you see a list of all existing libraries. Using the **Edit** buttons, you can perform the following actions.

- **Used by**: Show which other monitoring objects use this library.
- **Clone**: Create a [clone](#)³¹⁹³ of this library.
- **Delete**: Delete this library.
- **Settings**: Open this library and change the [settings](#)³²⁴⁵ of the library and its nodes.

Hover over  and select **Add Library** from the menu to add a new library.

Please also see [Working with Table Lists](#)²³⁷. Additionally, the multi-edit functionality is available. This enables you to change properties of several objects simultaneously via bulk changes. For more details, see the [Multi-Edit Lists](#)³¹⁹⁷ section.

Working with Libraries

For detailed information on how to create and edit libraries, see the following sections.

- [Libraries Step By Step](#)³²³⁸
- [Management](#)³²⁴²
- [Libraries and Node Settings](#)³²⁴⁵
- [Context Menus](#)³²⁵¹

Video Tutorial: PRTG Network Monitor - Libraries

- <https://www.paessler.com/support/videos/prtg-basics/libraries>

8.9.1 Libraries Step By Step

In order to create a new library, follow the steps in this section. In the web interface, click on the **Libraries** entry in the main menu to show the libraries main screen.

 This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

In this section:

- [Step 1: Add Library](#)  3238
- [Step 2: Add Library Nodes](#)  3238
- [Step 3: Set Library Node Display Settings](#)  3239
- [Step 4: View](#)  3240

Step 1: Add Library

- Hover over  and select **Add Library** from the menu to add a new library. An assistant is shown.
- Enter a **Library Node Name**.
- Define **Security Context**, **Tags** and **Access Rights** if you like.
- Click **Create**.

 For detailed information, see [Libraries Settings](#)  3245 section.

Step 2: Add Library Nodes

Click the **Management** tab. You will see a split screen:

- On the left side, your library is shown (empty in the beginning).
- On the right side, you see your device tree, as known from the device tree's [Management](#)  3229 tab.

Bandwidth Library in Management Mode

From the device tree on the right side, drag objects and drop them on the library on the left side. Each dropped object will be added immediately as a new **Library Node**. Repeat this procedure as often as you wish until you have added all desired items to the library.

- ❗ When adding single sensors to the library, there can only be one sensor in one library node.
- ❗ Library nodes can contain up to 1,000 sensors.

You can also create nested library nodes by adding a new node underneath an existing one or to a group.

Drag and drop nodes within the library to change their position. If you want to change the monitoring object that is associated with a library node, you can change the **Linked Object** in the node's settings.

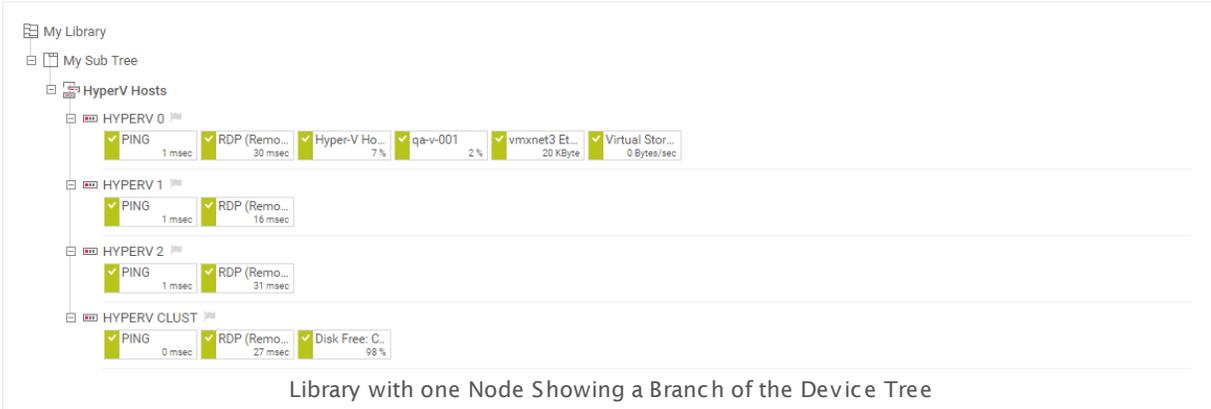

Step 3: Set Library Node Display Settings

You are still in the library **Management** tab.

Right-click the name of a **Library Node** and from the context menu, select **Edit | Settings...** to change the **Node Display Settings**. In this dialog, you can change the name of the library and its tags, as well as the linked object, node type, and filters.

These settings are available for each library node. You can choose to either show the **Linked Object** as a sub-tree of your device tree, or to view a collection of all sensors underneath the **Linked Object**.

When selecting the sub-tree view, the library node will just look like a branch in your device tree, as shown in the screenshot below for the library node named "My Sub Tree".

When selecting a sensor collection view, only the sensors underneath the **Linked Object** are shown, omitting probes, groups, and devices. You can additionally filter by certain sensor **Type**, **Status**, and **Tags**. Only matching sensors will be shown. The screenshot below shows the same **Linked Object** as above, but in sensor collection view, additionally filtered for sensors with a **bandwidthsensor** tag.

For detailed information, see [Libraries and Node Settings](#) (Overview—Library Node Display Settings) section.

Step 4: View

Click the **Overview** tab to see the final appearance of your library. You have the following options:

- Hover over an object to view a popup window with recent monitoring and status data.
- Use the sensor status selection bar to select which sensors you want to see for the library: Simply remove check marks for sensor states you want to hide.
 - ⓘ This function is the same you know from the device tree's [sensor status bar](#). The setting is reset the next time you open the library.

- Use the **Device Tree View** selection in the [page header bar](#)¹⁸⁵ to change the size of the library display.
 - ❗ This function is the same you know from the [device tree](#)¹⁸⁷.
- Use the **Search** box in the [page header bar](#)¹⁸⁵ to search the library for a string in object names. Matching objects will be shown full-colored, all others will be grayed out while the filter is active. Click the small x symbol in the search field to reset the filter.
 - ❗ This function is the same you know from the [device tree](#)¹⁸⁵.

It depends on the library's access rights and the currently logged in user account if it will be visible to other PRTG users. Also, clicking objects in the library (for example, sensors) will lead to more detailed information about the object or to an error message indicating insufficient access rights—depending on user account and access rights.

 In libraries, you can right-click objects to access the [Context Menus](#)³²⁵ of nodes and the library itself. You can also set up notifications to entire libraries, see our example chapter [here](#)³²⁹

More

Video Tutorial: Libraries in PRTG

- <https://www.paessler.com/support/videos/prtg-basics/libraries>

8.9.2 Management

i This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

Click the **Management** tab. You will see a split screen:

- On the left side, your library is shown (empty in the beginning).
- On the right side, you see your device tree, as known from the device tree's [Management](#) tab.

The screenshot displays the PRTG Network Monitor Management interface. The top navigation bar includes tabs for Overview, Management (selected), Settings, Notification Triggers, Comments, and History. Below the navigation bar, there are statistics: 55 errors, 105 warnings, 1640 OK, and 20 critical (of 1820 total). The main area is split into two panels:

- Left Panel (Library):** Titled "Library All bandwidth sensors". It shows a list of sensors categorized by type (e.g., Local Area, Ethernet-WFP Native, Ethernet-Traffic). At the bottom, there are buttons for "Add Library Node" and "Add Group".
- Right Panel (Device Tree):** Titled "Root". It shows a hierarchical tree of devices and their associated sensors. The tree includes:
 - Local Probe: Core Health (100%), Probe Heal... (100%), System He... (100%), Common S... (100%), Disk Free (79%), Intel[R] 825... (445 kbit/s), and SNMP CPU...
 - Network Discovery: HTTP (151 msec)
 - Network Infrastructure: Gateway: gw (PING: 0 msec, HTTP: 93 msec)
 - DNS/DHCP/ADS: PING (1 msec), RDP (Rem...) (15 msec), DNS (4 msec), CPU Load (3%), Memory (83%), Disk Free (71%), Pagefile Us... (0%), Uptime (9 d 12 h), Gigabit-Net... (1,672 kbit/s), Disk IO_To... (<1%), Disk IO 0 C... (<1%), Volume IO ... (70%), and Volume IO ... (16%)
 - Exchange: PING (1 msec), SSL Certifi... (1,501), SSL Certifi... (1,501), SSL Securi... Weak Proto... (1,501), HTTPS (94 msec), RDP (Rem...) (15 msec), IMAP (11 msec), POP3, SMTP, and CPU Load

At the bottom of the screenshot, the text "Bandwidth Library in Management Mode" is displayed.

Add and Change Library Nodes

From the device tree on the right side, drag objects and drop them on the library on the left side. Each dropped object will be added immediately as a new **Library Node**. Repeat this procedure as often as you wish until you have added all desired items to the library.

i When adding single sensors to the library, there can only be one sensor in one library node.

i Library nodes can contain up to 1,000 sensors.

You can also create nested library nodes by adding a new node underneath an existing one or to a group.

Drag and drop nodes within the library to change their position. If you want to change the monitoring object that is associated with a library node, you can change the **Linked Object** in the node's settings.

Set Library Node Display Settings

Right-click the name of a **Library Node** and from the context menu, select **Edit | Settings...** to change the **Node Display Settings**. In this dialog, you can change the name of the library and its tags, as well as the linked object, node type, and filters.

These settings are available for each library node. You can choose to either show the **Linked Object** as a sub-tree of your device tree, or to view a collection of all sensors underneath the **Linked Object**.

When selecting the sub-tree view, the library node will just look like a branch in your device tree, as shown in the screenshot below for the library node named "My Sub Tree".

Library with one Node Showing a Branch of the Device Tree

When selecting a sensor collection view, only the sensors underneath the **Linked Object** are shown, omitting probes, groups, and devices. You can additionally filter by certain sensor **Type, Status, and Tags**. Only matching sensors will be shown. The screenshot below shows the same **Linked Object** as above, but in sensor collection view, additionally filtered for sensors with a **bandwidthsensor** tag.

Library with one Node Showing a Collection of Bandwidth Sensors Only

📘 For detailed information, see [Libraries and Node Settings](#) ³²⁴⁵ (Overview—Library Node Display Settings) section.

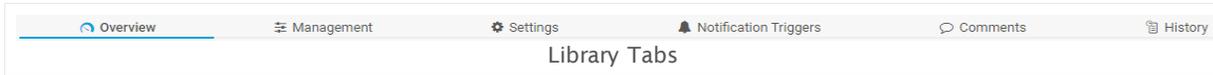

Context Menus

On right-click, there are different context menus available—in the **Management** as well as in the **Overview** tab.

 For detailed information, see [Context Menus](#)³²⁵¹ section.

8.9.3 Libraries and Node Settings

Using the libraries tabs you can access all functionalities and settings for a library.

Overview

Click the **Overview** tab any time to show the current state of your library.

Library Node Display Settings

While in the **Overview** tab, click the name of a **library node** to change its settings. Or, while in the **Management** tab, right-click a library node's name and select **Edit | Settings...** from the context menu. In both cases, the following settings are shown.

-  You can only change the settings of a node if it already contains monitoring objects like groups, devices, or sensors.

BASIC LIBRARY NODE SETTINGS

Library Node Name	Enter a meaningful name for the library node.
Security Context	<p>Define the security context for the Overview tab of the library. Choose a PRTG user account to define which objects will be visible. All users with access to the library will see the same content in this library as the security context user will see.</p> <p> Only sensors that are visible in the library will trigger a library notification.</p>
Tags	<p>Enter one or more tags, separated by space or comma. For example, you can use tags later to search for the library. Tags are not case sensitive.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>

NODE DISPLAY SETTINGS

Linked Object	Click the reading-class symbol to change the object that is linked to this library node. The Object Selector ^[240] will appear.
Node Type	<p>Select what you want to view for this library node. Choose between:</p> <ul style="list-style-type: none">▪ Show a subtree of the device tree in the library: View all objects underneath the linked object as a device tree.▪ Show a collection of filtered sensors in the library (max. 1000): View all sensors underneath the linked object (only sensors are shown). You can combine several filters with each other (see below). <p> The node can show up to 1,000 sensors, surplus sensors are discarded.</p>
Filter By Type	<p>This option is only visible if collection of sensors is enabled above. Select if you want to filter the sensor list by a certain type. Choose between:</p> <ul style="list-style-type: none">▪ Show all sensor types: Do not filter for a sensor type.▪ Show specific sensor types only: Filter the sensor list of the linked object for certain sensor types. <p> This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.</p>
Select Sensor Types	<p>This option is only visible if filtering by type is enabled above. A list of all sensor types is shown, currently available sensor types are shown in bold letters for your convenience.</p> <p>Set a check mark in front of each sensor type you want to include in the library node view. You can also select and deselect all items by using the check box in the table head.</p> <p> This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.</p> <p> You cannot filter for sensor types that are defined in PRTG Mini Probes.</p>
Filter By Status	<p>This option is only visible if collection of sensors is enabled above. Choose between:</p> <ul style="list-style-type: none">▪ Show all sensor states: Do not filter for a sensor status.

NODE DISPLAY SETTINGS

	<ul style="list-style-type: none"> ▪ Show sensors with a specific status only: Filter the sensor list of the linked object for sensors in certain states.
Select Sensor States	<p>This option is only visible if filtering by sensor state is enabled above. A list of sensor states is shown. Set a check mark in front of each status you want to include in the library node view. Choose from:</p> <ul style="list-style-type: none"> ▪ Unknown ▪ Up ▪ Warning ▪ Down ▪ Paused ▪ Unusual ▪ Down (Acknowledged) ▪ Down (Partial) <p>You can also select and deselect all items by using the check box in the table head.</p> <p> This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.</p>
Filter By Tags	<p>This option is only visible if collection of sensors is enabled above. Choose between:</p> <ul style="list-style-type: none"> ▪ Show all sensor tags: Do not filter for a tag. ▪ Show objects with specific tags only: Filter the sensor list of the linked object for sensors with a certain tag¹³⁹. <p> The tag of a sensor can also be inherited¹³⁷ by a parent object.</p>
Select Tags	<p>This option is only visible if collection of sensors is enabled above. Enter one or more tags¹³⁹ of sensors that you want to include in the library node view. You can also use plus (must have) and minus (must not have) signs to categorize tags, for example, +snmp;-wmi (must have the tag snmp and must not have the tag wmi).</p> <p> This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.</p>

NODE DISPLAY SETTINGS

Filter By Priority

This option is only visible if collection of sensors is enabled above. Choose between:

- **Show all priorities:** Do not filter for the [priority setting](#)³²⁴² of a sensor.
- **Show objects with specific priority only:** Filter the sensor list of the linked object for sensors with specific priority.

 The priority setting of a group, device, or sensor is ignored here; only the priority setting of the sensor itself is regarded.

Select Priority

This option is only visible if collection of sensors is enabled above. Define which priority setting sensors must have to appear in this collection. Set a check mark in front of each priority you want to include in the library node view. Choose from:

- ***** (highest)
- *****
- ****
- ***
- **
- * (lowest)

 This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.

Click **OK** to store your settings. If you close the dialog box via the **X**, all changes to the settings will be lost!

 After applying filters it might take several seconds for the changes to become visible. This is due to internal filter processes running in the background.

Management

Click the **Management** tab to edit the contents of your library, for example, to add items to the library using drag&drop.

 For more details, see section [Management](#)³²⁴².

Settings

Click the **Settings** tab to open a library's general settings.

BASIC LIBRARY SETTINGS

Library Name	Enter a meaningful name for the library.
Tags	Enter one or more tags ^[139] , separated by space or comma. For example, you can use tags later to search for the library. Tags entered here are inherited ^[137] to all library nodes underneath. Tags are not case sensitive.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[338] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

 When giving access rights to a user group, all members of this user group will be able to see the objects in the library just as seen by the user who originally created the library.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Notification Triggers

You can define notification triggers for any kind of object libraries. This is even possible for dynamic libraries, which can change with every scanning interval, for example, when you filter a library for the sensor status or priority.

 For details about how to use notifications, see section [Notifications](#) .

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the name of the PRTG user who made the change, and a message. The history log retains the last 100 entries.

Delete

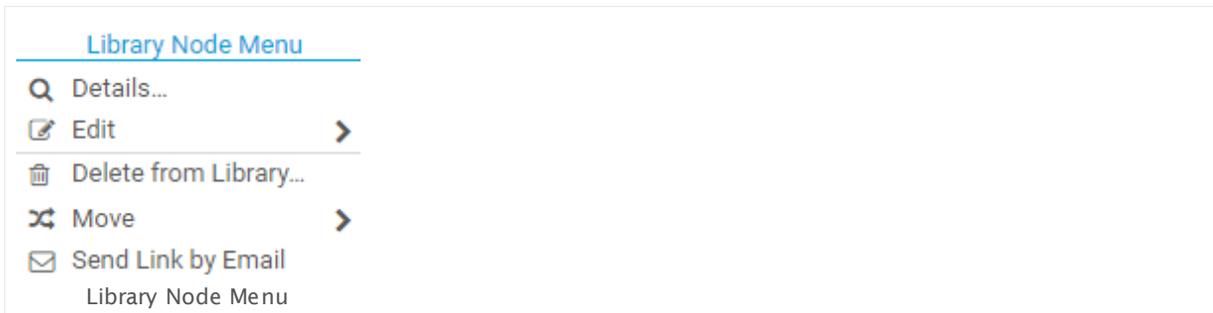

You can delete the entire library any time, simply right-click a library's name and select **Delete...** from the context menu.

8.9.4 Context Menus

On right-click, there are different context menus available.

Library Node Menu

While in the **Overview** tab or the **Management** tab of a library, right-click any library node to show its context menu.

- Select either **Details...** or **Edit | Settings...** to get to the [Libraries and Node Settings](#)³²⁴⁵.
 ⓘ While on the **Overview** tab, these settings are also accessible via left-click on the node's name.
- **Edit | Rename...** will give you an option to rename the library node quickly.
- **Delete from Library...** will remove this library node from the current library.
 ⓘ This will not delete any objects in your device tree.
- The **Move | ...** options will move the library node up and down within the library.
- Select **Send Link by Email** to open a new email using your system's standard email client. It will contain a direct link to the page you're currently viewing.

Monitoring Objects Menus

In libraries are the same [Context Menus](#)²⁴⁷ available you already know from the device tree. With one exception: While accessing these menus within libraries, the **Move** and **Delete** options are disabled to avoid accidental changes to your device tree.

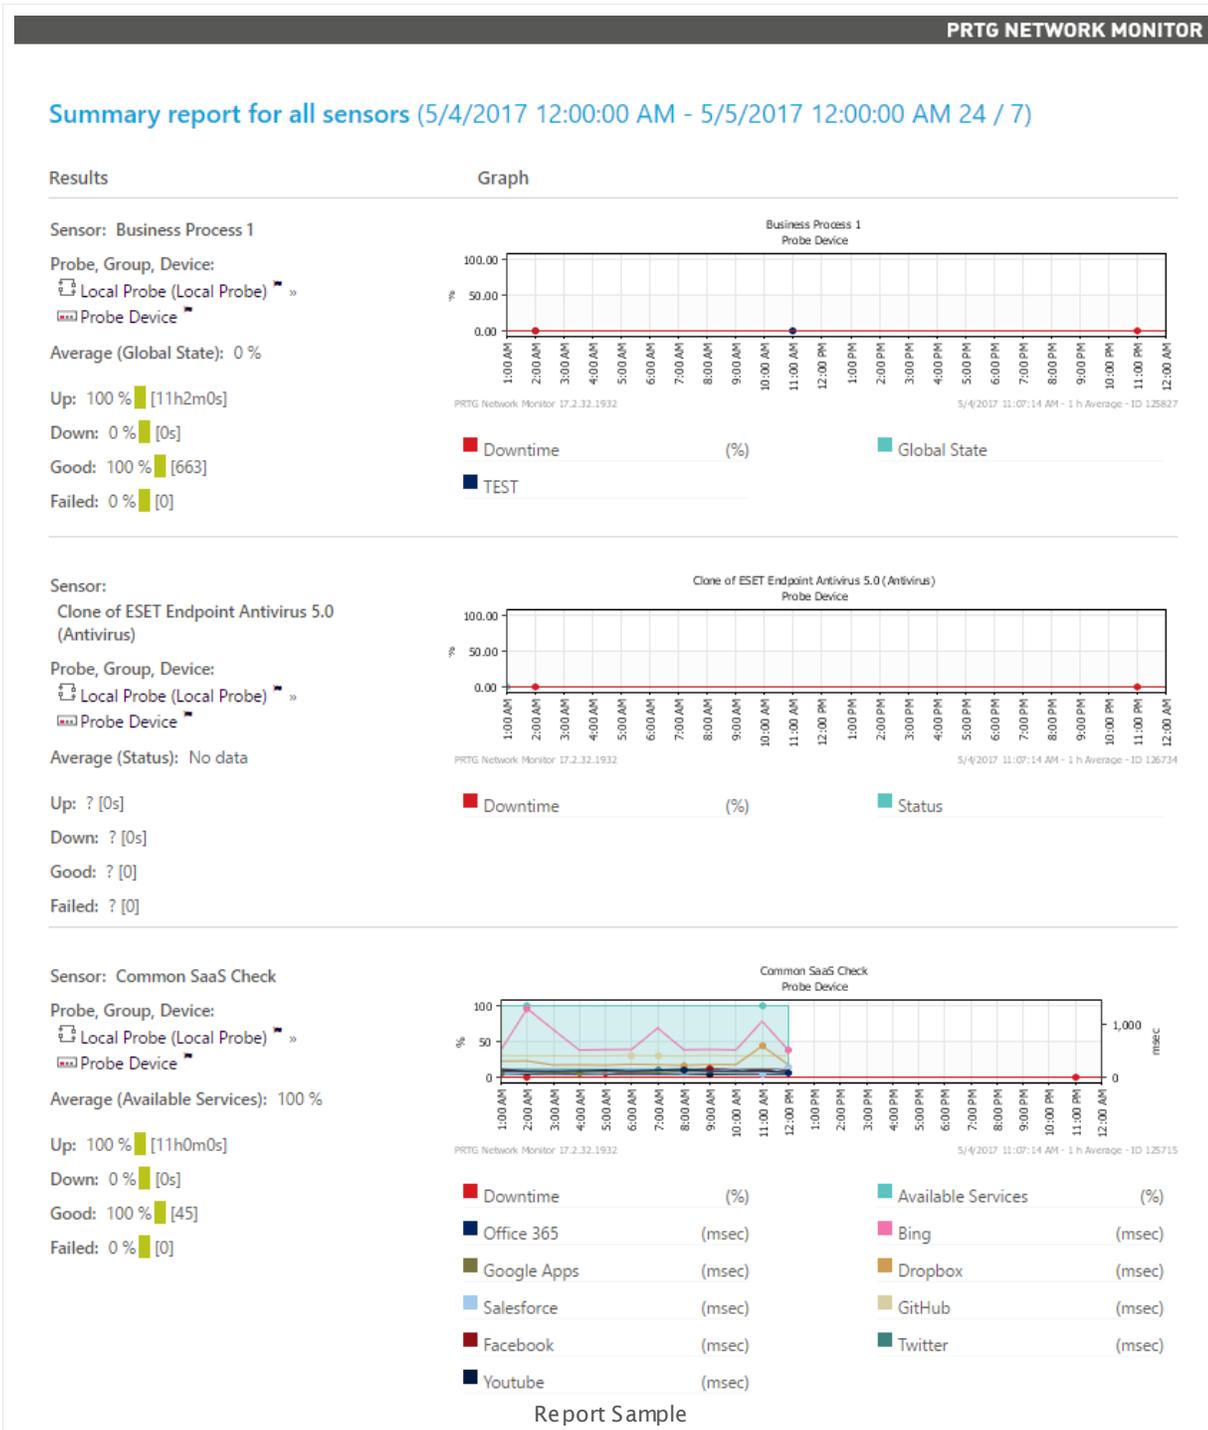

8.10 Reports

You can use reports to analyze historic monitoring results over a specified time such as one or more days, one month, or an entire year, and for your system configuration. You can create reports for all or only for certain sensors.

Introduction

PRTG includes a powerful reporting engine for the ad-hoc as well as scheduled report generation in HTML, PDF, CSV, and XML format. This means that you can run reports on demand or on a regular basis (for example, once a day or once a month). Furthermore, you can create reports for a single sensor or for a whole range of sensors. It is also possible to [create HTML reports of your system configuration](#)³²⁵².

The content and layout of the report is controlled by the report template of your choice and is the same for all sensors in a report. The report time that is shown in data tables and data graph legends depends on the system time of your PRTG core server, not on the [timezone settings](#)³³⁸⁰ of the current user account.

The sample report above shows the report data for devices on a local probe. You can see graphs for the preceding week, plus data tables with numeric results.

Start Reports

Click **Reports** in the [main menu](#)²⁷¹ to view or add reports of your monitoring data. Hover over **Reports** to show other menu items. Choose between:

REPORTS

- All Open the **Reports** overview page where you can view or add reports of your monitoring data.
- Add Report Open an assistant to directly [add](#)³²⁵⁷ a new report.
- Select Report > Open an existing report. Point to **Select Report** to show other menu items. Follow the menu path (it is specific to your setup) to select a report.
- Configuration Reports > Create reports for maps, reports, users & user groups, and system configuration to document changes to the configuration. Point to **Reports | Configuration Reports** to see the [available configuration reports](#)³²⁵⁶.

List of Reports

In the **All** view, you see a list of all existing reports for monitoring data. Every section shows information about one report:

- **Object**: Shows the name of the report.
- **Template**: Shows the name of the template that this report uses.
- **Security Context**: Shows the user account that PRTG uses to run the report.
- **Period**: Shows the time span that the report covers.

- **Schedule:** Shows if you set a schedule to regularly execute the report automatically.
- **Email:** If you set a schedule **and** an email address in the report settings, this shows the email address to which PRTG sends the report automatically.
- **Status:** Shows the current status of the report.
- **Next Run:** If you set a schedule in the report settings, this shows when PRTG runs the report the next time.
- **Last Run:** If you set a schedule in the report settings, this shows when PRTG ran the report the last time.
- **Number of Sensors in Last Run:** Shows about how many sensors the report includes data.

Please also see [Working with Table Lists](#)²³⁷. Additionally, the multi-edit functionality is available. This enables you to change properties of several objects simultaneously via bulk changes. For more details, see the [Multi-Edit Lists](#)³¹⁹⁷ section.

Hover over  and select **Add Report** from the menu to add a new report, or click the name of an existing report to view and edit its settings. You can also run a pre-configured report easily by clicking its name and then using the options in the **Run Now** tab.

 For both options, see the [Reports Step By Step](#)³²⁵⁷ section.

 You can only [run configuration reports](#)³²⁵⁴ via the main menu.

Working With Reports

For detailed information on how to create, edit, and schedule reports, see the following sections:

- [Reports Step By Step](#)³²⁵⁷
- [View and Run Reports](#)³²⁶¹
- [Report Settings](#)³²⁶⁵

Automatic Averaging

For performance reasons, PRTG automatically averages monitoring data when calculating data for large time spans. Data is then averaged regardless of the selected average interval.

TIME SPAN IN REPORT	MINIMUM LEVEL OF DETAIL (AVERAGE INTERVAL)
Up to 40 days	Any
40 to 500 days	60 minutes/1 hour or larger

Reports for time spans of more than 500 days are not possible. If you enter a longer time span, it will automatically be shortened to 365 days.

 Under certain circumstances, the resulting report may contain a time span that differs to the defined start and end date because of internal averaging processes. When averages are greater than 1 hour and they do not equal 24 hours and they are combined with certain time spans, it might happen that resulting datapoints are asynchronous to the time spans. Please especially consider this behavior when you use [API](#)³⁶⁰⁶ calls to generate reports.

Configuration Reports

Configuration reports are a special type of reports and show the current PRTG configuration. They are available for **Maps**, **Reports**, **Users & User Groups**, and **System Configuration**. PRTG generates configuration reports and displays them in a new browser window as an HTML page in the common PRTG report style (like, for example, [Historic Data Reports](#)²⁰⁴ of sensors). You can use configuration reports, for example, to file and document changes to the configuration of your PRTG installation.

Configuration reports contain the same information as you can see on the overview pages of [Maps](#)³²⁷⁸, [Reports](#)³²⁵², as well as on the system administration tabs [User Accounts](#)³³⁷⁶ and [User Groups](#)³³⁸³. The configuration report **System Configuration** includes the current system administration settings of the tabs [User Interface](#)³³⁴³, [Monitoring](#)³³⁵⁵, [Notification Delivery](#)³³⁶¹, [Core & Probes](#)³³⁶⁸, and [Cluster](#)³³⁹⁴.

 Configuration reports are interactive so you can click available links to go to the corresponding webpage in the PRTG web interface.

8.10.1 Reports Step By Step

To create a new report or to run an existing one, follow the steps in this section. In the PRTG web interface, click the **Reports** entry in the main menu to show the reports main screen.

 This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

Quick Start: Run an Existing Report

PRTG is delivered with several pre-configured reports. To use one of them, click a report's name in the reports main screen and select the **Settings** tab. The next steps are the same as for completely new reports. Although some settings are already given, we recommend that you check them. For example, check the sensors that are included in the report. For some reports that come with PRTG, there are no sensors added yet. Continue with [Step 3: Define Additional Options](#)³²⁵⁹ in this section.

Step 1: Add Report

Hover over  and select **Add Report** from the menu to add a new report. An assistant appears where you can define various settings. First, enter a meaningful **Report Name**.

Add Report Assistant

Step 2: Select a Template

In the **Template** option, select one of the report templates from the list. This defines the overall look of your report and how detailed (regarding the intervals) monitoring data is included. If you are not sure yet, try a template that appears most suitable to you. You can still change all settings later.

 For a detailed description of the available template options, see section [Report Settings](#) .

Step 3: Define Additional Options

Select a **Security Context** (best choose **PRTG System Administrator**, if available), your **Timezone**, and the **Paper Size** for PDF generation.

 For detailed information, see section [Report Settings](#) .

Step 4: Select Nodes and Sensors

Choose the sensors you want to include in the report. When running a [cluster](#) , define the **Cluster Node** the monitoring data is taken from first. Select a specific node from the list. If you select **All nodes**, PRTG creates a report with data from all of your cluster nodes, but only the primary channel of every sensor appears in the report.

Every report shows monitoring results based on sensor data. There are two ways to include sensors in a report: You can either add sensors manually or by tag. In the **Include Sensors by Tag** field, enter one or more tags that match the sensor range you want a report for.

For example, enter the tag **bandwidthsensor** to include all sensors that measure bandwidth (or select it from the list of tags that PRTG suggests). PRTG provides this tag by default when you add any bandwidth sensor, so the tag typically gathers all bandwidth sensors, unless you configured your system differently. You can enter several tags. Hit the enter key, or insert a comma or space after each tag and enter the next one. Use the **Filter Included Sensors by Tag** field to explicitly filter sensors with certain tags from the bulk of tags or manually selected sensors defined above.

Tagging is a great option to group sensors or other objects. For more information, see the [Tags](#)  section. You can also leave the tag fields empty and only choose specific sensors manually later.

Step 5: Decide on a Schedule and Additional Settings

In the **Report Schedule** section, choose if you want to run the report on a regular basis or on demand only. Also define which time **Period** will be covered by the report, if you want to show percentiles, if you want to generate CSV and XML data files for reports with data tables, and add report comments or special access rights.

 For detailed information, see the [Report Settings](#)  section.

 Scheduled reports are not executed on [failover nodes](#)³⁷²⁰ by default.

Save your settings. If you leave the current page, all changes to the settings will be lost!

Step 6: Check and Adjust the Sensors Included

After saving the settings, switch to the **Sensors Selected by Tag** tab to see a list of all sensors that you added with the tag(s) you defined in step 4. To change tags, go back to the **Settings** tab. You can additionally add sensors manually. To do so, switch to the **Select Sensors Manually** tab. The final report shows sensors from both manual and by tag selection.

 See section [Report Settings](#)³²⁷⁵ for detailed information and mind the [Remarks for Reports](#)³²⁶³.

Step 7: Run Report

Switch to the **Run Now** tab, select a period, and in the **Processing Options** select **View Report as HTML**. Click the **Run Report** button. PRTG generates the report in a new browser window or tab immediately. Depending on the number of selected sensors and the used template, it may take a few minutes until you see the report. If you do not want to wait, close the newly opened browser window or tab and select a PDF option in the **Processing Options**. Click the **Run Report** button again. The report is then generated in the background and you get a **ToDo ticket** or email once it is finished.

 For large PDF reports, PRTG automatically splits the output into separate files to avoid huge PDF files. You can change the number of sensors that PRTG includes into each PDF file by editing the report templates manually. For details, see this Knowledge Base article: [Can I change the number of PDFs created by a report?](#)

More

Knowledge Base: Can I change the number of PDFs created by a report?

- <https://kb.paessler.com/en/topic/11863>

8.10.2 View and Run Reports

In the PRTG web interface, click **Reports** in the main menu bar to show the reports main screen. Click a report's name to select it. Use the various report tabs to access all functionalities and settings for the selected report.

Click **Go to all reports** at the bottom of the page to return to the list of all **Reports**.

i This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

Run Now

On the **Run Now** tab you can execute a report immediately with the settings configured. Please mind the [Remarks for Reports](#).

RUN REPORT "[Name]"

Report for

Define the time span covered by the report. Choose between:

- **Current Period:** Use monitoring data of the current period. The actual time span depends on the report period type defined in the report's [settings](#). It can be today, this week, this month, or this year.
- **Previous Period:** Use monitoring data of the last period. The actual time span depends on the report period type defined in the report's [settings](#). It can be yesterday, last week, last month, or last year.
- **Select a Period:** Use monitoring data of a period other than current or previous. Select below.
- **Select Date Range Manually:** Define a custom time span for the monitoring data that will be used. Set start and end date below.

Date Range

This selection is only visible if you enable the period option above. From the list, select a data range for which PRTG will generate the report. The shown time spans depend on the available monitoring data and on the report period type defined in the report's [settings](#). It can be days, weeks, months, or years.

RUN REPORT "[Name]"

Start Date	This selection is only visible if you enable the date range option above. Define the begin of the time span for which PRTG will generate the report. Use the date time picker to enter the date and time. Make sure you define a valid period.
End Date	This selection is only visible if you enable the date range option above. Define the end of the time span for which PRTG will generate the report. Use the date time picker to enter the date and time. Make sure you define a valid period.
Quick Range	This selection is only visible if you enable the date range option above. Choose between different pre-defined ranges by simply clicking the desired range. Each click changes the Start and End Date fields above accordingly.

PROCESSING OPTIONS

File Format and Delivery	<p>Define how you want to view the report. Choose between:</p> <ul style="list-style-type: none">▪ View Report as HTML: Directly view the report in your web browser. PRTG loads it in a new browser window or tab.▪ Create and store PDF and data files (available for templates with data tables): Create a PDF file and, depending on the Data Files settings ^[3265] of the report, CSV and XML files of the report and store them. Once finished, you will find it in the Stored Reports tab and a To Do ticket ^[230] will be created. By default, PRTG sends out a notification email to the administrator in this case.▪ Create PDF and data files (available for templates with data tables), store them, and send by email: Create a PDF file and CSV and XML files of the report, store the files, and send them via email once finished. <p> CSV and XML data files are only generated for report templates that include data tables.</p> <p> To create PDF files, ensure the print spooler service is running on the system with your PRTG server.</p> <p> Certain special characters, for example, 4-byte unicode characters, may not be displayed correctly in PDF reports. As workaround, generate an HTML report and save it as PDF.</p>
--------------------------	--

PROCESSING OPTIONS

 When generating reports with Internet Explorer 11, we recommend that you use one of the PDF options for optimal results.

 For large PDF reports, PRTG automatically splits the output into separate files to avoid huge PDF files. You can change the number of sensors that PRTG includes into each PDF file by editing the report templates manually. For details, see this Knowledge Base article: [Can I change the number of PDFs created by a report?](#)

Target Email Address This setting is only available if you define above to send the report by email. Enter a valid email address to which PRTG will send the report.

 You can change the configuration for outgoing emails in the [System Administration—Notification Delivery](#) 3361 settings.

Compression This setting is only available if you define above to send the report by email. Define if you want to compress the attached report files before sending. Choose between:

- **Send files uncompressed:** PRTG will not compress the report files before they are sent by email but send the files in their original size.
- **Send all in one ZIP file:** PRTG will compress the report files to a ZIP file before they are sent by email.

Click the **Run Report** button to start report generation. Depending on the number of selected sensors, this may take a while. If you experience a long waiting time when generating HTML reports for immediate view, please consider using one of the PDF options. You can then view the report as soon as it has finished.

Remarks for Reports

- Any sensor graph in your report will only show channels that are enabled via the **Show in Graphs** option in the [Sensor Channels Settings](#) 3160.
- Reports show statistics for uptime (**Up** and **Down** in percent) and requests (**Good** and **Failed** in percent). Values between **5%** and **95%**, as well as **100%** and **0%**, are rounded to whole numbers without decimal places. Other values are shown with 3 decimal places.
- Due to rounding, the statistics in section **Sensor Status History** of the report might differ in a few seconds from the values in section **Uptime Stats**.
- Data reporting is limited to 5 requests per minute.
- Reports cannot show uptime or downtime data for the [Sensor Factory Sensor](#) 1720.

Part 8: Ajax Web Interface—Advanced Procedures | 10 Reports
2 View and Run Reports

- Create reports that include an appropriate amount of data. Reports may not work as expected if too many sensors with short scanning intervals have to be processed. Adjust your report size and time span that the report covers if necessary.

Stored Reports

In the **Stored Reports** tab you can view all PDF reports and data files created in the past. Click a name to open the report. Reports are stored until they are deleted according to the data purging settings of your PRTG configuration. You can set data purging limits for reports in the [System Administration—Core & Probes](#) settings.

Other Tabs

For all other tabs, see the [Report Settings](#) section.

8.10.3 Report Settings

In the PRTG web interface, click **Reports** in the main menu bar to show the reports main screen. Click a report's name to select it. Use the various report tabs to access all functionalities and settings for the selected report.

Click **Go to all reports** at the bottom of the page to return to the list of all **Reports**.

 This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

Run Now

On the **Run Now** tab you can execute a report immediately with the settings that you configured before.

 See section [View and Run Reports](#) ³²⁶¹ for details.

Stored Reports

On the **Stored Reports** tab you can view reports created in the past.

 See section [View and Run Reports](#) ³²⁶¹ for details.

Settings

Click the **Settings** tab to open the settings of a report. Please mind the [Remarks for Reports](#) ³²⁶³.

BASIC REPORT SETTINGS

Report Name	Enter a meaningful name to identify this report. The name of the report is used in reports lists ²⁷² and as headline of generated reports.
Tags	Enter one or more tags, separated by space or comma. For example, you can use tags later to search for the report. Tags are not case sensitive.

BASIC REPORT SETTINGS

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Template

Select a template for the report. The template defines the overall look of your report and in which detail (interval) the report shows monitoring data. PRTG includes several report templates out of the box. You can choose from templates in the following categories:

- **Data Table Only:** Create a report with data tables only. Choose from several intervals. Reports with this template also generate data files (CSV and XML) if set in the **Data Files** section of the report.
- **Graph Only:** Create a report with graphs only. Choose from several intervals. Reports with this template cannot generate data files (neither CSV nor XML).
- **Graph with Data Table:** Create a report with graphs and data table. Choose from several intervals. Reports with this template also generate data files (CSV and XML) if set in the **Data Files** section of the report.
- **List of Sensors:** Create a report in a compact sensor list style. This is available with and without graphs. Reports with this template cannot generate data files (neither CSV nor XML)
- **Top 100 Highest and Lowest:** Create a report with up to 100 objects with the highest and lowest average values. Choose from different intervals. Reports with this template cannot generate data files (neither CSV nor XML)
- **Top 10 Uptime/Downtime:** Create a report with up to 10 objects with the highest uptime and downtime each. You can choose between data in percent and hours. Reports with this template cannot generate data files (neither CSV nor XML)
- **Top 100 Uptime/Downtime:** Create a report with up to 100 objects with the highest uptime and downtime each. You can choose between data in percent and hours. Reports with this template cannot generate data files (neither CSV nor XML)

 Monitoring data within an interval is averaged. See also the comment on data averaging in the [Reports](#) (Automatic Averaging) section.

 For information on how to modify templates, see this Knowledge Base article: [How do I modify PRTG's report templates?](#)

BASIC REPORT SETTINGS

Security Context	<p>Define the user account^[3376] that you want to use for access to your monitoring data. The report only contains objects that the selected user^[158] is allowed to view.</p> <p>Choose a PRTG user from the list. The available users depend on your configuration. By default, this is the user that created the report. PRTG System Administrator users can change this setting.</p>
Timezone	<p>Define the time zone to use for all date-specific settings in this report (see below^[3271]). Choose a time zone from the list.</p>
Paper Size	<p>Define the paper size in which PDF reports are created. Choose between:</p> <ul style="list-style-type: none">▪ None: Do not specify a paper format. The size is set automatically.▪ A4: Use German DIN A4 format.▪ A3: Use DIN A3 format.▪ A2: Use DIN A2 format.▪ Legal: Use North American legal paper format.▪ Letter: Use North American letter paper format.▪ Ledger: Use North American ledger paper format.
Orientation	<p>Define the page orientation for the data in PDF reports. Choose between:</p> <ul style="list-style-type: none">▪ Portrait: Use portrait mode for the page orientation.▪ Landscape: Use landscape mode for the page orientation. The landscape format is designed to properly show data tables of sensors with many channels. Other parts of the report will remain in portrait mode and do not re-size to the landscape format.

SENSORS ("WHAT SENSORS WILL BE INCLUDED IN THE REPORT?")

Cluster Node	<p>This field is only visible when you run PRTG in Clustering^[130] mode. Define the cluster node from which the report will take monitoring data. Choose a cluster node from the list. The available options are specific to your configuration.</p>
--------------	---

SENSORS ("WHAT SENSORS WILL BE INCLUDED IN THE REPORT?")

By default, the current master node is set. Select **All nodes** to create a report with data from all of your cluster nodes.

- ❗ A report for all nodes includes data of the primary sensor channels only, not for other sensor channels. Be careful with big reports for all nodes because the report generation may slow down significantly.
- ❗ If you select a failover node, report and data files will not show data from the local probe or from a remote probe and might be empty or show "0" values.
- ❗ You can generate CSV and XML data files only for a single failover node. If you choose the option **All nodes**, the report will not create data files!

Add Sensors Manually If you want to manually choose the sensors included in this report, please save settings and switch to the [Select Sensors Manually](#) ³²⁷⁵ tab.

Include Sensors by Tag Define the sensors included in this report by [tag](#) ¹³⁹¹. Enter one or more tags. The report covers all sensors that have at least one of the tags. Please enter a string or leave the field empty.

You can also use plus (must have) and minus (must not have) signs to categorize tags, for example, **+snmp;-wmi** (must have the tag **snmp** and must not have the tag **wmi**). See the section [Tags](#) ¹³⁹¹ for details.

❗ [Tags are inherited](#) ¹³⁹¹ automatically. So, for example, if you enter the tag of a [group](#) ¹³⁴¹ here, the report will include all sensors within this group. For detailed information, see the [Inheritance of Settings](#) ¹³⁷¹ section. For sensors you add by tag, the report includes all sensor channels automatically, except if you run a PRTG [cluster](#) ¹³⁰¹ and select **All nodes** in the **Cluster Node** selection above.

Filter Included Sensors by Tag Filter the included sensors further. This option works best in combination with manually added groups and devices. From the sensors that are implicitly added because of their parent objects, the report includes only the ones with the tags you enter here.

Enter one or more tags to include sensors in the report. Confirm a tag with enter, space, or comma key. Please enter a string or leave the field empty.

You can also use plus (must have) and minus (must not have) signs to categorize tags, for example, **+snmp;-wmi** (must have the tag **snmp** and must not have the tag **wmi**). See the section [Tags](#) ¹³⁹¹ for details.

SCHEDULE

Report Schedule	<p>Define at which time you want to run the report. Choose between:</p> <ul style="list-style-type: none">▪ No schedule (run interactive/on-demand only): Only use the options on the Run Now tab to start generating this report manually.▪ Every full hour: Run this report every 60 minutes.▪ Every day at a specific hour: Run this report every 24 hours.▪ Every specific day of a week: Run this report every 7 days. Specify the day below.▪ Every specific day of a month: Run this report on a specific day every month. Specify below.▪ The day after a quarter is finished (i.e. at 1. April for the 1. January - 31. March Quarter): Run this report for every quarter of the year.▪ Every specific date: Run this report on a specific date every year. Specify below.
Specify Hour	<p>This setting is only visible if you select a specific hour above. From the list, select the hour you want to run the report at. PRTG automatically chooses a suitable time within this hour, usually at the beginning of it.</p>
Specify Day	<p>This setting is only visible if you select the day of week or day of month option above. From the list, select a day of week or a date of the month you want to run the report.</p> <p>If you select Last, the report will always run on the last day of the month, regardless of how many days the month has. If you select a date that does not exist in every month, for example, February 31st, PRTG will automatically run the report on the last day of this month.</p>
Specify Date	<p>This setting is only visible if you select the specific date option above. Enter a valid date in the format DD.MM., for example, 31.12. The report runs annually on this date.</p>
Scheduled Processing	<p>This setting is only visible if you select one of the schedule options above. Define what to do with a finished report. Choose between:</p>

SCHEDULE

- **Save report to disk and send it by email:** Create a PDF file and, depending on the [Data Files](#) ³²⁷³ setting, data files of the report, store it, and send it via email. You find the report in your emails and on the **Stored Reports** tab. Define an email address below.
- **Save report to disk only:** Create a PDF file and, depending on the [Data Files](#) ³²⁷³ setting, data files of the report and store it. Once finished, you find them on the **Stored Reports** tab. You receive also a [ToDo ticket](#) ²³⁰¹ from PRTG. By default, PRTG sends out a notification email to the administrator in this case.
- **Send report by email only:** Create a PDF file and, depending on the [Data Files](#) ³²⁷³ setting, data files of the report and send them via email once finished. With this option the report is not permanently stored in PRTG. Define an email address below.

 For large PDF reports, PRTG automatically splits the output into separate files to avoid huge PDF files. You can change the number of sensors that PRTG includes into each PDF file by editing the report templates manually. For details, see this Knowledge Base article: [Can I change the number of PDFs created by a report?](#)

 Certain special characters, for example, 4-byte unicode characters, may not be displayed correctly in PDF reports. As workaround, generate an HTML report and save it as PDF.

Email Address

This setting is only visible if you select a send by email option above. Enter a valid email address to which PRTG sends the report. To enter more addresses, separate them by comma. PRTG sends a message with all recipients in the "To" field of the email.

 You can change the configuration for outgoing emails in the [System Administration—Notification Delivery](#) ³³⁶¹ settings.

Send to User Group

This setting is only visible if you select a send by email option above. From the list, choose a user group to send an email with the report to all members of this group. You can edit user groups in [System Administration—User Groups](#) ³³⁶³.

 If you define individual email addresses (see field above) and a user group, PRTG will send the report to the individual email addresses as well as to the members of the selected user group. In both cases, PRTG will send one message with all recipients in the "To" field of the email.

Compression

This setting is only visible if you select a send by email option above. Define if PRTG will compress the attached report files before sending them out. Choose between:

SCHEDULE

- **Send files uncompressed (default):** PRTG sends the report files by email in their original size.
- **Send all in one ZIP file:** PRTG will compress the report files to a ZIP file before they are sent by email.

PERIOD

Reported Period	Define the time span the report covers. Choose between: <ul style="list-style-type: none">▪ Current: Use monitoring data of the current period. Define the period type below.▪ Previous: Use monitoring data of the last period. Define the period type below.
Report Period Type	Define the type of period you want to create a report for. Choose between: <ul style="list-style-type: none">▪ Day▪ Week▪ Month▪ Quarter (January-March, April-June, etc.)▪ Year Depending on your selection, different period selections are shown below.
Day Period	This setting is only visible if you select day period type above. Define the hours when a day starts and ends. Choose from the list of hours. Default setting is 0:00-23:59 .
Week Period	This setting is only visible if you select week period type above. Define when the week starts and ends. Choose between: <ul style="list-style-type: none">▪ Monday-Sunday: A reported week starts on Monday.▪ Saturday-Friday: A reported week starts on Saturday.▪ Sunday-Saturday: A reported week starts on Sunday.
Month Period	This setting is only visible if you select month period type above. Define when the month starts and ends. Choose between:

PERIOD

- **1.-last day:** A reported month starts on the first and ends on last of the month.
- **15.-14.:** A reported month starts on 15th and ends on 14th of the month.

Year Period

This setting is only visible if you select year period type above. Define when the year starts and ends. Choose between:

- **1/1-12/31:** A reported year starts on January 1st.
- **7/1-6/30:** A reported year starts on July 1st.

Report only for specific hours-of-day (Schedule)

Include certain time spans within the defined period only. If a schedule is selected, the report will include only monitoring data for specified hours or weekdays within the defined period. Select **None** to include all available monitoring data in the report, or choose a schedule.

For example, select the schedule **Weekdays** to exclude all weekends from the report. The available schedules depend on your configuration.

 For more information, see the [Account Settings—Schedules](#) section.

INCLUDE PERCENTILES

Percentile Results

Define if you want to include an additional [percentile calculation](#)  of your data in the report. Choose between:

- **Do not show percentiles:** PRTG does not use a percentile formula to calculate your monitoring results. It will show only the standard values.
- **Show percentiles:** PRTG adds a column to the result data tables that shows percentiles for every sensor channel.

 Percentiles are not available for all report templates. If a template does not support percentiles, they will simply not show up in the report, even when you enable this setting.

Likewise, percentiles are not available in a cluster setup if you choose the option **All Nodes** in the **Cluster Node** setting in the sensor section above.

INCLUDE PERCENTILES

Percentile Type	<p>This setting is only visible if you select Show percentiles above. Enter the percentile type you want PRTG to use for the calculation. If you choose, for example, to calculate the 95th percentile, enter "95" here and 5 % of peak values will be discarded.</p> <p>Please enter an integer value.</p>
Percentile Average Interval	<p>This setting is only visible if you select Show percentiles above. Enter a value to define the averaging interval on which PRTG bases the percentile calculation. The default value is 300 seconds (5 minutes). This means that PRTG takes 5 minute averages as basic values for the percentile calculation. Please enter an integer value.</p>
Percentile Mode	<p>This setting is only visible if you select Show percentiles above. Choose the mode for percentile calculation:</p> <ul style="list-style-type: none">▪ Discrete: PRTG takes discrete values to calculate percentile results.▪ Continuous: PRTG interpolates between discrete values and bases the calculation on interpolated values.

DATA FILES

CSV / XML Files	<p>Define if you want to generate CSV and XML files for data tables in the report in addition to the PDF. Choose between:</p> <ul style="list-style-type: none">▪ Do not include data files: PRTG will not generate CSV or XML files for the report but only a PDF file.▪ Include CSV files only (available for templates with data tables): PRTG will generate and store CSV files in addition to the PDF. CSV data files are only generated if the report uses a template with data tables.▪ Include XML files only (available for templates with data tables): PRTG will generate and store XML files in addition to the PDF. XML data files are only generated if the report uses a template with data tables.▪ Include all data files (available for templates with data tables): PRTG will generate and store CSV and XML files in addition to the PDF. CSV and XML data files are only generated if the report uses a template with data tables.
-----------------	--

DATA FILES

 If you run PRTG in a cluster, the report will not generate data files if you select **All nodes** in the [sensors selection](#)³²⁶⁷ above. Please specify a single failover node to get data files.

REPORT COMMENTS

- Introductory Comment** Enter your custom text that will show up on top of the first page of your report. Please enter a string or leave the field empty.
- Final Comment** Enter your custom text that will show up below the last data table or graph on the last page of your report. Please enter a string or leave the field empty.

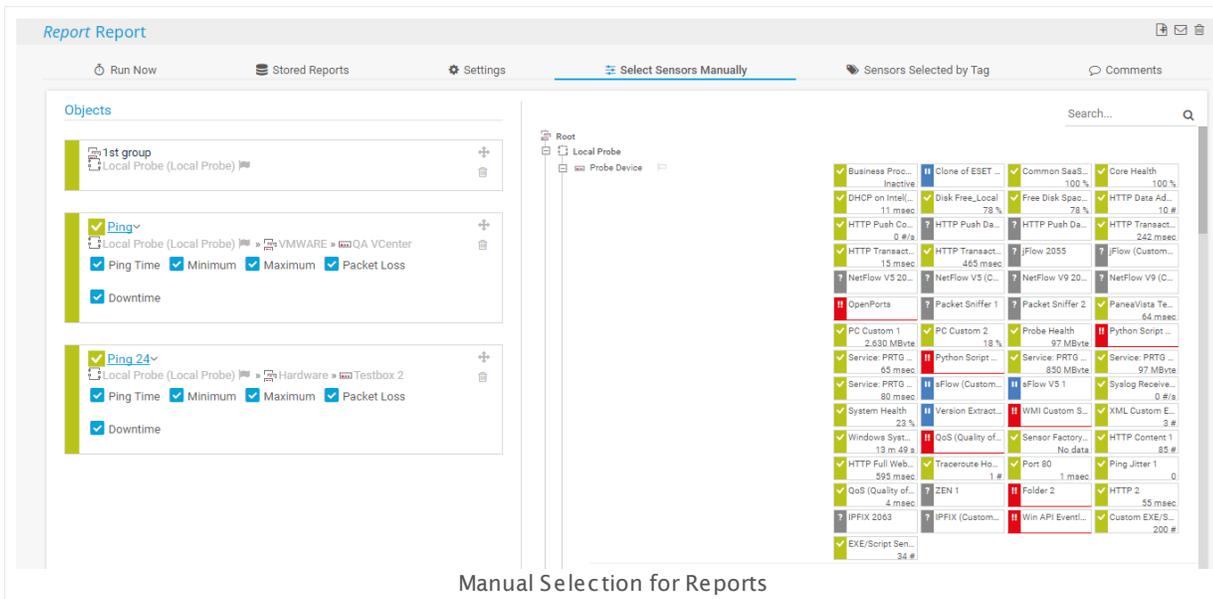

ACCESS RIGHTS

- User Group Access** Define which user group(s) will have access to the object that you are editing. A table with user groups and rights is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:
- **Inherited:** Use the settings of the parent object.
 - **None:** Users in this group cannot see or edit the object. The object does not show up in lists.
 - **Read:** Users in this group can see the object and review its settings.
 - **Write:** Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings.
 - **Full:** Users in this group can see the object, as well as review and edit its settings as well as edit access rights.
- You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Select Sensors Manually

Click the **Select Sensors Manually** tab to manually choose sensors that you want to include in the report. You see a split screen: On the left side, there is a list of objects that the report already contains (empty in the beginning), and on the right side, you see a less colorful view of your device tree, like on the [Management](#)^[329] tab in the device tree. You can add objects to the report using drag and drop.

▪ Add Items

From the device tree on the right side, drag objects and drop them on the list on the left side. You can add entire probes, groups, devices, or single sensors. Each dropped object is added as a new list item. Repeat this procedure as often as you wish until you have added all desired items to the report.

i The objects you drop on the left side are always added to the end of the list, you cannot add objects directly in another order.

▪ Select Sensor Channels

If you add a sensor to the selection, you can specify the sensor channels that the report will include. By default, all channels are selected. To exclude a channel from the report, remove the check mark in front of a channel name.

i If you run a PRTG [cluster](#)^[130], you can only choose between single channels if you select one specific **Cluster Node** in the report settings. If you select **All nodes** the report's **Cluster Node** setting, the channel selection is not available and the report contains only the primary channel of each sensor.

i All channels will be reselected when you move objects. We recommend that you change the order of the objects before you deselect sensor channels.

▪ Change Order

You can change the order of manually selected objects on the left side with drag and drop. Each item you add appears at the end of the list by default. To change the order, point to the drag and drop symbol (two arrows) in the upper right corner of a selected item, drag it to the desired position, and drop it there.

 All channels will be reselected when you move objects. We recommend that you change the order of the objects before you deselect sensor channels.

▪ Remove

To remove any objects from the report, click the trash can symbol next the respective list item, or select several list items while holding down the **Ctrl** key and click the green trash symbol appearing at the top of the list.

Your selection is saved automatically. There is no undo function. The final report will include both sensors selected manually and those selected by tag.

 **Permanently exclude a sensor channel from reports:** To avoid a reselection of channels when you change the object order, permanently exclude unwanted channels from the report.

1. Click the sensor name under **Objects** to open its **Overview** tab.
2. Open the [settings](#)^[3162] of the desired channel.
3. Choose option **Hide from Graphs** in section **Graph Rendering**.
4. Choose option **Hide from Tables** in section **Table Rendering**.
5. **Save** and the channel will not appear in the object selection nor in reports anymore. Note that the channel also will not appear in any other graphs or data tables using this option.

 You have to choose both hide options to not show a channel in the sensor selection of a report.

Sensors Selected by Tag

Click the **Sensors Selected by Tag** tab to view all sensors that are added to the report depending on the **Include Sensors by Tag** setting of the report. In the [table list](#)^[237], you see all sensors that you added to the report by their respective tags. This is for your information only, you cannot change sensors here.

However, you can switch to the **Settings** tab of the report and change the tags that the report uses to include sensors. Additionally, you can also exclude sensors with certain tags there. The final report will include both sensors selected manually and those selected by tag.

For sensors that you add by tag, all sensor channels are included in the report automatically, except you use a PRTG [cluster](#)^[130] and select **All nodes** in the **Cluster Node** selection of the report. In this case, the report includes only the primary channel of each sensor.

 The final report will include both sensors selected manually and those selected by tag.

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

8.11 Maps

With the **Maps** feature (some people might call this 'dashboards') you can create web pages with up-to-the-minute monitoring status information in a customizable layout. Using this unique concept, you can also make your overview pages of live data publicly available, if you like.

Example of a PRTG Map

In this section:

- [Introduction](#) ³²⁷⁸
- [Start Maps](#) ³²⁷⁹
- [Maps Overview](#) ³²⁷⁹
- [Maps Rotation](#) ³²⁸⁰
- [Maps in Home Menu](#) ³²⁸²
- [Working with Maps](#) ³²⁸²

Introduction

There are countless possibilities for the implementation of maps. For example, you can use this feature to:

- Create network maps with status icons for each device on the map.
- Create quick views of your network that can be shown on network operations center screens.
- Create a quick network overview for publishing on the Intranet, allowing at-a-glance information for management of other employees.

- Create a custom view of the most important sensors in your monitoring setup.
- Create Top 10 lists of the sensors of a specific group or device.

Technically, a map is a usual HTML web page. You can build a schema of your network by choosing from hundreds of device icons and connect them with lines. A map can consist of the following elements:

- A set of map items, which can include device icons, sensor status icons, graphs, data tables, lists of sensors, connection lines, geographical maps, or custom HTML code.
- An optional background image (a JPG, PNG, or GIF file, for example, your company logo, or a graphical view of your network).

You can also specify the size of the map. Using the AJAX-based map editor, you can place the items anywhere on the map, and you can also change their size. Each map has a unique URL that you can use to link to the map. Users who want to access the map either need an account in your PRTG installation, or can access a public URL of the map if you allow the **Public Access** feature. Public maps contain a unique **Map ID** access key in the URL to block unwanted visitors.

PRTG comes with a pre-configured standard map that you can use right away. You can also change or delete it, if you like. The map is automatically created when you install PRTG for the first time (visible for the [PRTG System Administrator](#)^[158] user):

- **Sample Dashboard:** By default, this map shows a graphical structure of your device tree, a list of [alarms](#)^[219], a [geo map](#)^[321], and more. This sample map has a 5***** [priority](#)^[242] so you can also open it under **Home** in the [main menu](#)^[263]. To not show it in the main menu, define a lower priority.

Start Maps

Click **Maps** in the [main menu](#)^[271] to view or add custom views of your network's status and monitoring data. **Hover** over **Maps** to show other menu items. Choose between:

MAPS	
All	Open the Maps overview page where you can view or add custom views of your network's status and monitoring data.
Add Map	Open an assistant to directly add ^[326] a new map.
Select Map >	Open an existing map. Hover over Select Map to show other menu items. Follow the menu path (it is specific to your setup) to select a map.

Maps Overview

In the **All** view, you see a list of all existing maps. Click the name of a map to view it. To add a new map, hover over  and select **Add Map** from the menu.

Click the **Edit** button for the following options:

- Click the **Map Rotation** button to rotate between maps.
- Click the **Clone** button to create an exact copy of this map. As soon as you click this, the map is cloned and the cloned map's settings are shown.
- Click the **Delete** button to remove this map.
- Click the **Settings** button to edit the map settings.

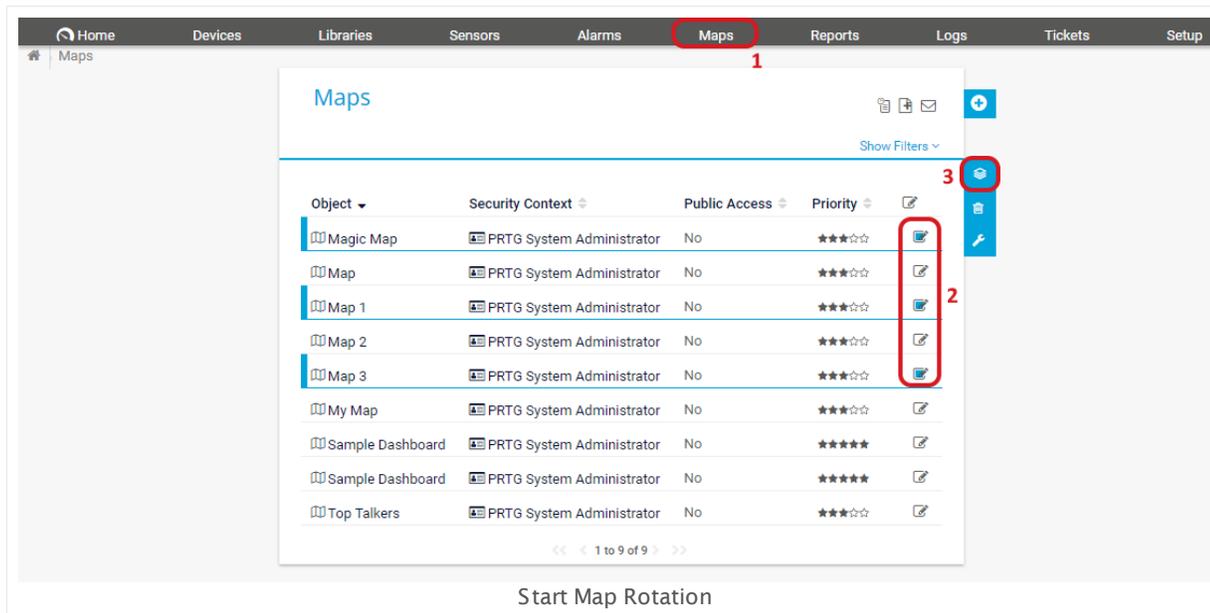

You can also define the [priority](#) of a map. Maps with a 5***** priority appear in the [main menu bar](#) under **Home** for direct selection (up to 10 entries). For details, see section [Maps in Home Menu](#).

Please also see [Working with Table Lists](#). Additionally, the multi-edit functionality is available. This enables you to change properties of several objects simultaneously via bulk changes. For more details, see the [Multi-Edit Lists](#) section.

Map Rotation

The Map Rotation feature in PRTG allows you to show several maps or dashboards rotating on one page. Map rotation makes it possible to show different information on one screen based on time. You can compare this with a slide show. Follow the steps below to configure your own map rotation.

1. Open the **Maps** overview page from the PRTG [main menu bar](#).
2. Select the maps that you want to rotate using the **Edit** buttons.
3. The [Multi-Edit](#) menu appears.
4. Click **Map Rotation** in the multi-edit menu.
5. That's all: PRTG will show the selected maps in rotation on a new page.
 This requires login credentials for PRTG.
6. You can change the time until a new map appears with the arrows symbol  in the lower right corner. Hover over the arrows symbol and choose between **10s**, **30s**, **60s** (seconds), **10m** (minutes), and **Refresh** now.

Public Map Rotation

You can also set up a **public map rotation** that you can use without login credentials. For this purpose, you have to create a custom URL that defines which maps will publicly rotate. The public map rotation URL has this format: the address of your PRTG server, followed by **/public/mapshow.htm?ids=**, followed by map IDs and secret keys.

1. Allow **public access** in the [settings](#) of the maps you want to rotate.
2. Find the map IDs and secret keys to add them to the URL that opens the public map rotation.
 - a. To find the ID of a map, open the map with your web browser. The map ID is included in the URL of the map as value of the parameter **id**, for example, `https://<yourprtgserver>/map.htm?id=2124`, where the number **2124** is the needed ID.
 - b. To find the secret key of a map, open the settings of the map, make sure you have selected a [public access option](#), and copy the entry of the **Secret Key** field.
3. Connect each map ID with the secret key of the same map using a colon, in this format: **mapid:secret key**
4. Add all IDs with their secret keys to the URL for the public map rotation. Separate each **mapid:secretkey** token from the next **mapid:secretkey** token with a comma.
5. The complete URL has this format: **https://yourprtgserver/public/mapshow.htm?ids=mapid1:secret key 1,mapid2:secret key 2,mapid3:secret key 3**
This is an example URL for public rotation of two maps:
`https://prtg.example.com/public/mapshow.htm?ids=9507:4049BEA1-B89C-4B5D-ACC4-3C8E00566EB8,9358:718D3CE1-DF00-4B92-AE8A-E0253B912C37`
6. Open the created URL with your browser and PRTG will start the public map rotation.
7. You can change the time until a new map appears with the arrows symbol in the lower right corner. Hover over the arrows symbol and choose between **10s**, **30s**, **60s** (seconds), **10m** (minutes), and **Refresh** now.

Maps in Home Menu

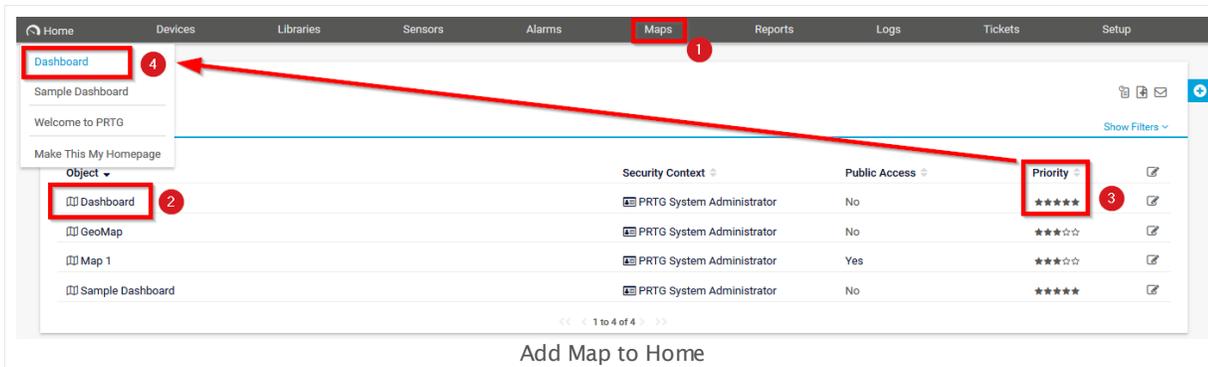

You can add any map to **Home** in the [main menu bar](#)^[263] of the PRTG web interface. This option gives you quick access to your most important maps.

If you open a map via **Home**, it will appear as **dashboard** without the [tabs](#)^[3297] that are available when opening a map via the **Maps menu**^[271]. In contrast to a map that you [open via URL](#)^[3285], your dashboard is embedded in the PRTG web interface with [global header area and page footer](#)^[181].

You can control whether a map appears in the **Home** menu via [priorities](#)^[242]. Every map with a 5***** star priority will appear as a single entry under **Home**. You can include up to 10 map entries in the **Home** menu.

1. Open the **Maps** overview via the PRTG [main menu bar](#)^[271].
 2. In the [table list](#)^[237], look for the entry of the map that you want to add to the **Home** menu.
 3. In column **Priority**, select 5***** stars for the desired map.
- ✔ The map will appear in the **Home** menu (manually refresh the page with **F5** to immediately see the changes).

❗ PRTG provides a sample dashboard in the **Home** menu by default. You can remove the sample dashboard and other, later defined dashboards from the menu by changing the priority to 4***** stars or lower.

Working with Maps

For detailed information on how to create and edit maps, and to learn how to make them accessible to others, see the following sections.

- [Maps Step By Step](#)^[3283]
- [Map Designer](#)^[3287]
- [Maps Other Settings](#)^[3297]

8.11.1 Maps Step By Step

To create a new map, follow the steps in this section. In the web interface, click **Maps** in the [main menu bar](#)³²⁸³ to show the maps main screen.

 This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

In this section:

- [Step 1: Add Map](#)³²⁸³
- [Step 2: Add Map Items](#)³²⁸⁴
- [Step 3: View and Share](#)³²⁸⁵
- [Create Advanced Maps](#)³²⁸⁵

Step 1: Add Map

Hover over  and select **Add Map** from the menu to add a map. An assistant appears. Enter a **Map Name** and define **Map Layout** settings (size and optionally a background image). In the **Public Access** section, define the accessibility to your map without login.

 For detailed information, see [Maps Settings](#)³²⁹⁷ section (Settings).

Add Map (Step 1 of 2)

< Cancel

No public access (map cannot be viewed without login)

Allow public access (map can be viewed by using a unique URL)

Allow public access, disable all links (map can be viewed by using a unique URL)

Create 

Add Maps Assistant Step 1

Step 2: Add Map Items

- Click the **Create** button to open the **Map Designer**.
- Select an object from the device tree on the left.
- **Drag&drop** an object from the items list on the right to the main window of the Map Designer.
- The item will immediately appear on the map.
- Define further properties of the item: mark it in the main window of the Map Designer and see section **Properties** on the right. **Save** your changes to the properties.

- Repeat this procedure as often as you wish until you have added all desired items to the map.
- Drag items to change their position. You can also draw connection lines between items and edit the properties of existing items.

 For detailed information, see [Map Designer](#)³²⁸⁷ section.

Step 3: View and Share

Click the **View Map** tab to see your map. If available for an object, you can click most object names as well as all sensors. It depends on the access rights of the object and the currently logged in user account if you can get more detailed information about the object or an error message indicating insufficient access rights.

Click the **Get HTML** tab to get the direct URL of your map that you can share with others. You can also [add your map as dashboard to the Home menu](#)³²⁸² of the PRTG web interface.

 For detailed information, see [Maps Settings](#)³³⁰⁰ section.

-  The single map items will refresh in the refresh interval you define for this map when viewing it. Hover over the arrows symbol in the lower right corner to define the interval.
-  Map objects of type **Data Tables**, for example, include entries according to the security context as defined in the [settings of the map](#)³²⁹⁷, but the table headings regard to the rights of the particular user account that views the map. Because of this, a user might see more objects in the table itself than denoted in the header.

Create Advanced Maps

PRTG Maps provide the possibility to publish data from various sources. Besides using the default map items you can create a completely individual map with desired data in any design. See the following articles for more details.

- **Adding External Information to PRTG Maps:** <https://kb.paessler.com/en/topic/9263>
Embed information from other sources than PRTG into your map using IFRAME or IMG, for example, weather and traffic maps or webcam images.
- **Map Rotation and Public Map Rotation:** [PRTG Manual: Maps](#)³²⁸⁰
Show several maps rotating on one page just like in a slide show.
- **Nest Maps:** <https://kb.paessler.com/en/topic/71833>
Display and link multiple maps within one map.
- **Accumulating Sensor Data with HTTP XML/REST Value Sensor:** <https://kb.paessler.com/en/topic/71932>
Display sensor data from various PRTG installations in a single map using the [HTTP XML/REST Value sensor](#)¹⁰⁹⁵.
- **Use your Own Images in PRTG Maps:** <https://kb.paessler.com/en/topic/8043>
Add any browser-compatible image to your map.
- **Adding and Customizing Map Objects:** <https://kb.paessler.com/en/topic/1703>
Create customized or completely new map objects.

Part 8: Ajax Web Interface—Advanced Procedures | 11 Maps
1 Maps Step By Step

- **Custom Map Objects for PRTG Maps:** <https://kb.paessler.com/en/topic/61263>
Find ready-to-use custom map objects and other map customizations.

- <https://www.paessler.com/support/videos/prtg-advanced/creating-maps>

8.11.2 Map Designer

Use the **Map Designer** to create a map web page representing your network.

i This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

In this section:

- [Use a Proper Browser](#)  3287
- [Basic Design Concept](#)  3287
- [Device Tree Selection](#)  3288
- [Properties Selection](#)  3290
- [Edit Existing Map Items—Properties Box](#)  3293
- [Edit Existing Map Items—Hover Icons](#)  3294
- [Edit Existing Map Items—Using Cursor Keys](#)  3294
- [Draw Connection Lines Between Items](#)  3294
- [Snap To Grid](#)  3295
- [Undo and Redo](#)  3296
- [More](#)  3296

Use the Proper Browser

Due to the map designer's extensive scripting capability, it is important that you use a compatible browser when editing maps. We recommend that you use Google Chrome 67 or later (recommended). You can also use Mozilla Firefox 61 or later, or Microsoft Internet Explorer 11. The map designer is **not** fully compatible with earlier versions of Internet Explorer or Opera browsers.

Basic Design Concept

Click the **Map Designer** tab to open the editor. It might take a few moments to load. Here, you can create your map by adding or changing items. The designer screen consists of three main parts: The **Device Tree** on the left side, the current **Map** in the middle, and the **Properties** on the right side.

Part 8: Ajax Web Interface—Advanced Procedures | 11 Maps 2 Map Designer

The screenshot displays the PRTG Network Monitor Map Designer interface. On the left is the 'Device Tree' with a search bar and a list of nodes including 'HQ (Local Probe)', 'AWS', 'Probe Device', and various sensors like 'Core Health', 'CPU Load Loc', 'Probe Health', 'System Health', 'Logins Failed', 'Windows Syst', 'Sensor Count', 'QoS One Way', 'Volume IO Tc', 'Volume IO C:', 'Volume IO Ha', 'PRTG user Lo', 'Planty 4 - Soil', 'Planty 1 - Soil', and 'Planty APAC'. The central map area features a large 'PRTG NETWORK MONITOR' logo, a donut chart titled 'Top 10: Most Used CPUs (Branch Office (Remote Probe))' with a value of 3525, and a central icon of a server rack labeled 'HQ (Local Probe)'. The donut chart is divided into segments representing different sensors. The 'Properties' panel on the right shows 'Default Icons A' and 'Default Icons B' with various icon sets, and a list of sensors including 'CPU Load', 'SNMP CPU Load', and 'System'. The interface also includes a 'View Map' button, 'Map Designer' tab, 'Settings', 'Get HTML', 'Comments', and 'History' options.

Each map item takes attributes from both selections.

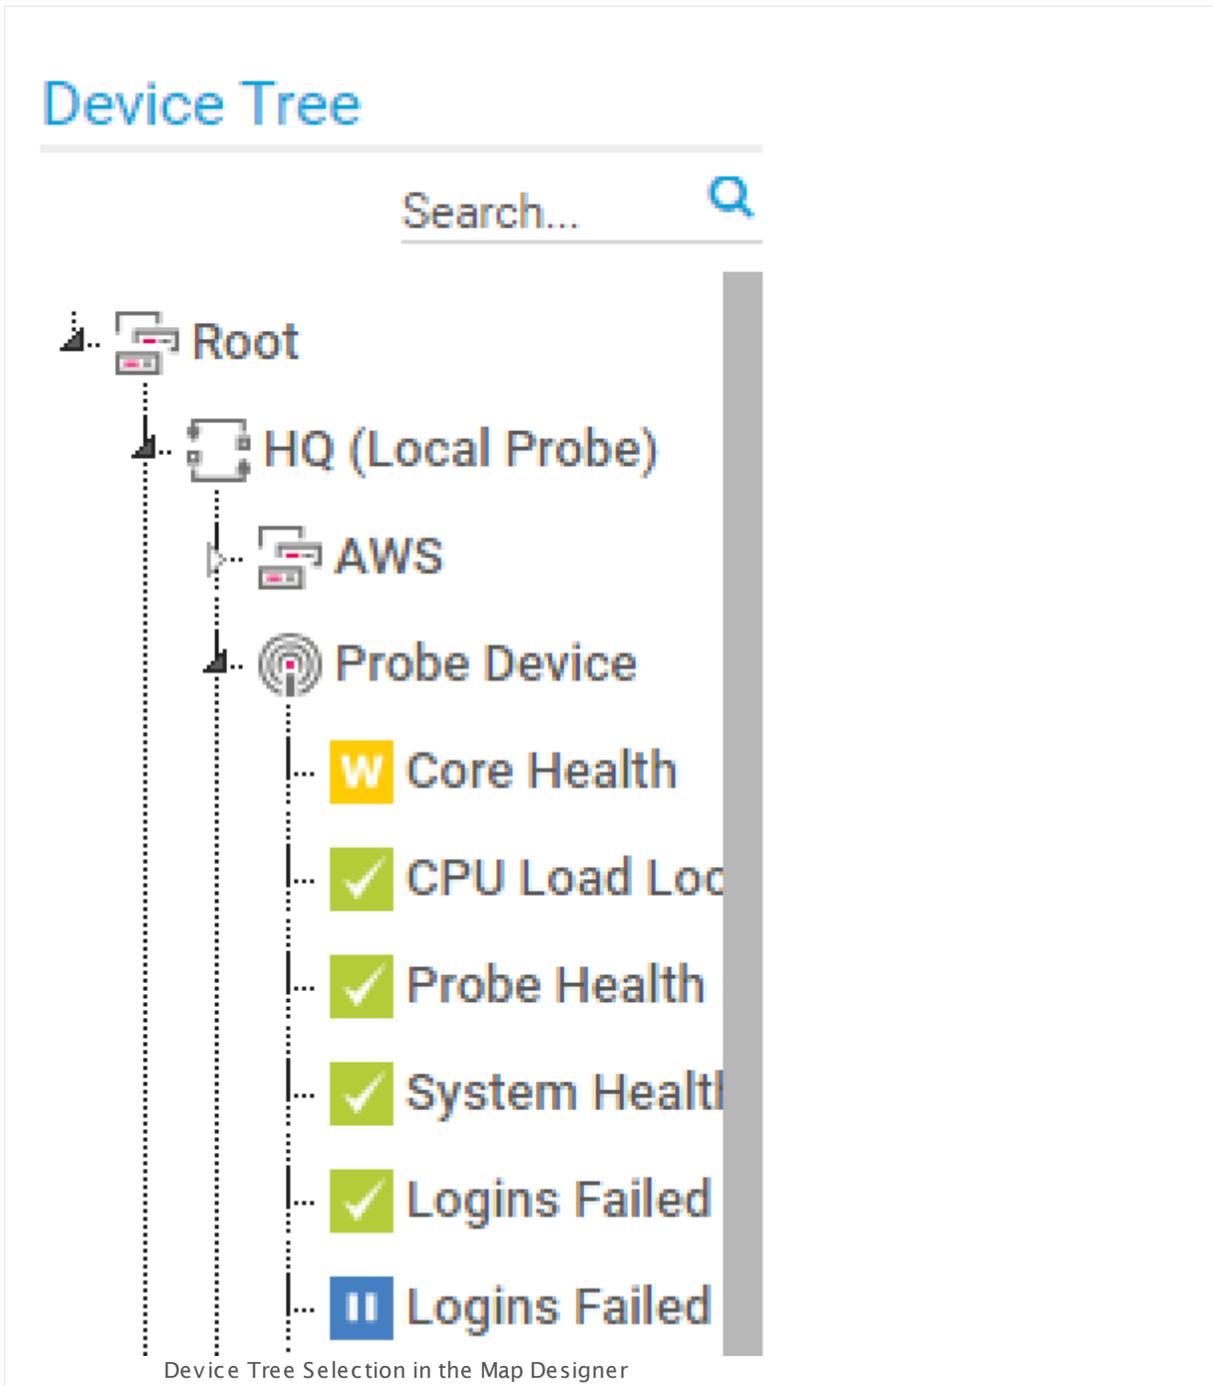

- **Device Tree** (left): Select the monitored object whose data you want to show on the map.
- **Properties** (right): Define how to show the map item.

Simply **drag&drop** any object from either side onto the map, or **double-click** on an object. You will always see all changes immediately.

Device Tree Selection

Use the **Device Tree** to select the monitored object whose data you want to show on the map (this can be a probe, a group, a device, or a single sensor). To find the desired object you have the following options:

- Use the arrow symbols at the beginning of each line to open nodes in the device tree and show objects below probes, groups, and devices.
- Enter a few characters into the **Search** box in the upper right corner to search for names (or part of names) of objects in your configuration. You will see the search results immediately. Click the gray x icon to clear your search.

- No matter which method you choose to find the desired object, you can always drag any object from the **Device Tree** onto a free area of the map to create a new map item.
- If you drag it onto an existing map item, it replaces the existing item while **Properties** and size stay the same.
- You can also select a map item and double click a **Device Tree** object to replace the map item. If no item is selected, double clicking an object adds a new map item.

- To gain more space for map editing, reduce the size of the **Device Tree** box by dragging its right border to the left. Drag it to the right to enlarge it again.

Properties Selection

Use the **Properties** selection to define how to show the map item (for example, as an icon, a map, a table, or a graph). Select the appearance in different categories. Hover over a property object to get a live preview of it (in most cases).

- ① If a certain **Properties** object is not available for the selected **Device Tree** object, you will see a corresponding text note.

Properties

Top:	Left:	Width:	Height:	Layer:
100	50	350	460	2

- > Custom HTML

Properties Selection in the Map Designer

There are many different property object types available. Simply click one of the categories to show all available types.

- **Default Icons A, Default Icons B**

These categories offer a variety of iconic symbols of typical network devices in the current PRTG style. Category A comes with object data which category B does not include.

- **Icons A, Icons B, Icons C**

These three categories offer a variety of iconic symbols of typical network devices. Below each icon you can see the object name and a sensor overview for the object. This shows how many sensors are in which [status](#)^[195]. For some sensors, a mini graph is shown as well.

- **Icons A (Static), Icons B (Static), Icons C (Static)**

These three categories offer the same variety of iconic symbols of typical network devices as the category described above. Here, no object data is displayed but only the icon.

- **Static Images**

This category offers free or public domain geographical maps from different sources. Use properties section Geo Maps if you want to show PRTG [Geo Maps](#)^[321] in the map.

 The items in this section are independent from the selected **Device Tree** objects.

 For additional geographical maps and other map customizations, see this Knowledge Base article: [Where can I find custom map objects and other map customizations?](#)

- **Status Icons**

This category offers options to insert [status](#)^[195] icons in different styles. These show the object name and an overview of how many sensors there are and their status. For example, you can add "traffic lights" or the QR code of a monitoring object to your map. There is also an object available for audible alert that will play a sound when the number of alarms of the monitored object are > 0. Note that your browser must support playing embedded sounds for this icon.

 See also this Knowledge Base article: [Which audible notifications are available in PRTG? Can I change the default sound?](#)

- **Cluster**

If you use the PRTG [Clustering](#)^[130] feature, you can add icons to your map that show the status of your cluster.

 The **Map** icon does not scale automatically, so the nodes are displayed on top of each other by default. Please manually enlarge this icon in the main window of the **Map Designer** (downwards and to the right) until it fits your needs.

- **Data Tables**

Choose from several [table lists](#)^[237] that show sensor lists for the currently selected object. You can also choose from several lists that show sensors in a certain status only.

- **Device Tree Views**

Add several [views of your device tree](#)^[187] to the map, including [sensor gauges](#)^[198] for the selected object.

- **Status Donuts**

Choose from several status donuts that either show all alarms or all sensor states for the selected object. These are the same status donuts that you see on the [Welcome Page](#)^[175].

- **Geo Maps**

In this category you can choose between a globe and a geographical map. You can see the location of the currently selected object in the **Device Tree** on the map. To use this feature, you must enable Geo Maps integration and you have to enter a **Location** in the settings of the monitoring object you want to use this with. For more information, see the [Geo Maps](#)^[321] section.

 If Geo Maps integration is disabled, you will only see white boxes instead of map previews.

- **Graphs**
This category offers different graph styles in several dimensions and detail. You can also select graphs including a legend or sensor states.
- **Objects**
Add some simple geometric shapes to your map. The items in this section do not depend on the selected object in the **Device Tree**.
- **Top 10**
Choose from several tables that show the top 10 sensors in certain categories, like least used CPUs, highest bandwidth usage, best availability, or slowest websites.
- **Custom HTML**
You can use this property, for example, to add [custom text](#)³²⁹⁴, external images or applets to your map. To actually add custom HTML code to your map, add the item, and mark it to [edit](#)³²⁹³. You can then copy your custom code into the **HTML Before** and **HTML After** fields in the **Properties** box on the right side.

No matter which object you choose, you can always drag any object from the **Properties** box onto a free area of the map to create a new map item. If you drag it onto an existing map item, it replaces this item, while its **Device Tree** object attributes and size stay the same. You can also select a map item and double click an object in the **Properties** box to replace the map item. If no item is selected, double clicking an object will add a new map item.

To gain more space for map editing, reduce the size of the **Properties** box by dragging its left border to the right. Drag it to the left to enlarge it again.

Edit Existing Map Items—Properties Box

Click a map item to select it. You can then edit its attributes using the fields in the upper part of the **Properties** box on the right side:

- **Top, Left, Width, and Height** fields
Enter position and size values for direct positioning. Click the **Save** button to save your settings. Alternative: Use the mouse to move and resize a map item.
- **Layer** field
The layer number defines if an item appears on top of or behind another item if they overlap. The item with the higher number appears on top. Enter a positive integer value and click the **Save** button to save your settings. Alternative: Use the arrow symbols in the context menu of a map item to **Bring to front** or **Send to back** an item one layer (see below).
- **External Link**
PRTG maps are interactive. You can enter the address of any website here. If you click the map item when viewing the map, PRTG will open this page in a browser window. Enter the whole URL to an external website (for example, <https://www.paessler.com>) or the address of a subpage of your PRTG installation (for example, [devices.htm](#)).
- **HTML**
Click the arrow symbol underneath to show the **HTML Before** and **HTML After** fields. Any HTML code you enter in these fields is added before or respectively after the map item. Enter your custom HTML code that embeds an object and click the **Save** button. Your HTML object is inserted into the map. For example, you can enter the code `` to insert an image of a Paessler logo.

Edit Existing Map Items—Hover Icons

Hover over a map item to show the edit icons for it.

- **Bring to front (arrow up symbol)**
Move this item one layer to the front. This is useful when adding several items to a map that overlap each other.
- **Send to back (arrow down symbol)**
Move this item one layer to the back. This is useful when adding several items to a map that overlap each other.
- **Delete (trash symbol)**
Delete this item.
 Be careful! The item will be deleted immediately without notice and you cannot undo this. Alternative: Select the item and press the **Del** button on your keyboard.
- **Drop Connections (scissors symbol)**
If there are connection lines between two items, you can delete all lines starting from this item. Connection lines will be dropped immediately.

Edit Existing Map Items—Using Cursor Keys

While an object is selected, use the cursor keys to move it one pixel at a time. Hold the **Shift** key in combination with the cursor keys to move the object 10 pixels at a time.

Add Custom Text to the Map

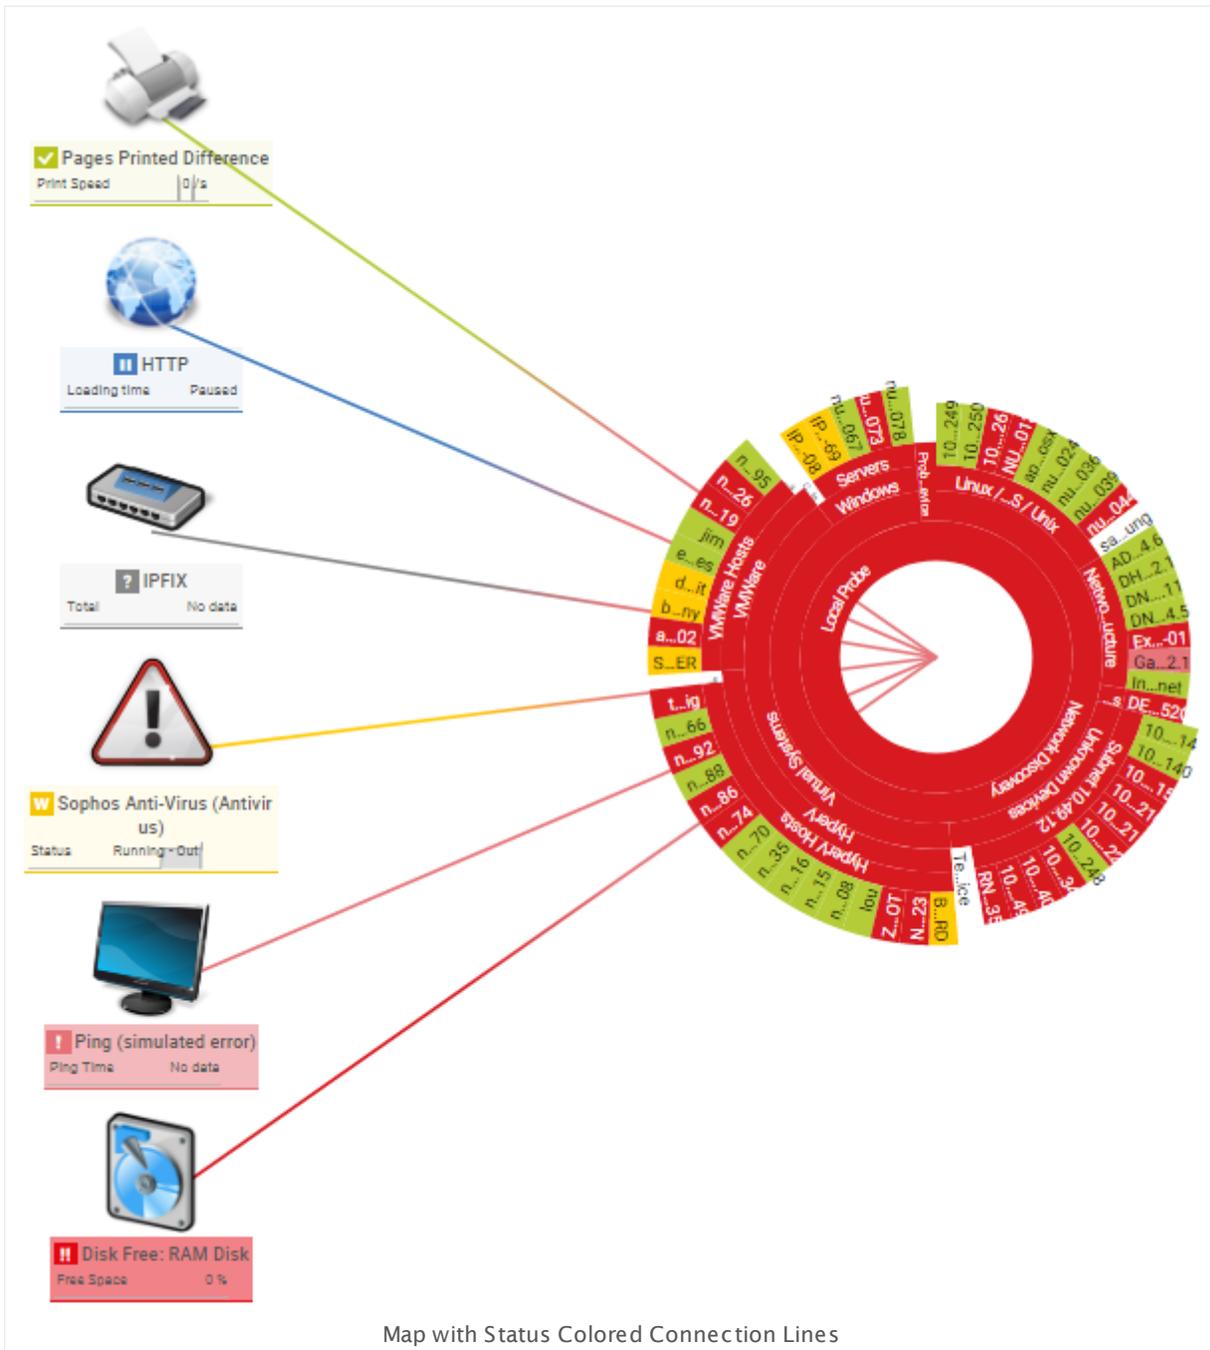

You can add custom text with individual styling to your map using the **Custom HTML Element**.

 For details, see the Knowledge Base: [How to add text to a map?](#)

Draw Connection Lines Between Items

You can draw connection lines between any map items via drag and drop. Click the gray handles next to an item and drag a line to the item you want to draw a connection to. A line between these items appears immediately. This can be useful to indicate network connections or logical coherence between two items. To delete connection lines, click the scissors symbol in the item's [edit icons](#)³²⁹³.

Lines between objects are colored dynamically depending on the [status](#)¹⁹⁵ of linked objects. For example, a line is red as long as one of the object's icons shows a red **Down** status. This only affects half of the line, at the end where the red sensor is shown. If both objects connected show a red sensor, this results in a continuous red line.

Snap to Grid

Choose **Snap to Grid** below the **Device Tree** box to define how map items are positioned when adding or moving them via drag and drop. The setting is active immediately. With snap to grid enabled, you can place items aligned with the grid only. If you deselect the **Snap to Grid** option, you can place map objects completely free.

Undo and Redo

You can revert previous changes to the map and its objects with the **Undo** button (**Ctrl+Z**) in the **Device Tree** box. To revert undo actions, use the **Redo** button (**Ctrl+Y**). You can undo and redo up to 50 changes when you work on a map. Because PRTG saves changes persistently in your configuration, you can even revert changes later.

Both buttons are only available if they can apply, otherwise they are grayed out.

8.11.3 Maps Settings

Using the Map tabs you can access all functionalities and settings for a map.

View Map

Click the **View Map** tab any time to show a preview of your map.

Map Designer

Click the **Map Designer** tab to edit the contents of your map.

 For details, see manual section [Map Designer](#)³²⁸⁷.

Settings

Click the **Settings** tab to open a map's general settings.

 When using the **Add Map** dialog, not all of these settings are available. You can change them later by clicking the **Settings** tab.

BASIC MAP SETTINGS

Map Name	Enter a meaningful name for the map.
Security Context and Color Mode	<p>Define the user account that the map will use for access to monitoring data. The map will only contain objects that the selected user¹⁵⁸ is allowed to view. This setting also affects the color mode³³⁰⁷ of maps that are displayed without a PRTG login (public maps). In this case, the color mode setting from the security context user is taken.</p> <p>Choose a user account from the list. The available users depend on your configuration. By default, the security context is the user account that created the map. PRTG System Administrator users can change this setting.</p> <p> Basically, the security context is the minimum access right a user account has when viewing a map. If the security context of a map is PRTG System Administrator, every user account will see all objects on the map, no matter what the particular user rights are.</p>

BASIC MAP SETTINGS

i Map objects of type **Data Tables**, for example, include entries according to the security context, but the table headings regard to the rights of the particular user account that views the map. Because of this, a user might see more objects in the table itself than denoted in the header.

Timezone Define the time zone that the map will use for all date-specific options. Select a time zone from the list.

Tag Filter This setting affects table map objects. Enter one or more tags separated by spaces or commas to include sensors in tables. Only sensors with one of the tags entered here will appear in this map's data tables, including sensors that [inherit](#)¹³⁷ tags from parent objects. Please enter a string or leave the field empty.

i For some map objects like sunburst and treemap, the tag filter applies to devices, groups, and probes. If you use only tags of sensors, these map objects will not appear on the map. Filtering sunburst and treemap objects with multiple tags may not work properly and is not officially supported.

i Use this setting with care because it will affect all tables of the current map!

MAP LAYOUT

Map Width Define the width of the map in pixels. Please enter an integer value.

Map Height Define the height of the map in pixels. Please enter an integer value.

Automatic Scaling Define if you want the map to automatically adapt to your screen size. Choose between:

- **Scale map view to fit browser size:** The size of the map adapts automatically to the size of your screen. Choose this method if the map is shown on various screens with different resolutions so that it uses the available place in the browser window the best possible way.
- **Do not auto-scale map view:** The map uses always the size that you define above.

MAP LAYOUT

Background Picture	<p>Define if you want to use a background picture for the map. Choose between:</p> <ul style="list-style-type: none">▪ Use an image in the background of the map: Use a custom background image that you define below.▪ Do not use a background image: Do not use a background image.
Background Image	<p>This option is only visible if you enable a background picture above. Click the Select File button and select an image from your computer or network.</p> <p> Only images in the format JPG, PNG, and GIF are supported. The file size must be smaller than 20 MB. If you try to upload other images, you get an error message.</p>
Background Color	<p>Select a background color for this map. Either enter a hex color code or choose a color from the color selector. The hex color code field will always display the currently defined color.</p>

PUBLIC ACCESS

Public Access	<p>Define if others can see the map. Choose between:</p> <ul style="list-style-type: none">▪ No public access (map cannot be viewed without login): Do not allow public access to the map. Only users with both a login to the PRTG web interface and sufficient access rights can see the map.▪ Allow public access (map can be viewed by using a unique URL): Allow access to the map using a unique address. The URL contains a key that you can change below. The map will be an interactive public map.▪ Allow public access, disable all links except for Geo Maps (map can be viewed by using a unique URL): Allow access to the map using a unique address. The URL contains a key that you can change below. If you choose this option, all links on the map are disabled, so it will be a non-interactive public map.  This option does not apply to geographical maps  embedded in your map. It is not possible to disable the links in map objects that contain a Geo Map. Workaround: Place an empty, transparent square object over the Geo Map object and link it to an unrelated URL.
---------------	---

PUBLIC ACCESS

i Maps with public access are displayed using the color mode from the security context user. See Security Context and Color Mode for more information.

Secret Key

This field is only visible if public access is enabled above. The key is automatically generated. It is part of the public URL for the map. You can also enter a customized string. We recommend that you use the default value. For more information on public access, see the [Get HTML](#)³³⁰⁰ section.

i The characters comma "," and colon ":" are not allowed in the secret key field!

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object that you are editing. A table with user groups and rights is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists.
- **Read:** Users in this group can see the object and review its settings.
- **Write:** Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings.
- **Full:** Users in this group can see the object, as well as review and edit its settings as well as edit access rights.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Get HTML

Your PRTG map is like a standalone HTML page. You can make it accessible to others, if you like. Depending on the **Public Access** [setting](#)³²⁹⁷ of your map, a visitor needs to provide PRTG user account login data to view the map, or sees the map immediately using a URL containing a secret key. When using this unique key, you can also include your map on another webpage, embedding it via `<iframe>`.

- **Option 1: Link to a web page with the map that requires login credentials**
The shown URL requires login credentials in order to display the map. PRTG asks the user trying to view the map via this URL for login credentials.
 - ❗ In the URL, usually the IP address is given via which the page is available. Maybe a NAT translation is set in your firewall, or you may want to use a domain name or a name from a dynamic DNS service for public access. Please customize the URL you use for access to your needs.
- **Option 2: Link to a web page that displays the map without a login**
To get the shown URL working for public access without a login, enable **Public Access** in the [settings tab](#)³²⁹⁷ of your map.
 - ❗ In the URL, usually the IP address is given via which the page is available. Maybe a NAT translation is set in your firewall, or you may want to use a domain name or a name from a dynamic DNS service for public access. Please customize the URL you use for access to your needs.
- **Option 3: Show a map inside other web pages using an IFRAME**
For your convenience, this shows source code for adding an **iframe** to another webpage. It includes a URL for direct access. Just copy the code and paste it into your webpage code. Also enable **Public Access** in the [settings tab](#)³²⁹⁷.
 - ❗ In the URL, usually the IP address is given via which the page is available. Maybe a NAT translation is set in your firewall, or you may want to use a domain name or a name from a dynamic DNS service for public access. Please customize the URL you use for access to your needs.

While a map is shown via these URLs, you can change the refresh interval any time by hovering over the arrows symbol in the lower right corner. Choose between **10**, **30**, or **60** seconds, **10** minutes or **Refresh** now. The map adapts automatically to the size of the browser window if you enable the [auto-scaling setting](#)³²⁹⁷.

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the name of the PRTG user who made the change, and a message. The history log retains the last 100 entries.

Delete

You can delete the entire map any time by clicking the trash symbol on the right.

8.12 Setup

In the setup settings of the PRTG web interface, you can define almost all system settings for PRTG. However, some of the machine-oriented settings are defined using two Windows administration tools (see [Others](#)³³⁰³ section below).

In the main menu, click on **Setup** to show the available options.

- Some setup options are only available for PRTG on premises (marked with the PRTG on premises icon), so you cannot use these on PRTG hosted by Paessler instances.
- ☁ Some setup options are only available for PRTG hosted by Paessler (marked with the PRTG hosted by Paessler icon), so you cannot use these on PRTG on premises instances.

8.12.1 Account Settings—My Account

In the **My Account** settings you can define values regarding your (currently logged in) PRTG user. All settings in this section are user-specific. Some account options may not be available, but restricted to the administrator.

■ If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

The screenshot shows the 'Account Settings' page for a user. The page has a navigation bar with 'My Account', 'Notification Templates', 'Notification Contacts', and 'Schedules'. The main content area is divided into three sections:

- Mobile App:** Includes a 'Use Mobile App' checkbox and a 'Show QR Code for Mobile App Login' button.
- User Account:** Contains input fields for 'Login Name' (prtgadmin), 'Display Name' (PRTG System Administrator), and 'Primary Email Address' (johnqpublic@company.com). There is a 'Save' button. The 'Password' section has radio buttons for 'Don't change' (selected) and 'Specify new password'. There is also a 'Passhash' field with a 'Show passhash' button.
- Account Control:** Includes a 'Primary Group' dropdown menu (set to 'PRTG Administrators'), a 'Status' field (set to 'Active'), and a 'Last Login' timestamp (25.07.2018 10:41:38).

The page footer reads 'My Account Settings'.

My Account Settings

i This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

MOBILE APP

Use Mobile App

Click **Show QR code for Mobile App Login** to display the QR code to easily copy your account settings to the mobile app.

USER ACCOUNT

Login Name

Enter the login name for the user.

 This option is not available in PRTG hosted by Paessler.

Display Name

Enter a name that the user recognizes. It will not be used for login purposes.

Primary Email Address

Enter the user's email address.

 Please use an email client that can show HTML emails, otherwise you cannot read emails from PRTG.

Password

Define the user password. For security reasons, the account settings page does not contain the password. Choose between:

- **Don't change**
- **Specify new password**

If you choose to specify a new password, enter the old password and then the new password twice.

 The new password must be at least 8 characters long. It must contain a number and a capital letter. Leading and trailing whitespaces will be cut. The password of a PRTG Administrator user can only be changed by the same PRTG Administrator user.

 This option is not available in PRTG hosted by Paessler.

Passhash

Click **Show passhash** to display the passhash for the selected user. You need the passhash of a user if you use the PRTG [Application Programming Interface \(API\)](#)³⁸⁰⁶. This setting is shown for your information only and cannot be changed here.

 This option is not available in PRTG hosted by Paessler.

API ACCESS

 These settings are only available in PRTG hosted by Paessler.

API Username	Shows the username of the current user account. You need a username if you use the PRTG Application Programming Interface (API) ³⁶⁰⁶ . This setting is shown for your information only and cannot be changed here.
API Passthrough	Click Show passthrough to display the passthrough for the selected user. You need the passthrough of a user if you use the PRTG Application Programming Interface (API) ³⁶⁰⁶ . This setting is shown for your information only and cannot be changed here.
Reset API Passthrough	Click Generate new passthrough to reset the passthrough of the current user.

ACCOUNT CONTROL

Account Type	<p>This setting is only visible to administrator users. However, it will not show if the user whose account you want to modify is a member of a group with administrative rights.</p> <p>Define the account type for the current user. Choose between:</p> <ul style="list-style-type: none">▪ Read/Write User: You can change settings.▪ Read Only User: You cannot edit any settings except your own password. This is a good choice for public or semi-public logins. <p> This setting cannot be changed for the default administrator user.</p>
Acknowledge Alarms	<p>This setting is only visible if Read Only User is enabled above. Acknowledging an alarm is an action that requires write access rights. However, you can explicitly allow this action to read-only users. If enabled, they still do not have write access, but may acknowledge alarms²²⁰. Choose between:</p> <ul style="list-style-type: none">▪ User may acknowledge alarms: Allow acknowledging alarms for this user.▪ User may not acknowledge alarms (default): The user will not be able to acknowledge alarms.

ACCOUNT CONTROL

Password Changes	<p>Decide if you want the user to be able to change their account's password or not. If you allow the user to change the password, this option will be available in the My Account settings of the respective user. Choose between:</p> <ul style="list-style-type: none">▪ User may change the account password▪ User may not change the password (default) <p> This field is only visible if you edit this option for read-only users as an administrator.</p>
Primary Group	<p>This setting is available only for administrator users. Select the primary group for the current user. Every user has to be member of a primary group to make sure there is no user without group membership. Membership in other user groups is optional. For user experience there is no difference between the primary and other user groups.</p> <p> You cannot change the primary group of Active Directory users. Users that you added with Active Directory Integration can only have this AD group as their primary group. If you need to change this, please delete this user account and add it again.</p>
Status	<p>This setting is only shown for administrator users. Define the status of the current user. Choose between:</p> <ul style="list-style-type: none">▪ Active: The current user can login to the account.▪ Inactive: The current user's login is disabled. Use this option to temporarily deny access for this user. <p> This setting cannot be changed for the default administrator user.</p>
Last Login	<p>Shows the time stamp of the user's last login. This setting is shown for your information only and cannot be changed here.</p>

USER GROUPS

Member of	<p>Shows the groups the current user is member of. Access rights to the device tree are defined on group level. This setting is shown for your information only and cannot be changed here.</p>
-----------	---

WEB INTERFACE

Auto Refresh	<p>Define if you want PRTG to reload web pages automatically for the current user. Choose between:</p> <ul style="list-style-type: none">▪ Refresh pages (recommended): Automatically refresh the single page elements on the web pages in PRTG.▪ No automatic refresh: Do not automatically refresh web
Auto Refresh Interval (Sec.)	<p>This setting is only relevant if you enable auto refresh above. Enter the number of seconds that PRTG waits between two refreshes. We recommend that you use 30 seconds or more. Minimum value is 20 seconds.</p> <p> Shorter intervals create more CPU load on the server running PRTG. If you experience load problems while using the web interface (or PRTG maps³²⁷⁸), please set a higher interval.</p>
Play Audible Alarms	<p>Define when PRTG will play an audible alarm the current user on web pages whenever there are new alarms²¹⁹. Choose between:</p> <ul style="list-style-type: none">▪ Never: Do not play sound files on any web pages.▪ On dashboard pages only: When there are new alarms, play a predefined sound on dashboard²⁶³ pages only. The sound will be played with every refresh of the dashboard page if there is at least one new alarm.▪ On all pages: When there are new alarms, play a predefined sound on all web pages. The sound will be played with every page refresh if there is at least one new alarm. <p> Audible alarms are only played if the New Alarms value in the Global Header Area¹⁸³ of the PRTG web interface is greater than 0 after a page refresh. The number of existing alarms is not considered.</p> <p> For more information about audible notifications and supported browsers, see this Knowledge Base article: Which audible notifications are available in PRTG? Can I change the default sound?</p>
Homepage URL	<p>Define the user's default page, which is loaded after logging in or clicking on the Home²⁶³ button in the main menu.</p>
Timezone	<p>Define the time zone for the current user. Depending on the time zone you select here, PRTG shows the current user's local time zone in all data tables and graph legends.</p> <p> PRTG receives the UTC (Coordinated Universal Time) from the system time set on the PRTG core server for this purpose.</p>

WEB INTERFACE

Date Format	<p>Define the date format for the current user. The following formats are available:</p> <ul style="list-style-type: none">▪ Use System Settings: Use the date format of the server PRTG runs on.▪ DD.MM.YYYY HH:MM:SS (24h)▪ DD.MM.YYYY HH:MM:SS (AM/PM)▪ MM/DD/YYYY HH:MM:SS (24h)▪ MM/DD/YYYY HH:MM:SS (AM/PM)▪ YYYY-MM-DD HH:MM:SS (24h)▪ YYYY-MM-DD HH:MM:SS (AM/PM) <p> This setting will take effect after the next login.</p>
Color Mode	Select a color mode for your web interface.

TICKET SYSTEM

Email Notifications	<p>Define if you want to get emails from the ticket system. Choose between:</p> <ul style="list-style-type: none">▪ I want to receive an email whenever a ticket changes: You will receive an email each time a ticket is assigned to you or your user group, or if a ticket that is assigned to you or your user group is changed.  If you edit tickets that are assigned to you or your user group, or you assign a ticket to yourself or your user group, you will not get an email.▪ I do not want to receive any emails from the ticket system: You will not get any emails about tickets.
---------------------	---

Notification Contacts

In the [Notification Contacts](#)³³³⁴ tab you can define recipients for each user account. Recipients can be email addresses, phone numbers, or push devices (iOS and Android devices with the corresponding [PRTG smartphone app](#)³⁴⁰⁴).

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the name of the PRTG user who made the change, and a message. The history log retains the last 100 entries.

Save your settings. If you leave the current page, all changes to the settings will be lost!

More

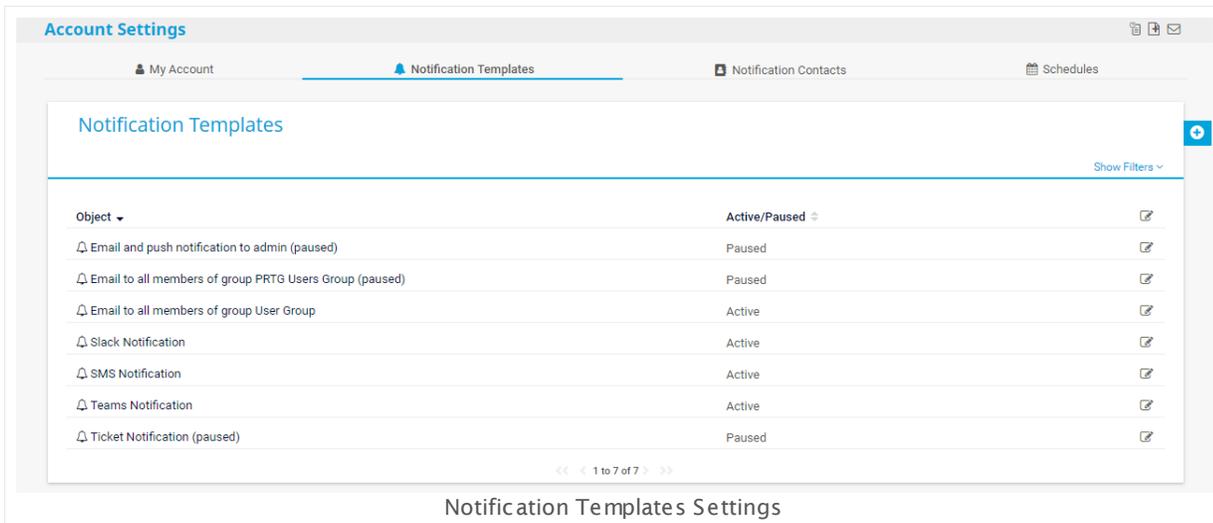

Knowledge Base: Which audible notifications are available in PRTG? Can I change the default sound?

- <https://kb.paessler.com/en/topic/26303>

8.12.2 Account Settings—Notification Templates

In the notification templates settings, you can define and change notifications for the current PRTG user. Notifications can be triggered for specific sensor states and values.

■ If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

Note

This section describes one of four steps to set up the notification system in PRTG. To complete your notification setup, go through all of the following steps:

1. Check and set up the **Notification Delivery** settings to define how and to which recipient PRTG will send messages.
For detailed information, see [System Administration—Notification Delivery](#) ³³⁶¹.
2. Check and set up **Notification Contacts** for the PRTG users to define the recipients of notifications.
For detailed information, see [Account Settings—Notification Contacts](#) ³³³⁴.
3. Check and set up **Notification Templates** to define the notification methods and their content.
For detailed information, see [Account Settings—Notification Templates](#) ³³¹¹.
4. Check and set up **Notification Triggers** for objects to define when notification messages will be sent.
For detailed information, see [Sensor Notification Triggers Settings](#) ³¹⁷⁰.

i We recommend that you always set up at least two notifications with different delivery methods for a notification trigger, for example, one [email notification](#)^[3317] and one [SMS notification](#)^[3320]. If delivery via email fails (due to an email server failure or other reasons), PRTG can still notify you via your smartphone. Simply set your latency setting to a [state trigger](#)^[3172] and a notification via a delivery method other than the one for the first trigger. Or set up a second trigger with another notification for the corresponding object.

 For background information, see the [Notifications](#)^[3216] section.

Notification Templates

Click the **Notification Templates** tab to show a list of existing notification templates. Using the **Edit** buttons on the right, perform the following actions to set up a notification template:

- **Send test notification:** Trigger this notification immediately for testing purposes.
 - i** When testing notifications, PRTG will not resolve the placeholders, but rather send the original variables instead.
- **Used by:** Show all objects that trigger this notification.
- **Pause:** Pause this notification. If a notification is [paused](#)^[245], PRTG will not send messages when this notification is triggered.
- **Resume:** Resume monitoring of a paused object at any time.
- **Delete:** Delete this notification (not possible for predefined notifications).
- **Settings:** Open the [settings of a notification template](#)^[3312].

Please also see [Working with Table Lists](#)^[237]. Additionally, the multi-edit functionality is available. This enables you to change properties of several objects simultaneously via bulk changes. For more details, see the [Multi-Edit Lists](#)^[3197] section.

Notification Template Settings

Hover over  and select **Add Notification Template** from the menu to add a new notification template, or click the name of an existing notification template to edit it.

i This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

BASIC SETTINGS

Template Name	Enter a meaningful name for the notification template, for example, SMS to service team.
---------------	---

BASIC SETTINGS

Tags	Enter one or more tags ¹³⁹ . Confirm each tag with the space, comma, or enter key. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. Tags will be automatically inherited ¹³⁹ .
Status	Select the status of the notification. Choose between: <ul style="list-style-type: none">▪ Started: This notification is active. PRTG executes this notification when it is triggered.▪ Paused: Pause this notification. If a notification is paused, PRTG does not execute this notification when it is triggered.
Schedule	Define intervals for notifications to pause. You might want the notifications to pause for scheduled maintenance periods or regular server reboots at certain intervals. For continuous notification select None . This selection will make your notifications be active 24/7 without pause. You can also choose one of the suggested schedules from the list. Usually schedules define when this notification will be active. Schedules defined as period list set this notification to inactive at the corresponding time spans. The available options depend on your setup.  To add or change existing schedules, see Account Settings—Schedules ³³⁸ .
Postpone	Define whether PRTG should send you notifications that were triggered while the notification was Paused later on, when the notification status is in Started again. <ul style="list-style-type: none">▪ No: Discard all notifications that are triggered while the notification is paused.▪ Yes: Collect all notifications that are triggered while the notification is paused. Send out all these notifications once the Paused status ends.

NOTIFICATION SUMMARIZATION

Method

Define if and how PRTG summarizes several notifications into one or more messages (max. 1,000 characters). Define if several notification triggers are to be collected over a specified time period and then send as a single summarized notification. Choose between:

- **Always notify ASAP, never summarize:** Always send out one notification for each received notification trigger as soon as possible (for example, immediately).
- **Send first DOWN message ASAP, then summarize:** When receiving several **DOWN** triggers, send the first notification immediately, then keep summarizing notification triggers into one message, regardless of sensor state.
- **Send first DOWN and UP message ASAP, then summarize:** When receiving several **DOWN** or **UP** triggers, send each first notification immediately, then keep summarizing notification triggers into one message, regardless of sensor state.
- **Send all DOWN messages ASAP, summarize the others:** When receiving several **DOWN** triggers, send out one notification for each trigger received, but summarize notifications for all non-**DOWN** triggers into one message.
- **Send all DOWN and UP messages ASAP, summarize the others:** When receiving several **DOWN** or **UP** triggers, send out one notification for each trigger received, but summarize the notifications for all non-**DOWN** and non-**UP** triggers into one message.
- **Always summarize notifications, regardless of type:** When receiving several notification triggers, summarize notifications, regardless of the kind of trigger received. Please note, the maximum number of notifications (see below) still applies.

 Regardless of the option you choose, PRTG never summarizes notifications of the types **Send Slack Message**, **Send Microsoft Teams Message**, **Execute HTTP Action**, **Execute Program**, and **Assign Ticket** because it always sends them immediately. The messages of all other notification types can be summarized.

 'first DOWN' and 'first UP' messages refer to trigger condition and clear condition respectively. You can also define 'WARNING' or 'UNUSUAL' states as trigger conditions or even thresholds or other triggers notification summarizations. The condition clear triggers, if applicable, are defined in the respective trigger conditions as well. The triggers all qualify as "first DOWN" or "first UP" messages.

NOTIFICATION SUMMARIZATION

 PRTG collects up to 25 single notifications for one summarization and will send out the message as soon as this number is reached (or when the gathering time has passed). If there are more than 25 notifications within the defined time span, you will receive more than one message with up to 25 entries each. For example, 74 collected notifications would result in 3 summarized messages with 25, 25, and 24 collected notifications.

Subject for Summarized Messages

Define a subject that PRTG will include when sending summarized notifications. You can use the placeholder **%SUMMARYCOUNT** for the number of messages that are summarized.

 The subject you define is only used for **Send Email** and **Amazon SNS** messages.

Timespan for Summarizing Messages (in Minutes)

Define a time span in minutes to define how long PRTG collects notifications for summarization. Please enter an integer value.

 If you enter a rather long time span, for example, **60** minutes, PRTG will collect notifications for one hour before sending them out summarized unless other features (see above) require an earlier message dispatch.

ACCESS RIGHTS

User Group Access Define which user group(s) will have access to the object that you are editing. A table with user groups and rights is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists.
- **Read:** Users in this group can see the object and review its settings.
- **Write:** Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings.
- **Full:** Users in this group can see the object, as well as review and edit its settings as well as edit access rights.

You can create new user groups in the [System Administration—User Groups](#) settings.

Notification Templates Settings—Choose Notification Methods

With the following settings, you can add one or more methods for how PRTG sends out a notification message. You can choose one method or combine several methods from the list. Whenever the notification is triggered, PRTG sends out messages or performs actions for all configured methods at once.

To choose a method, mark the check box in front of the corresponding notification type. You can then see and set the options as described below. The following notification methods are available.

- [Email](#)
- [Push Notification](#)
- [SMS/Pager Message](#)
- [Slack Message](#)
- [Microsoft Teams Message](#)
- [Add Entry to Event Log](#)
- [Syslog Message](#)
- [SNMP Trap Message](#)
- [Execute HTTP Action](#)
- [Execute Program](#)

- [Amazon SNS Message](#) 
- [Ticket](#) 

 In your message, you can use various placeholders. Some of them are already filled in by default. For a complete list of available placeholders, see this Knowledge Base article: [What placeholders can I use with PRTG?](#)

- Some notification types are only available for PRTG on premises (marked with the PRTG on premises icon). You cannot use these on PRTG hosted by Paessler instances.

SEND EMAIL

 This notification method uses notification contacts to deliver the messages. Please set up and check them for the desired user accounts in advance under [Account Settings — Notification Contacts](#) .

 The three options for recipients below (user, user group, email address) work simultaneously. Because of this, you can define more than one user as recipient of this notification. PRTG sends the notification email to the active email contacts of the user you select, to the active email contacts of all members of the user group you select, and to all email addresses you enter into the **Send to Email Address** field.

 You can include custom email headers and footers into PRTG HTML emails. For details, see this Knowledge Base article [How can I include my own logo into HTML emails?](#)

Sender	Define which email address and sender name will appear in the FROM part of your email notifications. Choose between: <ul style="list-style-type: none"> ▪ Default: Use the default sender email and name as defined in the global Notification Delivery  settings. ▪ Custom: Override the global sender email and name.
Sender Email Address	Enter an email address to use as sender of all email notifications. This field overrides the global setting from the Notification Delivery  tab. The default value is the global sender email. <p> The email address must be allowed by the outgoing SMTP server defined in the Notification Delivery  settings.</p>
Sender Name	Enter a sender to use as sender of all email notifications. This field overrides the global setting from the Notification Delivery  tab. The default value is the global sender name.

SEND EMAIL

- Send to User** Select a user of your PRTG installation to send the notification email to. PRTG sends this notification to each email contact of this user account. You can add and edit email contacts of a user in [Account Settings—Notification Contacts](#)³³³⁵. Choose **None** to not use this feature.
- Send to User Group** Select a user group to send an email with the notification to all members of this group. PRTG sends this notification to the email contact of every group member. You can edit user groups under [System Administration—User Groups](#)³³³⁵ and email contacts under [Account Settings—Notification Contacts](#)³³³⁵. Choose **None** to not use this feature.
- ❗ If you select a user group and a specific member of this group as recipients, the user will only receive a single email. This also applies if you enter an individual email address below that is already defined as an email contact of the selected user.
 - ❗ If you define individual email addresses (see below), to a specific user (see above), and a user group, PRTG sends the message to the individual email addresses, to the individual user, as well as to the members of the selected user group. In all cases, PRTG sends one message with all recipients in the "To" field of the email.
- Send to Email Address** Enter one or more recipient email addresses to which PRTG sends the notification email. If you enter more than one address, separate them with commas. Leave this field empty to send this notification only to the email contacts of the user or members of the user group you choose above.
- We recommend that you use the options **Send to User** and/or **Send to User Group** instead because you can manage the notification contacts of users more easily this way.
- Subject** Enter the subject of the email notification.
- Several [placeholders](#)³³³² (variables) are used here by default: [%
sitename] %device %name %status %down (%message)
- Format** Define the kind of email that PRTG sends when the notification is triggered. Choose between:
- **HTML:** PRTG uses the default HTML email template for the message part of the email.
 - ❗ Please use an email client that can show HTML emails, otherwise you cannot read emails from PRTG.

SEND EMAIL

- **Text**: PRTG uses the default plain text email template for the message part of the email.
- **Text with custom content**: PRTG uses custom plain text for the message part of the email. You can enter your individual text below.

Custom Content This field is only visible if you select the custom text option above. Enter the desired message for this email notification in plain text format. You can use [placeholders](#) ^[3332] here.

Priority Define the priority that PRTG sets for the email. Most email clients can show this priority flag. Choose between:

- **highest**
- **high**
- **normal**
- **low**
- **lowest**

SEND PUSH NOTIFICATION

 Push notifications only work with the apps [PRTG for Android](#) ^[3485] and [PRTG for iOS](#) ^[3484]. You have to activate push notifications in the settings of your app first. For details about the setup, see this Knowledge Base article: [How can I send push notifications with PRTG?](#)

 This notification method uses notification contacts to deliver the messages. Please set up and check them for the desired user accounts in advance under [Account Settings —Notification Contacts](#) ^[3335].

 The PRTG server needs to communicate on port 443 to the PRTG Cloud to send push notifications, which is <https://api.prtgcloud.com:443> (the same as for the [Cloud HTTP Sensor](#) ^[619], the [Cloud Ping Sensor](#) ^[629] and [support tickets](#) ^[3424]).

 The two options for recipients below (user, user group) work simultaneously. Because of this, you can define more than one user as recipient of this notification. PRTG sends the notification to the active push contacts of the user you select and to the active push contacts of all members of the user group you select.

SEND PUSH NOTIFICATION

- Send to a User** Select a user of your PRTG installation to send the push notification to. PRTG sends this notification to each push contact of this user account. You can edit push contacts of a user in [Account Settings—Notification Contacts](#)³³³⁵ and add push contacts by activating push notifications in the Android or iOS app with this user. Choose **None** to not use this feature.
- Send to a User Group** Select a user group to send the push notification to all members of this group. PRTG sends this notification to each push contact of every member of this group. You can edit user groups under [System Administration—User Groups](#)³³⁸³ and push contacts under [Account Settings—Notification Contacts](#)³³³⁵. Choose **None** to not use this feature.
-  If you select a user group and a specific member of this group as recipients at the same time, this user receives the text message only one time.
- Message** Define the message. A message with information about the sensor status is already predefined. Several [placeholders](#)³³³² (variables) are used here: [%sitename] %device %name %status %down (%message)
- You can change the message to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).

SEND SMS/PAGER MESSAGE

-  You have to set up this notification method in the [System Administration—Notification Delivery](#)³³⁶¹ settings first.
-  This notification method uses notification contacts to deliver the messages. Please set up and check them for the desired user accounts in advance under [Account Settings—Notification Contacts](#)³³³⁵.
-  The three options for recipients below (user, user group, email address) work simultaneously. Because of this, you can define more than one user as recipient of this notification. PRTG sends the notification to the active SMS contacts of the user you select, to the active SMS contacts of all members of the user group you select, and to every phone number you enter into the **Send to Number** field.
-  This notification method uses the central proxy settings that you define for your PRTG core server. For details, see [System Administration—Core & Probes](#)³³⁶⁸ (section **Proxy Configuration**).

SEND SMS/PAGER MESSAGE

Send to User	<p>Select a user of your PRTG installation to send the notification to. PRTG sends this notification to each SMS contact of this user account. You can add and edit SMS contacts of a user in Account Settings—Notification Contacts^[3335]. Choose None to not use this feature.</p>
Send to User Group	<p>Select a user group to send a text message with the notification to all members of this group. PRTG sends this notification to each SMS contact of every member of this group. You can edit user groups under System Administration—User Groups^[3383] and SMS contacts under Account Settings—Notification Contacts^[3335]. Choose None to not use this feature.</p> <p>i If you select a user group and a specific member of this group as recipients at the same time, this user receives the text message only one time. This also counts if you enter an individual phone number below that is already defined as an SMS contact of the selected user.</p>
Send to Number	<p>Define the number to which PRTG sends the text message. The format depends on the SMS provider. Usually, you use a plus sign "+", followed by country code and number. For example, enter +1555012345.</p> <p>i Ensure the number format meets the requirements of your SMS provider or the hardware that you use in combination with an API call. Sometimes a preceded plus sign is not required. A wrong format may result in undelivered messages!</p> <p>If you enter more than one number, separate them by comma. Leave this field empty to send this notification only to the SMS contacts of the user or members of the user group you choose above.</p> <p>We recommend that you use the options Send to User and/or Send to User Group instead because you can manage the notification contacts of users more easily this way.</p>
Message	<p>Define the message. A message with information about the sensor status is already predefined. Several placeholders^[3332] (variables) are used here: [%sitename] %device %name %status %down (%message)</p> <p>You can change the message to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).</p>

SEND SLACK MESSAGE

 Regardless of the **Notification Summarization** method chosen above, PRTG sends notifications of the type **Send Slack Message** always as soon as possible (ASAP). They are never summarized.

URL of Slack Webhook	Enter the URL of the incoming webhook that you set up in your Slack workspace.
Sender Name	Enter a sender name to use as sender of Slack notifications. This field overrides the sender that you may have defined in your Slack workspace.
Title	Enter the title of your Slack notification. The following placeholders  (variables) are used here by default: %device %name
Subtitle	Enter the subtitle of your Slack notification. The following placeholder  (variable) is used here: %message
Content	Choose between the following options to define the content of your Slack notification: <ul style="list-style-type: none">▪ Use default content: The notification message will include information about the Status, Last Scan, Last Value, Last Up, Coverage, Downtime, Priority, Probe, and Group.▪ Define custom content: The notification message will include the pieces of information that you choose in the Content options (see next step).
Select Content	This field is only visible if you select the Define custom content option above. Add a check mark in front of the piece of monitoring information that you want PRTG to include in your Slack notification. Remove the check mark in front of the items that you do not want to include. Multiple choices are possible. The following types of monitoring information are available: <ul style="list-style-type: none">▪ Name▪ Host▪ Status▪ Last Scan▪ Last Value

SEND SLACK MESSAGE

- **Message**
- **Last Down**
- **Last Up**
- **Coverage**
- **Downtime**
- **Uptime**
- **Priority**
- **Probe**
- **Group**
- **Device**
- **Date and time**
- **Timezone**
- **Comments (probe)**
- **Comments (group)**
- **Comments (device)**
- **Comments (sensor)**
- **History**

For more information on these types of monitoring information, please refer to the [placeholders](#)³³³².

SEND MICROSOFT TEAMS MESSAGE

 Regardless of the **Notification Summarization** method chosen above, PRTG sends notifications of the type **Send Microsoft Teams Message** always as soon as possible (ASAP). They are never summarized.

URL of Teams Webhook Enter the URL of the incoming webhook that you set up in your Microsoft Teams workspace.

Title Enter the title of your Microsoft Teams notification.

The following [placeholders](#)³³³² (variables) are used here by default:
%device %name

SEND MICROSOFT TEAMS MESSAGE

Subtitle	<p>Enter the subtitle of your Microsoft Teams notification.</p> <p>The following placeholder³³³² (variable) is used here: %message</p>
Content	<p>Choose between the following options to define the content of your Microsoft Teams notification:</p> <ul style="list-style-type: none">▪ Use default content: The notification message will include information about the Status, Last Scan, Last Value, Last Up, Coverage, Downtime, Priority, Probe, and Group.▪ Define custom content: The notification message will include the pieces of information that you choose in the Content options (see next step).
Select Content	<p>This field is only visible if you select the Define custom content option above.</p> <p>Add a check mark in front of the piece of monitoring information that you want PRTG to include in your Microsoft Teams notification. Remove the check mark in front of the items that you do not want to include.</p> <p>Multiple choices are possible.</p> <p>The following types of monitoring information are available:</p> <ul style="list-style-type: none">▪ Name▪ Host▪ Status▪ Last Scan▪ Last Value▪ Message▪ Last Down▪ Last Up▪ Coverage▪ Downtime▪ Uptime▪ Priority▪ Probe▪ Group▪ Device

SEND MICROSOFT TEAMS MESSAGE

- **Date and time**
- **Timezone**
- **Comments (probe)**
- **Comments (group)**
- **Comments (device)**
- **Comments (sensor)**
- **History**

For more information on these types of monitoring information, please refer to the [placeholders](#) [3332].

ADD ENTRY TO EVENT LOG

 This option is not available in PRTG hosted by Paessler.

Logfile	<p>Define the logfile into which PRTG writes the message. Choose between:</p> <ul style="list-style-type: none"> ▪ Application: Use the Windows application logfile in the event log. ▪ PRTG Network Monitor: Write messages to the PRTG Network Monitor logfile in the Windows event log.
Event Source	<p>This setting is only relevant when using the Application logfile. Enter the source for the event. Usually, this is the name of the application.</p>
Event Type	<p>Select the type of the event. Choose between:</p> <ul style="list-style-type: none"> ▪ Error ▪ Warning ▪ Information
Event Log Message	<p>Define the message. A message with information about the sensor status is already predefined. Several placeholders [3332] (variables) are used here. You can change it to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).</p>

SEND SYSLOG MESSAGE

 This option is not available in PRTG hosted by Paessler.

Host/IP	Define the IP address or DNS name of the computer running the syslog server.  You can receive and analyze syslog messages with the Syslog Receiver Sensor ²⁶⁵⁹ .
Syslog Port	Enter the port number on which syslog messages are sent. By default, this is port number 514.  Only User Datagram Protocol (UDP) is supported.
Facility	Define the facility information. There are several options available from the list.
Encoding	Define the encoding of the syslog message that PRTG sends to your syslog receiver. Choose between: <ul style="list-style-type: none"> ▪ ANSI ▪ UTF-8
Message	Define the message. A message with information about the sensor status is already predefined. Several placeholders ³³²⁶ (variables) are used here. You can change it to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).

SEND SYSLOG MESSAGE—SYSLOG MESSAGE SEVERITY STATUS

 Depending on the status of the sensor that triggers the syslog notification, PRTG sets the **Severity** level of the message automatically.

 OK	Severity level: Notice (5)
 Warning	Severity level: Warning (4)
 Error	Severity level: Error (3)

SEND SNMP TRAP

For information about the OIDs that PRTG uses in the content of the SNMP traps, see this Knowledge Base article: [Is it possible to send SNMP traps using PRTG?](#)

This option is not available in PRTG hosted by Paessler.

Host/IP	Define the IP address or DNS name of the computer running the trap receiver.  You can receive and analyze SNMP trap messages with the SNMP Trap Receiver Sensor <small>2479</small> .
SNMP Port	Enter the port number on which trap messages are sent. By default, this is port number 162 .
Community String	Enter the community string of the device. By default, this is set to public . Please enter a string or leave the field empty.
Specific Trap Code	Enter a code that can help you identify the purpose of the trap. Default value is 0 . Please enter an integer value.
Message ID	Enter an ID that helps you identify the origin of the trap. Please enter an integer value. PRTG sends it on the OID 1.3.6.1.4.1.32446.1.1.1 .
Message	Define the message. A message with information about the sensor status is already predefined. Several placeholders <small>3332</small> (variables) are used here. You can change it to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).
Agent IP	Define the IP address of the agent. Leave this field empty to use the IP address of your PRTG web server.

EXECUTE HTTP ACTION

Regardless of the **Notification Summarization** method chosen above, PRTG sends notifications of the type **Execute HTTP Action** always as soon as possible (ASAP). They are never summarized.

EXECUTE HTTP ACTION

 This notification method uses the central proxy settings that you define for your PRTG core server. For details, see [System Administration—Core & Probes](#)³³⁰⁸ (section **Proxy Configuration**).

 For more details, see section [Custom Notifications](#)³³⁰⁹. You can find ready-to-use custom notifications in the PRTG Script World, see [below](#)³³³¹.

URL	<p>Enter the URL to which PRTG sends the request.</p> <p> HTTP notifications work with and without SSL.</p>
SNI (Server Name Indication)	<p>Select if PRTG will send the SNI extension to the TLS protocol along with the HTTP request. Choose between:</p> <ul style="list-style-type: none"> ▪ Do not send SNI (default): PRTG will not send an SNI when executing the HTTP action. ▪ Send SNI: PRTG will send an SNI when calling the target URL. Specify the SNI below.
Virtual Host (SNI)	<p>This field is only visible if you select the SNI option above. Enter the SNI name that your endpoint configuration requires. Usually, this is the Fully Qualified Domain Name (FQDN) of the virtual host.</p>
HTTP Method	<p>Choose the HTTP method that you want PRTG to use. Choose between:</p> <ul style="list-style-type: none"> ▪ GET ▪ POST ▪ PUT ▪ PATCH
Payload	<p>This field is only visible if you choose POST, PUT, or PATCH above.</p> <p>Enter a payload here. The payload is the data that PRTG will transmit to the URL you have specified. You can use placeholders³³³² here. Line breaks are supported.</p>

EXECUTE PROGRAM

 Regardless of the **Notification Summarization** method chosen above, PRTG sends notifications of the type **Execute Program** always as soon as possible (ASAP). They are never summarized.

 For more details, see section [Custom Notifications](#)³⁶⁵⁸. You can find ready-to-use custom notifications in the PRTG Script World, see [below](#)³³³¹.

 This option is not available in PRTG hosted by Paessler.

Program File Select an executable file from the list. PRTG runs it every time the notification is triggered. In this list, you see the files that are in the corresponding **/Notifications/EXE** sub-directory of your PRTG core server system. To appear in this list, store the files as BAT, CMD, DLL, EXE, PS1, or VBS.

 To find this path, see section [Data Storage](#)³⁷³⁴.

 In a cluster setup, copy your files to every cluster node installation manually. This makes sure PRTG can execute the notification even when the master node fails. If your custom notification executes an external program, install it on all cluster nodes as well.

Parameters Enter parameters with which the program file will be started. You can use [placeholders](#)³³³² here. For example, if you use a batch file that contains a **%1** variable, you can provide a value for this variable here.

 You need to escape special characters and whitespaces in your parameters and surround them with double quotes. See section [Escape Special Characters and Whitespaces in Parameters](#)³³¹¹ for details.

Domain or Computer Name Enter a Windows authority if you want to use another security context for the program than the security context of the PRTG probe service.

Username Enter the username for Windows access.

Password Enter the password for Windows access.

Timeout Enter a timeout in seconds. After this time has passed, PRTG stops the process if it has not terminated yet. Please enter an integer value.

SEND AMAZON SIMPLE NOTIFICATION SERVICE MESSAGE

AWS Access Key ID	Enter your access key as shown in your login area at aws.amazon.com. Please enter a string.
AWS Secret Access Key	Enter your secret access key as shown in your login area at aws.amazon.com. Please enter a string.
Location	<p>Define the location of your Amazon service. Choose one of the shown locations:</p> <ul style="list-style-type: none">▪ US East (Northern Virginia)▪ US West (Ohio)▪ US West (Northern California)▪ US West (Oregon)▪ Canada (Central)▪ EU West (Ireland)▪ EU Central (Frankfurt)▪ EU (London)▪ Asia Pacific (Singapore)▪ Asia Pacific (Sydney)▪ Asia Pacific (Seoul)▪ Asia Pacific (Tokyo)▪ Asia Pacific (Mumbai)▪ South America (Sao Paulo)
ARN	Enter the Amazon resource name. Please enter a string.
Subject	<p>Enter the subject of the message. Please enter a string.</p> <p> The maximum length for the subject is 202 characters. Characters that exceed this number will be cut off.</p>
Message	<p>Define the message. A message with information about the sensor status is already predefined. Several placeholders³³³² (variables) are used here. You can change it to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).</p> <p> The message part is only sent if you use email based notifications delivered by Amazon SNS. For SMS delivery, only the subject is sent while the message part is ignored because of SMS size restrictions.</p>

ASSIGN TICKET

 Regardless of the **Notification Summarization** method chosen above, PRTG sends notifications of the type **Assign Ticket** always as soon as possible (ASAP). They are never summarized.

 For details about the ticket system, see manual section [Tickets](#)²³⁰.

Assign to User or User Group Specify whether to assign the notification ticket to a user group or to a single user. Choose between:

- **To User Group:** Select a user group below to which PRTG assigns this ticket.
- **To User:** Select the dedicated user below to whom PRTG assigns this ticket.

Assign Ticket to this User Group / User Select the user or user group to which PRTG assigns the notification ticket.

Subject Enter the subject of the ticket. Several placeholders (variables) are used here by default. You can change it to your liking.

Content Define the message in the ticket. A message with information about the sensor status is already predefined. Several [placeholders](#)³³³² (variables) are used here. You may change it as you wish.

When Condition Clears Specify if PRTG closes the ticket automatically when the defined trigger condition clears. Choose between:

- **Close ticket automatically (recommended):** PRTG closes the ticket automatically if the trigger condition is not met anymore.
- **Leave ticket open:** PRTG does not close the ticket after the condition has cleared.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Script World Notifications

In addition to the built-in notification, you can create your own notifications. Just write a script or a program and use it with an **Execute Program** notification or execute an HTTP action. There are already many free, useful scripts, plugins, and add-ons for PRTG in the [PRTG Script World](#) available for download. Here is a list of the custom notifications that you can find there.

- How to Send Custom HTML Notifications

- Sending Notifications Using Telegram Bots

Others

 For information about the comments and history tabs, see [Object Settings](#)²¹⁷ section.

Escape Special Characters and Whitespaces in Parameters

 You need to escape special characters in parameters that you pass to an executable or script and surround them with quotation marks to make sure the characters are interpreted correctly. Especially PowerShell scripts require adequate escaping so that the parameters are passed in a valid PowerShell syntax. To make escaping easy and secure, PRTG automatically does most of the escaping for you.

Please follow these rules to escape special characters and whitespaces in the parameters fields:

- Use quotes for parameters that contain whitespaces.

```
-name "Mr John Q Public"
-name 'Mr John Q Public'
```

- Use double quotes for parameters that contain single quotes.

```
-name "Mr 'John Q' Public"
```

- Use single quotes for parameters that contain double quotes.

```
-name 'Mr "John Q" Public'
```

- Use a backslash (\) to escape and pass a literal double quote.

```
-name pub\"lic
```

- Use double quotes for parameters that contain double **and** single quotes and escape double quotes.

```
-name "pu'b\"lic"
```

In Secure Shell (SSH) scripts, you can use alphanumeric characters and the special characters ":", "_", "-", "=", and "/" outside of quoted strings.

 We recommend that you do not pass passwords in parameters. Use PRTG placeholders instead. See section [Custom Sensors](#)³⁶⁵ for details.

8.12.3 Account Settings—Notification Contacts

In the **Notification Contacts** settings the PRTG user who is currently logged in defines and changes their notification contacts.

Notification contacts are unique for each user account. That is, every user of a PRTG installation can individually define how they want to get notified by PRTG. Recipients of [notifications](#)^[3216] are email addresses, phone numbers, push devices (with [PRTG for Android](#)^[3485] or [PRTG for iOS](#)^[3484]), and users of certain instant messaging services.

The [notification methods](#)^[3316] **Send Email**, **Send SMS/Pager Message**, or **Send Push Notification** allow you to set a PRTG user who will receive notifications at **all** their **active** notification contacts. If you select a user group, PRTG will send the notifications to **all active** contacts of **all** users that are in this group. To exclude defined notification contacts from notification delivery, you can use the **pause** feature to deactivate them.

■ If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

Note

This section describes one of four steps to set up the notification system in PRTG. To complete your notification setup, go through all of the following steps:

1. Check and set up the **Notification Delivery** settings to define how and to which recipient PRTG will send messages.
For detailed information, see [System Administration—Notification Delivery](#)^[3361].
2. Check and set up **Notification Contacts** for the PRTG users to define the recipients of notifications.
For detailed information, see [Account Settings—Notification Contacts](#)^[3334].
3. Check and set up **Notification Templates** to define the notification methods and their content.
For detailed information, see [Account Settings—Notification Templates](#)^[3311].
4. Check and set up **Notification Triggers** for objects to define when notification messages will be sent.
For detailed information, see [Sensor Notification Triggers Settings](#)^[3170].

ⓘ We recommend that you always set up at least two notifications with different delivery methods for a notification trigger, for example, one [email notification](#)^[3317] and one [SMS notification](#)^[3320]. If delivery via email fails (due to an email server failure or other reasons), PRTG can still notify you via your smartphone. Simply set your latency setting to a [state trigger](#)^[3172] and a notification via a delivery method other than the one for the first trigger. Or set up a second trigger with another notification for the corresponding object.

■ For background information, see the [Notifications](#)^[3216] section.

Notification Contacts Overview

Click on the **Notification Contacts** tab to show a list of all existing notification contacts of the currently logged in PRTG user. Using the buttons in the particular contact rows, you can do the following:

- **Pause:** Pause this notification contact. If a notification contact is [paused](#)²⁴⁵, PRTG does not send any messages to this contact when a notification for this user is triggered.
- **Edit:** Open the [settings of this notification contact](#)³³⁵ and change its description and recipient.
 - ❗ This is not possible for predefined notification contacts, for example, the primary email address. You can change the primary email address under [Account Settings—My Account](#)³³⁴.
- **Delete:** Delete this notification contact.
 - ❗ This is not possible for predefined notification contacts, for example, the primary email address.

Notification Contacts Settings

Hover over  and select **Add Email Contact** or **Add SMS Contact** to add a new notification contact, or click the **Edit** button of an existing notification contact to edit it. A dialog box appears where you can enter the contact settings.

❗ PRTG adds push contacts automatically for the corresponding user when you install a PRTG mobile app on your smartphone or tablet, connect to the PRTG server, and activate push notifications. You cannot add push contacts manually. If your mobile device rejects push notifications actively for an existing push contact, for example, because you deactivated push on the target device or reset it, the PRTG server will [pause](#) this contact automatically. The affected PRTG user account will receive a [ToDo ticket](#)²³⁰ in this case.

ADD NEW / EDIT NOTIFICATION CONTACT

Description	Enter a meaningful name for the notification contact, for example, SMS to Admin Mobile or similar.
Recipient	<p>Enter a valid email address for the contact type Email. You can add an SMS contact by entering a valid phone number. The format of the phone number depends on the SMS provider. Usually, you use a plus sign "+", followed by country code and number. For example, enter +1555012345</p> <p>❗ Ensure the number format meets the requirements of your SMS provider or the hardware that you use in combination with an API call. Sometimes a preceded plus sign is not required. A wrong format may result in undelivered messages!</p>

ADD NEW / EDIT NOTIFICATION CONTACT

 For the contact type **Push**, this field shows a unique token that you cannot change here. This token is needed to send push notifications through the cloud. For details, see this Knowledge Base article: [How can I use push notifications with PRTG?](#)

Contact Type Shows the type of contact, either **Email**, **SMS**, or **Push**. This setting is shown for your information only and cannot be changed here.

If you want to use another contact type, create a new contact with **Add Email Contact** or **Add SMS Contact**, or activate push notifications in your PRTG for iOS or Android app.

Click the **Save** or **Add** button to save your settings, or click **Cancel** to close the dialog box without changes to your configuration.

A cloud contact is added automatically when you install the PRTG app on your smartphone, connect to the PRTG server, and enable push notifications.

Others

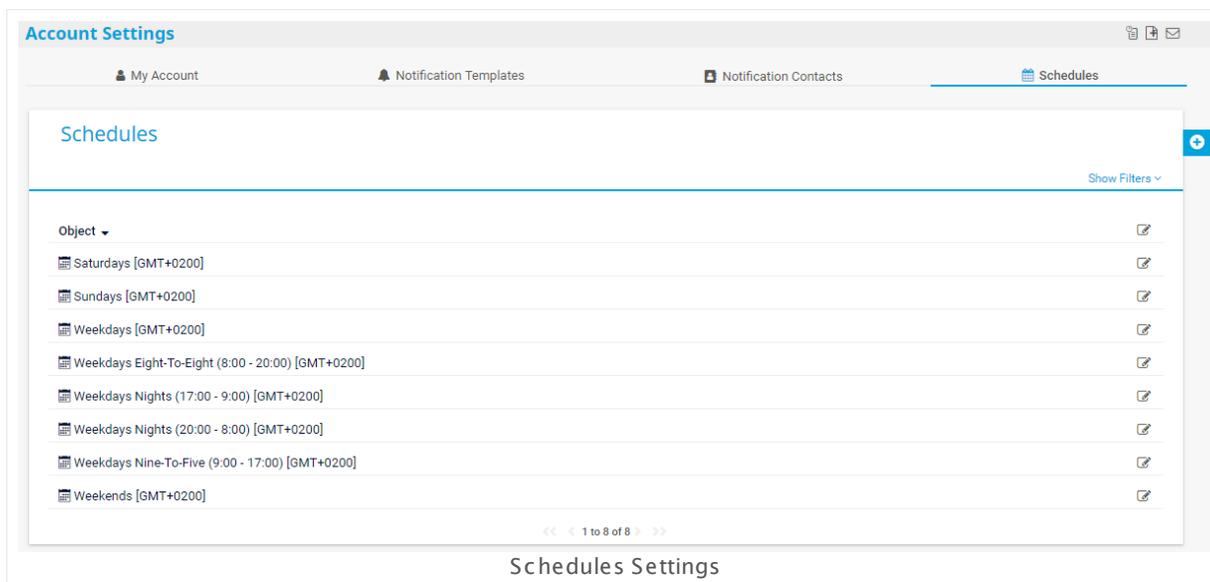

There are some settings that you must make in the [PRTG Administration Tool](#)  3560, available as native Windows application. For more details, see the sections:

- [PRTG Administration Tool on Core Server System](#)  3561
- [PRTG Administration Tool on Remote Probe System](#)  3567

8.12.4 Account Settings—Schedules

In the schedule settings you can define or change schedules for the currently logged in user. You can use schedules to [pause](#)^[245] monitoring/notification at for certain time periods with the period lists option. Also you can activate it at certain times with the time table option. You can also use schedules to define the time periods that are to be covered when creating [reports](#)^[325].

■ If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

Schedules Settings

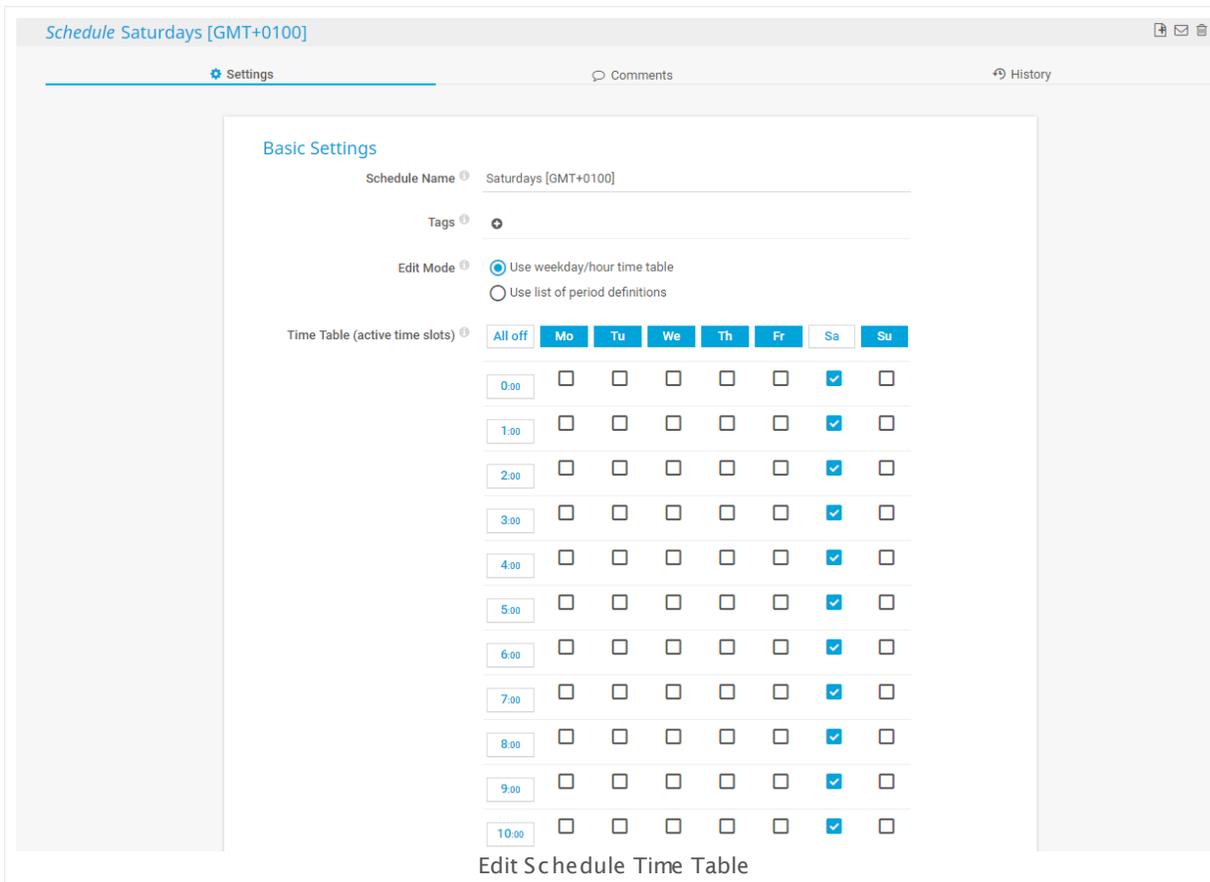

i This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

Click on the **Schedules** tab to show a list of all existing schedules. Using the **Edit** button, you can perform the following actions:

- **Used by:** Show a list of objects using this notification.
- **Delete:** Delete this notification (not possible for predefined notifications)
- **Settings:** Shows the settings of the selected schedule.

Please also see [Working with Table Lists](#)^[237]. Additionally, the multi-edit functionality is available. This enables you to change properties of several objects simultaneously via bulk changes. For more details, see the [Multi-Edit Lists](#)^[319] section.

Hover over  and select **Add Schedule** or click the name of an existing notification to edit.

BASIC SETTINGS

Schedule Name Enter a meaningful name for the schedule that describes the defined time span(s) or their purpose.

Tags Use tags to filter for objects of certain categories. See section [Tags](#) ¹³⁹ for more information.

Edit Mode Select how you want to define a schedule. Choose between:

- **Use weekday/hour time table:** Define a schedule by adding check marks to available check boxes. The lowest possible increment is one hour.
 -  This time table defines which time slots are **active**.

BASIC SETTINGS

- **Use list of period definitions:** Define a schedule by entering text lines using a specific syntax (see below).

 This time table defines which time slots are **inactive**.

Time Table

This selection is only visible if you enable the time table option above. Define the schedule. It will be used for monitoring objects, reporting, and notifications.

You can set time spans with a precision of one full hour by adding check marks. If a box is checked, it means the object is active during this hour. If unchecked, the object will be paused during this hour. You can set check marks individually, or change complete ranges for certain days of the week or time spans.

- To add ranges of check marks, use the weekday buttons **Mo**, **Tu**, **We**, **Th**, **Fr**, **Sa**, and **Su**, as well as the time buttons on the left side. If the color of a button is blue, a click will select the range. To select all ranges, click **All on**.
- To remove ranges of check marks, use weekday and time buttons that are active. If the color of a button is white, a click will deselect the range. To remove all ranges, click **All of**.

Period List

This field is only visible if you enable period definitions above. Define the date/time ranges in which the objects using this schedule will be **inactive** (for example, paused). During other times, the objects will be active. Enter the ranges in this format:

- **ww:hh:mm-ww:hh:mm**

 Ensure you enter each period exactly in the required syntax! Otherwise you will receive an error message. Please go back to the schedule and correct the according entry in this case.

 For details and examples, see [Schedules Settings—Period Definition Syntax](#)³³⁴¹ below.

 Schedules use the time zone of the computer on which your PRTG core server is running. This may diverge to other time displays in PRTG that are saved in UTC.

- If you define a schedule with the Time Table option in the [schedule settings](#)³³³⁹, the time to which the schedule applies is converted to the time zone of [your PRTG user account](#)³³⁰⁷. This means that the schedule is executed according to the time that your user account shows.
- If you use the Period List option, PRTG will **not** adjust the schedule to the time zone of your user account! The schedule will apply according to the time on your PRTG server in this case. Because of this, you will encounter time shifts for schedules if there are changes to the time zone on the server or in case of different daylight saving and standard time changes.

ACCESS RIGHTS

User Group Access Define which user group(s) will have access to the object that you are editing. A table with user groups and rights is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists.
- **Read:** Users in this group can see the object and review its settings.
- **Write:** Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings.
- **Full:** Users in this group can see the object, as well as review and edit its settings as well as edit access rights.

You can create new user groups in the [System Administration—User Groups](#) settings.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Schedules Settings—Period Definition Syntax

Define one or more periods of time during which the object using this schedule will be **inactive**. In each line, enter one range in the format **ww:hh:mm-ww:hh:mm**: weekday, hour, minute.

- **Possible values for ww:** mo, tu, we, th, fr, sa, su.
- **Possible values for hh:** Enter the hour in 24 hour format (no AM/PM allowed), for example, a number between 00 and 23.
- **Possible values for mm:** Enter the minute, for example, a number between 00 and 59.

Example

This example shows a schedule that pauses an object during the weekend as well as on Wednesday evenings.

```
fr:19:30-mo:06:05
we:18:45-we:23:00
```

Any object using this schedule will be paused from Friday, 7:30 p.m. to Monday, 6:05 a.m. as well as on Wednesday from 6:45 p.m. to 11 p.m. It will be active during the other times.

Others

 For information about the comments and history tabs, see the [Object Settings](#)²¹⁷ section.

8.12.5 System Administration—User Interface

In the user interface settings you can define global values regarding the PRTG website appearance, PRTG web server settings and performance, Geo Maps, and graph settings.

■ If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

User Interface Settings

ⓘ This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

WEBSITE

PRTG Site Name When using the web interface, the site name is shown in the title bar of your browser window. It is also used by default in notification emails. Please enter a string.

DNS Name If your PRTG web interface is (additionally) reachable via a DNS name, enter it here. It is used, for example, by default in notification emails to generate links. Please enter a string.

ⓘ The special characters " and \ are not allowed in the DNS Name.

☁ This option is not available in PRTG hosted by Paessler.

Website Language Choose the system language from the dropdown list. Default is **English**. Depending on your installation, you may be able to choose other languages here. This setting defines the language of the [PRTG web interface](#)^[166], as well as of the [PRTG Administration Tool](#)^[3560].

ⓘ If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears that asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the [Enterprise Console](#)^[3430], or of [PRTG Apps for Mobile Network Monitoring](#)^[3484] will be disconnected and reconnected.

WEBSITE

Graph Type Select how graphs will be displayed throughout the web interface and in [reports](#).

- **Use area graphs (recommended):** Display filled graphs.
- **Use line graphs:** Display graphs using single lines only.

We recommend using area charts, as they're better to read.

 Graphs containing data from more than one cluster node will always be displayed with line graphs automatically.

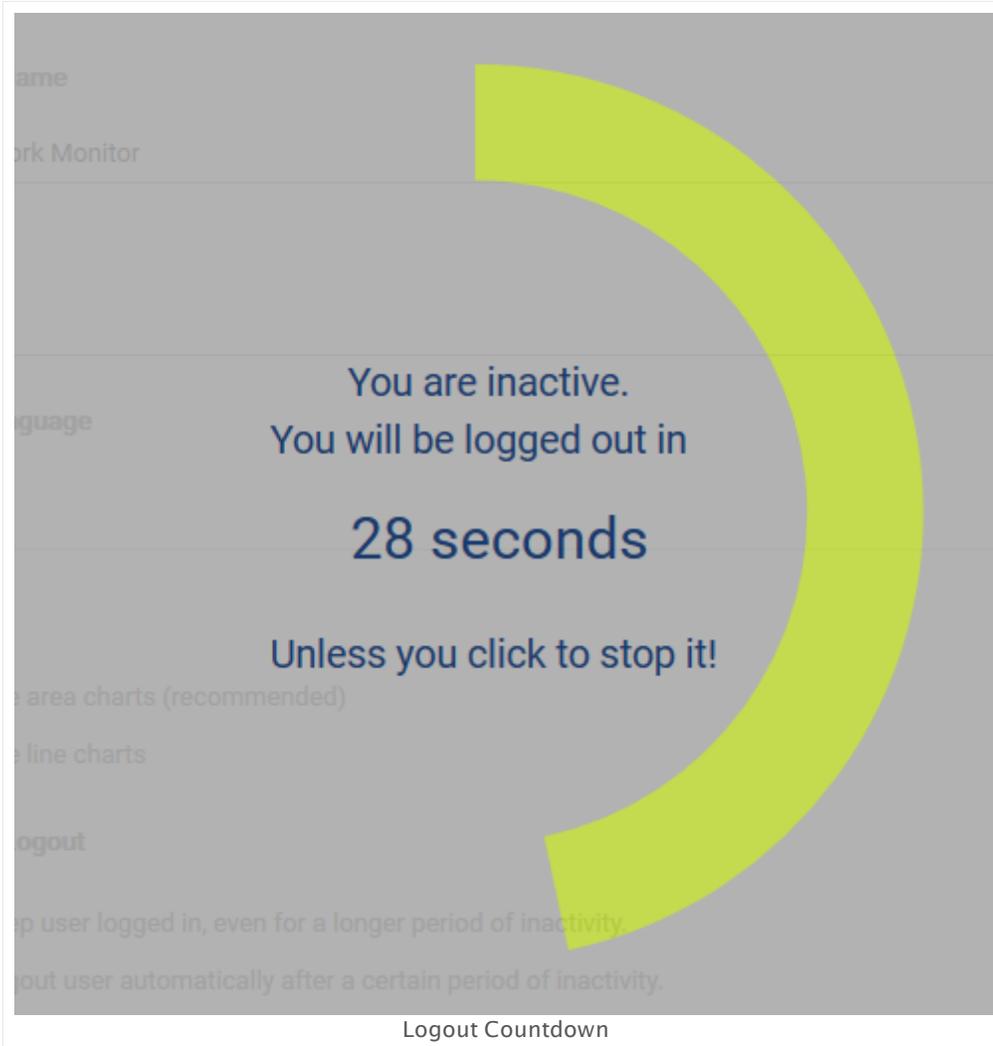

Automatic Logout Define if a user who is inactive for a certain period of time will be logged out from the PRTG interface automatically for security reasons. Choose between:

- **Keep user logged in, even for a longer period of inactivity.**
- **Logout user automatically after a certain period of inactivity.**

Automatic Logout after Minutes This field is only visible if you select the logout option above. Specify in minutes after which time of inactivity a user will be logged out automatically. Please enter an integer value. PRTG will redirect to the login page once this time has expired.

If the value you enter here is greater than 1 minute, a logout countdown will appear 1 minute before you are logged out. If the value is 1 minute, you will see the logout countdown 30 seconds before you are logged out. Click into the browser to stop the countdown and stay logged in.

WEBSITE

Google Analytics Tracking ID

You can track the usage of PRTG web pages with Google Analytics by entering your **Google Universal Analytics Tracking ID** into this field. You need a Google Analytics account for this feature. Create a tracking ID within the Google Analytics portal and provide it here. PRTG will then dynamically integrate it into the website.

Please enter a string or leave the field empty. The string will look like this: **UA-xxxxxx-xx**

 For details, see this Knowledge Base article: [How can I integrate Google Analytics in PRTG?](#)

 This option is not available in PRTG hosted by Paessler.

GEO MAPS

Map Service Provider	<p>Select if and how you want to integrate the Geo Maps feature into the web interface. If enabled, PRTG uses the first line of the location setting of an object^[217] to show it on a geographical map. Choose a map provider:</p> <ul style="list-style-type: none">▪ Do not show maps (disables Geo Maps integration): Disable Geo Maps integration and do not show geographical maps in the web interface.▪ Default (recommended): The recommended default option currently reroutes the map requests to Nokia Maps. See this blog article for details: Geo Maps Requires a Change of Map Service Provider▪ HERE Maps: Use HERE Maps to show geographical maps.▪ CloudMade (API key required): Use CloudMade to show geographical maps. Please sign up for an API key on their developer website to use this service.▪ Google Static Maps (API key required): Use Google Static Maps to show geographical maps. Please sign up for a Google Maps API v3 key to use this service as of PRTG version 13! <p> For more information about the different map providers, see this Knowledge Base article: Which provider should I use for PRTG's "Geo Maps" feature?</p>
Map Type	<p>This setting is only visible for some map providers. Depending on the chosen provider, several options are shown. Each will show map tiles in a different appearance. Choose a map type from the list.</p>
API Key (required)	<p>This field is only visible if you selected a provider that requires an API key. Obtain your personal key and paste it here.</p> <p> For more information on how to get a Google API key, see this Knowledge Base article: How do I get a Google Maps API key for use in PRTG?</p>

WEB SERVER

Performance Strategy	Select if you want to enable performance improvements for the web interface.
----------------------	--

WEB SERVER

- **All Features: Show all features and live data (recommended):** Provide full functionality and show all menu items.
- **More Speed: Limit features and delay display (experimental):** Improve reaction time and speed of the web interface by delaying display of monitoring data and hiding some features.

 For more information on how to speed up the web interface, see this Knowledge Base article: [How can I speed up PRTG—especially for large installations?](#)

IP Address for Web Server

PRTG is running a web server in order to provide access via the web and Windows interface. Please specify the IP address this web server will run on. Later, you can log in to PRTG by simply pointing your browser to the specified IP address.

Choose between:

- **Localhost, 127.0.0.1 (PRTG will not be accessible from other computers):** Use **127.0.0.1** only. The PRTG web interface and the Enterprise Console will only be accessible from the computer PRTG is installed on. Either the selected port or at least one port in the range from **8080** to **8089** has to be available on **127.0.0.1**.

 If you run PRTG on localhost, please do not use the DNS name **http://localhost** to log in to the web server, as this may considerably slow down the PRTG web interface. Please use your local IP address or **http://127.0.0.1** instead.

- **All IPs available on this computer:** Use all IP addresses available on this computer and enable access to the web server for all of these addresses. The TCP port selected below must be free on every available IP address.
- **Specify IPs:** Select specific IP addresses on which the PRTG Web server will run. A list specific to your system is shown. Add a check mark in front of every IP address you want the PRTG web server to be available at. You can also select and deselect all addresses by clicking on the check box in the table header. Either the selected port or at least one port in the range from **8080** to **8089** has to be available on the specified IP address.

 Regardless of the selected setting above, one port in the range from **8080** to **8180** has to be available on the specified IP address so PRTG can create reports. The report engine will try to connect to the core server on one of these ports.

WEB SERVER

 If PRTG does not find a network card on startup it will switch the IP setting to **Localhost**. This setting will remain, even if a network card is available later on. If you disabled or removed the network card on the machine running the PRTG core server, please re-check this setting.

 If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears that asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the [Enterprise Console](#)^[3430], or of [PRTG Apps for Mobile Network Monitoring](#)^[3484] will be disconnected and reconnected.

 This option is not available in PRTG hosted by Paessler.

TCP Port for Web Server

PRTG runs a web server in order to provide access via the web interface and the Enterprise Console. Please specify on which port this web server will run. Choose between:

- **Secure HTTPS server (recommended, mandatory for internet access):** We recommend this setting and you need it to access the PRTG server via the internet. Use a secure HTTPS connection that is encrypted via SSL on port 443.

 Although the connection is secure, you will see an [SSL Certificate Warning](#)^[172] in your browser when logging in to the PRTG web interface, because the default certificate is unknown to your browser. You can install another SSL certificate for PRTG later. Please see [Using Your Own SSL Certificate](#)^[3736].

 If port 80 is free, PRTG will reserve it as well. When users try to connect on port 80 via HTTP, they will then be redirected to port 443 via HTTPS. You can change this behavior by using a registry setting.

If port 443 is not available, PRTG will try port 8443 as fallback. If this port is also not available, PRTG searches from port 32000 upwards for a free port. PRTG will send a [ticket](#)^[230] that shows you the currently used port number and will switch back to 443 as soon as it is available again.

- **Insecure HTTP server (standard port 80, not recommended):** Use a standard web server without SSL encryption on port 80. This setting is not recommended for WAN connections.

 If you use an insecure web server on the internet, attackers could potentially spy on credentials you enter into PRTG. We strongly recommend that you use this option in a LAN only.

WEB SERVER

- **Expert configuration:** This setting allows you to specify a custom web server port and the security of the connection. This option is intended for systems with an existing web server on the standard port. Define port and encryption below.

 If PRTG always uses a fallback port after a server restart, check for other programs that use the same port as PRTG. For example, the Microsoft IIS web server also uses the port 80 (443 for SSL) by default and blocks it. Please disable such programs and services on startup.

 If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears that asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the [Enterprise Console](#)³⁴³⁰, or of [PRTG Apps for Mobile Network Monitoring](#)³⁴⁸⁴ will be disconnected and reconnected.

 This option is not available in PRTG hosted by Paessler.

Web Server Port

You will see this setting only if you select **Expert configuration** above. Enter the TCP port number you want the PRTG web server to run on. Please enter an integer value.

 If you use a secure connection and port 80 is free, PRTG will reserve it as well. When users try to connect on port 80 via HTTP, they will be redirected to the custom port via HTTPS. You can change this behavior by using a registry setting.

 If the defined port for a secure connection is not available, PRTG will try port 8443 as fallback. If this port is also not available, PRTG searches from port 32000 upwards for a free port. PRTG sends a [ticket](#)²³⁰¹ that shows you the currently used port number and will switch back to the original port as soon as it is available again.

 If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears that asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the [Enterprise Console](#)³⁴³⁰, or of [PRTG Apps for Mobile Network Monitoring](#)³⁴⁸⁴ will be disconnected and reconnected.

 This option is not available in PRTG hosted by Paessler.

WEB SERVER

Web Server Security

You will see this setting only if you select **Expert configuration** above. Specify if you want to use an SSL encryption. Choose between:

- **Use SSL encryption (HTTPS):** Use a secure HTTPS connection that is encrypted via SSL on a custom port as defined above.
 - ❗ Although the connection is secure, you will see an [SSL Certificate Warning](#)^[172] in your browser when you log in to the PRTG web interface, because the default certificate is unknown to your browser. You can install another SSL certificate for PRTG later. Please see [Using Your Own SSL Certificate](#)^[3736].

- **Don't use encryption (not recommended):** This setting is not recommended for WAN connections. Use a standard web server without SSL encryption on a custom port as defined above.

⚠ If you use a web server without encryption on the internet, attackers could potentially spy on credentials you enter into PRTG. We strongly recommend that you use this option in a LAN only.

❗ If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears that asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the [Enterprise Console](#)^[3430], or of [PRTG Apps for Mobile Network Monitoring](#)^[3484] will be disconnected and reconnected.

☁ This option is not available in PRTG hosted by Paessler.

SSL Security

Specify the security level that will be used for SSL connections from and to the PRTG web server. Choose between:

- **High security (recommended):** The web server will only accept high security connections from clients like web browsers, [apps](#)^[3484], the [Enterprise Console](#)^[3430], or API clients. These clients must be able to support modern ciphers that support authentication and encryption of **128 bits** or stronger and **forward secrecy**. All modern web browsers do this.
- **Weakened security (necessary for old web browser and old client software):** If you have clients that do not support the high security setting, you can choose this 'normal security level' setting to connect (for example, older browsers, browsers running on Windows XP, some default browsers on Android systems). However, we strongly recommend that you update your clients in this case.

WEB SERVER

 This option is not available in PRTG hosted by Paessler.

Currently Active IP
Address/Port
Combination(s)

Shows all currently active combinations of IP addresses and ports on which the PRTG server listens for web requests. This setting is shown for your information only and cannot be changed here.

 PRTG internally uses port 8085 for report generation.

 This option is not available in PRTG hosted by Paessler.

GRAPH SETTINGS: SELECT FOR HOW MANY DAYS HISTORIC DATA REMAINS ACCESSIBLE

PRTG shows several graphs in the [objects' detail pages](#)^[198] in the web interface. These are kept in RAM memory for fast display without causing extra CPU load or disk usage. The longer the time frames and the shorter the intervals are, the more memory will be used for this. You can adapt the details for all four graphs. This setting will also change the caption of the objects' tabs in the [web interface](#)^[166] and [Enterprise Console](#)^[3430].

 If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears that asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the [Enterprise Console](#)^[3430], or of [PRTG Apps for Mobile Network Monitoring](#)^[3484] will be disconnected and reconnected.

Live Graph

The live graph is available for sensors only. For the live graph, no fixed time span is given, but you can define how many values will be displayed. The actual time span covered by the live graph depends on the scanning interval set for the sensor you're viewing and is calculated automatically. By default, **120 Values** is set, which results in a graph covering a time span of two hours, if a scanning interval of 60 seconds is set for the sensor. Other scanning intervals will result in graphs covering different time spans. Choose between:

- **60 Values:** This corresponds to a live graph covering a time span of one hour if a 1 minute scanning interval is set. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more.

GRAPH SETTINGS: SELECT FOR HOW MANY DAYS HISTORIC DATA REMAINS ACCESSIBLE

- **120 Values:** This corresponds to a live graph covering a time span of two hours if a 1 minute scanning interval is set.
- **240 Values:** This corresponds to a live graph covering a time span of four hours if a 1 minute scanning interval is set.
- **480 Values:** This corresponds to a live graph covering a time span of eight hours if a 1 minute scanning interval is set.
- **960 Values:** This corresponds to a live graph covering a time span of 16 hours if a 1 minute scanning interval is set. Uses most RAM memory.

Graph 1

By default, this is the **2 days** graph in the web interface. You can change it to more or less detail by choosing a time span and a monitoring interval average associated with it. Monitoring results will be averaged regardless of the actual scanning interval set for the sensors. Choose between:

- **1 day with 1 minute averages:** Results in 1440 values.
- **1 day with 5 minutes averages:** Results in 288 values.
- **1 day with 15 minutes averages:** Results in 96 values. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more.
- **2 days with 1 minute averages:** Results in 2880 values. Uses most RAM memory.
- **2 days with 5 minutes averages:** Results in 576 values.
- **2 days with 15 minutes averages:** Results in 192 values.
- **4 days with 1 hour averages:** Results in 96 values. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more.

Graph 2

By default, this is the **30 days** graph in the web interface. You can change it to more or less detail by choosing a time span covered and a monitoring interval average associated with it. Choose between:

- **10 days with 1 hour averages:** Results in 240 values.
- **20 days with 1 hour averages:** Results in 480 values.
- **30 days with 1 hour averages:** Results in 720 values.
- **30 days with 6 hour averages:** Results in 120 values. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more.

GRAPH SETTINGS: SELECT FOR HOW MANY DAYS HISTORIC DATA REMAINS ACCESSIBLE

- **40 days with 1 hour averages:** Results in 960 values.
- **40 days with 6 hour averages:** Results in 160 values.
- **60 days with 1 hour averages:** Results in 1440 values. Uses most RAM memory.
- **60 days with 6 hour averages:** Results in 240 values.

Graph 3

By default, this is the **365 days** graph in the web interface. You can change it to more or less detail by choosing a time span covered and a monitoring interval average associated with it. Choose between:

- **100 days with 1 day averages:** Results in 100 values. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more.
- **200 days with 1 day averages:** Results in 200 values.
- **365 days with 1 day averages:** Results in 365 values.
- **400 days with 1 day averages:** Results in 400 values.
- **750 days with 1 day averages:** Results in 750 values. Uses most RAM memory.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

8.12.6 System Administration—Monitoring

In the monitoring settings you can define global values regarding scanning intervals, unusual and similar sensors detection, auto-discovery, and uptime threshold.

■ If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

Monitoring Settings

ⓘ This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

SCANNING INTERVALS

☁ This option is not available in PRTG hosted by Paessler.

Available Intervals Define the intervals available in the dropdown list of [every object's settings](#)^[247]. In the text field, enter one value in each line. Use **s**, **m**, **h**, and **d** for defining seconds, minutes, hours, and days. By default, there are the following scanning intervals defined:

30s: 30 seconds

1m: 1 minute

5m: 5 minutes

10m: 10 minutes

15m: 15 minutes

30m: 30 minutes

1h: 1 hour

4h: 4 hours

6h: 6 hours

12h: 12 hours

1d: 1 day

SCANNING INTERVALS

 We recommend that you do not use intervals shorter than 10 seconds to prevent system overload. Intervals below 10 seconds are not officially supported! The maximum supported scanning interval is 10 days.

You can also define specific points in time to indicate when PRTG executes scanning actions. Enter up to 50 concrete UTC points in time according to the formula

@ UTC hh:mm, hh:mm

 Your local time may be different from the UTC time!

 For more information on how to set specific points in time as a scanning time for sensors, see this Knowledge Base article: [Can I set a sensor to run at a specific time?](#)

UNUSUAL DETECTION

The unusual detection can set sensors to an **Unusual status**¹⁹⁵ when there are values that are untypical for the time span in which they are measured. PRTG compares the current average values to the historic monitoring results for this purpose. If the current values show a big difference to the values that are normally retrieved by a sensor, this sensor will indicate this with the unusual status.

You can define the granularity of the unusual detection here (this means, how big the difference must be to cause an unusual status). If you disable the unusual detection (both settings to **Never**), sensors will never show an unusual status.

-  You can enable and disable unusual detection for specific devices, entire groups, and probes in the respective **Object Settings**²¹⁷.
-  Unusual detection requires sensor data from at least four weeks (28 to 34 days) to have enough data available for comparison. If there is less data available, the unusual status cannot be calculated.

Show Unusual When Define when a sensor shows the unusual status, comparing the weekday. If you enable the detection here, the average of the values that were measured on the day before is compared to the average of the same weekday in previous weeks. Choose between:

- **Never:** Disable unusual detection for weekday average.

UNUSUAL DETECTION

- **24h average is <80% or >120% of weekday average:** The average of the values measured on the day before is either lower than 80% or higher than 120% than usually on the same weekday.
- **24h average is <50% or >200% of weekday average:** The average of the values measured on the day before is either lower than 50% or higher than 200% than usually on the same weekday.
- **24h average is <20% or >500% of weekday average (recommended):** The average of the values measured on the day before is either lower than 20% or higher than 500% than usually on the same weekday.
- **24h average is <10% or >1,000% of weekday average:** The average of the values measured on the day before is either lower than 10% or higher than 1,000% than usually on the same weekday.
- **24h average is <1% or >10,000% of weekday average:** The average of the values measured on the day before is either lower than 1% or higher than 10,000% than usually on the same weekday.

For example, consider a traffic sensor that usually measures 100 MB average traffic on a weekday. If you choose the first option, it would show an unusual status if the average from the day before is below 80 MB or above 120 MB.

Show Unusual When

Define when a sensor shows the unusual status, comparing the hour-of-day. If you enable the detection here, the average of the values that were measured in the hour before is compared to the average of the same hour on the same weekday in previous weeks. Choose between:

- **Never:** Disable unusual detection for hour-of-day average.
- **Hourly average is <80% or >120% of hour-of-day average:** The average of the values measured in the hour before is either lower than 80% or higher than 120% than usually in this hour of this weekday.
- **Hourly average is <50% or >200% of hour-of-day average:** The average of the values measured in the hour before is either lower than 50% or higher than 200% than usually in this hour of this weekday.
- **Hourly average is <20% or >500% of hour-of-day average (recommended):** The average of the values measured in the hour before is either lower than 20% or higher than 500% than usually in this hour of this weekday.

UNUSUAL DETECTION

- **Hourly average is <10% or >1,000% of hour-of-day average:**
The average of the values measured in the hour before is either lower than 10% or higher than 1,000% than usually in this hour of this weekday.
- **Hourly average is <1% or >10,000% of hour-of-day average:**
The average of the values measured in the hour before is either lower than 1% or higher than 10,000% than usually in this hour of this weekday.

Consider a traffic sensor that usually measures 10 MB average traffic within an hour. If you choose the first option, it would show an unusual status if the average from the hour before is below 8 MB or above 12 MB.

Logging

Define if unusual events will be written to the logfile. Choose between:

- **Do not log unusual events**
- **Write unusual events into the log** (default)

SIMILAR SENSORS DETECTION

Similar sensors detection enables PRTG to analyze sensor data for similarities. The detection will run in the background with low priority. The recommended setting for similar sensors detection is to let PRTG automatically decide how many channels will be analyzed. However, you can also override this setting.

i When similar sensors analysis is turned off or you have exceeded 1,000 sensors and have chosen the automatic analysis depth option, the similar sensors entry will not be shown in the main menu bar.

Analysis Depth

Define the number of channels PRTG will analyze to detect similarities between sensors or turn the analysis off. Choose between:

- **Manage automatically based on sensor count (recommended):** The analysis depth depends on the total number of sensors you have configured. PRTG will analyze all channels for up to 500 sensors, and only the primary sensor channels for up to 1,000 sensors. If exceeding 1,000 sensors, the analysis will be turned off. This is the default setting in PRTG on premises.

SIMILAR SENSORS DETECTION

- **Analyze primary channels only:** Only the primary channels of sensors are analyzed. Be aware of potentially high CPU load of PRTG when choosing this setting for more than 1,000 sensors.
- **Analyze all channels (higher CPU load):** Similarity detection is applied to all channels. Be aware of potentially high CPU load of PRTG when choosing this setting for more than 500 sensors.
- **Turn analysis off:** No similarity detection takes place. Choose this option if you are not interested in the analysis results or you want to keep the CPU load of PRTG at a minimum. This is the default setting in PRTG hosted by Paessler.

RECOMMENDED SENSORS DETECTION

With the sensor recommendation engine, PRTG can analyze devices in your network and suggest sensors that are still missing for a complete monitoring. The analysis runs with low priority in the background when you add a new device, when the last analysis was executed more than 30 days ago, or when you [manually start](#)^[214] it.

See the manual section [Recommended Sensors](#)^[213] for more information, for example, on [SNMP settings](#)^[214], on the [results](#)^[214] you get and on how you [add the suggested sensors](#)^[215].

.

 This option is not available in PRTG hosted by Paessler.

Detection Engine

Define if you want PRTG to analyze your devices to recommend useful sensor types. Choose between:

- **Manage automatically based on sensor count (recommended):** PRTG runs the detection engine for installations with up to 5,000 sensors by default. If you exceed this threshold, PRTG disables the detection engine for performance reasons. We recommend that you set this option so you do not miss any important monitoring data about your network, without risking to run into performance issues.
- **Always show recommendations:** PRTG always analyzes your devices even if your installation exceeds 5,000 sensors and you will never miss any suggestion to complete your monitoring. But if you enable this option, please keep in mind this setting in case you encounter performance issues.

RECOMMENDED SENSORS DETECTION

- **Turn recommendations off:** PRTG never recommends sensors. Select this option if you have performance issues with PRTG or if you do not want to see this information on [device overview tabs](#)^[198]. Moreover, you will not find the option **Recommend Now** in [device context menus](#)^[254] or on overview tabs anymore.

AUTO-DISCOVERY

Run Discovery At Define the time when PRTG automatically runs an [Auto-Discovery](#)^[282] in your network if you configured a daily or weekly **Discovery Schedule** in the [auto-discovery group settings](#)^[285]. Choose a full hour between **0:00** and **23:00**. We recommend that you choose a time when there is little user activity in your network, because auto-discoveries can produce a certain amount of load.

UPTIME THRESHOLD

Desired Minimum Uptime Define which uptime in percent PRTG regards as 100 percent. This setting affects the colors shown next to the sensor icons in reports. Select one of the predefined values between **90 %** and **99.999 %**.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

8.12.7 System Administration—Notification Delivery

In the notification delivery settings, you can define global settings for notification delivery. If you do not want to use a specific notification method, just leave the respective fields empty.

■ If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

Note

This section describes one of four steps to set up the notification system in PRTG. To complete your notification setup, go through all of the following steps:

1. Check and set up the **Notification Delivery** settings to define how and to which recipient PRTG will send messages.
For detailed information, see [System Administration—Notification Delivery](#) ³³⁶¹.
2. Check and set up **Notification Contacts** for the PRTG users to define the recipients of notifications.
For detailed information, see [Account Settings—Notification Contacts](#) ³³³⁴.
3. Check and set up **Notification Templates** to define the notification methods and their content.
For detailed information, see [Account Settings—Notification Templates](#) ³³¹¹.
4. Check and set up **Notification Triggers** for objects to define when notification messages will be sent.
For detailed information, see [Sensor Notification Triggers Settings](#) ³¹⁷⁰.

ⓘ We recommend that you always set up at least two notifications with different delivery methods for a notification trigger, for example, one [email notification](#) ³³¹⁷ and one [SMS notification](#) ³³²⁰. If delivery via email fails (due to an email server failure or other reasons), PRTG can still notify you via your smartphone. Simply set your latency setting to a [state trigger](#) ³¹⁷² and a notification via a delivery method other than the one for the first trigger. Or set up a second trigger with another notification for the corresponding object.

📖 For background information, see the [Notifications](#) ³²¹⁶ section.

Notification Delivery Settings

ⓘ This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

SMTP DELIVERY

SMTP Delivery Mechanism	<p>Define how PRTG sends emails using Simple Mail Transfer Protocol (SMTP). Choose between:</p> <ul style="list-style-type: none"> ▪ Direct delivery using built-in email relay server (default): Use the SMTP relay server built into PRTG. This server manages its own email queue. For each email, it looks up the target SMTP server via the MX record of the target domain, and send the email. ▪ Use SMTP relay server (recommended inside LANs/NATs): Set up your own SMTP relay server to send emails. Enter data below. ▪ Use two SMTP relay servers (primary and fallback server): Set up two own SMTP relay servers—one primary and one as fallback server. Enter data below. <p> When monitoring inside your NAT or LAN, it is often a good idea to use your own LAN-based relay server to deliver notification emails quicker.</p> <p> This option is not available in PRTG hosted by Paessler.</p>
Sender Email	<p>Enter an email address to use as sender of all emails. This setting is global and applies to all email notifications by default. You can override the sender email in the settings of individual Notifications³³¹⁷.</p>
Sender Name	<p>Enter a name to use as sender of all emails. This setting is global and applies to all email notifications by default. You can override the sender name in the settings of individual Notifications³³¹⁷.</p>
HELO Ident	<p>Enter the HELO Ident for SMTP. This must be a unique name, preferably the DNS name of the machine running PRTG. See SMTP RFC 2821: The sender-SMTP must ensure that the domain parameter in a HELO command is a valid principal host domain name for the client host.</p> <p> This option is not available in PRTG hosted by Paessler.</p>
SMTP Relay Server	<p>This field is only visible if you enable SMTP relay server above. Enter the IP address or DNS name of the SMTP relay server.</p> <p> This option is not available in PRTG hosted by Paessler.</p>
SMTP Relay SMTP Port	<p>This field is only visible if you enable SMTP relay server above. Enter the port number the SMTP relay server is running on. Standard value is 25.</p>

SMTP DELIVERY

 This option is not available in PRTG hosted by Paessler.

SMTP Relay Authentication

This field is only visible if you enable SMTP relay server above. Select the kind of authentication required for the SMTP server. Choose between:

- **No authentication is required:** Use SMTP without authentication.
- **Use standard SMTP authentication:** Use standard authentication.
- **SASL authentication is required:** Use secure authentication via Simple Authentication and Security Layer (SASL).

 This option is not available in PRTG hosted by Paessler.

SMTP Relay User

This field is only visible if you enable SMTP authentication above. Enter a valid username.

 This option is not available in PRTG hosted by Paessler.

SMTP Relay Password

This field is only visible if you enable SMTP authentication above. Enter a valid password.

 This option is not available in PRTG hosted by Paessler.

Use Encrypted Connection

This field is only visible if you enable SMTP relay server above. Enter the security level for SMTP connections. Choose between:

- **Never:** Use insecure connection with plain text transfer.
- **If supported by server:** Use a secure connection (default).

 This option is not available in PRTG hosted by Paessler.

SSL Method

This setting is only visible if you enable SMTP relay server and encryption above. It is only relevant for secure connections. Select the SSL or TLS version that your SMTP device supports.

We recommend that you use the default value. If you do not get a connection, try with another setting. Choose between:

- **SSL V2 or V3**
- **SSL V3**
- **TLS V1**

SMTP DELIVERY

- **TLS V1.1**
- **TLS V1.2**

 This option is not available in PRTG hosted by Paessler.

SMTP Relay Server
(Fallback)

SMTP Relay SMTP Port
(Fallback)

SMTP Relay
Authentication
(Fallback)

Use Encrypted
Connection (Fallback)

These fields are only visible if you enable the option for two SMTP relay servers above. Please see also the settings that you made for your primary SMTP relay server.

SSL Method (Fallback)

SMTP Relay User
(Fallback)

 This option is not available in PRTG hosted by Paessler.

SSL Method (Fallback)

SMTP Relay User
(Fallback)

SMTP Relay Password
(Fallback)

Security (Fallback)

SMS DELIVERY

 Although PRTG has built-in support for the Application Programming Interface (API) of some SMS providers, we cannot officially provide support regarding these SMS service providers. If you have technical questions about SMS delivery beyond PRTG, please contact your SMS provider directly.

SMS DELIVERY

 Instead of using a pre-configured provider you can always use a custom URL, enabling you to use extended parameters (this is also an alternative when using providers for which we offer pre-configured options).

You need an internet connection to send text messages via the HTTP API.

 For information about sending SMS via separate hardware using third-party software, see this Knowledge Base article: [How can I send SMS text message notifications via a modem or a mobile phone with PRTG?](#)

Configuration Mode Define how you want to select an SMS provider. Choose between:

- **Select an SMS provider from a list of providers:** Select a provider from a list below.
- **Enter a custom URL for a provider not listed:** Use another provider and enter the service URL manually below.

Service Provider This field is only visible if you choose the provider list above. Select a service provider from the list. PRTG offers a small incomplete list of providers.

 Some providers might require a port configuration in your firewall. For details, see this Knowledge Base article: [Which URLs does PRTG use for its preconfigured SMS providers?](#)

User This field is only visible if you choose the provider list above. Enter a username for the service provider account.

Password This field is only visible if you choose the provider list above. Enter a password for the service provider account.

API ID / Account This field is only visible if you choose the provider list above. Some providers need an additional API ID or account information. If provided, enter it here. Please enter a string or leave the field empty.

Custom URL This field is only visible if you enable the custom provider option above. From the documentation of your SMS provider, enter the service URL that is used to send SMS messages.

Use the following placeholders for the recipient phone number and the text message:

- **%SMSNUMBER**
- **%SMSTEXT**

 Please use the **GET** method to request the custom URL. **POST** requests are not supported.

SMS DELIVERY

Custom URL-SNI	Select if PRTG will send the SNI extension to the TLS protocol along with the HTTP request. Choose between: <ul style="list-style-type: none">▪ Do not send SNI (default): PRTG will not send an SNI when executing the HTTP action.▪ Send SNI: PRTG will send an SNI when calling the target URL. Specify the SNI below.
Virtual Host (SNI)	This field is only visible if you select the SNI option above. Enter the SNI name that your endpoint configuration requires. Usually, this is the Fully Qualified Domain Name (FQDN) of the virtual host.
Encoding for SMS	Define the encoding of the URL string that PRTG sends to your provider. Choose between: <ul style="list-style-type: none">▪ ANSI local system codepage (default)▪ UTF-8▪ UTF-16
Maximum Length of Text	Some SMS providers will not allow SMS messages exceeding a certain amount of characters. PRTG will restrict the number of characters according to the length specified in this field. A value of 0 means the SMS is sent at its full length.

 The [notification](#)³³¹¹ methods **Send SMS/Pager Message** and **Execute HTTP Action** will use the central proxy settings defined for your PRTG core server. For details, see [System Administration—Core & Probes](#)³³⁶⁸ (section **Proxy Configuration**).

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

8.12.8 System Administration—Core & Probes

In the core and probe management settings you can define settings for the core server, as well as the settings for probe connections if you use remote or mini probes.

i If you cannot save changes to **Core & Probes** settings because you get an **Error (Bad Request)** with the message **Active Directory Domain not accessible**, ensure you provide the correct access type for your domain in section **Active Directory Integration**³³⁷²! For example, change from "local user" to **Use explicit credentials** and provide correct credentials for the domain. Please note that PRTG automatically sets the access type "local system" by default, so you might need to change this.

■ If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

Core and Probes Settings

i This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

PROXY CONFIGURATION

 This option is not available in PRTG hosted by Paessler.

Use Proxy Server	<p>We recommend that you use PRTG with a direct internet connection. However, if you need to use a proxy, you can configure the relevant settings here. Choose between:</p> <ul style="list-style-type: none"> ▪ No, use direct connection to the internet (default): Do not use a proxy. Use this setting if there is a direct internet connection available to the server running the PRTG core server. ▪ Yes, in our network a proxy is mandatory: Define proxy settings below. <p>i Proxy settings are valid for Auto-Update³⁴⁰⁷, Activate the Product⁹⁹, obtaining Geo Maps³²¹¹ tiles, and for sending out HTTP, push, and SMS text message Notifications³³¹⁶.</p>
Proxy Server	<p>This setting is only visible if proxy usage is enabled above. Enter the address of the proxy server that you use for outbound connections. Please enter a valid address.</p>

PROXY CONFIGURATION

Port	This setting is only visible if proxy usage is enabled above. Enter the port number of the proxy server that you use for outbound connections. Please enter an integer value.
Use Proxy Credentials	This setting is only visible if proxy usage is enabled above. Determine whether the proxy server needs credentials or not. Choose between: <ul style="list-style-type: none">▪ No, there are no credentials necessary: Do not use credentials for proxy connections.▪ Yes, the proxy server requires credentials: Define credentials (username and password) below.
User	This setting is only visible if proxy credentials are enabled above. Enter a username for proxy authentication. Please enter a string.
Password	This setting is only visible if proxy credentials are enabled above. Enter a password for proxy authentication. Please enter a string.

PROBE CONNECTION SETTINGS

Probe Connections IPs	Define how PRTG handles incoming connections from probes. Choose between the following options: <ul style="list-style-type: none">▪ Local Probe only, 127.0.0.1 (PRTG will not be accessible for Remote Probes): The PRTG core server^[126] only accepts local probe connections. You cannot use remote probes^[370] with this setting enabled. This is the default setting in PRTG on premises.▪ All IPs available on this computer: The PRTG server will always accept incoming connections from remote probes, no matter on which IP address of the core server they come in. This is the default setting in PRTG hosted by Paessler.▪ Specify IPs: The PRTG server will accept Incoming connections from remote probes^[371] only on the selected IP address(es) of the core server. In the list, select the IP addresses by adding a check mark in front of the desired IPs. <p> You can also change this setting in the PRTG Administration Tool on Core Server System^[356].</p>
-----------------------	---

PROBE CONNECTION SETTINGS

 If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears that asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the [Enterprise Console](#)³⁴³⁰, or of [PRTG Apps for Mobile Network Monitoring](#)³⁴⁸⁴ will be disconnected and reconnected.

 This option is not available in PRTG hosted by Paessler.

Access Keys

Enter a list of access keys, one per line. Every (remote) probe that wants to connect to this PRTG installation has to use one of these keys.

 For more information on how to set this key for a probe, see the [PRTG Administration Tool](#)³⁵⁸⁸ section.

Allow IPs

Enter a list of remote probe IPs or DNS names that will be accepted when connecting to this PRTG installation. Provide one IP address or DNS name per line. The local probe (**127.0.0.1**) is always allowed automatically. PRTG will check the list of allowed addresses first before the list of denied addresses.

- **[Empty]**: An empty field does not allow any remote probes (but only the local probe). Please enter IP addresses or DNS names to allow remote probe connections.

 We recommend that you use IP addresses rather than DNS names, because DNS name resolution may be cached.

- **any**: Enter the word **any** to automatically allow all remote probe connections. This is the default setting in PRTG hosted by Paessler.

 We recommend that you only use this option in intranets in PRTG on premises!

 If the IP address of your remote probe changes regularly (for example, due to an internet provider assigning IP addresses dynamically), please enter the potential IP range for this remote probe or use the **any** option.

 You can use the PRTG syntax for IP address ranges here. For more information, see the [Define IP Ranges](#)³⁶⁹² section.

PROBE CONNECTION SETTINGS

Deny IPs

Enter a list of remote probe IPs or DNS names that will **not** be accepted when connecting to this PRTG installation. Provide one IP address or DNS name per line. This is useful to explicitly deny connections from certain remote probes you do not want to include in your setup any more (for example, for a certain time).

Access to IP addresses or DNS names you allowed above will be denied if you enter them here. This is useful to allow access to an IP range in the field above, but deny access to a single IP address. You can use the PRTG syntax for IP address ranges here (see the [Define IP Ranges](#) section).

-  We recommend that you use IP addresses rather than DNS names, because DNS name resolution may be cached.

Deny GIDs

Enter a list of GIDs, one global ID (GID) per line. The access to matching GIDs will be denied. If you remove a remote probe from the device tree or if you deny a remote probe after installation, its GID will be automatically entered here. This specific remote probe will not be able to connect anymore. Denying GIDs is more precise than denying IPs, where other remote probes at the same location could be excluded too.

-  What is a global ID (GID)? It is the ID that PRTG Network Monitor attributes to every device that you include in your monitoring.

Mini Probes

Define if you want to allow Mini Probe connections to your PRTG server. If you want to use Mini Probes, you need to set up your PRTG web server to accept connections of Mini Probes here and choose the secure HTTPS server option in the [web server settings](#) section. Choose between:

- **No Mini Probes:** Mini Probes cannot connect to your PRTG web server. You are not able to monitor with Mini Probes if you choose this option.
- **Allow Mini Probes to connect to the web server:** Mini Probes can connect to your PRTG web server and use the [defined TCP port for the web server](#) for this purpose. The default port for SSL connections is **443**.
- **Allow Mini Probes to connect to an extra port:** Mini Probes can connect via a specific port to your PRTG web server. This is useful if you do not want to have your whole PRTG web server reachable from other networks all the time only because of Mini Probes.
 -  SSL is always required to be active on the Mini Probe port.

 See section [Mini Probe API](#) for the full Mini Probe documentation. See also this Knowledge Base article: [Where can I find PRTG Mini Probes which are ready to use?](#)

PROBE CONNECTION SETTINGS

 If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears that asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the [Enterprise Console](#)³⁴³⁰, or of [PRTG Apps for Mobile Network Monitoring](#)³⁴⁸⁴ will be disconnected and reconnected.

 This option is not available in PRTG hosted by Paessler.

Mini Probe Port

This field is only visible if you select the extra Mini Probe port option above. Enter the number of the port that you want to use for Mini Probe connections. Ensure that SSL is available on this port.

 If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears that asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the [Enterprise Console](#)³⁴³⁰, or of [PRTG Apps for Mobile Network Monitoring](#)³⁴⁸⁴ will be disconnected and reconnected.

 This option is not available in PRTG hosted by Paessler.

ACTIVE DIRECTORY INTEGRATION

 This option is not available in PRTG hosted by Paessler.

Domain Name

To use the [Active Directory Integration](#)³⁶⁰³ enter the name of your local domain. Please enter a string or leave the field empty.

 PRTG does not support trusted domains or AD subdomains. For more important notes about AD integration, see section [Active Directory Integration—Notes and Limitations](#)³⁶⁰⁴.

ACTIVE DIRECTORY INTEGRATION

Access Type	<p>Define which user account PRTG will use to configure Active Directory (AD) access. PRTG uses this account to query the AD for existing groups. Choose between:</p> <ul style="list-style-type: none">▪ Use the PRTG core service account (usually LOCAL SYSTEM): Use the same Windows user account configured for the "PRTG Core Server Service". In a default installation, this is the "local system" Windows user account. If this account does not have the right to query all groups of your Active Directory, do not use this option.▪ Use explicit credentials: Define a user account that PRTG will use to authenticate against the Active Directory. This should be a user account with full access to all of your Active Directory groups.
Access User	<p>This field is only visible if you enable the use of explicit credentials above. Enter the Windows user account name that PRTG will use to authenticate for Active Directory configuration.</p>
Access Password	<p>This field is only visible if you enable the use of explicit credentials above. Enter the password for the Windows user account that PRTG will use to authenticate for Active Directory configuration.</p>

HISTORIC DATA PURGING: DEFINE FOR HOW MANY DAYS HISTORIC DATA REMAINS ACCESSIBLE

Data purging enables you to automatically delete unnecessary data to free up disk space and improve system performance. You can define different time spans for several kinds of data. Select here for how many days historic data remains accessible.

 For further information on storage locations, see the [Data Storage](#)  section.

 This option is not available in PRTG hosted by Paessler.

 PRTG hosted by Paessler purges historic data using the default purging limits of PRTG on premises (see the table below). You cannot modify historic data purging limits in PRTG hosted by Paessler.

HISTORIC DATA PURGING: DEFINE FOR HOW MANY DAYS HISTORIC DATA REMAINS ACCESSIBLE

Logfile Records Define how long records in the system logfile **Log Database.db** will be kept. Enter a value in days. All entries older than this value will be deleted from the logfile automatically. This also affects the content of the **Logs**^[228] tab of monitoring objects like sensors. Keep this value as low as possible to enhance system performance.

 Default value is **30** days.

Web Server Log Records PRTG creates one web server logfile every day. Define how many web server logfiles are kept. Enter a value in days. All web server logfiles older than this value will be deleted automatically.

 Default value is **30** days.

Historic Sensor Data Define for how many days historic sensor data are kept for all sensors. It is used to create **reports**^[3252] of monitoring data. Enter a value in days.

Depending on the used intervals and the number of sensors in your setup, the file containing this data can become large. For smaller installations (500 sensors or less) a value of 365 is usually fine.

 Historic sensor data is the basis for reports on monitoring data. If you decrease this value, there will be less historic monitoring data available!

 Default value is **365** days.

Toplist Records Define how long toplist records for **Flow**^[3514] and **Packet Sniffer**^[3512] sensors are kept. Enter a value in days. We recommend using 30 days here.

 Old toplist data will be purged automatically as soon as a limit of 2 GB is reached. The oldest data is deleted first from the database.

 Default value is **30** days.

Closed Tickets Define how long tickets that are in status **closed** are kept. Enter a value in days.

 Default value is **365** days.

HISTORIC DATA PURGING: DEFINE FOR HOW MANY DAYS HISTORIC DATA REMAINS ACCESSIBLE

Reports	<p>Reports generated in PDF format are stored on disk for later reference. Define the maximum age for these reports. Enter a value in days. All reports older than this value are deleted automatically.</p> <p> Default value is 365 days.</p>
Configuration Auto-Backups	<p>PRTG creates one backup of your configuration every day. Define the maximum age for these backups. Enter a value in days. All configuration backup files older than this value will be deleted automatically.</p> <p> Default value is 365 days.</p>
Full HTTP Sensor Screenshots	<p>Define how long the screenshots of the HTTP Full Web Page Sensor¹⁰²⁷ (PhantomJS browser engine) are kept. Enter a value in days. PRTG will delete older screenshots with every sensor scan.</p> <p> Default value is 10 days.</p>

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Remote Probe Setup

Find more information about setting up remote probes in the [Multiple Probes and Remote Probes](#)³⁷⁰⁷ section.

8.12.9 System Administration—User Accounts

PRTG administrator users can change all user account settings and add new users.

■ If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

User Accounts Overview

The **User Accounts** tab shows a list of all user accounts that exist on this PRTG server. The **Users** table shows various information about each user at a glance.

- **Object**: the name of the user account. Click it to open the [User Account Settings](#)³³⁷¹.
- **Type**: the account type, for example, PRTG **Administrator** user or **Read Only User**
- **Email**: the **Primary Email Address** of this user account
- **Primary Group**: the Primary Group of this user account. Click it to open this [user group's settings](#)³³⁸¹.
- **Group Memberships**: all user groups that contain this user account
- **Active/Paused**: the status of this user account

■ See also section [Working with Table Lists](#)²³⁷¹ for more information.

You have several options to manage user accounts and groups on this page:

- To change a user's settings, select it from the list by clicking the username. The available setting options are the same as shown in the [My Account](#)³³⁰⁴ settings of the currently logged in user (plus some account control options).
- To add a new user to PRTG on premises, hover over  and select **New User** from the menu. The options are the same as for existing users (with slight differences).
- To add a new user to PRTG hosted by Paessler, click the **Invite User** button. The options are almost the same as for existing users, but the initial login password will be generated automatically. The new user can change it later. Click **Send Invite** to save your settings and to send the invitation per email to the defined **Primary Email Address**.
- To batch-add several users at once in a simple way, hover over  and select **Add Multiple Users** from the menu. In the dialog box that appears, select an existing [user group](#)³³⁸³ from the dropdown menu and enter or paste a list of email addresses. They can be separated by a space, comma, semicolon, or a new line. Click the **OK** button to confirm. For each address, PRTG will create a new local user account within the selected user group, carrying the email address as value for **Login Name**, **Username**, and **Email Address**. A new password will be generated automatically and sent to the email address.
- To add a new user group to PRTG on premises, hover over  and select **Add User Group** from the menu. The options are the same as for existing groups (with slight differences).
- To add a new user group to PRTG hosted by Paessler, hover over the **Add User Group** button.

- Access rights in PRTG are given via user groups. Please make sure a user account is member of the correct [user group](#)^[3383] and give access to this group in your device tree [object's settings](#)^[217].

 Predefined objects cannot be deleted!

User Accounts Settings

 This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

USER ACCOUNT

Login Name	<p>Enter the login name for the user.</p> <p> This option is not available in PRTG hosted by Paessler.</p>
Display Name	<p>Enter a name that the user recognizes. It will not be used for login purposes.</p>
Primary Email Address	<p>Enter the user's email address.</p> <p> Please use an email client that can show HTML emails, otherwise you cannot read emails from PRTG.</p>
Password	<p>Define the user password. For security reasons, the account settings page does not contain the password. Choose between:</p> <ul style="list-style-type: none"> ▪ Don't change ▪ Specify new password <p>If you choose to specify a new password, enter the old password and then the new password twice.</p> <p> The new password must be at least 8 characters long. It must contain a number and a capital letter. Leading and trailing whitespaces will be cut. The password of a PRTG Administrator user can only be changed by the same PRTG Administrator user.</p> <p> This option is not available in PRTG hosted by Paessler.</p>
Passhash	<p>Click Show passhash to display the passhash for the selected user. You need the passhash of a user if you use the PRTG Application Programming Interface (API)^[3606]. This setting is shown for your information only and cannot be changed here.</p>

USER ACCOUNT

 This option is not available in PRTG hosted by Paessler.

API ACCESS

 These settings are only available in PRTG hosted by Paessler.

API Username Shows the username of the current user account. You need a username if you use the PRTG [Application Programming Interface \(API\)](#). This setting is shown for your information only and cannot be changed here.

API Passthrough Click **Show passthrough** to display the passthrough for the selected user. You need the passthrough of a user if you use the PRTG [Application Programming Interface \(API\)](#). This setting is shown for your information only and cannot be changed here.

Reset API Passthrough Click **Generate new passthrough** to reset the passthrough of the current user.

ACCOUNT CONTROL

Account Type This setting is only visible to administrator users. However, it will not show if the user whose account you want to modify is a member of a group with administrative rights.

Define the account type for the current user. Choose between:

- **Read/Write User:** You can change settings.
- **Read Only User:** You cannot edit any settings except your own password. This is a good choice for public or semi-public logins.

 This setting cannot be changed for the default administrator user.

ACCOUNT CONTROL

Allow Acknowledge Alarms

This setting is only visible if **Read Only User** is enabled above. Acknowledging an alarm is an action that requires write access rights. However, you can explicitly allow this action to read-only users. If enabled, they still do not have write access, but may [acknowledge alarms](#)²²⁰. Choose between:

- **Allow:** Allow acknowledging alarms for this user.
- **Deny:** The user will not be able to acknowledge alarms.

Password Changes

Decide if you want the user to be able to change their account's password or not. If you allow the user to change the password, this option will be available in the [My Account](#)³³⁰⁴ settings of the respective user. Choose between:

- **User may change the account password**
- **User may not change the password** (default)

i This field is only visible if you edit this option for read-only users as an administrator.

Primary Group

This setting is available only for administrator users. Select the primary group for the current user. Every user has to be member of a primary group to make sure there is no user without group membership. Membership in other user groups is optional. For user experience there is no difference between the primary and other user groups.

i You cannot change the primary group of **Active Directory** users. Users that you added with [Active Directory Integration](#)³⁶⁰³ can only have this AD group as their primary group. If you need to change this, please delete this user account and add it again.

Status

This setting is only shown for administrator users. Define the status of the current user. Choose between:

- **Active:** The current user can login to the account.
- **Inactive:** The current user's login is disabled. Use this option to temporarily deny access for this user.

i This setting cannot be changed for the default administrator user.

Last Login

Shows the time stamp of the user's last login. This setting is shown for your information only and cannot be changed here.

USER GROUPS

Member of Shows the groups the current user is member of. Access rights to the device tree are defined on group level. This setting is shown for your information only and cannot be changed here.

WEB INTERFACE

Auto Refresh Define if you want PRTG to reload web pages automatically for the current user. Choose between:

- **Refresh pages (recommended):** Automatically refresh the single page elements on the web pages in PRTG.
- **No automatic refresh:** Do not automatically refresh web pages.

Auto Refresh Interval (Sec.) This setting is only relevant if you enable auto refresh above. Enter the number of seconds that PRTG waits between two refreshes. We recommend that you use **30** seconds or more. Minimum value is 20 seconds.

 Shorter intervals create more CPU load on the server running PRTG. If you experience load problems while using the web interface (or PRTG [maps](#)^[3278]), please set a higher interval.

Play Audible Alarms Define when PRTG will play an audible alarm the current user on web pages whenever there are new [alarms](#)^[219]. Choose between:

- **Never:** Do not play sound files on any web pages.
- **On dashboard pages only:** When there are new alarms, play a predefined sound on [dashboard](#)^[263] pages only. The sound will be played with every refresh of the dashboard page if there is at least one new alarm.
- **On all pages:** When there are new alarms, play a predefined sound on all web pages. The sound will be played with every page refresh if there is at least one new alarm.

 Audible alarms are only played if the **New Alarms** value in the [Global Header Area](#)^[183] of the PRTG web interface is greater than 0 after a page refresh. The number of existing alarms is not considered.

 For more information about audible notifications and supported browsers, see this Knowledge Base article: [Which audible notifications are available in PRTG? Can I change the default sound?](#)

WEB INTERFACE

Homepage URL	Define the user's default page, which is loaded after logging in or clicking on the Home ²⁶³ button in the main menu.
Timezone	Define the time zone for the current user. Depending on the time zone you select here, PRTG shows the current user's local time zone in all data tables and graph legends. <i>i</i> PRTG receives the UTC (Coordinated Universal Time) from the system time set on the PRTG core server for this purpose.
Date Format	Define the date format for the current user. <i>i</i> This setting will take effect after the next login.
Color Mode	Select a color mode for your web interface.

TICKET SYSTEM

Email Notifications	Define if you want to get emails from the ticket system. Choose between: <ul style="list-style-type: none"> ▪ I want to receive an email whenever a ticket changes: You will receive an email each time a ticket is assigned to you or your user group, or if a ticket that is assigned to you or your user group is changed. <i>i</i> If you edit tickets that are assigned to you or your user group, or you assign a ticket to yourself or your user group, you will not get an email. ▪ I do not want to receive any emails from the ticket system: You will not get any emails about tickets.
---------------------	---

Notification Contacts

In the [Notification Contacts](#) ³³³⁴ tab you can define recipients for each user account. Recipients can be email addresses, phone numbers, or push devices (iOS and Android devices with the corresponding [PRTG smartphone app](#) ³⁴⁰⁴).

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the name of the PRTG user who made the change, and a message. The history log retains the last 100 entries.

Save your settings. If you leave the current page, all changes to the settings will be lost!

- <https://kb.paessler.com/en/topic/26303>

8.12.10 System Administration—User Groups

The PRTG administrator users can change existing user groups or add new ones, and define the users that are member of a certain group.

■ If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

All the security settings as well as further rights management are conducted via the user groups. This means that group membership controls what a user may do and which objects the user will see when logged in. The actual rights for each object can be defined in an object's settings. There, you can define different rights for each user group.

The **User Groups** table shows you all existing user groups with various information at a glance. You can see all **Members** of a group as well as all user accounts that have this group as **Primary Group** or as **Active Directory Group**.

- To change a user group's settings, select it from the list by clicking on the group name.
- To add a new user to PRTG on premises, hover over  and select **New User** from the menu. The options are the same as for existing users (with slight differences).
- To add a new user to PRTG hosted by Paessler, click the **Invite User** button. The options are almost the same as for existing users, but the initial login password will be generated automatically. The new user can change it later. Click **Send Invite** to save your settings and to send the invitation per email to the defined **Primary Email Address**.
- To batch-add several users at once in a simple way, hover over  and select **Add Multiple Users** from the menu. In the dialog box that appears, select an existing [user group](#)³³⁸³ from the dropdown menu and enter or paste a list of email addresses. They can be separated by a space, comma, semicolon, or a new line. Click the **OK** button to confirm. For each address, PRTG will create a new local user account within the selected user group, carrying the email address as value for **Login Name**, **Username**, and **Email Address**. A new password will be generated automatically and sent to the email address.
- To add a new user group to PRTG on premises, hover over  and select **Add User Group** from the menu. The options are the same as for existing groups (with slight differences).
- To add a new user group to PRTG hosted by Paessler, hover over the **Add User Group** button.
- For each user group you create, PRTG automatically adds a new [device group](#)¹³⁴ with the name **[group_name] home** to the device tree.
- For each user group you create, PRTG automatically adds a new [email notification](#)³³¹⁷ to [notifications](#)³²¹⁶ with [read access rights](#)¹⁵⁸ for this user group. It has the name **Email to all members of group [group_name]**.

- By default, there are no [access rights](#)^[158] on existing objects for a newly created PRTG user group. Initially, users in this group will not see any objects in the PRTG device tree except the automatically created **home** group (with write access rights). Please edit the [object settings](#)^[217] in your device tree and set access rights for your newly created user group in the **Inherit Access Rights** section.
 - ❗ The easiest way is to set these rights in the [Root Group Settings](#)^[331].
- ❗ The multi-edit option is not available for the standard user groups PRTG Administrators and PRTG Users Group.
- ❗ Predefined objects cannot be deleted!
- ❗ If you want to delete an Active Directory group, you have to delete all users that are in this group in PRTG first. This is because users that you add with [Active Directory Integration](#)^[3603] always have this group as their primary group.

User Groups Settings

- ❗ This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

USER GROUP SETTINGS

User Group Name	Enter a name for the user group.
Administrative Rights	<p>Define if the members of this group will be PRTG administrators. If you enable this option, all members of this group will have full access to all monitoring objects, maps, reports, user accounts and user groups, and they can change the PRTG monitoring configuration. Choose between:</p> <ul style="list-style-type: none"> ▪ Yes: Give full PRTG administrator rights to all members of this group. ▪ No: Do not make members of this group administrators. Access to monitoring objects for users that are member of this group will be controlled by the Access Rights settings defined in the Object Settings^[217] of Probes, Groups, Devices, or Sensors. <p>❗ This option is especially useful in combination with the Active Directory option below.</p>

USER GROUP SETTINGS

Default Homepage	Enter a PRTG internal web page. This will set the default homepage for all new users created with this group. A user will be redirected to this page after logging in. This concerns new users either added by an Active Directory login or by the Add multiple users feature.
Use Active Directory	<p>Define if this PRTG user group will be connected to a group in your active directory. Choose between:</p> <ul style="list-style-type: none">▪ Yes: Connect this group to an AD group. Choose below. For detailed information, see Active Directory Integration³⁶⁰³.▪ No: Do not use Active Directory integration for this group, but choose local user accounts instead. <p> This option is not available in PRTG hosted by Paessler.</p>
Active Directory Group	<p>If a valid Active Directory Domain is set in the System Administration—Core & Probes³³⁷² settings and Active Directory integration is enabled above, a dropdown menu will appear, showing the groups in your Active Directory. Choose the group whose members will be able to log in to PRTG using their Active Directory domain credentials. All of those AD users will be in the security context of the PRTG group you're about to create/edit.</p> <p> For detailed information, see Active Directory Integration³⁶⁰³.</p> <p>If your Active Directory contains more than 1000 entries in total, PRTG will display an input field instead of a dropdown menu. This is done due to performance reasons. In the input field, you can enter the group name only. PRTG will then add the prefix automatically.</p> <p> This option is not available in PRTG hosted by Paessler.</p>
New User Type	<p>If Active Directory integration is enabled above, define the default rights for all new users in this user group. If a user logs in for the first time using Active Directory credentials, PRTG will automatically create a new local user account for this user, applying the user type defined here. Choose between:</p> <ul style="list-style-type: none">▪ Read/Write User: The user may change settings.▪ Read Only User: The user may not edit any settings except the own password. This is a good choice for public or semi-public logins.

USER GROUP SETTINGS

Acknowledge Alarms	<p>This setting is only visible if Read Only User is enabled above. Acknowledging an alarm is an action that requires write access rights. However, you can explicitly allow this action to read-only users. If enabled, they still do not have write access, but may acknowledge alarms^[220]. Choose between:</p> <ul style="list-style-type: none">▪ User may acknowledge alarms: Allow read-only users to acknowledge alarms.▪ User may not acknowledge alarms (default): Read-only users will not be able to acknowledge alarms.
Allowed Sensors	<p>Define if members of this user group will be able to create all available sensor types or only specific ones. Choose between:</p> <ul style="list-style-type: none">▪ Users may always create all sensor types: No restrictions for group members are applied.▪ Users may create certain sensor types only: Choose the allowed sensor types below. This option is especially interesting for a Managed Service Provider (MSP).
Users May Create These Sensor Types	<p>This field is only visible if you defined that the users in this group are only allowed to create certain sensor types. A list of all available types is shown with their name. Select the desired types by adding check marks in front of the respective lines. You can also select and deselect all items by using the check box in the table head.</p>
Ticket System Access	<p>Define if the members of this user group will be able to use the PRTG ticket system^[230]. Choose between:</p> <ul style="list-style-type: none">▪ Members can use the Ticket System: No restrictions for group members are applied.▪ Members can NOT use the Ticket System: The Tickets^[274] option in the main menu bar^[274] will not be visible to users in this group.

MEMBERS

Members	<p>This setting is only available if Active Directory integration is disabled above. Define which local user accounts will be a member of this group. To add a user account from the list, add a check mark in front of the username. The user accounts available depend</p>
---------	--

MEMBERS

on your setup.

PRIMARY USERS

User List

Shows a list of all user accounts with this group set as primary group. This is shown for information purposes only. You can change it in a [user account's settings](#)³³⁷⁶.

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the name of the PRTG user who made the change, and a message. The history log retains the last 100 entries.

Save your settings. If you leave the current page, all changes to the settings will be lost!

8.12.11 System Administration—Administrative Tools

With the administrative tools you can start system specific processes for debugging purposes. Use them if our technical support advises you to do so. You can start the respective processes by clicking the **Go!** button.

■ If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

Core Administrative Tools

The screenshot displays the 'Core Administrative Tools' section of the PRTG web interface. It features a navigation menu at the top with options like Home, Devices, Libraries, Sensors, Alarms, Maps, Reports, Logs, Tickets, and Setup. Below this, there are sub-tabs for User Interface, Monitoring, Notification Delivery, Core & Probes, User Accounts, User Groups, and Administrative Tools. The main content area is titled 'Core Administrative Tools' and contains several tool cards, each with a 'Go!' button:

- Create Configuration Snapshot:** Saves current configuration as ZIP file in the 'Configuration Auto-Backups' folder.
- Write Core Status File:** Creates a debug file on the core system.
- Clear Caches:** Clears the web server's internal caches for Geo Maps and Active Directory authentication.
- Load Lookups and File Lists:** Reloads the lookup files from the 'lookups/custom' folder and other file lists that are displayed in the web interface, for example, SNMP libraries, device icons, and report templates.
- Recalculate PRTG Graph Data Cache:** Note: due to the recalculation the PRTG Core Server Service will be restarted.
- Restart Core Server:** Restarts the PRTG Core Server Service.
- Reload Logging Configuration:** Apply changes of the Logging Configuration to all PRTG Modules.

A note at the bottom of the page states: "Want to schedule a regular restart of the core server? Please go to the device tree and open the Settings of the Local Probe. In the Scheduled Restart Settings, edit the Restart Options."

PRTG Core Administrative Tools

CORE ADMINISTRATIVE TOOLS

Create Configuration Snapshot

Create a snapshot of your PRTG configuration. This action can take up to 100 seconds. Once finished, you will find a ZIP file that contains a ***.dat** file in the **Configuration Auto-Backups** subfolder of your [PRTG data directory](#)^[3734]. If you run a PRTG cluster, this action is executed on the cluster node you are currently logged in to. The ZIP file follows the name pattern **PRTG Configuration (Snapshot YYYY-MM-DD HH-MM-SS).zip**.

☁ This option is not available in PRTG hosted by Paessler.

CORE ADMINISTRATIVE TOOLS

Write Core Status File Create status files of your PRTG core server. You will find the two text files in the **Logs (System)** sub folder of your [PRTG data directory](#)^[3734]. If you run a PRTG cluster, this action is executed on the cluster node you are currently logged in to. The files are named **Core Status.txt** and **Core Memory.txt**. They are overwritten each time you click this button.

 This option is not available in PRTG hosted by Paessler.

Clear Caches PRTG caches tiles for [Geo Maps](#)^[3211] and user data for [Active Directory Integration](#)^[3603]. Use this button to delete the cache if you encounter broken Geo Maps tiles, or if you changed a user's password in the Active Directory.

 This option is not available in PRTG hosted by Paessler.

Load Lookups and File Lists (Re)load the [lookup files](#)^[3693] from the `\lookups\custom` folder. In this folder your customized lookup files are stored. If you have created a new lookup file or changed something in an existing lookup file, it might be necessary to load or to reload these files.

With this option, you can also manually reload file lists in the PRTG web interface. If you have added new [device icons](#)^[403], [device templates](#)^[3203], [report templates](#)^[3259], OIDlib files for the [SNMP Library sensor](#)^[2237], or language files to the PRTG program directory on the PRTG core server system while the server was running, reloading the file lists might be necessary to display new files in the web interface.

 Usually you will not have to reload file lists manually. A list will be automatically reloaded when opening the according settings page with a latency of 10 seconds. If you save new device templates via the web interface, the template list will be refreshed immediately.

 This option is not available in PRTG hosted by Paessler.

Recalculate PRTG Graph Data Cache

PRTG constantly writes monitoring data to disk and keeps the graphs for your graph tabs in memory. If PRTG is ended unexpectedly, the graph cache may get corrupted. In this case, graphs may be shown empty or show wrong data.

If you experience graph display problems, a graph recalculation will fix the problem. Click **Go!** to delete the data cache file and recalculate it automatically.

CORE ADMINISTRATIVE TOOLS

 If you apply recalculation, PRTG needs to restart the core server. Because of this, all users of the PRTG web interface, of the [Enterprise Console](#)^[3430], or of [Smart phone Apps](#)^[3484] will be disconnected. After clicking the **Go!** button, a dialog window will appear that asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen.

 Directly after this action your graphs will be empty. They will be re-filled successively while recalculation in the background progresses. Until recalculation is finished, performance of the PRTG web interface may be affected due to high disk I/O activity.

Restart Core Server

Restart the PRTG core server service manually. Click the **Go!** button for this purpose.

 If you restart the core server, all users of the PRTG web interface, of the [Enterprise Console](#)^[3430], or of [Smart phone Apps](#)^[3484] will be disconnected. After clicking the **Go!** button, a dialog window will appear that asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen.

 If you want to schedule an automatic restart of Windows services for both core server and probe service, you can do this in the corresponding [Probe Settings](#)^[371].

 This option is not available in PRTG hosted by Paessler.

Reload Logging Configuration

For debugging reasons it might be necessary to change the log levels of your PRTG instance. The Paessler Support Team will take you through the necessary steps that are required to change your logging configuration. The log level changes will vary according to your PRTG instance, its setup, and the solution of your issue.

To apply the changes to your PRTG logging, load them by clicking **Go!**.

Probe Administrative Tools

Probe Administrative Tools

Write Probe Status Files

Creates a set of debug files on all probe systems.

Restart All Probes

Restarts all probe services. For disconnected probes, please use the PRTG Administration Tool on the respective probe system to start the probe service.

Probe #1 "Local Probe"

connected from: 127.0.0.1:60983
 Last Data: 20.06.2018 21:14:01 (0 sec ago) (Mittleeuropäische Zeit)
 .NET Framework Support: Installed: v4\Client (4.5.51641), v4\Full (4.5.51641), v4.0\Client (4.0.0.0)

Want to schedule a regular restart of a remote probe? Please go to the device tree and open the Settings of the respective remote probe. In the Scheduled Restart Settings, edit the Restart Options.

PRTG Probe Administrative Tools

PROBE ADMINISTRATIVE TOOLS

Write Probe Status Files

Create status files of your PRTG probes. PRTG writes status files for the local probe running on the PRTG core server (if you run a PRTG cluster, on the cluster node you are currently logged in to) as well as for all remote probes configured (if any).

On the respective systems, you will find four text files in the **Logs (System)** sub folder of the [PRTG data directories](#)³⁷³⁴. The files follow the name pattern **Probe Memory XX.txt**, **ProbeState XX.txt**, **ProbeState AXX.txt**, and **ProbeState BXX.txt**. They are overwritten each time you click this button.

Restart All Probes

Restart all PRTG probes as well as the local probe Windows service. If there are any [remote probes](#)³⁷⁰⁷ configured, the probe Windows services on the respective remote systems will be restarted as well. To restart single probes only, see below.

 Disconnected probes cannot be restarted here. Please use the [PRTG Administration Tool](#)³⁵⁶⁰ on the probe system to start a disconnected probe.

PROBE ADMINISTRATIVE TOOLS

 If you run a PRTG cluster, this action is executed on the cluster node you are currently logged in to. In this case, remote probes are only restarted if you are logged in to the primary master node. The cluster probe Windows service of failover nodes is not restarted if you execute this action on the master node. If you want to restart the cluster probe Windows service of a failover node, please log in to this failover node's web interface and click the **Go!** button there.

Probe [#Number]
"[Name]"

This section shows information about the connection status. If the probe is currently connected, the field shows the source IP address and port number used by the probe. For the **Local Probe**, the IP will always be 127.0.0.1. You will also see information about the date when the last data packet was received from the probe.

If you want to restart a single probe, click the corresponding **Restart Probe** button. Entries for every single probe are following.

 Disconnected probes cannot be restarted here. Please use the [PRTG Administration Tool](#)³⁵⁶⁰ on the probe system to start a disconnected probe.

 This option is not available on the **Hosted Probe** of a PRTG hosted by Paessler instance.

Others

There are some settings that you must make in the [PRTG Administration Tool](#)  3560, available as native Windows application. For more details, see the sections:

- [PRTG Administration Tool on Core Server System](#)  3561
- [PRTG Administration Tool on Remote Probe System](#)  3567

8.12.12 System Administration—Cluster

In the cluster settings you can define the cluster settings. During [Failover Cluster Configuration](#)^[3720], the cluster settings were already pre-defined. See the [cluster status](#)^[3412] to see if all nodes in your cluster are properly connected.

 This feature is not available in PRTG hosted by Paessler.

 If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

Cluster Settings

 This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

You can set up two, three, four, or five nodes in one cluster for PRTG on premises. In the table of the cluster settings, the information of each node is written in one line.

CLUSTER NODE SETUP

Node Name	Enter the name of the node (for display purposes).
Node ID	The ID is unique for every node. We recommend that you use the default value.
Node State	<p>You can set the state for every failover node. Choose between:</p> <ul style="list-style-type: none"> ▪ Active: Set the node to be active. ▪ Inactive: Set the node to be not active. It will be disabled in the cluster configuration. It will then be not an active part of the cluster and will not appear in the cluster status^[3412] any more. <p> This setting is not available for the master node of a cluster. The master is always set to Active.</p>
IPs/DNS Names Used for Connections Between Nodes	Define the IP addresses or DNS names that will be used for the connections between the nodes. You can enter different values for every node-node connection.

CLUSTER NODE SETUP

For example, in the field #2 => #1, enter the address under which the master node server can be reached from the second cluster member. Usually, this is the IP address or DNS name of the master node. Do this for all available node connections, for example, if you run three nodes, enter the address under which second node can be reached from the third cluster member into the field #3 => #2.

 See also section [Failover Cluster Step by Step, Step 4](#)  and following.

 If you use [remote probes](#)  outside your local network or outside your Network Address Translation (NAT), ensure the IP addresses or DNS names you enter here are valid for both the cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. These addresses must not be private and have to be reachable from the outside, otherwise your remote probes will not be able to connect.

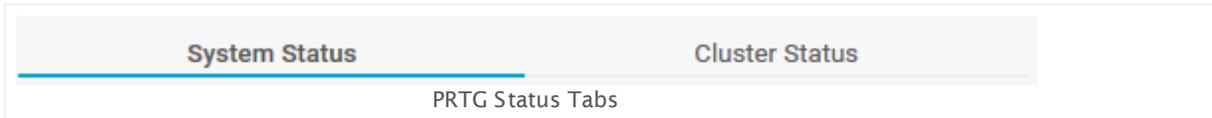

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

 For how to set a cluster node into **Maintenance Mode**, see [PRTG Status—Cluster Status](#) .

 The entire setup process for a cluster requires several different steps. For more information and step-by-step guidance, see [Failover Cluster Configuration](#) .

8.12.13 PRTG Status—System Status

To view the status of your PRTG installation, select **Setup | PRTG Status** from main menu. Click on the tabs to change the different settings.

You can view the following aspects of the PRTG status:

- [PRTG Status—System Status](#) 3396
- [PRTG Status—Cluster Status](#) 3412

System Status

Click on the **System Status** tab to view relevant system information. You might need this data for debugging or when you contact our support team. They ask you in some cases to provide PRTG status information to analyze your issues with PRTG. Furthermore, this page shows interesting usage statistics. Use the links at the top of the page for quick access to status information.

SOFTWARE VERSION AND SERVER INFORMATION

PRTG Version	Shows the exact version of the build your PRTG installation is currently running on.
Auto-Update Status	Shows the latest auto-update message available from Software Auto-Update <small>3407</small> . For example, the message will indicate any PRTG updates ready to be installed.  This information is not displayed in PRTG hosted by Paessler.
Operating System	Shows the exact Windows version build and service packs, the number and kind of CPUs, and the computer name, of the system the PRTG core server is installed on. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.  When running PRTG on virtual systems, not all of the mentioned values may be available.  This information is not displayed in PRTG hosted by Paessler.

SOFTWARE VERSION AND SERVER INFORMATION

Server Time	Shows the date and time of the system the PRTG core server is installed on. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Server CPU Load	Shows the current CPU load of the system the PRTG core server is installed on. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Username	Shows the username ^[3304] of the PRTG user you're currently logged in as.
Browser	Shows the name and user agent string of the browser you're currently viewing this page with.

LICENSING

License Status	Shows the activation status of this installation of PRTG. Usually, PRTG completes the activation automatically during installation or when you change your license information. Only if PRTG cannot connect directly to the internet, a manual activation is necessary. For details, see Activate the Product ^[99] .
License Name	Shows the owner of the license ^[96] that you use for this installation of PRTG. License Name, license key, and system ID together build your license information.  You will find the label License Owner in some documents from the Paessler shop. License Owner is the same as License Name for which you will be asked while installing PRTG or when you change your license key ^[96] .
License Key	Shows the license ^[96] key that you use for this installation of PRTG. License Name, license key, and system ID together build your license information.
System ID	The system ID is a fixed value that is automatically assigned to your PRTG installation.
Licensed Edition	Shows the PRTG edition that you use for this installation of PRTG. This determines how many sensors you can use in your monitoring (see below).

LICENSING

Last Update	Shows the date of the last update for this PRTG installation. We recommend that you use the PRTG Auto-Update ^[3407] to get the most out of PRTG.
Maintenance until	Shows the expiration date and the days remaining for your active maintenance contract. You can buy maintenance for each PRTG license. With an active maintenance contract you may download any available updates and use our premium email support.
Number of Sensors	<p>Shows the number of sensors you can use in your monitoring with your current edition of PRTG (see above). If you reach the limit, PRTG will set each new sensor that you add to a Pause status^[195] automatically. To upgrade your license right now, click the Need more sensors? Click here to upgrade! button to visit our web shop.</p> <p>Editions that allow an unlimited number of sensors do not restrict the number of possible sensors by license, so you can create sensors until the performance limit^[26] is reached. This means that you can use about 10,000 sensors per core server (depending on your system's performance, sensor types, and scanning intervals). For details, see section Detailed System Requirements^[26].</p>

SYSTEM STARTUP LOG

Shows the log information created during the last startup of the PRTG core server. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

SYSTEM WARNINGS

If there are any warnings, PRTG will show them here. Usually, you will see "None" system warnings.

CLUSTER STATUS

This box is only visible if you run a PRTG cluster. This section lists all cluster nodes configured in your monitoring.

Node **[Number]** Shows the name of the cluster node as well as the node type (primary/secondary node) and status (current master/failover node). Additionally, all connections from this node to the other cluster nodes are shown, as illustrated on the [PRTG Status—Cluster Status](#) 3412 page.

LOCAL STATUS

This box is only visible if you run a PRTG cluster. This section lists information about the cluster node you're currently logged in to.

Server State Cluster Messages Shows internal summary information about the current node and the communication between the nodes. You might be asked about this by Paessler's technical support staff.

CLUSTER CONNECTIONS

This box is only visible if you run a PRTG cluster. This section lists information about the connections between the different cluster nodes.

State of Local Node Shows Treeversion and size of the Server Volume, both internal system information.

State of Cluster Members For each cluster node, the name and IP address is shown, as well as a state CRC code, the time stamp of the last "keep alive" signal sent, the current size of the buffer, and the remote IP.

Message State of Cluster Members For each cluster node, the name, IP address, and unique identifier is shown, as well as the connection state, and statistic information about the cluster message system that is used for the communication between the different nodes.

CORE SYSTEM MEMORY

Shows machine-oriented information regarding the memory usage of the core server system. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

 See the Knowledge Base for more information: [What do the PRTG core system memory parameters mean?](#)

THREAD INFORMATION

Shows machine-oriented information regarding the threads running on the core server system. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

ACTIVITY HISTORY

The "Activity History" shows how busy PRTG was for you in the past. The graphs indicate the number of activities on the last 365 days. Below the graphs, you see statistics about the past day.

Sensor Scans	Shows how often all sensors ¹³⁵ in this PRTG installation refreshed their data in the past.
Sensor State Changes	Shows how often the Sensor States ¹⁹⁵ changed in the past.
Notifications Sent	Shows how many Notifications ³²¹⁶ PRTG sent out in the past.
Reports Generated	Shows how many Reports ³²⁶² PRTG created in the past.
Page Views	Shows how often pages in the PRTG web interface were opened in the past.
Sensors	Shows how many sensors ¹³⁵ existed in this PRTG installation in the past.
Devices	Shows how many devices ¹³⁵ existed in this PRTG installation in the past.

ACTIVITY HISTORY

Reports	Shows how many Reports  existed in this PRTG installation in the past.
Maps	Shows how many Maps  existed in this PRTG installation in the past.

AUTO-DISCOVERY TASKS

Currently Running	Shows the number of auto-discovery tasks that are currently running. A high number of auto-discovery tasks can negatively influence system performance.
-------------------	---

BACKGROUND TASKS

Historic Data	Shows if PRTG is re-calculating the historic data cache in the background. If so, you will see the tasks to do until done. Usually, this calculation is done after every core server restart.
Toplist Buffer	When using xFlow  or Packet Sniffer  sensors, PRTG stores Toplist data. The data stream received is buffered and written to the data directory of the core system. Depending on the number and size of the data stream as well as the hard disk and system performance of the core system, the buffer size can rise. When reaching a buffer size of 500 , Toplist data is dropped, which can lead to incorrect Toplist values for the sensors.
Similar Sensors Detection	Shows the current status and the selected setting for the analysis depth of the Similar Sensors  analysis.
Recommended Sensors Detection	Shows the current status of the detection engine and the current tasks of the Recommended Sensors Detection  .

DATABASE OBJECTS

Shows statistic information about your monitoring configuration. This information might be necessary when contacting Paessler's technical support staff.

Probes	Shows the total number of probes ³⁵¹ configured.
Groups	Shows the total number of groups ³⁷⁵ in your configuration.
Devices	Shows the total number of devices ⁴⁰² in your configuration.
Sensors	Shows the total number of sensors ⁴²⁸ in your configuration.
Channels	Shows the total number of channels ¹³⁶ in your configuration.
User Groups	Shows the total number of user groups ³³⁸³ in your configuration.
Users	Shows the total number of users ³³⁷⁶ configured.
Notifications	Shows the total number of notifications ³³¹¹ configured.
Schedules	Shows the total number of schedules ³³³⁸ configured.
Maps	Shows the total number of created maps ³²⁷⁸ in your installation.
Libraries	Shows the total number of created libraries ³²³⁵ in your installation.
Reports	Shows the total number of reports ³²⁵² in your installation.
Bitfield/Boolean/ Integer/Range Lookups	Shows the total number of used lookups by lookup type ³⁷⁰⁰ .
Requests/Second	Shows a value calculated from the total number of sensors and the average scanning interval configured. This number indicates how many monitoring requests per second are sent from the probe(s) to the devices in your network. There are no general guidelines what is a "good" value here. This depends on the sensor types used as well as on your system's performance.

SENSORS BY PERFORMANCE IMPACT

Shows all sensor types used in your configuration ordered by performance impact (from very low to very high). If your PRTG system is very slow, you can see which sensors might cause this issue. Please consider the recommended number of sensors in the respective [manual sections](#)⁴²⁸ for sensors with high and very high performance impact.

-  In the list, internal short names are used for sensor types instead of the official designations.

SENSORS BY INTERVAL

Shows all sensor types used in your configuration ordered by scanning interval. Please choose reasonable scanning intervals for sensors that can affect the system performance. See the respective [manual sections](#)⁴²⁸ for sensors for more information.

-  In the list, internal short names are used for sensor types instead of the official designations.

PROBES

This section lists all probes configured in your monitoring. If there are no remote probes configured, only the **Local Probe** or **Hosted Probe** appears in the list, which always runs on the PRTG core server.

-  If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to. Remote probes (if any) will only be shown when you are logged in to the primary master node. When logged in to a failover node, the cluster probe running on this node will appear as **Local Probe**.

Probe **[#Number]**
"**[Name]**"

Information about the connection status is shown. If the probe is currently connected, the field shows the source IP address and port number used by the probe. For the **Local Probe**, the IP will always be 127.0.0.1. You will also see information about the date when the last data packet was received from the probe.

If you want to restart a single probe, please open the [Administrative Tools Settings](#)³³⁸⁸.

SYSTEM SETTINGS

Web Server URL	Shows the URL to access the PRTG web interface ^[166] . If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Web Server IPs	Shows all IP addresses the PRTG web server is running at. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Web Server Ports	Shows the port the PRTG web server is running at. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Web Server Port usage	Shows the number of ports used by the PRTG web server.
Incoming Probe Connection Binding	Shows a combination of the two values below.
Incoming Probe Connection IPs	Shows a list of all IP addresses on which your current PRTG installation listens to incoming remote probe connections. This is the same information as shown in the System Administration—Core & Probes ^[398] settings. 0.0.0.0 means that the core server listens on all local network adapter IPs.
Incoming Probe Connection Port	Shows the port number on which your current PRTG installation listens to incoming remote probe connections. The default port is 23560 .
Probe Allow IPs	Shows all source IP addresses that will be accepted by the core server for incoming remote probe connections. This is the same information as shown in the System Administration—Core & Probes ^[398] settings and can be changed there. any means that all remote probe connections are accepted, regardless of the IP address of the remote probe system.
Probe Deny IPs	Shows all source IP addresses that will be denied by the core server for incoming remote probe connections. This is the same information as shown in the System Administration—Core & Probes ^[398] settings and can be changed there. Denied IPs are superior to allowed IPs. If this field is empty, there are no denied IPs.  PRTG automatically adds the IP address of a remote probe system to this list when you delete a remote probe from your device tree ^[133] .

SYSTEM SETTINGS

DataPath Shows the path where PRTG stores its configuration, monitoring database, etc. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to. In order to change this setting, please open the [PRTG Administration Tool](#) on the system of the PRTG core server (or of the respective cluster node, if applicable).

WEB SERVER ACTIVITY

Shows statistic information about the web server since last startup. All values are reset when the core server is restarted. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

Time Since Startup	Shows the time that has passed since the PRTG web server was started.
Page Views	Shows the total number of page views on this core server.
Geo Maps	Shows the total number of geo maps shown on this core server.
HTTP Requests	Shows the total number of HTTP requests to this core server.
HTTP Requests > 500/1000/5000 ms	Shows for how many (percent) of the HTTP requests above the page delivery took longer than 500, 1,000, or 5,000 milliseconds.
Slow Request Ratio	Shows a calculated number of the HTTP request values above. The lower this number, the faster is your installation's web interface.

SYNCHRONIZATION

The core server holds the configuration of the entire monitoring and deploys it to the probes. This section shows statistic information about the synchronization of the core server with the local probe and all connected remote probes (if any), since last startup of the core server. All values shown here are reset when the core server is restarted. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

SYNCHRONIZATION

- ❗ Only when logged in to the primary master node, you will see synchronization data for remote probe connections.

Last Synchronization with a Probe	Shows the time stamp of the last probe synchronization, and if there is still something to do.
Probe/Core Message Count	Shows the total number of messages sent between core and probe(s), as well as a calculated message speed value.
Raw Buffer Count	Shows the number of raw buffers and a corresponding status indicator.
Configuration Requests Sent	Shows the total number of configuration requests and the requests that still have to be sent.
Configuration Requests Deleted	Internal debug information. Usually, this value will be 0.
Configuration Requests With Response	Internal debug information. Usually, this value will be 0.

- <https://www.paessler.com/prtg/requirements>

Knowledge Base: How can I speed up PRTG—especially for large installations?

- <https://kb.paessler.com/en/topic/2733>

Knowledge Base: What do the PRTG core system parameters mean?

- <https://kb.paessler.com/en/topic/71671>

8.12.14 PRTG Status—Auto-Update

Whenever a new version of the software is available from the Paessler website, PRTG will download the setup file automatically if a direct internet connection is available. The **PRTG System Administrator** user will then receive a [ToDo ticket](#)^[230] with instructions to initiate the update installation.

For customers using a [Freeware or Trial Edition](#)^[21], automatic software updates are available at any time. Customers using a [Commercial Edition](#)^[21] need to have an active maintenance contract to receive updates.

 This option is not available in PRTG hosted by Paessler.

Status

 This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

To view the auto-update page of your PRTG installation, select **Set up | Auto-Update** from main menu. On the **Status** tab, you can download and perform updates.

Using Auto-Update

If there is a new version available, you will see detailed information about the available version. Please read these notes carefully! You find a summary of current and past release notes below the update section. For detailed release notes, click **PRTG Release Notes and Version History**, which will redirect you to the [version history page on paessler.com](#).

To install the latest available version, click **Install Update [version number]**. PRTG will ask you to confirm installation and license—and that's it!

 Downloaded software versions are automatically saved in the [PRTG program directory](#)^[3734] in the **\download** subfolder. The **prtg.zip** that contains all necessary files is also cached in this folder.

Part 8: Ajax Web Interface—Advanced Procedures | 12 Setup 14 PRTG Status—Auto-Update

Here you can automatically update your PRTG installation.

- If you are using the freeware or trial edition you can always update to the latest version for free
- If you are using a commercial edition your license key must be covered by a valid maintenance contract in order to download updates.
- You can always prolong your maintenance at <https://shop.paessler.com>

You can deactivate automatic downloading in the [Settings](#) tab.

Update Status For PRTG Network Monitor

Remaining Maintenance Days	4704 (4/29/2030)
Latest Message from Auto-Update	[6/12/2017 3:50:05 PM] Downloaded version (17.2.32.2190) is not newer than your current version (17.2.32.2194).
Currently Installed Version	17.2.32.2194+
Currently Selected Release Channel	Canary Select Other Release Channel
Latest Version Available from Paessler	17.2.32.2196 NEW! Check For Latest Update and Download
Latest Downloaded Version	

Automatic Software Update Page

Manually Install an Interim Update

Not all available updates from Paessler will be pushed to all customers, but they are still available from the website. Sometimes Paessler Support may ask you to update to the latest version.

In this case please click the **Check For Latest Update and Download** button. PRTG will then connect to the Paessler servers and download the setup file, regardless of the status of the update-check. Then **Install Update [version number]**.

 To use this function, a direct internet connection is necessary on the computer running the PRTG core server.

Select Other Release Channel

PRTG is available in three different release channels.

 For details about continuous rollout and release channels, see the Paessler Blog: [Version 12 of PRTG will introduce "Continuous Rollout"](#)

To change the release channel you receive updates from, please open the auto-update [Settings](#)³⁴⁰⁹ tab and choose the desired release channel in the **Release Channel** section.

Log

Click the **Log** tab to show log information about the update status of PRTG, newest first. In the [table list](#)²³⁷ appearing, you can filter the items by using the [respective options](#)²³⁷.

 For more information, see the [Logs](#)²²⁸ section.

Settings

Click the **Settings** tab to configure the PRTG **Software Auto-Update**.

SOFTWARE AUTO-UPDATE

When a New Version is Available	<p>Define what to do when there are software updates available. Choose between:</p> <ul style="list-style-type: none"> ▪ Automatically download and install the latest version: PRTG automatically downloads and installs any new version as soon as PRTG detects that there is a newer version available (PRTG checks this once per day). <ul style="list-style-type: none">  The installation of a new version will restart the PRTG Windows services and may also include a server restart. ▪ Automatically download the latest version and alert the admin: PRTG automatically downloads any new version as soon as PRTG detects that there is a newer version available (PRTG checks this once per day). After successful download, PRTG will create a ToDo ticket²³⁰ for the PRTG System Administrator user. ▪ Alert the admin only: When PRTG detects that there is a newer version available, it will not download updates automatically, but create a ToDo ticket²³⁰ only. You can still download updates manually on the Auto-Update³⁴⁰⁸ page.
Installation Time	If you select the automatic installation option above, choose the desired time for installation of updates from the dropdown menu.
Release Channel	<p>PRTG updates are delivered in different release channels. You can choose between maximum stability, or most early access to new features. Choose between:</p> <ul style="list-style-type: none"> ▪ Stable: Updated about once per month (most conservative option, recommended): These are our best tested versions. Choose this channel for live environments you have to depend on! ▪ Preview: Updated about once per week: Versions in this channel are already thoroughly tested in our labs, but may still contain limitations in certain monitoring configurations. Choose this channel if you are willing to take a little risk for the benefit of getting new features and bug fixes a little earlier. We strongly recommend to not use those versions in live environments you have to depend on!

SOFTWARE AUTO-UPDATE

- **Canary: Updated daily (testing only, should not be used on live systems):** Updated every night. Use with CAUTION! Software versions in this channel are not tested yet, might contain severe bugs, and are provided for testing purposes only. We strongly recommend to **not** use those versions in live environments you have to depend on!

 For details about continuous rollout and release channels, see the Paessler Blog: [Version 12 of PRTG will introduce "Continuous Rollout"](#)

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Notes

There are a few things we ask you to consider regarding automatic software updates:

- In order for auto-update to work, the machine running the PRTG core server needs direct internet access. If a proxy connection is needed, please configure it in the [System Administration—Core & Probes](#)³³⁶⁸ settings.
 For details about the update servers, see this Knowledge Base article: [Which servers does PRTG connect to for Software Auto-Update and for Activation?](#)
- During installation the core server may be restarted without notice.
- PRTG updates existing remote probes automatically, causing short downtimes in monitoring of remote locations. In rare cases a manual update of remote probes is required after you update the core server. In these cases you will be notified in the device tree, and monitoring of remote locations will be interrupted until you perform the [manual update](#)¹⁰¹¹ on the system(s) running the remote probe(s). If a server with a probe uses several network connections with different IP addresses, ensure these addresses are included in the [list of allowed IPs](#)³³⁶⁹. Otherwise the remote probe on this machine might be disconnected after an update.
- In a cluster installation the update needs to be installed on one node only. The new version will then be deployed to all other cluster nodes automatically (causing a short downtime for the monitoring on the cluster nodes, one after another).
- If you run several individual PRTG core servers that are not in a cluster, for example, in combination with the [Enterprise Console](#)³⁴³¹, an update has to be initiated and confirmed for each single core server.
- You can disable automatic downloading on the [Auto-Update Settings](#)³⁴⁰⁹ tab. Updates will then only be downloaded on request, when you click the **Check For Latest Update and Download** button.
- PRTG does not start auto-update downloads if there is less than 500 MB disk space available on the core server system. If this is the case, you can check this on the [Log](#)³⁴⁰⁸ tab.

- Virus scanners can potentially cause issues when downloading or installing software updates. To avoid such issues, we recommend that you make the appropriate exclusions for the [PRTG program directory](#)³⁷³⁴.

8.12.15 PRTG Status—Cluster Status

To view the status of your PRTG installation, select **Setup | PRTG Status** from main menu. Click on the tabs to change the different settings.

You can view the following aspects of the PRTG status:

- [PRTG Status—System Status](#) ³³⁸⁶
- [PRTG Status—Cluster Status](#) ³⁴¹²

Cluster Status

Click the **Cluster Status** tab to view all nodes connected to the cluster. This tab is only available if you run PRTG in [cluster mode](#) ¹³⁰. The following information is available:

- **Cluster Status** with all connected nodes as table and graphic
- **Cluster Log** with all log entries for cluster connections

The screenshot displays the 'Cluster Status' view in the PRTG interface. It features two main sections: 'Cluster Status' and 'Cluster Log'.

Cluster Status Section:

- Node 1: PRTG Network Monitor (10.0.10.34)**
 - Primary Node (Current Master)
 - Action: Start Maintenance Mode
 - Connection To: Node 10.0.10.35, IP: 10.0.10.35, State: Connected
- Node 2: Node 10.0.10.35**
 - Secondary Node (Failover Node, Version: 50186)
 - Action: Start Maintenance Mode
 - Connection To: PRTG Network Monitor (10.0.10.34), IP: 10.0.10.34, State: Connected

A diagram above the nodes shows a 'Failover Node' (Node 10.0.10.35) and a 'Current Master' (PRTG Network Monitor (10.0.10.34)) connected by a bidirectional arrow.

Cluster Log Section:

Select Range: Show filter Date Range: 2017-06-05 00:00 - 2017-06-13 00:00 Items: > 50

Example of a PRTG Cluster Status View

Click the **Start Maintenance Mode** link to put a cluster node in maintenance mode. A node in this mode is still connected to the cluster, but its monitoring results are discarded until you click the **Stop Maintenance Mode** link. You can use this functionality to explicitly exclude a node from monitoring if you know that the monitoring values will not be accurate, for example, because you reconfigure the failover server. During maintenance, a cluster node is displayed with a transparent color in the overview graphic.

 On this page, you will not see if your [remote probes are connected to failover nodes](#)³⁷²³. Please connect to your failover nodes and check explicitly if remote probes are connected (for example, in the device tree of the PRTG web interface on a cluster node).

 For more information about cluster settings, see section [System Administration—Cluster](#)³³⁹⁴.

 This feature is not available in PRTG hosted by Paessler.

8.12.16 PRTG Status—Licensing Status and Settings

To view information about the license of your PRTG installation and to enter your license key, select **Setup | License** from the main menu.

 This option is not available in PRTG hosted by Paessler.

You can view the following aspects of your PRTG license:

- [Your License—Status](#)  ³⁴¹⁴
- [Your License—Log](#)  ³⁴¹⁵
- [Update Your License](#)  ³⁴¹⁶

 If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

 This documentation refers to the **PRTG System Administrator** user accessing the PRTG web interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

Status

Click the **Status** tab to view information about your license.

LICENSING	
License Status	Shows the activation status of this installation of PRTG. Usually, PRTG completes the activation automatically during installation or when you change your license information. Only if PRTG cannot connect directly to the internet, a manual activation is necessary. For details, see Activate the Product  ⁹⁹¹ .
License Name	Shows the owner of the license  ⁹⁶¹ that you use for this installation of PRTG. License Name, license key, and system ID together build your license information.

LICENSING

 You will find the label License Owner in some documents from the Paessler shop. License Owner is the same as License Name for which you will be asked while installing PRTG or when you [change your license key](#)^[96].

License Key	Shows the license ^[96] key that you use for this installation of PRTG. License Name, license key, and system ID together build your license information.
System ID	The system ID is a fixed value that is automatically assigned to your PRTG installation.
Licensed Edition	Shows the PRTG edition that you use for this installation of PRTG. This determines how many sensors you can use in your monitoring (see below).
Last Update	Shows the date of the last update for this PRTG installation. We recommend that you use the PRTG Auto-Update ^[3407] to get the most out of PRTG.
Maintenance until	Shows the expiration date and the days remaining for your active maintenance contract. You can buy maintenance for each PRTG license. With an active maintenance contract you may download any available updates and use our premium email support.
Number of Sensors	Shows the number of sensors you can use in your monitoring with your current edition of PRTG (see above). If you reach the limit, PRTG will set each new sensor that you add to a Pause status ^[195] automatically. To upgrade your license right now, click the Need more sensors? Click here to upgrade! button to visit our web shop. Editions that allow an unlimited number of sensors do not restrict the number of possible sensors by license, so you can create sensors until the performance limit ^[26] is reached. This means that you can use about 10,000 sensors per core server (depending on your system's performance, sensor types, and scanning intervals). For details, see section Detailed System Requirements ^[26] .

Log

Click the **Log** tab to show a [table list](#)^[237] of all system log entries with all messages and status changes regarding your license.

Change and Update License Information

Use the buttons to edit your license or refresh your maintenance information.

- **Change License Key:** If you want to use another license for this PRTG installation, for example, after an license upgrade, click this button to change your license information. See [below](#) ³⁴¹⁶ for more details.
- **Refresh Information:** If you have renewed your maintenance and the licensing information above does not show the new maintenance period yet, click this button to manually refresh your maintenance information. An automatic refresh of the maintenance information may take several days. See [below](#) ³⁴¹⁶ for more details.
- **Deactivate this License:** If you want to use the license of the current PRTG installation on another computer, click this button to deactivate the license. This is necessary, for example, when you move PRTG to another computer, because a PRTG license can be active on only one computer at the same time. Once you have deactivated the license, the PRTG installation on this computer will revert to the [Freeware Edition](#) ²¹ after a grace period of 30 days.

 See also section [Activate the Product](#) ⁹⁹.

Update Your License Information

Click **Change License Key** or **Refresh Information** on the **PRTG License** page to update your license. Provide the necessary information and click **Update License** to complete the activation of your license.

 If you have any issues with license activation or update, please click the **Contact Support** button to contact us directly via the [Paessler Service Center](#) in our shop (internet access required).

STEP 1: CHOOSE ACTIVATION TYPE

Activation Type	<p>Define how you want to validate and activate your license. Choose between:</p> <ul style="list-style-type: none"> ▪ Automatic (online activation with optional HTTP proxy): PRTG will connect to the activation server and validate your license. The license will be activated automatically. For automatic activation, internet access is necessary from the the computer running this PRTG installation. ▪ Manual (offline activation): Choose manual activation if the PRTG server has no access to the internet and cannot connect to activation.paessler.com.  This is the default selection if the PRTG server is offline.
-----------------	--

STEP 2: VERIFY YOUR PRTG LICENSE

License Name	<p>Enter the License Name that you have received from us, the Paessler AG. It must exactly match. To avoid typing errors, please copy and paste the License Name.</p> <p> You will find the label License Owner in some documents from the Paessler shop. License Owner is the same as License Name for which you will be asked while installing PRTG or when you change your license key^[96].</p>
License Key	<p>Enter the license key you have received from us, the Paessler AG. To avoid typing errors, please copy and paste the License Key. It must exactly match your license key.</p>
System ID	<p>This field shows the system ID, a fixed value assigned to your PRTG installation. This setting is shown for your information only and cannot be changed here.</p>

For offline activation, click **Save to File** to write your license information into a text file.

STEP 3: ACTIVATE YOUR PRTG

If you select the automatic activation type, you can now update your license. Define if you need an HTTP proxy for the HTTPS connection to the activation server and click **Update License**.

PROXY CONFIGURATION

 This option is not available in PRTG hosted by Paessler.

Use Proxy Server	<p>We recommend that you use PRTG with a direct internet connection. However, if you need to use a proxy, you can configure the relevant settings here. Choose between:</p> <ul style="list-style-type: none">▪ No, use direct connection to the internet (default): Do not use a proxy. Use this setting if there is a direct internet connection available to the server running the PRTG core server.▪ Yes, in our network a proxy is mandatory: Define proxy settings below.
------------------	---

PROXY CONFIGURATION

 Proxy settings are valid for [Auto-Update](#)³⁴⁰⁷, [Activate the Product](#)⁹⁹, obtaining [Geo Maps](#)³²¹¹ tiles, and for sending out HTTP, push, and SMS text message [Notifications](#)³³¹⁶.

Proxy Server	This setting is only visible if proxy usage is enabled above. Enter the address of the proxy server that you use for outbound connections. Please enter a valid address.
Port	This setting is only visible if proxy usage is enabled above. Enter the port number of the proxy server that you use for outbound connections. Please enter an integer value.
Use Proxy Credentials	This setting is only visible if proxy usage is enabled above. Determine whether the proxy server needs credentials or not. Choose between: <ul style="list-style-type: none"> ▪ No, there are no credentials necessary: Do not use credentials for proxy connections. ▪ Yes, the proxy server requires credentials: Define credentials (username and password) below.
User	This setting is only visible if proxy credentials are enabled above. Enter a username for proxy authentication. Please enter a string.
Password	This setting is only visible if proxy credentials are enabled above. Enter a password for proxy authentication. Please enter a string.

STEP 3: REQUEST ACTIVATION DATA

If you select the manual activation type, you have to request your activation data on <https://www.paessler.com/activation> using your license information. Open the activation page from a computer that can connect to <https://www.paessler.com> and provide your license information.

Generate the key file for your license and provide this data below.

STEP 4: PROVIDE ACTIVATION DATA

This step is only necessary if you do an offline activation.

- Copy the content of the key file that you have generated on <https://www.paessler.com/activation>.
- Paste it into the **Activation Data** field. Alternatively, click **Load from File** if you have saved the key file with your activation data.
- Click **Update License** to complete the activation of your license.

8.12.17 Optional Downloads and Tools

To see optional downloads, select **Setup | Downloads and Tools** from the main menu. Click a tab to switch between different options.

There are the following downloads available:

- [Client Apps for Mobile Devices](#) 
- [Client App for Windows \(Enterprise Console\)](#) 
- [Remote Probe Installer](#) 
- [PRTG Tools](#) 

Client Apps for Mobile Devices

To monitor your network while on the go, use our free apps for smartphones and tablets. They run on iOS and Android.

 For more information on **PRTG for iOS** and **PRTG for Android**, see the Paessler Website: [Mobile Network Monitoring with PRTG—Mobile Apps for Smartphones and Tablets](#)

Client App for Windows (Enterprise Console)

Download the Windows Graphical User Interface (GUI) **Enterprise Console** to the current system. If you use the Enterprise Console, you can access the PRTG on premises web interface with a native Windows application. The version of the Enterprise Console must match the version of your PRTG server.

 For more information, see [Install the Enterprise Console](#) 

 This feature is not available in PRTG hosted by Paessler.

Remote Probe Installer

With remote probes you can extend your monitoring to distributed networks that are not directly reachable from your PRTG core installation. The version of the remote probe installer must match your version of PRTG, so it is a good idea to download it from here.

 For more information, see section [Install a PRTG Remote Probe](#) 

PRTG Tools

You can use several freeware tools directly from the Paessler labs that help you to manage your network and to diagnose and test network monitoring issues. Open the **PRTG Tools** tab and click the **More Information and Download** button to navigate to our freeware tools webpage. There you can find a collection of various tools for PRTG Network Monitor.

 Find all tools on the Paessler Website: [Freeware Network Tools](https://www.paessler.com/tools)

More

Paessler Website: Mobile Network Monitoring with PRTG—Mobile Apps for Smartphones and Tablets

- <https://www.paessler.com/apps>

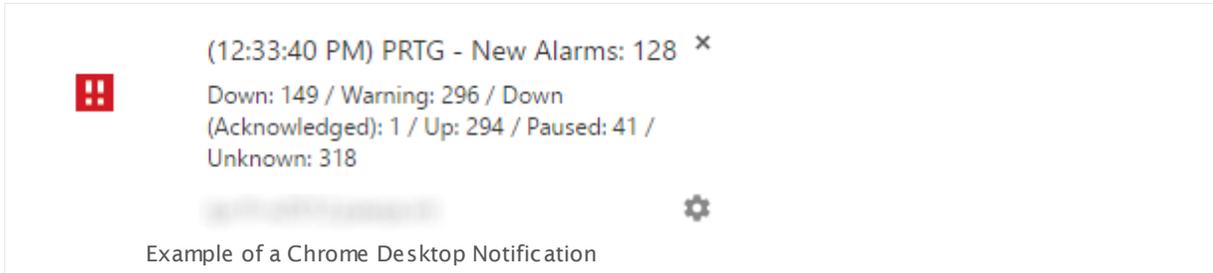

Paessler Website: Freeware Network Tools

- <https://www.paessler.com/tools>

8.12.18 Desktop Notifications

While you are logged in to the PRTG web interface with your Google Chrome or Firefox browser, PRTG can show notifications on your desktop whenever there are new alarms in your monitoring.

PRTG will show desktop notifications (by default, in the lower-right corner of your desktop) whenever there are new alarms after a page refresh in the PRTG web interface. The notification displays the number of new alarms and the current number of each sensor status.

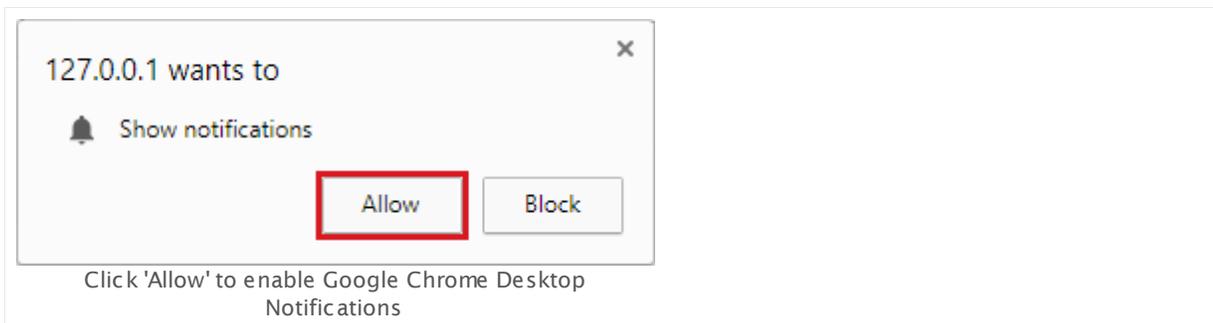

i Desktop notifications are not available for Internet Explorer.

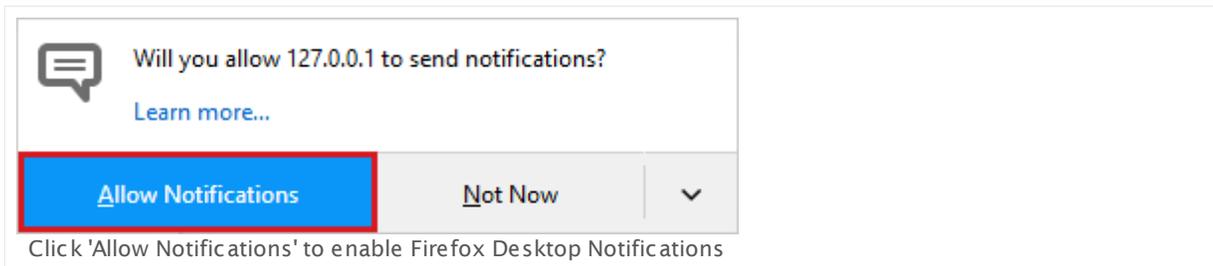

Desktop Notifications Settings

When you log in to the PRTG web interface, a message appears, asking you to allow desktop notifications. You have to initially allow the notifications for each installation/profile of Firefox or Google Chrome.

i Desktop Notifications in Google Chrome are not available for HTTP connections. See section [System Administration—User Interface](#) for more information.

- In Google Chrome, click **Allow** to add the URL of the PRTG web interface to the allowed sites.
- In Firefox, click **Allow Notifications** to add the URL of the web interface to the allowed sites.

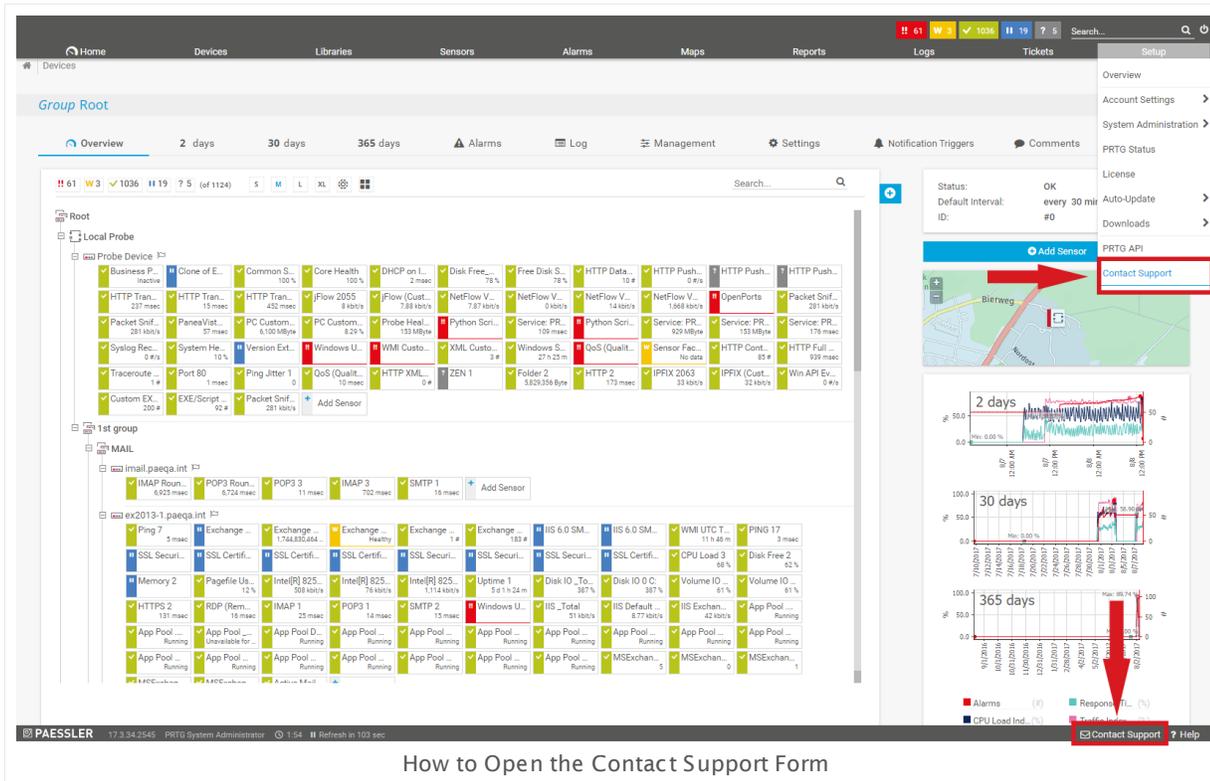

Disabling or Re-Enabling Desktop Notifications

To disallow or re-allow desktop notifications for the PRTG web interface, edit your browser options:

- In **Google Chrome**: Click the **View site information** symbol in the address bar of the browser. You can block or re-allow notifications for the current URL in section **Notifications**.
- In **Firefox**: Click the **Show site information** symbol in the address bar of the browser. You can block or re-allow notifications for the current URL in section **Permissions**.

8.12.19 Support—Contact Support

For technical issues, please use the **Contact Paessler Support / Send Your Feedback to Paessler** form in PRTG. To open the form, select **Setup | Contact Support** from the main menu. You can also open the form via **Contact Support** in the footer on every page in PRTG.

How to Open the Contact Support Form

On the one hand, you can use this form to give us **feedback**. Help improve PRTG by providing criticism, praise, bug reports, and feature requests. Any comments are welcome! Your feedback will be handled directly by the Paessler Support Team.

On the other hand, you can use this form to ask for support regarding technical issues. To make the support contact more comfortable, PRTG can automatically attach a screenshot in combination with a **Support Bundle** that contains several selected PRTG logfile and status files. This information really helps our support team to analyze any issues you may have with PRTG. Please also consider the suggested links to articles regarding the scope of your issue.

Premium Email Support

We offer our support directly from our headquarters in Nuremberg, Germany, working closely with our development department to guarantee the fastest and most constructive assistance possible. As we have to analyze a lot of data over the course of a support case, like logfile and screenshots, we use email as our primary support mechanism. Our office is staffed Monday to Friday from 7 a.m. until 10 p.m. (UTC+1), so you will receive an answer within 24 hours on business days. Depending on the complexity of the case, we may need to ask for remote access to your system, or to schedule a remote desktop session.

Support Ticket System

Customers with valid maintenance can open support tickets. Please use the **Contact Support** form of your PRTG installation for technical questions to get the best possible help from our experts. If you have trouble using this form, you can fill out the [support ticket form on our webpage](#).

Updates and Your License Key

Are you looking for updates or your license key? Log in to our [service center](#).

Language

Please write us in English or German language.

Single Topics

Please open a new ticket for each new topic.

Security Reports

If you are a user of PRTG or any other of our services and would like to file a security report, please send an email to security@paessler.com. Please always include a detailed technical summary in your email. If you wish to send us an encrypted email, please use the public key on this page <https://www.paessler.com/support>.

Network Planning

Do you need assistance for your network setup or detailed installation planning? Our partners are happy to help. Please [contact a partner near you](#).

Freeware Users

Do you use our Freeware? We try to answer your questions in a timely manner, but if we are busy, paying customers come first. You may find a prompt answer in our [Knowledge Base](#).

Feature Requests

You have requests or suggestions that could improve PRTG Network Monitor? Our [Support Team](#) is happy to hear your ideas! Read more in our Knowledge Base on [how we handle your feedback](#).

 PRTG securely transmits your feedback or support question including the support bundle to Paessler via the PRTG Cloud. Please make sure your PRTG server has access to the internet and can reach the URL <https://api.prtgcloud.com:443>

Contact Paessler Support / Send Your Feedback to Paessler
✕

Ask a Question or Give Us Your Feedback

Your Ticket ID PAExxxx
(If You Have One)

Your Email Address

john.q.public@company.com

Scope of Your Question

PRTG configuration and usage

PRTG clients (Enterprise Console and mobile apps)

Technical issues (performance, webserver, sensors, probes, cluster)

Critical issue (large parts of my monitoring do not work)

Other (including feedback and feature requests)

Tech Support resources that may be helpful for you:

- Help with installation, licensing, and setup
- Information about data storage/backup/migration and updating PRTG
- Working with user accounts and user rights
- Installing an SSL certificate for the PRTG web server
- Configuring failover clustering

Emotional State

Describe Your Question in One Sentence

Cancel
Submit

Contact the Paessler Support or Send Feedback

Ask a Question or Give Us Your Feedback

Provide the following information in this section of the contact form:

- **Your Ticket ID PAExxx:** If you have already opened a new ticket (directly via email to support@paessler.com, via the [Knowledge Base](#), or via the [support form on paessler.com](https://support.paessler.com)), enter its ID here. You can find it in your confirmation email regarding the request we received. You can provide the ID with "PAE" in front or just the number. If you leave this field empty, you will create a new ticket when you submit this form.
- **Your Email Address:** Enter your email address here. You can provide any of your addresses; however, the recommended and default address is the email address of your PRTG account to be able to associate you with your license.
- **Scope of Your Question:** Select a topic regarding your issue and consider the proposed links.
- **Emotional State:** If you want to, you can indicate your current feelings about PRTG.
- **Describe Your Question in One Sentence:** Provide short information with max. 60 characters to indicate the topic of your issue.
- **Do You Have Any Further Comments?:** Leave your comments here. They can be feedback or support questions. If you have a support question, please describe your issue with as many details as possible!

Attach a Screenshot and/or Support Bundle

To provide the most helpful information possible, you can attach a screenshot of the current page and a support bundle with useful analytical data about your PRTG installation.

In section **Screenshot**, choose between:

- **Do not attach screenshot:** Send the ticket without a screenshot.
 - ⓘ We recommend that you attach a screenshot of the affected PRTG webpage so that we can understand your request more easily.
- **Create and attach screenshot (recommended):** Create a screenshot of the currently displayed page in PRTG to send it with your ticket. You can see a preview below the screenshot section.
 - ⓘ If you encounter issues on a specific page in PRTG, open the contact support form on this page to get a screenshot of it. This is not possible on error pages, which are not meaningful enough for our support team to solve your issue.

In the section **Support Bundle**, you can choose between several packages that differ in coverage of information:

- **Attach Base Pack with logfiles (recommended):** Contains logfiles of your PRTG installation and the following information:
 - System status
 - Lists of sensors regarding their current states
 - Core state data
 - Probe Health sensor data
 - Current log entries

- **Attach Base Pack with log files and PRTG configuration file:** Additionally contains the configuration file.
 - ⚠ Send this package only if our support team told you so! Encrypted passwords in the config.dat file and passwords that your browser masks while you enter them on settings pages will be removed before PRTG sends this package to Paessler Support.
- **Do not attach a Support Bundle:** The ticket will not contain files. Choose this option only when sending feedback.

Click the **Submit** button to send your request directly to our technical support team, or click **Cancel** to return to the page where you opened the contact form. Usually, you will receive an answer from our support team within one or two business days, no matter whether you provide feedback or you have a question.

- ⚠ If you have questions or feedback regarding your license purchase, upgrade, or maintenance extension, please [contact our customer service](#)¹⁷⁸.

- <https://kb.paessler.com/en/topic/33873>

Part 9

Enterprise Console

9 Enterprise Console

The Enterprise Console (in old PRTG versions called "Windows GUI") is one alternative [interface](#) ^[125] that you can use to connect to the PRTG core server to configure your setup, view monitoring results, and keep an eye on your network. It is a native Windows application for fast access to data and monitoring management.

The Enterprise Console (EC) provides extended pop-up window functionalities, as well as a seamless link to the [Ajax web interface](#) ^[166] where you can change your monitoring configuration and access further functionalities such as [reporting](#) ^[3454], [maps](#) ^[3452], [system setup](#) ^[3463], [tickets](#) ^[3458], and [libraries](#) ^[3448]. The EC shows most of the functions with an embedded webkit browser, for a few options the EC opens an external browser window (using your default browser).

Remarks

-  There are some known issues with the Enterprise Console. Because we are currently developing a new PRTG desktop client, we will not patch the following issues anymore.
 - The Enterprise Console runs under all [supported Windows versions](#) ^[26], but it is not fully compatible with Windows 10. Running the EC on Windows 10 results in several issues, so please use another operating system.
 - The Enterprise Console does not support [System Information](#) ^[222] and does not show this tab on devices. Please use the PRTG web interface to access system information of a device.
 - Starting the auto-discovery from the [context menu](#) ^[3480] via **Auto Discovery | Run Auto-Discovery** does not work. Please use the PRTG web interface to instantly run an [auto-discovery](#) ^[3407].
-  PRTG hosted by Paessler does not support connections from the Enterprise Console. If you want to use it, please connect the Enterprise Console to a PRTG on premises instance.

Access Several Core Servers in One Console

As an additional functionality, you can configure access to several PRTG core servers in the Enterprise Console. It can show data of all your independent core server installations at a glance (for example, the [device tree](#) ^[3439] and [alarms list](#) ^[3450]), so you can manage your monitoring centrally, also when it is spread across different servers.

Getting Started

Every installation of PRTG Network Monitor includes the Enterprise Console and installs it automatically on the computer running the PRTG core server. If you want to use the Enterprise Console on another computer, please [download](#) ^[3420] and install it there. For details, see the [Install the Enterprise Console](#) ^[113] section.

 The Enterprise Console is mainly designed to review and manage an existing installation of PRTG that you have already set up. If you just start monitoring, we recommend that you first run through the [Smart Setup](#)^[521] in the [PRTG web interface](#)^[166] and add your network devices there.

 For detailed instructions, see section [Quick Start Guide](#)^[46]. Once finished, you can seamlessly switch to the Enterprise Console.

Requirements for Connections to PRTG Web Server(s)

To show monitoring data of your PRTG setup, the Enterprise Console must be able to establish a connection to your PRTG web server(s). For this purpose, please ensure the following.

- The following server settings in the Enterprise Console have to match the following settings in the [PRTG Administration Tool](#)^[3561].
 See section [PRTG Servers](#)^[3463] for details.

ENTERPRISE CONSOLE SERVER SETTINGS	PRTG ADMINISTRATOR SETTINGS
Server IP / DNS name	IP address for PRTG's Web Server on the Web Server tab
Port	<p>TCP Port for PRTG's Web Server on the Web Server tab</p> <p> PRTG switches to port 8080 as a fallback after a restart when port 80 is already used, and to port 8443 if port 443 is not available. PRTG keeps the SSL connection in this case. If this port is also not available, PRTG tries from port 32000 on until it finds an available port. Because the EC cannot recognize these ports (8080, 8443, 32000+) automatically, enter the currently used port manually here in the Port setting. If you do not get a connection to the PRTG web server, check the currently used port in the Web Server settings under System Administration—User Interface^[3346] in the PRTG web interface.</p>
Login Name	Login Name on the Administrator tab
Password	Password on the Administrator tab

- No local software firewall blocks the connection.
- No local virus protection program blocks the connection.
- The specified port is not used by another application.
- No (hardware) firewall blocks the connection when connecting through a network (LAN or WAN).

- The software versions of the Enterprise Console and the PRTG web server have to match at least in the third number (for example, [EC version](#)³⁴³⁷ 15.3.18.3590 can connect to [server version](#)¹⁸¹ 15.3.18.3796).

 For common issues with the Enterprise Console and their solutions, see this Knowledge Base article: [Problems with the Enterprise Console: What can I do?](#)

9.1 First Start

This section helps you to start the Enterprise Console for the first time.

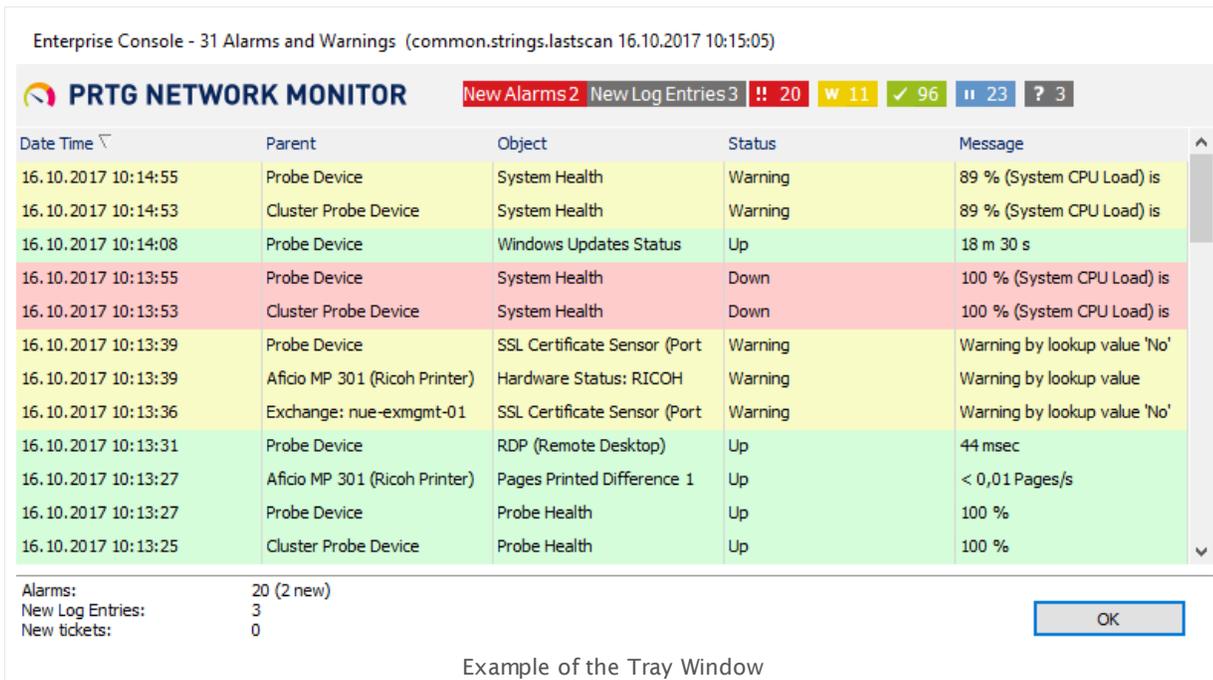

Open the Enterprise Console

Execute the **PRTG Enterprise Console.exe** to start the Enterprise Console. As soon as it opens, the Enterprise Console tries connecting to your PRTG installation, according to the defined PRTG server connection settings. In a fresh install of PRTG, the settings for the Enterprise Console installed on the computer running the PRTG core server are already predefined, so you can use the Enterprise Console right away. If you get an error message when opening the Enterprise Console, please [check the connection settings](#)³⁴³¹. For example, adjusting the settings is necessary if you changed the IP address of the server.

 For detailed information, see section [PRTG Servers](#)³⁴⁶³ (**PRTG Server Connection**).

Tray Window

By default, the Enterprise Console runs in background and shows a message box whenever there are new alerts, new messages, or new tickets for your monitoring. This window is one of the first things you see after opening the Enterprise Console.

Enterprise Console - 31 Alarms and Warnings (common.strings.lastscan 16.10.2017 10:15:05)

PRTG NETWORK MONITOR New Alarms 2 New Log Entries 3 !! 20 W 11 ✓ 96 || 23 ? 3

 New tickets: 0

OK

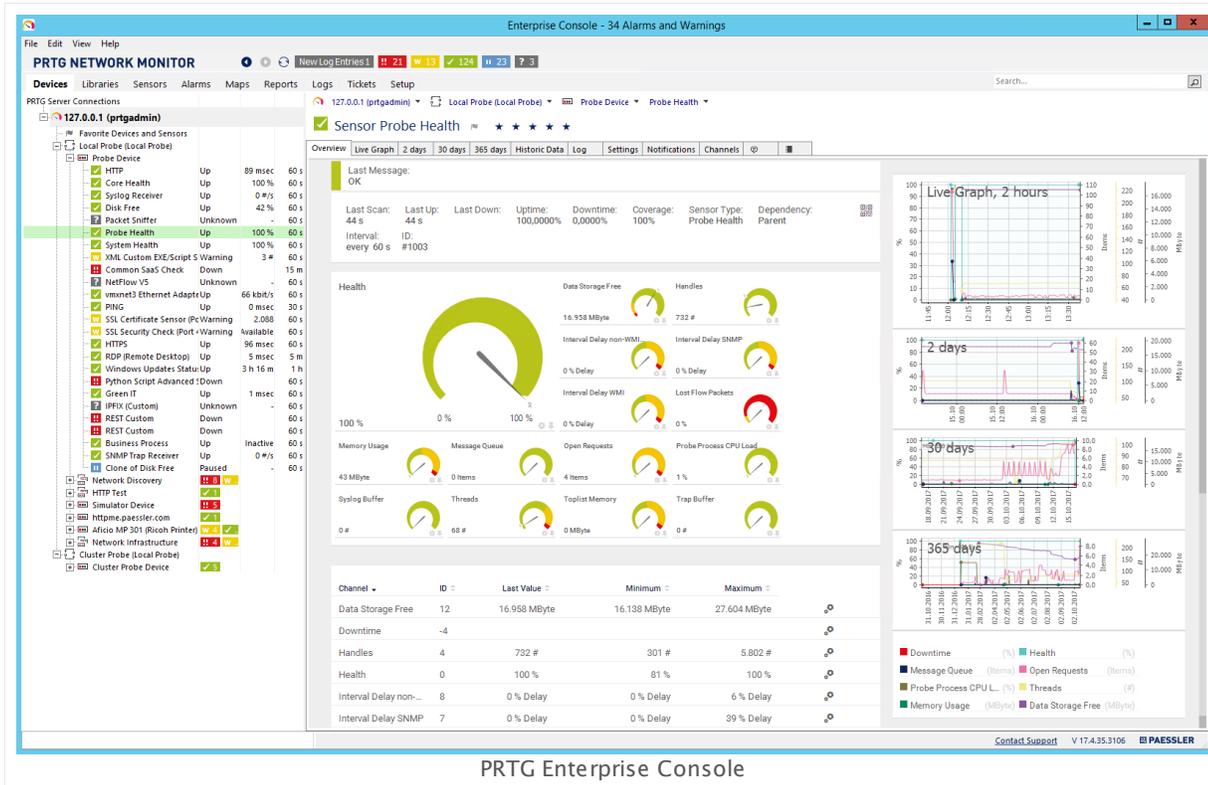

Example of the Tray Window

This window is always shown on top. Click the **OK** button to close it. You can change the tray behavior in the Enterprise Console settings.

 For detailed information, see section [Options](#)³⁴⁶⁸ (**System—Alerting**).

9.2 General Layout

The main layout of the Enterprise Console (EC in short form) program consists of different elements. See below for details.

PRTG Enterprise Console

From top to bottom, the main layout consists of:

- The [Windows menu](#)^[3435].
- The [page header bar](#)^[3435] with the PRTG logo, the viewpoint arrow symbols, the refresh icon, and the sensor states overview.
- The [menu tabs bar and page content](#)^[3435] underneath.
- The [server selection](#)^[3436] and [search bar](#)^[3436] in the upper right corner.
- The [news feed](#)^[3436] underneath the page content.
- The [status bar](#)^[3437] at the bottom of the window.

Often, the Enterprise Console displays data and settings directly. Some functionalities and extended setup additionally require a new window of the system's default browser and the [web interface](#)^[166] shows up. In this case, you are logged in to the web interface automatically via username and [hash value](#)^[3304]. In your browser, it might be necessary to confirm the certificate that is used by the PRTG web server.

For more information, see [SSL Certificate Warning](#)^[172] section.

If you configure your Enterprise Console for a connection with more than one PRTG core server, keep an eye on the [server selection](#)^[3436] bar to choose which server's data you want to access.

Windows Menu

The Windows menu gives access to general configuration and settings. For details, see section [Windows Menu Structure](#)^[3472].

Page Header Bar

The page header consists of the following parts:

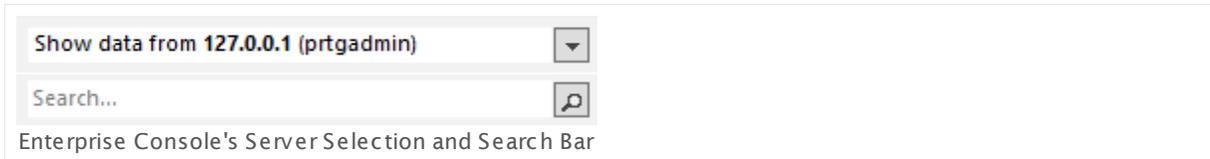

- **PRTG Logo**
Click the PRTG Network Monitor logo to open the [Ajax web interface](#)^[166] in the browser that you define in the Enterprise Console [Options](#)^[3466]. If you configured several PRTG core servers, the browser loads the web interface of the server that you have currently selected in the [Devices](#)^[3439] tab.
- **Previous Viewpoint / Next Viewpoint (Arrow Symbols)**
The Enterprise Console stores the different views that you navigate to in the application. Using these arrows (or using the shortcuts **Alt+Left** and **Alt+Right**), you can step back and forth in the history, just as you know from your web browser.
- **Refresh (Arrow Circle Symbol)**
Click the refresh symbol (**F5**) any time to refresh the current screen. This immediately queries data for the current screen from all active PRTG core servers just as the automatic refresh does. You can configure the update interval in the [Options](#)^[3466] settings.
- **Global Sensor Status Symbols**
This area shows the aggregated status of all sensors from all active PRTG core servers, divided into different sensor states. Depending on the particular sensor states, you see colored boxes with numbers, which symbolize the sensors. For example, you can see how many sensors are in **Up**, **Down**, **Warning**, **Pause**, **Unusual**, or **Unknown status**^[195]. Click a status icon to view a list of all sensors in the respective status.
Next to the global sensor status symbols you can also see the number of new alarms and new log entries, as well as the number of new tickets, if there are any. Click the respective icons to view [Alarms](#)^[219], [Logs](#)^[228], or [Tickets](#)^[230].
i When you view sensor lists, you can only show the sensors of one server at once. So, the global sensor overview shows the total number of sensors in a certain status on all active servers, but viewing a list of all sensors in a certain status from all servers is not possible for performance reasons.

Menu Tabs Bar and Page Content

You can navigate through your setup using the menu tabs bar. Please take a few minutes to familiarize yourself with all menu items. The page content underneath varies depending on the selected menu tab. It shows various information about your monitored objects.

 For a detailed description of all tabs, see section [Menu Tabs and Page Content](#) .

Server Selection

In the server selection bar you see all active PRTG core server connections that are configured for the current Windows user account (saved in the registry).

The server you select here determines globally which information the EC shows in all [Menu Tabs](#)  (except the **Devices** tab: the server selection does not apply for the devices tab). Depending on your selection, **Libraries**, **Sensors**, **Alarms**, **Maps**, **Reports**, **Logs**, **Tickets**, and **Setup** options are shown for the respective server only. Select **All PRTG Servers** to show consolidated information for all active PRTG core servers that appear in the list.

 For technical reasons, you cannot show consolidated information from all servers in the **Sensors**, **Setup**, and **Search Results** tab. To use these tabs, please select one single PRTG core server from the server selection bar.

Select **File | Manage PRTG Server Connections** from the [main menu](#)  to add or remove [PRTG Servers](#)  from the list, or to edit an existing one.

Search Bar

Select a single PRTG core server from the [server selection](#)  bar and enter a key word to search the respective server. In the **Search Results** tab, the Enterprise Console displays matching monitoring objects, help topics, and related objects. If you click a monitoring object (for example, a sensor) in the search results, the Enterprise Console opens this object on the [Devices](#)  tab with details in the device tree.

 If you have configured a connection in the [PRTG Servers](#)  options that uses a [Root ID](#)  other than 0, the EC will ignore this setting while searching. In this case, the EC shows **Search Results** for the entire server (starting at Root ID 0).

News Feed Bar

The news feed bar shows latest news by Paessler. Click the bar to open a window with an overview about recent articles. You can open a specific article in the web browser by clicking the particular header. If you do not want to show the news feed in your Enterprise Console, click the **X** symbol besides the bar. You can enable it again via **View | Show News Feed** in the [main menu](#)  (**Ctrl+N**).

Status Bar

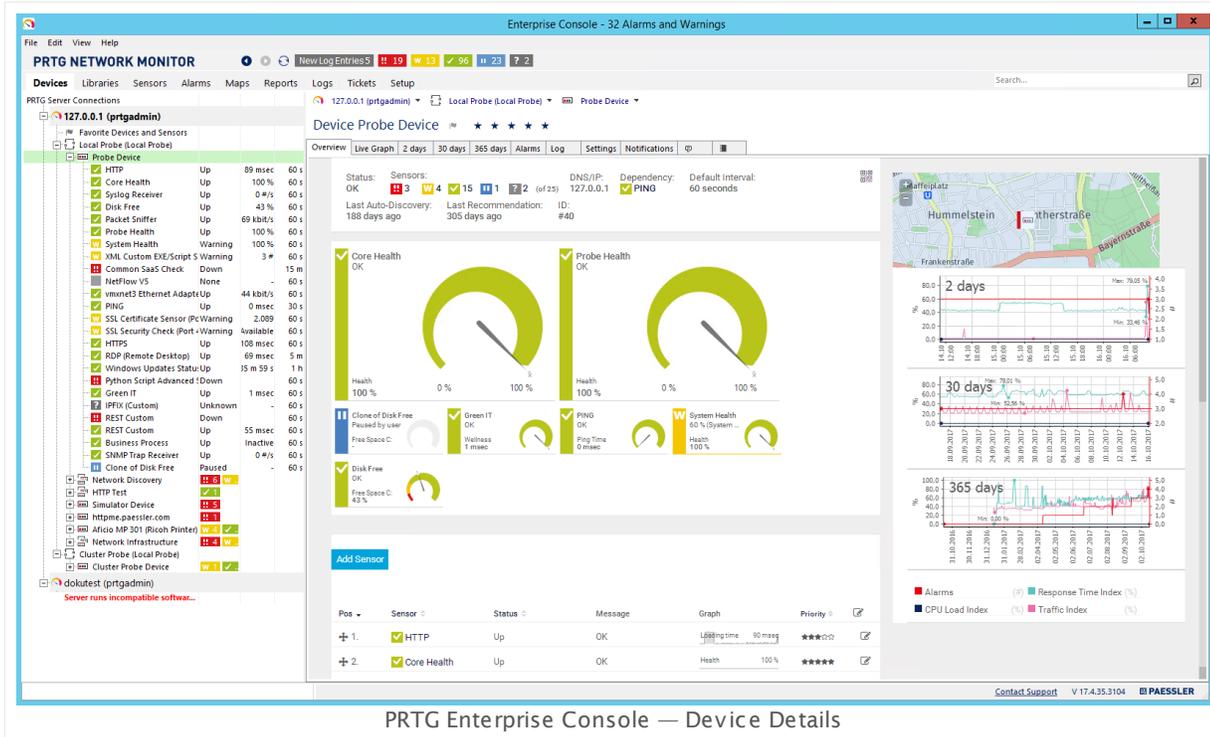

The status bar shows the version number of your PRTG Enterprise Console and the Paessler logo, which leads you to the Paessler website when you click it. Furthermore, the status bar contains a [Contact Support](#) link that opens a window to leave feedback or to ask for support.

You will also see a note if an update for one of connected servers is available. Click **Update Available** to open the [Auto-Update](#) page in the EC.

9.3 Menu Tabs and Page Content

Under the different menu tabs of the Enterprise Console, you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example.

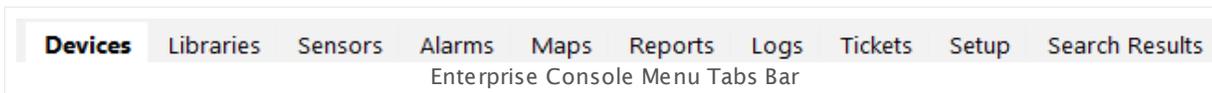

The following sections introduce the available options within the different tabs:

- [Devices](#) ³⁴³⁹
- [Libraries](#) ³⁴⁴⁶
- [Sensors](#) ³⁴⁴⁸
- [Alarms](#) ³⁴⁵⁰
- [Maps](#) ³⁴⁵²
- [Reports](#) ³⁴⁵⁴
- [Logs](#) ³⁴⁵⁶
- [Tickets](#) ³⁴⁵⁸
- [Set up](#) ³⁴⁶⁰
- [Search Results](#) ³⁴⁶²

9.3.1 Devices

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.

There is documentation available for the following tabs:

- [Devices](#)  3439
- [Libraries](#)  3446
- [Sensors](#)  3448
- [Alarms](#)  3450
- [Maps](#)  3452
- [Reports](#)  3454
- [Logs](#)  3456
- [Tickets](#)  3458
- [Setup](#)  3460
- [Search Results](#)  3462

Devices Menu Tab

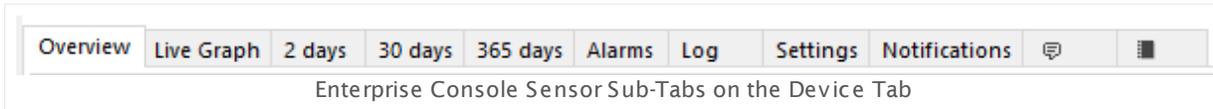

The **Devices** tab is your starting point for everyday use. The page is split into two parts. On the left hand side, it shows the tree-like device view that lists all configured PRTG core servers with their probes, groups, devices, and the sensors on the devices, in a hierarchical order. Next to each object you see an overview of the number of sensors, grouped by their current status.

The first child node of the tree is called **Favorite Devices and Sensors**. It contains all devices and sensors that you marked as [favorites](#)  242. To add an object to the favorites list, right-click the desired device or sensor and select the **Add to Favorites** entry from the [context menu](#)  247.

 For more information about the hierarchical order of the different objects in the device tree, see section [Object Hierarchy](#)  133.

On the right side you see details about the object selected on the left. The information is spread over several tabs.

Over the object's name you see always a path that you can use to navigate through the device tree. It can also help you to orient yourself if you get lost. If you click a **breadcrumb** item, a dropdown menu opens that shows all available objects on the same level. For example, you can use this to directly access all other sensors or a device, other devices within a group, another group on the same probe, other probes in your root group, or another PRTG server.

Edit Objects in the Device Tree

Use the **Edit** menu (or the object's [context menu](#)³⁴⁸⁰) to access different important functions of the items you have currently selected in the device tree on the left hand side.

- Add devices or sensors to the favorites list (or remove them from the list)
- Sort all sub nodes of an object alphabetically
- Move objects up and down in the tree
- Scan now
- Pause monitoring
- Access tools
- and many more

 For details about the available options, see section [Windows Menu Structure](#)³⁴⁷².

Select Multiple Items in Device Tree

In the device tree shown on the left, you can select one or more objects, even from different PRTG core servers. Hold down the **Ctrl** key to select more objects simultaneously with your mouse. Usually, you select more than one item to view combined graphs, or to apply a command from the [Windows Menu](#)³⁴⁷² (for example, **Scan Now** or **Pause**) to several objects.

When you select multiple items, the sub-tabs on the right side show data for **all** selected items at a glance. For example, when if you select two sensors, you see their tables next to each other. Graphs will actually appear combined! This is a great way to instantly show one chart containing the graphs of all selected objects. Each sensor channel is represented as one line. This aggregated view works for all kind of objects.

-  The tab **Live Graph** shows data for sensors only.
-  Below each graph you see a key. Hover over an entry in the key to display the corresponding line in the graph above in **bold**.

Aggregated Graph View in Enterprise Console

i You may need to enlarge the Enterprise Console's window to see all tables and graphs.

Devices—Overview

The **Overview** tab shows general information about the selected object. Depending on the selected object selected, you can see different information.

- For **servers**, **probes**, and **groups** the table shows information in the **Name** and **Status** section, such as priority, parent objects and number of sensors on this object. Additionally, the window shows a geographical map, if enabled in your PRTG configuration as well as in the Enterprise Console's **View** ³⁴⁷⁷ menu, and **index graphs** ²⁰⁰¹.
 For detailed information about geographical maps, see section **Geo Maps** ³²¹¹.
- For **devices**, the **Overview** tab shows device details and summary graphs for different time spans, gauges, as well as a list of all sensors on this device, **recommended sensors** ²¹³, and a geo map.
- For **sensors**, the **Overview** tab shows sensor details, current status, and the last value of all sensor channels, as well as sensor graphs for different time spans. You can also edit channel settings in this tab by clicking on a channel's gear icon.
 For details, see section **Sensor Channels Settings** ³¹⁶⁰.

Devices—Live Graph, 2 days, 30 days, 365 days

These tabs are only available if you enable the **Large Single Graph** (Ctrl+L) view in the [Windows Menu](#) (View).

For **Small Multiple Graphs** view, see section [Devices—Graph](#) below.

Select one of the tabs to display an object's monitoring results as **Live Graph** (content available for sensors only), or for different time spans in more or less detail (**2 days**, **30 days**, **365 days**). On every tab, you will see graphs as well as data tables.

While you view a sensor graph, you can hide single sensor channels individually. Remove the check mark symbol in front of a channel name underneath the graph, and the line of the according channel disappears. You can also **Show all** or **Hide all** channels by clicking these buttons in the graph. The graph view is reset immediately.

- The days mentioned here are the default setting. You can change the detail of the different graphs any time under [System Administration—User Interface](#).
- Below each graph you see a key. Hover over an entry in the key to display the corresponding line in the graph above in **bold**.

Devices—Graph

This tab is only available if you enable the **Small Multiple Graphs** (Ctrl+S) view in the [Windows Menu](#) (View). For **Large Single Graphs** view please see [above](#). This tab shows an overview with single graphs and data tables for live data, 2 days, 30 days, and 365 days. It might be necessary to enlarge the window to display all graphs.

- The days mentioned here are the default setting. You can change the detail of the different graphs any time under [System Administration—User Interface](#).
- Below each graph you see a key. Hover over an entry in the key to display the corresponding line in the graph above in **bold**.

Devices—Historic Data

The **Historic Data** tab is available for sensors only (not for probes, groups, or devices). When you open the historic data tab of a sensor, there is no sensor selection available. If you want to select a different sensor for the report, select **Sensors | View Historic Data** from the main menu in the PRTG web interface.

Historic Data Tab of Ping Sensor

Select the **File Format** for the results:

- **HTML web page:** Opens a new browser window with the historic data report
- **XML file:** Opens a new browser window with the historic data report as XML file.
- **CSV file:** Opens a new browser window with the historic data report as CSV file.

i When you click one of these items, a new window or tab of the external browser configured in the Enterprise Console's [Options](#)^[3470] will open. PRTG automatically logs in and redirects you to the respective web page. If your browser displays a certificate warning, find more information in section [SSL Certificate Warning](#)^[172].

📖 View and functionality are the same as in the web interface. For details about the available **Historic Data** report options, see section [Historic Data Reports](#)^[204] of the [Ajax Web Interface](#)^[166] documentation.

Devices—Log

Click the **Log** tab to show a table list with all log information **on this object**. This is a subset of the entries available via the [Logs](#)^[3456] menu tab.

The list can show up to one hundred entries at a time. Use the arrow symbols above the list to show other items. You can jump to the beginning of the list, or browse through it hundred by hundred. If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click the header of the column you want to sort by once or twice.

Devices—Settings

The **Settings** tab loads and displays the currently selected object's settings from the web interface. View and functionality are the same as in the web interface. For every type of object and for every sensor, different options are available. For detailed information, see the following sections (depending on the selected object) in the [Ajax Web Interface](#)^[166] documentation:

- [Probe Settings](#)^[351]
- [Group Settings](#)^[375]
- [Device Settings](#)^[402]
- [Sensor Settings](#)^[428]

Devices—Settings—Multi-Edit

If you select several objects on the left side, the **Settings** tab switches into [multi-edit mode](#)^[3197]. Using multi-edit, you can set a check mark for one or more settings. All changes apply to all selected objects. The multi-edit dialog displays settings that are common among the selected objects only.

If you select only sensors on the left side in the device tree, the **Settings** tab additionally displays a **Channel Settings** tab. Using this tab you can multi-edit the [settings of any channels](#)^[3160] that are common among the selected sensors, as long as the channels have the same name. Set a check mark for one or more channel settings. All changes apply to all selected sensors.

 You cannot use multi-edit for objects on different PRTG core servers.

Devices—Notifications

The **Notifications** tab loads and displays the currently selected object's settings from the web interface. View and functionality are the same as in the web interface. You can set different notification triggers.

 For detailed information, see section [Sensor Notification Triggers Settings](#)^[3170] in the [Ajax Web Interface](#)^[166] documentation.

 You cannot change notification settings for multiple objects at a time. We recommend that you use the [Inheritance of Settings](#)^[137] for easy configuration.

Devices—Comments

The **Comments** tab loads and displays the currently selected object's settings from the web interface. View and functionality are the same as in the web interface.

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Devices—History

The **History** tab shows all changes to the settings of an object with a timestamp, the PRTG user that conducted the change, and a message.

Drag & Drop Sorting in Device Tree

In the device tree, you can also move probes, groups, and devices simply via drag and drop. Activate it in the [Windows menu](#)^[3472] under **Edit | Drag & Drop Sorting** and then drag your objects as you like: You can move devices and groups, or add groups or devices to other groups. You can also move objects via the [context menu](#)^[3480].

You cannot move objects in the following cases:

- You cannot move any objects from one PRTG core server to another.
- You cannot move sensors from one device to another. To clone sensors to other devices using drag & drop, please use the [Ajax Web Interface](#)^[166].
 For detailed information, see section [Manage Device Tree](#)^[329].
- You cannot move devices from one group to another.
- You cannot move groups from one probe to another.
- You cannot move probes from one core server to another.

9.3.2 Libraries

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.

There is documentation available for the following tabs:

- [Devices](#) 
- [Libraries](#) 
- [Sensors](#) 
- [Alarms](#) 
- [Maps](#) 
- [Reports](#) 
- [Logs](#) 
- [Tickets](#) 
- [Setup](#) 
- [Search Results](#) 

Using Libraries is a great way to keep an eye on your network status because you can individually select which sensors you would like to see there.

 For a general introduction to PRTG Libraries, see section [Libraries](#) .

Libraries Menu Tab

The page is split into two parts. On the left hand side you see all available libraries from one or several servers, on the right hand side the actual libraries.

- Click a library's name to display it. In the tabs above the library, select from [Overview](#) , [Management](#) , [Settings](#) , [Notifications](#) , [Comments](#) , and [History](#) . Each of these tabs loads the respective functionality of the [Ajax Web Interface](#) . Click the **Save** button to apply changes to your settings.
- Underneath the tabs bar, there are different options available to change the current library view: You can set sensor filters (set or remove check marks to include or exclude sensors in a certain status) and change the device tree view.
 -  For details about the tree view, see section [General Layout—Tree View Layout](#) .
- Click a library node to edit the [node settings](#)  in a new window.

- Double-click a library's name on the left to open the library in the configured external web browser. You can edit it or add new libraries to this PRTG server.
- Right-click a library's name to open its [context menu](#)^[3480]. The following options are available: **Add**, **Edit**, **Delete**, **Clone**, **Send link by email**, and **Open in Web Browser** in the libraries overview on the left **Edit**, **Delete...**, **Add Library Node...**, **Add Group...**, and **Send Link by Email** on the **Overview** tab of a specific library on the right.
- Use the button **Add Library** to create a new library and the button for [object history](#)^[273] to view all changes to libraries.

 For more details about PRTG Libraries, see section [Libraries](#)^[3235].

Libraries Menu Tab—Add Library

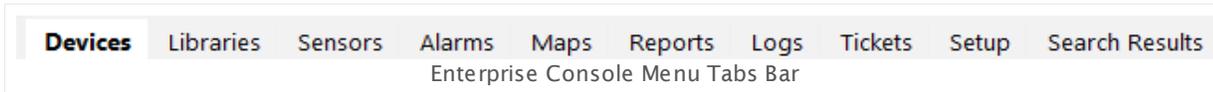

Click the **Add Library** button to add a new library to a PRTG server.

Depending on the current setting shown in the [server selection](#)^[3436] bar in the upper right corner, an (embedded) window will open (if one specific server is selected), or you will see a selection window that asks you to choose the core server you want to add the new item to. Choose an installation to start.

 For details about adding a library, see section [Libraries Step By Step](#)^[3238].

9.3.3 Sensors

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.

There is documentation available for the following tabs:

- [Devices](#)  3439
- [Libraries](#)  3446
- [Sensors](#)  3448
- [Alarms](#)  3450
- [Maps](#)  3452
- [Reports](#)  3454
- [Logs](#)  3456
- [Tickets](#)  3458
- [Setup](#)  3460
- [Search Results](#)  3462

Viewing lists of sensors is a great way to keep an eye on your network status because you can select which kind of sensors you want to see. You can filter by various parameters like object or sensor type, for example, and current sensor status.

Sensors Menu Tab

 For technical reasons, this function is available for one server at a time only. If you have configured more than one PRTG core server, choose one server from the server list in the upper right corner.

Click the **Sensors** entry in the menu tabs bar to show a table list of all sensors. You can enable a filter to only show certain sensors. To do so, choose from three different dropdown menus to build a filter. With each filter you can further decrease the number of shown sensors.

- **By Type**
The second dropdown menu shows [all sensor types](#)  429 available in your monitoring setup. Select an entry to only show sensors of this type. The default value is **All Sensors**.

- **By Status**

The third dropdown menu shows all possible [sensor states](#)¹⁹⁵. Select an entry to only show sensors that currently show this status. Choose between **All States**, **Down**, **Down (Acknowledged)**, **Down (Partial)**, **Warning**, **Up**, **Paused**, **Unusual**, and **Unknown**. The default value is **All States**.

 If you click a sensor symbol in the [page header bar](#)^{343b}, you can directly view a sensor list filtered by the selected sensor status for the selected server.

If you have filtered out all sensors and the list below shows no entries, remove some filters by reverting them to the default values.

 In the column **Last Value**, the table only shows the last value of the sensor's **primary channel**.

The list can show up to one hundred entries at a time. Use the arrow symbols above the list to show other items. You can jump to the beginning of the list, or browse through it hundred by hundred. If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click the header of the column you want to sort by once or twice.

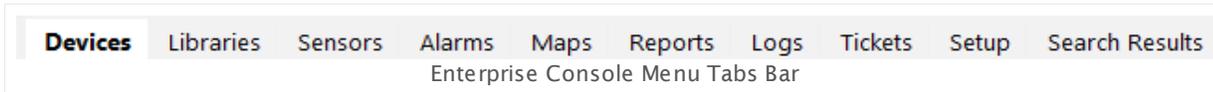

From this list view, you can select multiple items to apply the same action to them, for example, **Edit** | **Scan Now**.

You can select multiple items by the following means (you can also combine them):

- Click and hold your left mouse key while pointing to the lines you want to select
- Hold the **Ctrl** key while clicking to toggle the selection status of a single line
- Click a line and hold the **Shift** key while clicking another line to select all lines in between.

9.3.4 Alarms

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.

There is documentation available for the following tabs:

- [Devices](#)  3439
- [Libraries](#)  3446
- [Sensors](#)  3448
- [Alarms](#)  3450
- [Maps](#)  3452
- [Reports](#)  3454
- [Logs](#)  3456
- [Tickets](#)  3458
- [Setup](#)  3460
- [Search Results](#)  3462

Alarms Menu Tab

In the **Alarms** tab you can show the alarms of **all** active PRTG core servers. To do so, select **All PRTG Servers** from the server selection in the upper right corner.

The alarms list shows all sensors that are currently in a **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** status. Sensors in other states (for example, **Up**, **Paused**, or **Unknown**) do not appear here. This is useful for keeping track of all irregularities in your network.

Using the options **Error**, **Warning**, and **Unusual**, you can hide and show sensors in the respective status by removing and adding a check mark. When choosing **Error**, this includes sensors in the states **Down**, **Down (Partial)**, and **Down (Acknowledged)**.

Click **Show as Gauges** to show the sensors on the **Alarms** tab represented with [gauges](#)  198.

If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click once or twice on the header of the column you want to sort by.

From this list view, you can select multiple items to apply the same action to them, for example, **Edit** | **Scan Now**.

You can select multiple items by the following means (you can also combine them):

- Click and hold your left mouse key while pointing to the lines you want to select
- Hold the **Ctrl** key while clicking to toggle the selection status of a single line
- Click a line and hold the **Shift** key while clicking another line to select all lines in between.

Acknowledge Alarm

An acknowledged alarm shows up in the alarms list as "acknowledged" (see [Sensor States](#)^[195]) and will not [trigger](#)^[3170] any more [notifications](#)^[3216].

- ❗ If the alarm condition clears, the sensor usually returns to an **Up** status immediately with the next sensor scan.

To acknowledge an alarm, right-click a sensor entry and choose **Acknowledge Alarm...** from the context menu, enter a message and click the **OK** button. The message will appear in the last message value of the sensor. You can choose between: **Acknowledge Indefinitely...**, **acknowledge For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Until...**

If you choose **Until...** a dialog box appears:

ACKNOWLEDGE ALARM UNTIL

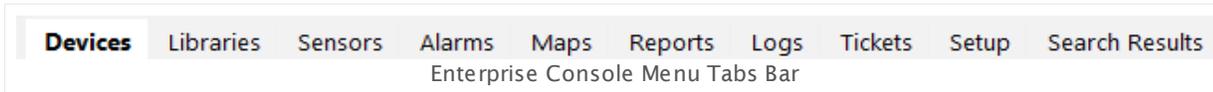

Selected Objects	Shows the sensor(s) that you want to acknowledge the alarm for. You can acknowledge alarms for more than one sensor using multi-edit ^[3197] .
Message	Enter a text, for example, the reason why you acknowledge the alarm. Please enter a string or leave the field empty.
Until	Enter the date when the acknowledge status will end. Use the date time picker to enter the date and time.

❗ If the alarm condition still persists after the specified date, the sensor will show a **Down** status again.

Only [users](#)^[3376] with write access rights may acknowledge alarms. You can give read-only users the right to acknowledge alarms, too. See section [User Accounts Settings](#)^[3377], section **Account Control**.

9.3.5 Maps

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.

There is documentation available for the following tabs:

- [Devices](#)  3439
- [Libraries](#)  3446
- [Sensors](#)  3448
- [Alarms](#)  3450
- [Maps](#)  3452
- [Reports](#)  3454
- [Logs](#)  3456
- [Tickets](#)  3458
- [Setup](#)  3460
- [Search Results](#)  3462

Maps Menu Tab

The page is split into two parts. On the left hand side you see all available maps from one or several servers, on the right hand side the details of the selected map.

- Click a map's name to display it. In the tabs above the map, select from **View Map**, [Map Designer](#)  3287, [Settings](#)  3297, [Get HTML](#)  3300, [Comments](#)  3301, and [History](#)  3301. Each of these tabs loads the respective functionality of the [Ajax Web Interface](#)  166. Remember to click the **Save** button to apply your settings.
- Double-click a map's name to open the map in the configured external web browser. You can edit it using the [Map Designer](#)  3287, or add new maps to this PRTG server.
- Right-click a map's name to open a [context menu](#)  3480. The following options are available: **Add**, **Edit**, **Delete**, **Clone**, **Send Link by Email**, and **Open in Web Browser**.
- Use the **Add Map** button to create a new map and the button for [object history](#)  273 to view all changes to maps.

 For more details, see section [Maps](#)  3276.

Maps Menu Tab—Add Map

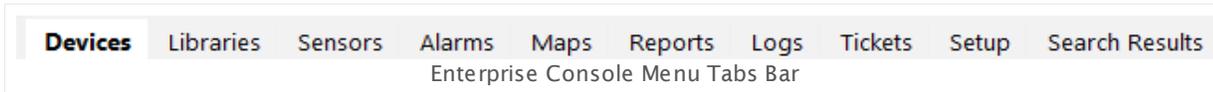

Click the **Add Map** button to add a new map to a PRTG server.

Depending on the current setting shown in the [server selection](#)  bar in the upper right corner, an (embedded) window will open (if one specific server is selected), or you will see a selection window that asks you to choose the core server you want to add the new item to. Choose an installation to start.

 For details about adding a map, see section [Maps Step By Step](#) .

9.3.6 Reports

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.

There is documentation available for the following tabs:

- [Devices](#)  3439
- [Libraries](#)  3446
- [Sensors](#)  3448
- [Alarms](#)  3450
- [Maps](#)  3452
- [Reports](#)  3454
- [Logs](#)  3456
- [Tickets](#)  3458
- [Setup](#)  3460
- [Search Results](#)  3462

Reports Menu Tab

On the **Reports** tab you see all available reports from one or several servers in one list.

If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click once or twice on the header of the column you want to sort by.

Choose one report and double click its name to open its details. The page will split into two parts. On the left hand side you see all available reports from one or several servers, on the right hand side the options for the currently selected report.

- Click a report's name in the list on the left to display its options. In the tabs above the report, select from [Run Now](#)  3261, [Stored Reports](#)  3264, [Settings](#)  3265, [Select Sensors Manually](#)  3275, [Sensors Selected by Tag](#)  3276, and [Comments](#)  3277. Each of these tabs loads the respective functionality of the [Ajax web interface](#)  166. Remember to click the **Save** button to apply your settings.
- Right-click a report's name to open its [context menu](#)  3480. The following options are available: **Add**, **Run Now**, **Edit**, **Delete**, **Clone**, **Send Link by Email**, and **Open in Web Browser**.
- Use the **Add Report** button to create a new report and the button for [object history](#)  2731 to view all changes to reports.

 For details, see section [Reports](#)  3252.

Reports Menu Tab—Add Report

Click the **Add Report** button to add a new report to a PRTG server.

Depending on the current setting shown in the [server selection](#)  bar in the upper right corner, an (embedded) window will open (if one specific server is selected), or you will see a selection window that asks you to choose the core server you want to add the new item to. Choose an installation to start.

 For details about adding a report, see section [Reports Step By Step](#) .

9.3.7 Logs

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.

There is documentation available for the following tabs:

- [Devices](#)  3439
- [Libraries](#)  3446
- [Sensors](#)  3448
- [Alarms](#)  3450
- [Maps](#)  3452
- [Reports](#)  3454
- [Logs](#)  3456
- [Tickets](#)  3458
- [Setup](#)  3460
- [Search Results](#)  3462

Logs show all past activities and events of your PRTG monitoring setup. This is useful for researching past user activities, system events, and, for example, to check whether messages were sent. In a typical setup, a huge amount of log data is produced. Because the activity of every single object is recorded, you can use this information to check if your setup works exactly as desired.

There are two options to call the logs list: Either you click the **Log** tab while you view an object's details on the [Devices](#)  3443 menu tab, or you choose the **Logs** entry from the menu tabs bar.

Logs Menu Tab

Click the **Logs** entry in the menu tabs bar to show a list of **all** log entries of a PRTG core server.

You can either view the entries of one or all servers. If you have configured more than one PRTG core server and you want to view entries from all servers in your [PRTG Servers](#)  3463 setup, simply select **All PRTG Servers** from the server selection in the upper right corner.

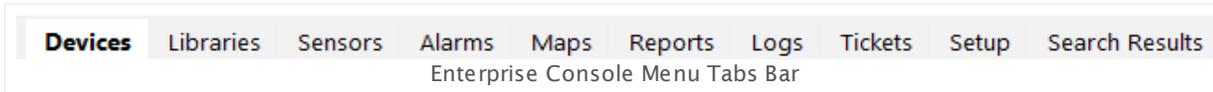

You can enable a filter to only show log entries of a certain event from the categories **Status Changes**, **System Events**, and **Object History**. Choose a category from the **Show** menu. The second dropdown menu shows all possible event types for the selected category. Select an entry to only show events of the respective event type. Choose a [sensor status](#)^[195] for status changes, **Probe Related**, **Auto Discovery**, **Notifications**, or **Status Messages** for system events, or a [system object for object history](#)^[229].

You can also define the time span for which you want to show logs. Use the date time picker to enter the date and time.

The list can show up to one hundred entries at a time. Use the arrow symbols above the list to show other items. You can jump to the beginning of the list, or browse through it hundred by hundred. If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click the header of the column you want to sort by once or twice.

9.3.8 Tickets

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.

There is documentation available for the following tabs:

- [Devices](#)  3439
- [Libraries](#)  3446
- [Sensors](#)  3448
- [Alarms](#)  3450
- [Maps](#)  3452
- [Reports](#)  3454
- [Logs](#)  3456
- [Tickets](#)  3458
- [Setup](#)  3460
- [Search Results](#)  3462

Tickets Menu Tab

 For technical reasons, this function is available for one server at a time only. If you have configured more than one PRTG core server, choose one server from the server list in the upper right corner.

On the **Tickets** tab you can view all tickets on the currently selected PRTG core server.

 You can only display tickets from one server at the same time, not from all PRTG servers.

In the header bar of the tickets list, you can choose several filters to find and display certain tickets: by status, type, concerned user or user group, related monitoring objects, and last edit. Click the **X** symbol to undo the date selection.

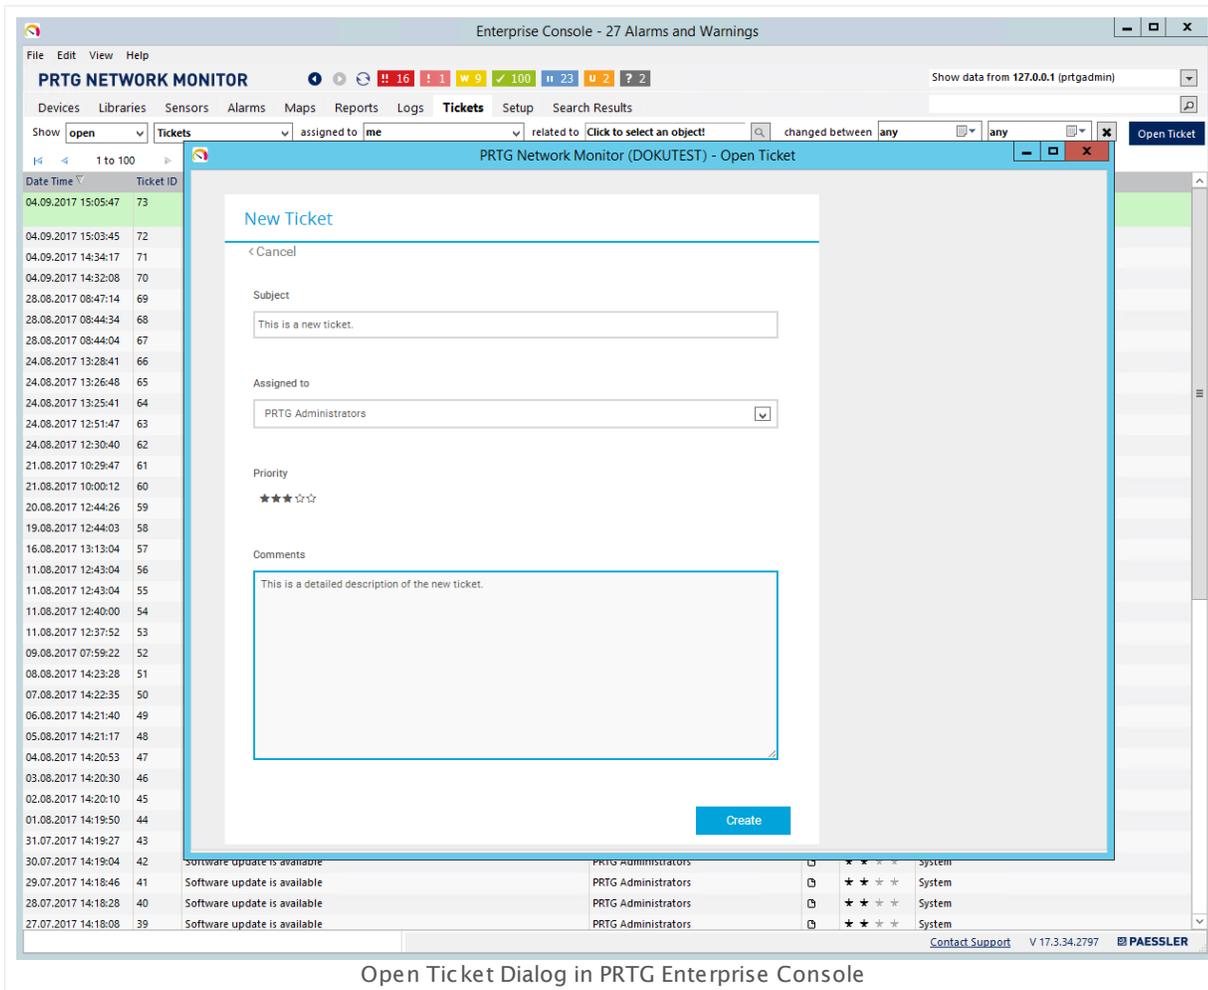

Double-click an entry in the tickets list to open a ticket in a new window and to conduct ticket related actions (edit, assign, resolve, close, or reopen). You can also multi-edit tickets via the context menu: mark several tickets by holding **Ctrl** or **Shift** and clicking on the corresponding tickets. **Right-click** a ticket to open the context menu.

The following actions are available: **Open Ticket**, **Edit Ticket**, **Assign Ticket**, **Resolve Ticket**, **Reopen Ticket**, **Close Ticket**, **Priority/Favorite**, **Open in Web Browser**.

The list can show up to one hundred entries at a time. Use the arrow symbols above the list to show other items. You can jump to the beginning of the list, or browse through it hundred by hundred. If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click the header of the column you want to sort by once or twice.

Tickets Menu Tab—Open Ticket

To open a new ticket, click **Open Ticket** in the upper right corner or in the context menu. Select a related object, click **Continue**, and provide **Subject**, **Assigned to**, **Priority**, and **Comments**. Once finished, click **Create** to create the ticket.

Open Ticket Dialog in PRTG Enterprise Console

For details about working with the PRTG ticket system, see section [Ticket s](#) ²³⁰ for the PRTG web interface.

9.3.9 Setup

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.

There is documentation available for the following tabs:

- [Devices](#)  3439
- [Libraries](#)  3446
- [Sensors](#)  3448
- [Alarms](#)  3450
- [Maps](#)  3452
- [Reports](#)  3454
- [Logs](#)  3456
- [Tickets](#)  3458
- [Setup](#)  3460
- [Search Results](#)  3462

Setup Menu Tab

 For technical reasons, this function is available for one server at a time only. If you have configured more than one PRTG core server, choose one server from the server list in the upper right corner.

On the **Setup** tab you can access all options available in the [Setup](#)  3302 menu of the Ajax web interface. You can collapse and expand the sections by clicking the **-** or **+** symbol.

For more information, refer to the respective section in the documentation for the PRTG web interface.

Account Settings:

- [My Account](#)  3304
- [Notifications](#)  3311
- [Notification Contacts](#)  3334
- [Schedules](#)  3338

System Administration:

- [User Interface](#)  3343

- [Monitoring](#) 
- [Notification Delivery](#) 
- [Core & Probes](#) 
- [Administrative Tools](#) 
- [Cluster](#)  (available in a [cluster](#)  setup only)

User Accounts:

- You see a list of configured user accounts. Select one to change settings. For details, see [User Accounts](#)  section.

User Groups:

- You see a list of configured user groups. Select one to change settings. For details, see [User Groups](#)  section.

PRTG Status:

- [System Status](#) 
- [Cluster Status](#)  (available in a [cluster](#)  setup only)
- [Licensing Status and Settings](#) 
- [Auto Update](#) 

Optional Downloads and Tools:

- [Client App for Windows \(Enterprise Console\)](#) 
- [Client Apps for Mobile Devices](#) 
- [Remote Probe Installer](#) 

Support:

- [Contact Support](#) 

9.3.10 Search Results

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.

There is documentation available for the following tabs:

- [Devices](#)  3439
- [Libraries](#)  3446
- [Sensors](#)  3448
- [Alarms](#)  3450
- [Maps](#)  3452
- [Reports](#)  3454
- [Logs](#)  3456
- [Tickets](#)  3458
- [Setup](#)  3460
- [Search Results](#)  3462

Search Results Menu Tab

 For technical reasons, this function is available for one server at a time only. If you have configured more than one PRTG core server, choose one server from the server list in the upper right corner.

The **Search Results** tab is only visible if you do a search using the search box in the upper right corner. For your search, the Enterprise Console shows all matching objects on one PRTG core server. Click a monitoring object in the results to show it in the Enterprise Console's [Devices](#)  3439 tab.

Other objects, for example, manual sections, load in an external browser window.

 When you click one of these items, a new window or tab of the external browser configured in the Enterprise Console's [Options](#)  3470 will open. PRTG automatically logs in and redirects you to the respective web page. If your browser displays a certificate warning, find more information in section [SSL Certificate Warning](#)  172.

9.4 PRTG Servers

The Enterprise Console connects to the web server API running on every PRTG core server installation. It supports saving the configuration for a connection to one or more PRTG core servers. In a full PRTG installation, there is already a connection predefined.

i For a successful connection, the program versions of Enterprise Console and PRTG core server have to match. When connecting to several servers, make sure they all run on the same software version. At least the third number of the whole version number has to be equal. For example, EC version 17.2.31.1917 can connect to server version 17.2.31.2018.

PRTG Servers List

From the main menu, select **File | Manage PRTG Server Connections** to view a list of all servers configured for the currently logged in Windows user account. You can also access this list by clicking the **PRTG Server Connections** entry above the device tree.

All PRTG Server Connections

Add PRTG Server Connection
 Delete PRTG Server Connection
 Move Up
 Move Down

Active	PRTG Server	Status	Background Activity	Core Version
<input checked="" type="checkbox"/>	127.0.0.1 (prtgadmin)			17.3.34.2797
<input checked="" type="checkbox"/>	demo (prtgadmin)			17.3.34.2797+

PRTG Servers List in the Enterprise Console

The list shows the server or display name, as well as login information used. In the **Status** column you see an overall sensor status for this server connection. You can also see if there is any **Background Activity** on the respective server (for example, a running [Auto-Discovery](#) ²⁸²), which can potentially affect performance and response times.

In the list, set a check mark for every PRTG server you want to poll with every update interval. If a server is not reachable, the Enterprise Console deactivates it automatically after several unsuccessful connection attempts. When opening the Enterprise Console, it automatically re-establishes the connection to all active servers.

Add or Edit a PRTG Server Connection

- Click **Add PRTG Server Connection** in the header bar above the server list to add a new server connection configuration.
- Click **Delete PRTG Server Connection** to remove an entry from the list.
- Click **Move Up** or **Move Down** to change the order of the servers on the [Devices](#) ³⁴³⁹ tab.

There is also a [context menu](#) ³⁴⁸⁰ available for each server connection with the following options.

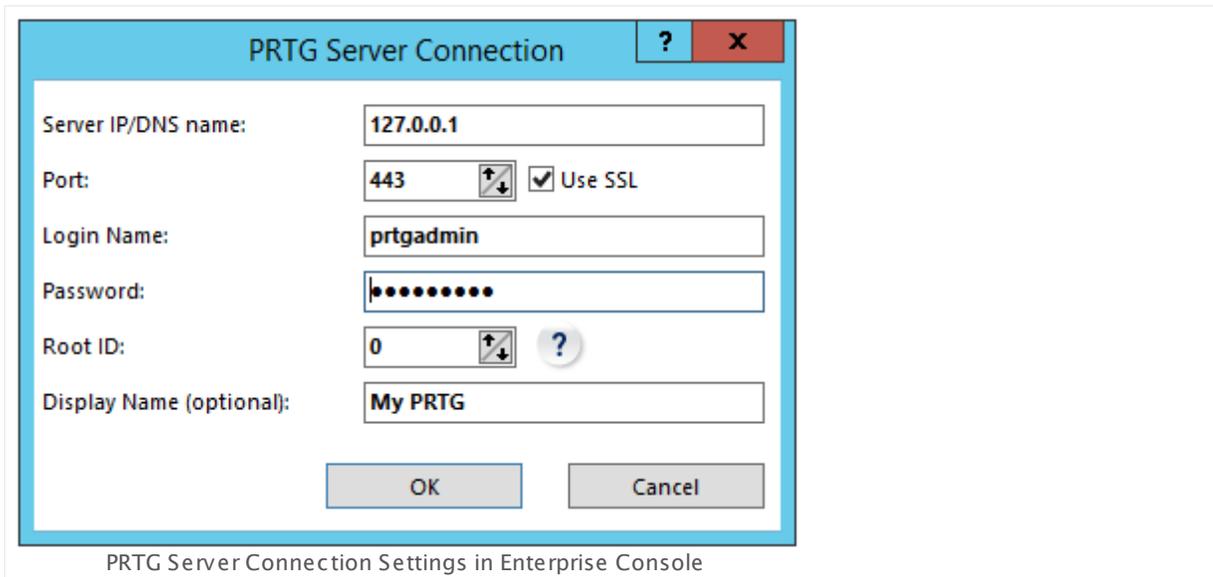

- Click **Deactivate PRTG Server Connection** to remove the server from the [Devices](#) ³⁴³⁹ tab but keep the server connection settings.
- **Add** a server.
- Open and edit the **Settings** of the server.

- **Delete** the server.
- **Move Up** and **Move Down** to change its position on the [Devices](#) tab.
- Open the server in the Ajax web interface (**Open in Web Browser**).

To change the settings of an existing server in the list, open its context menu with **right-click** and click **Settings** or click the respective wrench symbol in the table. You can alternatively use the context menu of a server on the [Devices](#) tab. There you can choose between **Edit PRTG Server Connection** to open the edit dialog, **Deactivate PRTG Server Connection** to not show this server's monitoring data anymore (you can later reactivate it in the [servers list](#)), or view [Dependencies](#).

When adding or editing, a dialog box appears to enter connection information.

- ❗ Connection settings are stored for each Windows user individually in the registry under the following node: `HKEY_CURRENT_USER\Software\Paessler\PRTG Network Monitor\WinGUI`

Server IP/DNS name

- Enter the IP address or DNS name of the PRTG server the Enterprise Console connects to.
- This is the same address or name as defined in the web server settings for the core server. For detailed information, see [PRTG Administration Tool](#) (**Web Server**) section. Make sure the values match.
- Make sure the server is reachable (especially when using Network Address Translation (NAT)) and no firewall settings block the connection.

Port

- Enter the port on which the PRTG server runs.

- This is the same port as defined in the web server settings for the core server. For detailed information, see [PRTG Administration Tool](#) ³⁶⁶² (Web Server) section. Make sure the values match.
- Make sure the server is reachable (especially when using Network Address Translation (NAT)) and no firewall settings block the connection.

Login Name

- Enter the login name that you use to login to the web server.
- This can be the administrator login or the login of another PRTG user.
- In a new installation, the login name is **prtadmin** by default.
- For detailed information about user accounts, see [System Administration—User Accounts](#) ³³⁷⁶ section.

Password

- Enter the password for the login name entered above.
- In a new installation, the password is **prtadmin** by default.

Root ID

- Enter the ID of the object that is [the root of the device tree](#) ¹³³.
- Default value is **0**, which is the **Root** group of your configuration.
- If you enter an other object's ID here, the device tree will start at this object, only showing all other objects below in the hierarchy.
- This is useful to only view a part of the device tree, which might load much faster.
- You can create several connections that only differ in the **Root ID** value to quickly switch between different views within your configuration, choosing different PRTG core server connections in the Enterprise Console's [Devices](#) ³⁴³⁹ tab.

Display Name (optional)

- Optionally enter a name that the EC displays in the **PRTG Server Connections** list.
- If you leave this field blank, the Enterprise Console displays the **Server IP/DNS name** setting there.

Click the **OK** button to save your settings or **Cancel** to discard them.

9.5 Options

From the [Windows menu](#)  of the Enterprise Console, select **File | Options...** to open the options dialog.

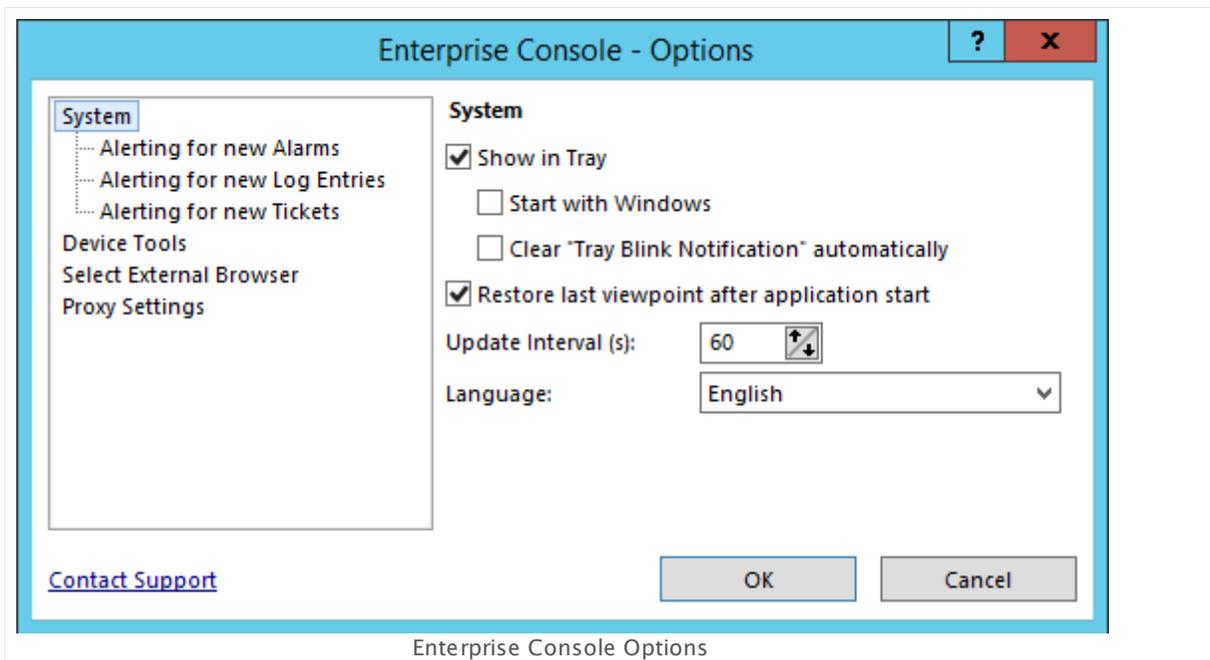

You can choose from these options on the left hand side:

- [System](#) 
- [System—Alerting](#) 
- [Device Tools](#) 
- [Select External Browser](#) 
- [Proxy Settings](#) 
- [Contact Support](#) 

System

From the [Windows menu](#)  of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

Change general system settings for the Enterprise Console.

ENTERPRISE CONSOLE – OPTIONS: SYSTEM

Show in Tray	<p>By default this setting is enabled. With this setting enabled, a PRTG icon appears in the Windows tray^[3433]. When you point your mouse to it, it will show information with the most important status information about your monitoring. With a right-click you can access a menu with access to the most important functions.</p> <p> To use any alerting functionalities (see System—Alerting^[3488] section), you must enable this option. If the tray icon is not shown, no alerting from the Enterprise Console is available.</p>
Start with Windows	<p>This setting is only available to change only if you enable the tray option above. By default this setting is enabled. With this setting enabled, the Enterprise Console will start up automatically when Windows starts.</p>
Clear "Tray Blink Notification" automatically	<p>This setting is only available to change only if you enable the tray option above. Whenever there are new entries in the Alarms^[3450] list, the tray icon will start blinking. If you enable this option, the tray icon will stop blinking automatically as soon as there are no more alarms.</p> <p> With this option disabled, the icon will keep blinking, even if all alarms are cleared meanwhile.</p>
Restore last viewpoint after application start	<p>If this option is enabled, the Enterprise Console saves information about the currently shown view (for example, sensor details, a certain graph, or a map^[3278]). It is written to the registry^[3471] when you close or exit the program. When you open the Enterprise Console again, it will try to restore the same view.</p> <p>Only if the object is not available any more (due to changes on the server, or due to unavailability of a server), the default view loads.</p>
Update Interval (Sec.)	<p>Define the number of seconds that the Enterprise Console waits before the screen refreshes. Please enter an integer value. Default value is 60 seconds. You can use the up and down arrows to go one second up or down.</p>
Language	<p>Choose the language for the Enterprise Console from the dropdown menu. Default is English. Depending on your installation, you can choose other languages here.</p> <p> This setting only influences the language of the Enterprise Console.</p>

System—Alerting

From the [Windows menu](#)³⁴⁷² of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

You can define what the Enterprise Console will do in case of new **Alarms, Log Entries, or Tickets**. The settings are the same for all of these three cases, but you can individually define them for each case. On the left side, select either **Alerting for new Alarms, Alerting for new Log Entries, or Alerting for new Tickets** and define the settings as follows.

 All alerting options only take effect if you enable the **Show in Tray** option in the [system](#)³⁴⁶⁶ settings above. If the tray icon is disabled, there will be no alerting from the Enterprise Console.

ENTERPRISE CONSOLE - OPTIONS: ALERTING FOR NEW ALARMS

Blink Tray Icon	The tray icon will blink if there are new items to be alerted for. You can additionally set the Clear Tray Blink Notification automatically option in the system ³⁴⁶⁶ settings above.
Balloon Info in Tray	Show a balloon info next to the PRTG tray icon if there are new items to be alerted for.
Popup Message	Show a popup message window if there are new items to be alerted for.  The popup window will be always on top until it is closed.
Play Sound	Play an audible notification if there are new items to be alerted for. There is a default sound defined. To change it, click the folder icon and select any standard WAV file from your hard disk drive. PRTG already comes with a small set of sounds you can choose from.  The sound file is only played on the computer running the Enterprise Console.
Open Enterprise Console	Open the Enterprise Console if there are new items to be alerted for.

Device Tools

From the [Windows menu](#)³⁴⁷² of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

In the **Device Tools** settings you can define commands that will be available in the [Windows Menu](#)³⁴⁷² and [context menu](#)³⁴⁸⁰ of groups, devices, and sensors. A command to initiate a remote desktop connection is already predefined.

 You may need to run the Enterprise Console as administrator to make the tool function work with your Windows version.

Click the **Add** button to add a new command, or choose an existing one from the list and click the **Edit** button to change the settings. Use the **Delete** button to remove an entry from the list.

ENTERPRISE CONSOLE – OPTIONS: EDIT TOOL

Name	Enter a custom name for your command. The command will show up with this name in context menus. Please enter a string.
Command	Enter the command you want to execute on the local machine. This can be, for example the name of a program or script, with or without path, according to your system's configuration.
Parameters	Enter the parameters with which you want to execute the command. You can use the placeholders (variables) from section Parameters—Available Placeholders ³⁴⁶⁹ . Other placeholders are not possible. During runtime, these placeholders are replaced by the respective values set for the monitoring object you select to execute this device tool. For example, the %id placeholder will be replaced by the ID of a group, a device, or a sensor, depending on which object you execute the command for.
Shortcut	Select a key shortcut for the command. Choose an F -key from the list or select None to not use a key.

Parameters—Available Placeholders

The following placeholders (variables) are available in the Enterprise Console.

PLACEHOLDER	AVAILABLE FOR GROUPS	AVAILABLE FOR DEVICES	AVAILABLE FOR SENSORS	WILL BE RESOLVED TO
%id				The object's ID as shown in the page header on the object's details page
%name				The object's Name
%host				The sensor's or device's IP Address/DNS Name
%message				The sensor's Last Message
%value				The sensor's Last Result value
%type				The sensor's Type

If you use a placeholder in combination with an object it is not available for, it will simply not be resolved but the placeholder itself will be returned.

To see the output of all placeholders for different objects you can create a simple test tool that displays the output in a command line window. Just create a tool with the command **cmd** and the following content in the **Parameters** field:

```
/K echo.id: %id && echo.name: %name
    && echo.host: %host && echo.message: %message
    && echo.value: %value && echo.type: %type
```

Right-click an object in the device tree and run the tool from the **Tools** option in the menu (either [Windows](#)^[3472] or [context menu](#)^[3481]).

Select External Browser

From the [Windows menu](#)^[3472] of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

With these settings you can define which browser the Enterprise Console will use when you select a command that requires to open an external browser window, for example, when you select **View | Open in Web Browser** from the Windows menu of the EC. You can only select browsers installed on the system running the Enterprise Console, other browser options are disabled.

By default, the system's default browser is opened. To change the Enterprise Console's behavior, choose between:

- **Use system default browser** ([browser.exe](#))
- **Use IE (Version: x)**
 - ❗ Only Microsoft Internet Explorer 11 is supported by the Ajax web interface! Please do not use it with Internet Explorer 10 or earlier! We recommend that you use Google Chrome 67 or later (recommended) or Mozilla Firefox 61 or later as external browser.
- **Use Firefox (Version: x)**
- **Use Chrome (Version: x)**
- **Use Safari (Version: x)**

Proxy Settings

From the [Windows menu](#)³⁴⁷² of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

If the connection to the PRTG core servers requires a proxy connection, you can set it here.

ENTERPRISE CONSOLE – OPTIONS: PROXY SETTINGS

No Proxy	Use a direct connection to the servers.
Use System Settings	Use your Windows default settings, configured in Internet Explorer . To view these settings, open the Internet Explorer on your system and select Tools Internet Options from the menu. Select the Connections tab and click the LAN settings button.
Manual Proxy Configuration	Manually enter a proxy configuration. Enter the IP address or DNS name of the proxy, a port number, as well as username and password (if required by the proxy). ❗ Only basic authentication is available!

Settings Storage

For each individual Windows user account, the settings of the Enterprise Console are stored in the Windows registry.

📖 For details, see section [Data Storage](#)³⁷³⁴.

9.6 Windows Menu Structure

The Windows menu of the Enterprise Console has four main menu items:

- [File](#)  3472
- [Edit](#)  3473
- [View](#)  3477
- [Help](#)  3478

File

The **File** menu offers system related options for the Enterprise Console. The particular close and exit options depend on the enabling status of the tray option.

FILE	
Manage PRTG Server Connections	<p>Show a list of all configured PRTG core server connections.</p> <p> For detailed instructions, see section PRTG Servers  3463 section.</p>
Options...	<p>Open the Options  3466 dialog to set EC system options and to configure one or more PRTG core server connections.</p>
Close or Exit	<p>This menu item appears as either Close or Exit, depending on whether the tray icon is enabled or disabled in the Options  3466 settings.</p> <ul style="list-style-type: none"> ▪ Use Close to close the Enterprise Console window. Alerting is still available via the tray icon then. You can also double-click the tray icon to re-open the Enterprise Console. ▪ Exit shuts down the Enterprise Console completely. This option is only available if the tray icon is not running. <p> Shortcut: Alt+X</p>
Close and Exit	<p>This menu item is only available if the Show in Tray option is enabled in the Options  3466 settings. It will completely shut down the Enterprise Console and tray icon, so no tray alerts are shown any more.</p> <p> Shortcut: Ctrl+Alt+X</p>

Edit

The content of the **Edit** menu varies, depending on which [menu tab](#)^[3438] you are and whether and which objects are selected within the [Devices](#)^[3439], [Sensors](#)^[3448], or [Alarms](#)^[3450] tab.

-  Some of the options open the Ajax web interface when you select them.
-  When you click one of these items, a new window or tab of the external browser configured in the Enterprise Console's [Options](#)^[3470] will open. PRTG automatically logs in and redirects you to the respective web page. If your browser displays a certificate warning, find more information in section [SSL Certificate Warning](#)^[172].

EDIT	
Scan Now	<p>Perform an immediate scan for all selected objects (use the Ctrl key to select multiple objects). This option polls all selected devices and queries new data for all sensors on them. If you choose this option for a probe or a group, you query data for all sensors in the object hierarchy^[133] underneath.</p> <p> Shortcut: Ctrl+K</p>
Details	<p>Open the overview tab for the selected object (probe, group, device, or sensor).</p>
Edit	<p>Access the pages for editing Settings...^[217], Notifications^[217], Access Rights...^[158], and Management^[217] (not for sensors) of the selected object. In addition, you can Rename... this object. Point on it to see available options.</p>
Dependencies	<p>This option is only available if you select a server (the Root group), a probe, or group. This function shows an overview of the dependencies^[141] configured for the selected object. If you select a dependencies option, the Enterprise Console opens the respective dependencies overview in a new window.</p> <p> For details, see section Show Dependencies^[320].</p>
Add Group...	<p>This option is only available if you select a probe or group (not the Root group). This option opens an assistant in a new window that guides you through adding a new group to the selected probe or group.</p> <p> For detailed instructions, see section Add a Group^[302].</p>
Add Auto-Discovery Group...	<p>This option is only available if you select a probe or group (not the Root group). This option opens an assistant in a new window that guides you through adding such a group.</p>

EDIT

 For detailed instruction, see section [Auto-Discovery](#) ^[282].

Add Device...

This option is only available if you select a probe or group (**not** the **Root** group). This option opens an assistant in a new window that guides you through adding a new device to the selected probe or group.

 For detailed instructions, see section [Add a Device](#) ^[311].

Add Sensor...

This option is only available if you select a device. This option opens an assistant in a new window that guides you through adding a new sensor to the selected device.

 For detailed instructions, see section [Add a Sensor](#) ^[325].

Auto-Discovery

This option is only available if you select a device. Hover over it to see available options. You can choose between:

- **Run Auto-Discovery**: This option starts an automatic search and adds new sensors to the selected device. The search is running in background. You will see new sensors after a few minutes automatically.

 If you have set the option **Manual (no auto-discovery)** in the [device settings section](#) ^[404] **Sensor Management** and start the auto-discovery, PRTG will not run it. Please note that the [Ajax web interface](#) ^[254] behaves differently in this case.

- **Run Auto-Discovery with Template**: With this option you can run an auto-discovery with a pre-defined device template.

 For more information, see section [Auto-Discovery](#) ^[283] (**Run Auto-Discovery Now**).

Create Device Template...

This option is only available if you select a device. This option opens an assistant in a new window that guides you through creating a device template. This template is then available for [auto-discovery](#) ^[282].

 For detailed instructions, see [Create Device Template](#) ^[3203].

Sort Alphabetically

This option is only available if you select a probe, a single group, or a device. This will sort direct children of the selected node such as groups, devices, or sensors in alphabetical order.

 The ordering is stored in the monitoring configuration so you cannot revoke it!

EDIT

- Acknowledge Alarm...** This option is only available if you select a sensor in a **Down** or **Down (Partial)** [status](#)¹⁹⁵. Point on it to see available options.
-  For details on how to acknowledge an alarm, see section [Alarms](#)³⁴⁵¹.
- Delete** Delete the selected object(s). You will be asked for confirmation before anything is actually deleted.
- Clone...** This option is only available if you select a single group, device, or sensor. This options opens an assistant in a new window that guides you through cloning the selected object.
-  For detailed instructions, see section [Clone Object](#)³¹⁹³.
- Move** Move the selected object(s) of the device tree (use the **Ctrl** or **Shift** key to select multiple objects). Hover over it to see available options. Choose between **Top**, **Up**, **Down**, and **Bottom** to move the object(s) to the top or bottom of the mother node, or one entry up or down.
- You can also move the selected group or device to another group with **To Other Group...** This option opens an assistant in a new window to guide you through the movement.
-  For details about allowed movements, see section [Devices](#)³⁴⁴⁵.
- Pause** Pause and resume monitoring for the selected objects from the device tree (use the **Ctrl** key to select multiple objects). Hover over it to see available options.
- Choose between:
- **Indefinitely**
 - **Resume**
 - **For 5 Minutes**
 - **For 15 Minutes**
 - **For 1 Hour**
 - **For 3 Hours**
 - **For 1 Day**

EDIT

- **Pause Until...:** This option will open an assistant in a new window where you can enter a message and a date. Use the date time picker to enter the date and time. PRTG will resume monitoring after this date.

You can also set up a **One-time maintenance window**: Enter a message and start and end date of the maintenance in the appearing window. Use the date time picker to enter the date and time.

Simulate Error Status

This option is only available if you select a sensor. Set the selected sensor to a simulated error status. As for the pause status, **Resume** will appear in the context menu if a the selected sensor is already in a simulated error state.

- ❗ **Simulate error status** does not work for sensors that run on a PRTG Mini Probe.

Priority/Favorite

Set the priority for the selected object. You can also add devices and sensors to favorites.

- 📖 For details, see section [Priority and Favorites](#) ²⁴².

Historic Data

Open the historic data tab of the selected object. Hover over it to see available options.

You can choose between **Last 2 days...**, **Last 30 days...**, and **Last 365 days....**, or when selected one sensor **Live Data...** and **View Historic Data....** You can also create a report.

- 📖 For detailed instructions, see [Historic Data Reports](#) ²⁰⁵ (Menu).

When you select one or more sensors (hold the **Ctrl** or **Shift** key to select multiple items), you can open the **Compare Sensors** dialog. The graphs of all chosen sensors appear in the comparison dialog automatically. You can add additional sensors in the comparison dialog.

- For sensors, you can open the [Similar Sensors Overview](#) ²⁰⁹.

Device Tools

Call a tool command. All placeholders (variables) configured in a tool command will be resolved for the currently selected object. Hover over it to see all available tools configured in your [Options](#) ³⁴⁶⁸ settings (**Device Tools**).

By default, a **Remote Desktop** tool is pre-configured that tries to initiate a remote desktop connection to the IP address or DNS name of the selected object. This will usually work for devices.

EDIT

You can also add a device tool directly to the selected object: **Add Device Tool...** will open [Options—Device Tools](#)³⁴⁶⁸.

For devices, additional options are available. They allow you to connect to the **Service URL** value defined in the device's [settings](#)³⁴⁴⁴, or open the **IP address/DNS name** of the device via the protocols **HTTP**, **HTTPS**, and **FTP**. For each of these functions, your system's default programs will be used. Usually, this is your browser. You can also install a remote probe on a device via [Remote Probe Quick Setup](#)³⁷¹³.

You may need to run the Enterprise Console as administrator to make the tool function work with your Windows version.

Find Duplicates

This option is only available if you select a device. Search in your PRTG configuration for devices with the same IP address or DNS name as the selected device. A new window with the results will appear, either showing existing duplicates or a message indicating that there are no duplicates.

Drag & Drop Sorting

Enable this option to sort all objects in the device tree via drag and drop. By default, this option is disabled to avoid accidental moves of objects.

For details, see section [Devices](#)³⁴⁴⁶.

Send Link by Email

Send the link to the selected object by email. This option opens a new email using your system's standard email client. It contains a direct link to the details page of the selected object.

Open Ticket

Open a ticket that refers to the currently selected object.

For details, see section [Tickets](#)³⁴⁵⁸.

Open in Web Browser

Open the currently selected object in the Ajax web interface. This option is not available if multiple objects are selected. You can set the default browser in the [Options](#)³⁴⁷⁰ settings.

View

The **View** menu provides settings related to what the Enterprise Console shows.

VIEW

Refresh	<p>Query data for the current screen from the PRTG core server immediately, just as the automatic refresh does. You can configure the auto-refresh in the Options³⁴⁶⁶ settings.</p> <p> Shortcut: F5</p>
Large Single Graph	<p>Change the view in Devices³⁴³⁹ menu tabs to large single graphs. This option displays live graphs and graphs for three other time spans in different tabs.</p> <p> Shortcut: Ctrl+L</p>
Small Multiple Graphs	<p>Change the view in Devices³⁴³⁹ menu tab to multiple small graphs. This option displays live graphs and graphs for three other time spans in one tab.</p>
Show Geo Maps	<p>Choose if you want to show Geo Maps³²¹¹ in the Enterprise Console.</p> <p> Shortcut: Ctrl+G</p>
Show News Feed	<p>Choose if you want to show the news feed in the Enterprise Console.</p> <p> Shortcut: Ctrl+N</p>
Next Viewpoint	<p>Go forward to the next viewpoint (only available if you went back to a previous viewpoint before). This is similar to a browser's function to go forth in history.</p> <p> Shortcut: Alt+Right</p>
Previous Viewpoint	<p>Go backwards to the previous viewpoint. This is similar to a browser's function to go back in history.</p> <p> Shortcut: Alt+Left</p>
Open in Web Browser	<p>Open the currently selected object in the Ajax web interface. This option is not available if multiple objects are selected. You can set the default browser in the Options³⁴⁷⁰ settings.</p>

Help

This menu provides links to help and information.

HELP

Help Center	Open the Help and Support Center in the Ajax web interface.
HTML Manual Enterprise Console...	Open the Enterprise Console ³⁴³⁰ sections of this manual in the Ajax web interface.
PRTG Network Monitor Homepage...	Open https://www.paessler.com/prtg in your browser for overall information about PRTG.
Contact Support	Open the Contact Support ³⁴²⁴ dialog box to leave feedback or to ask for support by sending a support bundle.

9.7 Context Menus

For every object in the Enterprise Console, there are context menus available that appear when you right-click an object in the device tree. These context menus vary depending on the selected object and always contain a sub-set of the options available in the Windows menu.

For detailed explanations, see section [Windows Menu Structure](#) ³⁴⁷².

9.8 Shortcuts Overview

The following shortcut keys are available in the Enterprise Console:

- **Alt+X**: File | Close **or** Exit
With the **Show in Tray** option enabled in the [Options](#)³⁴⁶⁶ settings, this is **Close**, otherwise **Exit**.
- **Ctrl+Alt+X**: File | Close and Exit
This menu item is only shown if the **Show in Tray** option is enabled in the [Options](#)³⁴⁶⁶ settings.
- **Alt+Right**: Next Viewpoint
- **Alt+Left**: Previous Viewpoint
- **Ctrl+K**: Edit | Scan Now
- **Ctrl+P**: Edit | Pause | Indefinitely
- **Ctrl+R**: Edit | Pause | Resume
- **Ctrl+E**: Edit | Simulate Error Status
- **Ctrl+L**: View | Large Single Graph
- **Ctrl+S**: View | Small Multi Graphs
- **Ctrl+G**: View | Show Geo Maps
- **Ctrl+N**: View | Show News Feed
- **F5**: View | Refresh
- **F6**: [Context Menu] | Tools | **Custom tool command, if available**
- **F7**: [Context Menu] | Tools | **Custom tool command, if available**
- **F8**: [Context Menu] | Tools | **Custom tool command, if available**
- **F9**: [Context Menu] | Tools | **Custom tool command** (default: **Remote Desktop**)
- **F10**: [Context Menu] | Tools | **Custom tool command, if available**
- **F11**: [Context Menu] | Tools | **Custom tool command, if available**
- **F12**: [Context Menu] | Tools | **Custom tool command, if available**

PRTG Apps for Mobile Network Monitoring

10 PRTG Apps for Mobile Network Monitoring

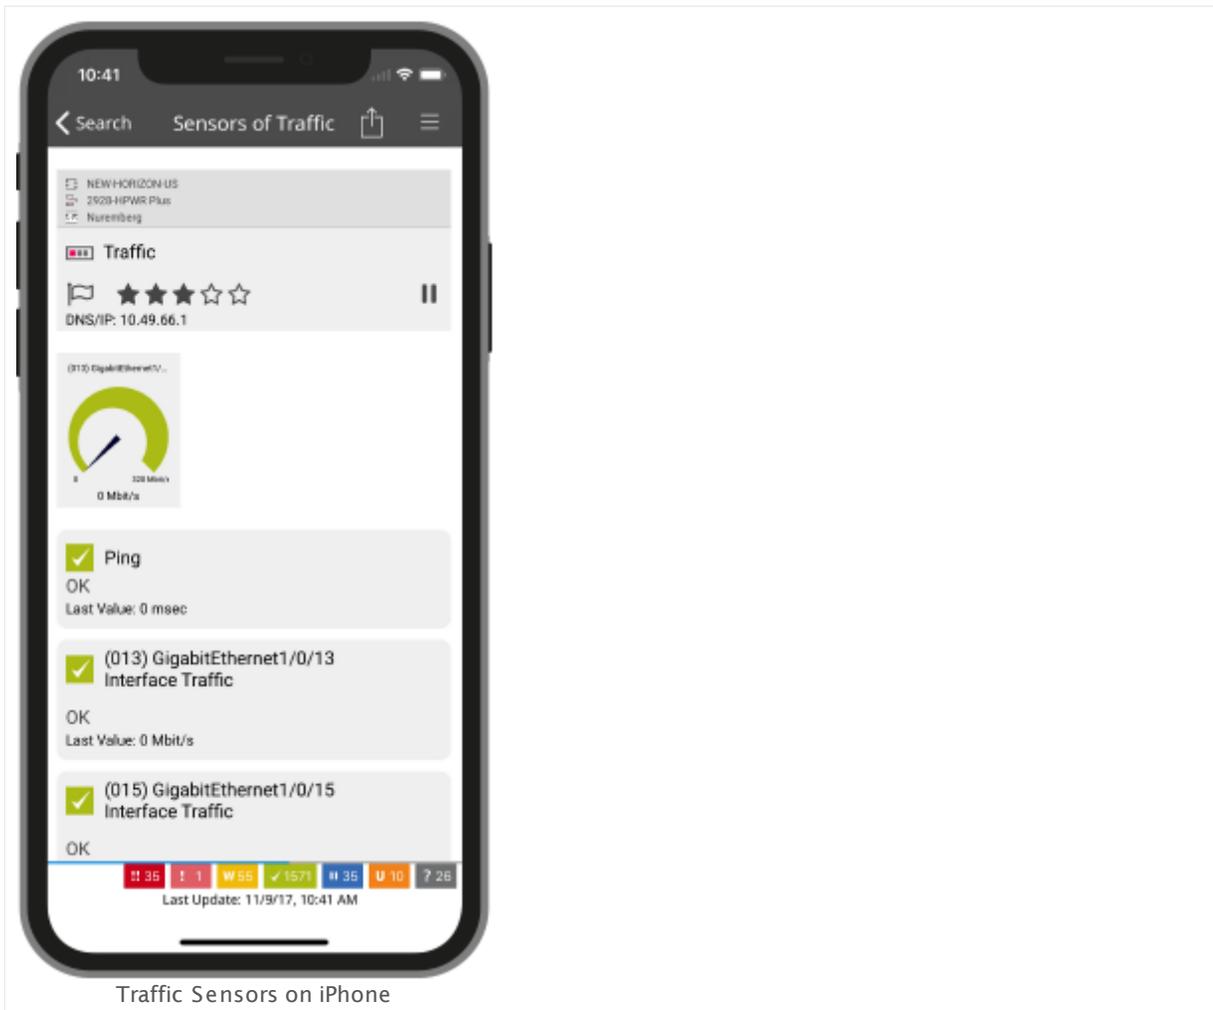

You can access your PRTG installation on your mobile devices with several PRTG apps. We provide apps for iOS devices and Android systems. You can download and use these apps for free. [PRTG for iOS](#)³⁴⁸⁴ and [PRTG for Android](#)³⁴⁸⁵ make it possible to monitor your network while on the go.

The basic requirements to use these free apps are a running PRTG core server that is accessible from the network your device is connected to (either directly or via a VPN connection) and a recent operating system version on your mobile device. For details about requirements, see below.

PRTG for iOS

PRTG for iOS is the iOS app for PRTG Network Monitor version 13 or later. You can use the newest app version on iPhone, iPad, and iPod touch with iOS version 9 or later. You can also use free [push notifications](#)³³¹⁹ with this app (required: PRTG for iOS 14.3.6 or later; PRTG 15.4.20 or later).

 For more information and to download this app, see our website: [PRTG for iOS](#).

Traffic Sensors on iPhone

PRTG for Android

PRTG for Android is the Android app for PRTG Network Monitor version 14 or later. Use it on your smartphone or tablet with Android version 4.0 or later, or on a Kindle Fire. For full functionality, we recommend that you use at least Android 4.1. You can also use free [push notifications](#) with the PRTG for Android app (required: PRTG for Android 14.3.2 or later; PRTG 15.4.20 or later).

 For more information and to download this app, see our website: [PRTG for Android](#)

11.1 Monitoring via SNMP

Monitoring via Simple Network Management Protocol (SNMP) is the most basic method of gathering bandwidth and network usage data.

How SNMP Monitoring Works

SNMP is a set of standards for communication with devices in a TCP/IP network. SNMP monitoring is useful if you are responsible for servers and network devices such as hosts, routers, hubs, and switches. It enables you to keep an eye on network and bandwidth usage, and monitor important issues such as uptime and traffic levels.

You can use SNMP to monitor the bandwidth usage of routers and switches on a port-by-port basis, as well as device readings such as memory and CPU load. The target devices must support SNMP. Most devices with enabled SNMP require the same configuration like SNMP version and community string. To find out how to set up SNMP on a specific device, search in the internet for your device name or model and SNMP configuration. You will likely get plenty of information on how to configure SNMP.

When you use a sensor with this technology, PRTG sends small data packets to devices, for example, querying routers, switches, and servers for the traffic counters of each port. These queries trigger reply packets from the device. Compared to PRTG's other bandwidth monitoring technologies via flows, packet sniffing, or WMI, the SNMP option creates the least CPU and network load.

Reasons to Choose SNMP Monitoring

SNMP is the most commonly used method mainly because it is easy to set up and requires minimal bandwidth and CPU cycles. If your network devices support SNMP and/or if you want to monitor large networks with several hundred or thousands of sensors, we recommend that you start with SNMP.

Besides network usage monitoring, another well-known feature of SNMP is the ability to also watch other network parameters such as CPU load, disk usage, temperature, as well as monitoring many other readings, depending on the queried device.

SNMP Network Issues

To use Simple Network Management Protocol (SNMP) for monitoring purposes, it is imperative that UDP packets can travel from the machine running PRTG to the device you want to monitor and back. This is usually the case in LANs and intranets. For connections across the internet, to a Demilitarized Zone (DMZ), or for Wide Area Network (WAN) connections, some changes to the traversed firewalls may be necessary.

Keep in mind that SNMP V1 and V2c are not secure protocols so you should not use them across the internet or insecure data connections. Only SNMP version 3 supports encryption.

Understanding SNMP Sensors

To better understand and set up SNMP sensors, you may want to learn more about the principles of [Object Identifiers \(OID\)](#) and [Management Information Base \(MIB\)](#).

-  For more information about this topic, see this Knowledge Base article: [How do SNMP, MIBs and OIDs work?](#)
-  For an overview and details about all SNMP sensors, see section [List of Available Sensor Types](#)^[431].
-  For more information about which SNMP sensor is best for your monitoring setup, see section [Choosing the Right SNMP Sensor](#)^[3494].

SNMP Versions

PRTG supports three versions of the SNMP protocol: Version 1, version 2c, and version 3.

SNMP Version 1

This is the oldest and most basic version of SNMP.

- Pro: Supported by most SNMP-compatible devices; simple to set up.
- Con: Limited security because it only uses a simple password ([community string](#)^[3492]) and sends data in clear text (unencrypted). Because of this, you should only use it inside LANs behind firewalls, but not in WANs. Version 1 only supports 32-bit counters, which are not enough for high-load (gigabits/second) bandwidth monitoring.

SNMP Version 2c

This version adds 64-bit counters.

- Pro: Supports 64-bit counters to monitor bandwidth usage in networks with gigabits/second loads.

- Con: Limited security (same as with SNMP V1).

SNMP Version 3

This version adds authentication and encryption to SNMP.

- Pro: Offers user accounts and authentication for multiple users and optional data packet encryption, increasing available security; plus all advantages of Version 2c.
- Con: Difficult to configure and higher overhead for the probe, which will reduce the number of devices that you can monitor (see [here](#)³⁴⁹¹ for more information).

SNMP Traps

Various devices can send SNMP trap messages to notify you of system events.

- PRTG supports SNMP v1 and SNMP v2c traps.
- Destination for SNMP traps: IP address of the trap receiver, which is the IP of the PRTG probe system (server with either a local or remote probe running on it) to which you add the [SNMP Trap Receiver Sensor](#)²⁴⁷⁹.

Which SNMP Version Should I Choose?

The SNMP version to choose depends on your environment, but as a guideline:

- If your network is publicly accessible, you may want to use SNMP v3, which has encryption and secure access. However security and encryption adds overhead, which results in less performance.
- If your network is isolated or well protected behind firewalls, the lower security of SNMP v1 or SNMP v2c may be sufficient.
- From the PRTG perspective, if you have a lot of devices to monitor, the SNMP v2c is preferable. It will allow you to monitor more devices on a shorter monitoring interval and supports 64-bit counters.

The most important thing is to set the same SNMP version in the PRTG settings (for example, on **Root** level) as you have configured in your target device. If you select an SNMP version that is not supported by the server or device you want to monitor, you receive an error message. Unfortunately, in most cases, these error messages do not explicitly point to the possibility that you use the incorrect SNMP version. These messages provide minimum information only, such as **cannot connect** or similar. Similar errors occur when community strings, usernames, or passwords do not match.

 For basic requirements for SNMP monitoring, see this Knowledge Base article: [My SNMP sensors don't work. What can I do?](#)

SNMP Overload and Limitations of the SNMP System

SNMP V1 and V2 scale directly with the performance of the hardware and the speed of the network. In our labs we are able to monitor 30,000 SNMP V1 sensors at a 60 second interval with one PRTG server (core and local probe) plus two remote probes with 10,000 sensors each.

However, SNMP V3 has performance limitations due to the SSL encryption. The main limiting factor is CPU power (as well as the other general limits for PRTG). Because of this limitation, you can monitor only a limited number of sensors per second using SNMP V3. Currently, PRTG is able to handle about 40 requests per second and computer core, depending on your system. This means that, on a common 1.x GHz computer with two cores, you can run about 5,000 SNMP v3 sensors with a 60 seconds scanning interval; on a system with four cores, you can monitor around 10,000 sensors with 60 seconds interval. The CPU load is at about 50% then. We do not recommend more.

Furthermore, the PRTG core server and probes should run on different computers. If you experience increased values in the **Interval Delay SNMP** or **Open Requests** channels of the **Probe Health Sensor** (values above 0 % indicate that the SNMP requests cannot be performed at the desired interval), you need to distribute the load over multiple probes. SNMP V1 and V2 do not have this limitation.

If you run into SNMP overload problems, you have three options:

- Increase the monitoring interval of the SNMP V3 sensors.
- Distribute the SNMP V3 sensors over two or more probes.
- Switch to SNMP V1 or V2 if you can go without encryption.

What is the SNMP Community String?

The SNMP **Community String** is similar to a user ID or password that allows access to the statistics of a router or another device. PRTG Network Monitor sends the community string along with all SNMP requests. If the correct community string is provided, the device responds with the requested information. If the community string is incorrect, the device simply discards the request and does not respond.

i SNMP community strings are only used by devices that support SNMP V1 and SNMP V2c protocols. SNMP V3 uses safer username/password authentication, along with an encryption key.

By convention, most SNMP V1/V2c equipment ships with a read-only community string set to the value **public**. It is standard practice for network managers to change all the community strings to customized values during device setup.

11.1.1 Choosing the Right SNMP Sensor

The Simple Network Management Protocol (SNMP) is easy to use and generally requires little configuration once it is set up. Many network devices support it and many parameters can be monitored with it. So to help cover all of your monitoring needs, PRTG provides you with around 70 SNMP sensors. These sensors range from monitoring general parameters to very specific parameters. Choosing the right sensor for SNMP monitoring that gives you the desired hardware parameters is a decision that depends on several factors: the type of hardware you have, what values you want to monitor, and a few others.

Check SNMP Capability

Make sure that each device you want to monitor supports SNMP, and that it is enabled. You can find out whether SNMP is supported by a device by either going to the vendor's website or check that it is enabled in the configuration of the device.

 If you are uncertain whether SNMP is enabled on the target device and works, we recommend that you try our [SNMP Tester](#), designed for just this purpose. You can scan for uptime to perform a basic check for SNMP availability of the target device.

Setup Checklist

1. Enable SNMP on the device.
2. Allow access to SNMP for the machine running PRTG Network Monitor in the device's security settings.
3. Allow User Datagram Protocol (UDP) packages to travel from the machine running PRTG to the device you want to monitor and back.
4. SNMP requires the use of UDP ports >1023 to the PRTG client side. This is important for your firewall settings.
5. Ensure that the firmware of the monitored device is up to date.
6. Select the appropriate SNMP protocol.

 It is important to know which SNMP version you have to select, because if it is not supported by the server or device you want to monitor, you will receive an error message.

 See this article in our Knowledge Base for more information: [General Introduction to SNMP and PRTG](#)

Vendor Specific SNMP Sensors

PRTG offers many vendor specific SNMP sensors for some common vendors. These sensors have been tailored to fit the end devices perfectly. Many years of experience allow us to work around familiar vendor implementation errors, for example if SNMP has not been fully implemented on an end device according to the RFCs. In this case, our vendor specific sensors still automatically receive the most important values with little to no effort on your part (looking for Object Identifiers (OIDs), for example). These sensors take care of everything for you.

Supported Vendors

- APC
- Buffalo
- Cisco

Part 11: Sensor Technologies | 1 Monitoring via SNMP

1 Choosing the Right SNMP Sensor

- Dell
- Fujitsu
- HP
- IBM
- Jakarta

- NetApp
- Poseidon
- QNAP
- SonicWall
- Synology

For more information, see this article in our Knowledge Base: [What SNMP Sensors does PRTG offer?](#)

Generic SNMP Sensors

PRTG offers several generic sensors that work with practically any device that supports SNMP, the corresponding Management Information Base (MIB) and Object Identifiers (OIDs), and correctly implements the according RFCs. The standard SNMP libraries of PRTG include predefined, common values for the generic SNMP sensors so that you can easily get started with monitoring via SNMP. You can monitor the following parameters with the generic sensors.

SENSOR	WHAT IT MONITORS
SNMP CPU Load sensor <small>1941</small>	<p>The SNMP CPU Load sensor monitors the system load using Simple Network Management Protocol (SNMP).</p> <ul style="list-style-type: none">▪ It shows the load of several CPUs in percent.
SNMP Disk Free sensor <small>2507</small>	<p>The SNMP Disk Free sensor monitors the free disk space on a logical disk via Simple Network Management Protocol (SNMP).</p> <p>It can show the following:</p> <ul style="list-style-type: none">▪ Free disk space in percent▪ Free disk space in bytes▪ Total disk space

SENSOR	WHAT IT MONITORS
SNMP Hardware Status sensor <small>2082</small>	<p>The SNMP Hardware Status sensor monitors the status of a hardware component of a server via Simple Network Management Protocol (SNMP).</p> <p>It shows the following:</p> <ul style="list-style-type: none">▪ Current status of the monitored hardware component▪ Number of errors per time period
SNMP Memory sensor <small>2288</small>	<p>The SNMP Memory sensor monitors the memory usage of a system via Simple Network Management Protocol (SNMP).</p> <p>It can show the following:</p> <ul style="list-style-type: none">▪ Available memory in bytes▪ Available memory in percent▪ Total memory
SNMP Printer sensor <small>2370</small>	<p>The SNMP Printer sensor is a generic sensor that monitors various types of printers via Simple Network Management Protocol (SNMP).</p> <p>It can show the following:</p> <ul style="list-style-type: none">▪ Total number of printed pages▪ Fill level of cartridges and toners▪ Status of the printer cover▪ Additionally, the sensor shows the printer status as sensor message.
SNMP RMON sensor <small>2403</small>	<p>The SNMP RMON sensor monitors traffic on a device using the Remote Monitoring (RMON) standard via Simple Network Management Protocol (SNMP). You can create it on an SNMP compatible device that provides traffic data via RMON. Depending on the data returned by your device, traffic data for each port can be displayed in different channels, allowing detailed analysis. If available, the sensor queries 64-bit counters.</p> <p>For each port, the sensor can show, for example:</p> <ul style="list-style-type: none">▪ Transmitted kbit/s▪ Packets (#/s)

SENSOR

WHAT IT MONITORS

- Broadcast Packets (#/s)
- Multicast Packets (#/s)
- CRC Errors (#/s)
- Undersize Packets (#/s)
- Oversize Packets (#/s)
- Fragments (#/s)
- Jabbers (#/s)
- Collisions (#/s)
- Packets <= 64 Byte (#/s)
- Packets 65 - 127 Bytes (#/s)
- Packets 128 - 255 Bytes (#/s)
- Packets 256 - 511 Bytes (#/s)
- Packets 512 - 1023 Bytes (#/s)
- Packets 1024 - 1518 Bytes (#/s)
- Drop Events (#/s)

[SNMP System Uptime sensor](#)

The SNMP System Uptime sensor monitors the time a device is running via Simple Network Management Protocol (SNMP).

- It reads the system uptime value of the monitored device and shows it.

[SNMP Traffic sensor](#)

The SNMP Traffic sensor monitors traffic on a device using Simple Network Management Protocol (SNMP). You can create it on a device that provides traffic data, one traffic sensor for each individual port.

It can show the following:

- Traffic in
- Traffic out
- Traffic total

You can also add additional channels:

- Errors in and out
- Discards in and out

SENSOR	WHAT IT MONITORS
SNMP Trap Receiver sensor <small>2479</small>	<ul style="list-style-type: none">▪ Unicast packets in and out▪ Non unicast packets in and out▪ Multicast packets in and out▪ Broadcast packets in and out▪ Unknown protocols <p>The SNMP Trap Receiver sensor receives and analyzes Simple Network Management Protocol (SNMP) traps.</p> <p>It shows the following:</p> <ul style="list-style-type: none">▪ Overall number of received traps per second▪ Trap messages categorized as "warning" per second▪ Trap messages categorized as "error" per second▪ Number of dropped trap packets per second▪ The actual trap messages

Operating System-based SNMP Sensors

PRTG also offers several operating system-based SNMP sensors that extend your SNMP monitoring. You can monitor the following parameters with these sensors.

SENSOR	WHAT IT MONITORS
SNMP Linux Disk Free sensor <small>2251</small>	<p>The SNMP Linux Disk Free sensor monitors free space on disks of a Linux/Unix system using Simple Network Management Protocol (SNMP).</p> <p>It shows the following:</p> <ul style="list-style-type: none">▪ Free total disk space in bytes▪ Free space in bytes for every mounted partition▪ Free space in percent for every mounted partition▪ Free inodes in percent for every mounted partition

SENSOR

WHAT IT MONITORS

[SNMP Linux Load Average sensor](#) 2263

The SNMP Linux Load Average sensor monitors the system load average of a Linux/Unix system using Simple Network Management Protocol (SNMP).

It shows the following:

- Average system load within a 1-minute interval
- Average system load within a 5-minute interval
- Average system load within a 15-minute interval

[SNMP Linux Meminfo sensor](#) 2271

The SNMP Linux Meminfo sensor monitors the memory usage of a Linux/Unix system using Simple Network Management Protocol (SNMP).

It shows the following :

- Available memory in absolute and percentage values
- Used physical memory (free memory plus buffer plus cache) in percent
- Free physical memory (free memory plus buffer plus cache) in bytes
- Used swap memory in percent
- Free swap memory in bytes
- Used memory on the whole system (physical memory plus swap) in percent
- Free memory on the whole system (physical memory plus swap) in bytes

[SNMP Linux Physical Disk sensor](#) 2273

The SNMP Linux Physical Disk sensor monitors input/output (I/O) on disks of a Linux/Unix system using Simple Network Management Protocol (SNMP).

It shows the following:

- Read bytes per second
- Written bytes per second
- Number of read accesses per second
- Number of write accesses per second

SENSOR	WHAT IT MONITORS
SNMP Windows Service sensor  2492	<p>The SNMP Windows Service sensor monitors a Windows service via Simple Network Management Protocol (SNMP).</p> <ul style="list-style-type: none"> ▪ It shows the operating status of the monitored service.

Custom SNMP Sensors

For your more individual needs, PRTG offers custom SNMP sensors. The monitoring capabilities of these sensors go beyond the scope of the generic sensors. The custom sensors allow you to show certain values that are not included in the standard libraries of PRTG. With these sensor types, you can monitor most devices that support SNMP and that PRTG does not have native sensor types for. Basically, you just need to find out the required Object Identifiers (OIDs) for your desired device readings, for example, in the vendor's documentation of your hardware device.

 For more details, see the Knowledge Base: [How do I find out which OID I need for an SNMP Custom sensor?](#)

SENSOR	WHAT IT MONITORS
SNMP Custom sensor  1949	<p>The SNMP Custom sensor monitors a single parameter that is returned by a specific Object Identifier (OID) using Simple Network Management Protocol (SNMP).</p> <ul style="list-style-type: none"> ▪ This sensor shows a single numerical value (int64) for a given OID. Each OID always refers to a specific parameter of a certain SNMP device. <p>Value types include the expected numeric type of the results at the given OID: You can choose between</p> <ul style="list-style-type: none"> ▪ Absolute (unsigned integer): for integer values such as 10 or 120 ▪ Absolute (signed integer): for integer values such as -12 or 120 (negative values supported) ▪ Absolute (float): for float values such as -5.80 or 8.23 (with decimal places) ▪ Delta (counter): PRTG calculates the difference between the previous and the current value. <p> See this video tutorial SNMP Custom and Library Sensor on our website for more information.</p>

SENSOR

WHAT IT MONITORS

[SNMP Custom Advanced sensor](#) 

The SNMP Custom Advanced sensor monitors numerical values returned for Object Identifiers (OIDs) using Simple Network Management Protocol (SNMP).

- The sensor displays numerical values for given OIDs that refer to this specific SNMP device. Up to 10 OIDs and corresponding numerical values are possible.

This sensor monitors very similarly to the regular SNMP Custom sensor, with the advantage of being able to poll up to 10 specific OIDs with a single sensor. For each OID you will be able to define a name, OID, expected type, and the unit to be displayed. The possible value types are the same as with the SNMP Custom sensor.

[SNMP Custom String sensor](#) 

The SNMP Custom String sensor monitors a string returned by a specific Object Identifier (OID) using Simple Network Management Protocol (SNMP). It can check for keywords. If you want to set limits to the sensor channel value, you can also extract a numeric value contained in the string.

This sensor shows the following:

- Response time of the monitored device
- Optionally a value extracted from the string
- In the sensor message, the sensor shows the string you [search](#)  for and which is the reason for a current **Warning** or **Down status** .

Hexadecimal-encoded strings can also be decoded as MAC addresses or IP addresses. The sensor can check for keywords via plain text or regular expression or you can use a regular expression to extract a numerical value from the string that can be evaluated later for additional alerts.

- See section [Number Extraction with Regular Expression](#)  for an example.

SENSOR

WHAT IT MONITORS

[SNMP Custom String Lookup sensor](#)

The SNMP Custom String Lookup sensor monitors a string that a specific Object Identifier (OID) returns via Simple Network Management Protocol (SNMP). It can map the string directly to a [sensor status](#) by using a [defined lookup file](#). Basically, this sensor type does a "reverse lookup". You have to define all potential return strings in the lookup file as text values, each in one lookup entry. Graphs and data tables show the value to which the string is mapped, usually an integer ([lookup type](#) **SingleInt**). See manual section [SNMP Custom String Lookup Sensor—Example](#).

- This sensor shows a retrieved string value and its status, as defined in the corresponding lookup file.

[SNMP Custom Table sensor](#)

The SNMP Custom Table sensor monitors entries from a table that is provided via Simple Network Management Protocol (SNMP). You can create one new sensor per table row. For each sensor, you can define up to ten channels. Each channel shows the value of one defined table column.

- It can show numerical values in up to 10 channels per table row.

Vendors use tables when there are multiple instances of the same object (for example, memory, disks). The sensor recognizes a table via a meta-scan and allows you to configure the indexes (interfaces) that you want to monitor.

 For more details, see the Knowledge Base: [What can I monitor with the SNMP Custom Table Sensor?](#)

[SNMP Library sensor](#)

The SNMP Library sensor uses a compiled Management Information Base (MIB) library file to create sensors that monitor a device via Simple Network Management Protocol (SNMP). This approach provides custom monitoring beyond the standard SNMP sensors of PRTG.

The content of the MIB file will determine which data types are available for monitoring. When you create the sensor, it will provide a list of counters that came back from the target device based on checking every Object Identifier (OID) in the MIB. From this list, you can choose what you want to monitor.

The SNMP Library sensor will automatically create the following custom SNMP sensor types based on the data types available in the MIB:

- [SNMP Custom Advanced sensors](#) for all OIDs the return single values

SENSOR

WHAT IT MONITORS

- [SNMP Custom String sensors](#)  for all OIDs that return string values
- [SNMP Custom Table sensors](#)  for all OIDs that return tables

 The SNMP Library sensor is not actually a sensor type and will not appear as running sensor. It is a sensor that uses the meta-scan facility of the PRTG probe to find or match OIDs from an MIB and eases the creation of custom sensors, because you do not have to enter the OIDs manually.

To monitor SNMP capable devices and add sensors using the SNMP Library sensor, download the manufacturer's MIB files for the target device, convert the MIB file to the Paessler **oidlib** format, and import it into PRTG. To make setting up your monitoring as convenient as possible, PRTG comes with pre-compiled **oidlib** library files that already contain the OIDs of SNMP counters for the most common devices in a network.

 For more details, see the Knowledge Base: [How do SNMP, MIBs and OIDs work?](#)

Default OIDLIB Files Overview

The following files are included in PRTG and are ready to use with the SNMP Library sensor. These allow the extension of your SNMP monitoring to many devices. Please be aware that not all devices and/or parameters may be supported by the libraries.

- **APC UPS.oidlib**
Can be used to monitor uninterruptible power supplies (UPS) from APC American Power Conversion Corp.
- **APCSensorstationlib.oidlib**
Can be used to monitor alarm status, communication status, humidity, and temperature as shown by an APC sensor station.
- **Basic Linux Library (UCD-SNMP-MIB).oidlib**
Can be used to monitor basic system parameters on Linux systems, such as memory, disk and swap, CPU, etc.
- **cisco-interfaces.oidlib**
Can be used to monitor Cisco specific parameters, for example, the number of present network interfaces on a system, several states of an interface (admin, oper, speed, type, errors, discards, etc.), and more.

- **cisco-queue.oidlib**
Can be used to monitor queues on a Cisco interface, for example, queue depth and its maximum, discarded messages from the queue, the number of the queue within the queue set, etc.
- **Dell Storage Management.oidlib**
Can be used to monitor Dell storage devices. Possible parameters include disk arrays, battery and power supply, fan and temperature, virtual disk, etc.
- **Dell Systems Management Instrumentation.oidlib**
Can be used to monitor the hardware of Dell systems. Possible parameters include ACPower and battery, alerts, base board, Bios, BMC, chassis, COO, cooling, event log, firmware, IDE, keyboard, memory, port, network, processor, SCSI, system, temperature, USB, UUID, etc.
- **HP LaserJet Status.oidlib**
Can be used to monitor toner, paper, and jam status of an HP LaserJet printer.
- **Linux SNMP (AX BGP DisMan EtherLike Host).oidlib**
Can be used to monitor different aspects of Linux systems.
 This file may detect a very large number of interfaces. It may take a few seconds until the selection table is shown.
- **Linux SNMP (Framework Proxy Not i v2).oidlib**
Can be used to monitor different aspects of Linux systems.
 This file may detect a very large number of interfaces. It may take a few seconds until the selection table is shown.
- **Linux SNMP (IP Net SNMP Not i OSPF RMON SMUX).oidlib**
Can be used to monitor different aspects of Linux systems.
 This file may detect a very large number of interfaces. It may take a few seconds until the selection table is shown.
- **Linux SNMP (Source TCP UCD UDP).oidlib**
Can be used to monitor different aspects of Linux systems.
 This file may detect a very large number of interfaces. It may take a few seconds until the selection table is shown.
- **Paessler Common OID Library.oidlib**
Can be used to monitor many common hardware devices. It is used for several sensors and is encrypted.
- **SNMP Informant std.oidlib**
Can be used to monitor logical disks, processor, memory, and network interface on Windows systems.

11.2 Monitoring via WMI

You can monitor Windows systems via [Windows Management Instrumentation \(WMI\)](#)^[3507] and [Windows Performance Counters](#)^[3508]. WMI is the Microsoft base technology for monitoring and managing Windows-based systems. PRTG uses this technology to access data of various Windows configuration parameters and status values. However, sensors using the WMI protocol generally have a high impact on system performance. In addition to strict WMI sensors, there are sensors that can use Performance Counters to monitor Windows systems.

To monitor via WMI and Performance Counters, it is usually sufficient to provide **Credentials for Windows Systems** in PRTG. However, monitoring via WMI is not always trivial and often causes issues.

See this article in our Knowledge Base if you run into issues: [My WMI sensors don't work. What can I do?](#)

It is also possible to use Simple Network Management Protocol (SNMP) for Windows devices. The same information is often available using any of these protocols. From a performance perspective, the preference would be SNMP, and then WMI or Performance Counters.

How WMI Works

WMI allows accessing data of many Windows configuration parameters, as well as current system status values. Access can be local or remote via a network connection. WMI is based on **COM** and **DCOM** and is integrated in Windows versions as of Windows Server 2000. PRTG officially supports WMI for Windows 7 or later.

WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the probe service only runs with 32-bit support. Without it, WMI sensors will not work.

To monitor remote machines, PRTG WMI sensors need Active Directory account credentials to have access to the WMI interface. You can enter these credentials in PRTG for the parent device or group, or in the [Root](#)^[334] group. The sensor will then inherit these settings.

Sensors using the Windows Management Instrumentation (WMI) protocol generally have a high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)^[125]. Above this number, please consider using multiple [Remote Probes](#)^[370] for load balancing.

For an overview and details about all WMI sensors, see the [List of Available Sensor Types](#)^[433] section.

Monitoring Windows Systems: Performance Counters

Besides sensor types that can monitor Windows systems only via WMI, PRTG provides sensor types that can use a **hybrid** approach. If you choose the hybrid approach, these sensors will first try to query data via Windows **Performance Counters** using **Remote Registry Service**. These Windows sensors use WMI as a fallback if Performance Counters are not available or cannot be read out. When running in fallback mode, PRTG re-tries to connect to Performance Counters after 24 hours. You can change the **Preferred Data Source** in the **Windows Compatibility Options** in the [Device Settings](#)^[402].

i You can identify these hybrid sensors by looking at their categories, for example, in the [Add Sensor](#)^[325] [dialog](#)^[325]. **Search directly** for "windows" and select "Performance Counters" as **Technology Used**. Among them are various sensors with "Windows" in the name, as well as some Hyper-V sensors.

Limitations of WMI on Windows Server 2008 (R1)

You should be aware that performance of WMI-based monitoring is drastically limited when the monitoring station or the monitored client runs on Windows Server 2008 (R1). When it comes to network monitoring via WMI, Windows Server 2008 R2 is many times faster than Windows Server 2008 (R1).

- i** These are not limitations of PRTG, but arise from the WMI functionality built into the Windows operating systems mentioned.
- i** These limitations also apply to Windows Vista, which is no longer officially supported. You can still monitor machines running Windows Vista, but PRTG core server and probes are no longer supported on this operating system.

The results of our tests are:

- On Windows Server 2008 R2 or Windows 7 (and on later Windows versions) you can run most WMI sensors if you provide optimal conditions, such as running the core and the target systems exclusively under Windows Server 2008 R2 and being located within the same LAN segment. Actual performance can be significantly less depending on network topology and WMI health of the target systems—we have seen configurations that could not go beyond 500 sensors (and even less).
- On Windows 2008 (R1) you can run about 300 WMI sensors with one minute interval.
- The more Windows 2008/Windows 7 client systems you have in your network, the more WMI monitoring performance will be affected.
- System performance (CPU, memory, etc.) of virtualization does not strongly affect WMI monitoring performance.

If you want to use WMI for network monitoring of more than 20 or 30 systems, please consider the following rules:

- Do not use Windows 2008 (R1) as monitoring stations for WMI-based network monitoring.
- Use Windows Server 2008 R2 (or later Windows versions) for WMI-based network monitoring instead.

- Consider setting up remote probes for the WMI monitoring. You still get far better WMI monitoring performance with a remote probe on a virtual machine running Windows Server 2008 R2 than on any bare metal system running Windows 2008.
- Consider switching to SNMP-based monitoring for large networks. Using SNMP you can easily monitor 10 times as many nodes as with WMI on the same hardware.

11.3 Monitoring via SSH

Monitoring via Secure Shell (SSH) enables you to gather performance and system data from many Linux and Unix distributions, as well as from certain Mac OS X systems. If your system is supported, this monitoring technology will work without any additional software on the target systems.

How Monitoring via SSH Works

To monitor remote machines via SSH, PRTG needs the credentials (preferably root access) of the devices. If you use SSH sensors with PRTG, you can enter the necessary credentials in PRTG for the parent device or group, or in the [Root](#) group, in the [Credentials for Linux/Solaris/Mac OS \(SSH/WBEM\) Systems](#) section on the [Settings](#) tab. The sensors then inherit these settings by default.

With each scanning interval, PRTG logs in to your devices and queries data by executing specific commands.

 For an overview and details about all SSH sensors, see the [List of Available Sensor Types](#).

Limitations When Using SSH Monitoring

Due to the plurality of Linux/Unix derivatives, SSH sensors cannot support all distributions on the market. Also, only certain Mac OS systems are supported.

 For a list of successfully tested distributions, see this Knowledge Base article: [Which Linux or Mac OS distributions are supported by the Linux/Unix sensors \(SSH, SNMP\)?](#)

Authentication via SSH Private Key

PRTG supports authentication via password or via private key.

When you use a private key, please ensure the following:

- Provide the key in [OpenSSH RSA](#) format.
- The key may **not** be encrypted! PRTG does **not** support password-protected keys.
- The key must be provided as an [RSA](#) key, you cannot use [DSA](#) keys with PRTG!

When you provide an unencrypted RSA private key in OpenSSH RSA format, please copy the entire key, including the

```
-----BEGIN RSA PRIVATE KEY-----
```

and

```
-----END RSA PRIVATE KEY-----
```

lines, into the designated text field in PRTG and **Save** your settings. Once you have pasted in and saved the private key, PRTG shows it as

```
*****
```

Please make sure a corresponding public key exists on the target device.

For a detailed description on how to convert and use an existing SSH key, see this Knowledge Base article: [How can I use private keys for my SSH sensors with PRTG?](#)

11.4 Monitoring Bandwidth via Packet Sniffing

Packet sniffing comes into consideration if your network devices do not support SNMP or xFlow to measure bandwidth usage and if you need to differentiate the bandwidth usage by network protocol and/or IP addresses.

❶ Packet Sniffer sensors support [Toplists](#)³¹⁸⁶ (Top Talkers, Top Connections, etc.).

How Packet Sniffing Works

If you need to know what applications or IP addresses cause the traffic in your network, you can use a packet sniffer. A packet sniffer looks at every single data package that travels through your network for accounting purposes.

PRTG can analyze the packets passing the network card of a PC or you can connect it to the **monitoring port** of a switch. To calculate bandwidth usage, PRTG inspects all network data packets either passing the PC's network card (shown on the left side in the schema above) or the data packages that a monitoring port of a switch (right side) sends with its built-in packet sniffer. Using remote probes, you can set up packet sniffers anywhere in your network (see [Add Remote Probe](#)³⁷⁰⁷ section).

[Comparing](#)³⁵¹⁷ the four bandwidth monitoring technologies that PRTG provides (SNMP, WMI, xFlow, and packet sniffer) this one creates the most CPU and network load, so you should only use it in small to medium-sized networks, on dedicated computers for larger networks or for individual computers.

Reasons to Choose Packet Sniffing

It is important to understand that the packet sniffer can only access and inspect data packages that actually flow through the network interface(s) of the machine running the PRTG probe software. This is fine if you only want to monitor the traffic of this machine (for example, your web server). In switched networks, only the traffic for a specific machine is sent to each machine's network card, so PRTG can usually not discern the traffic of the other machines in the network.

If you also want to monitor the traffic of other devices in your network, you must use a switch that offers a **monitoring port** or **port mirroring** configuration (Cisco calls it **SPAN**). In this case, the switch sends a copy to the monitoring port of all data packages traveling through the switch. As soon as you connect one of the PRTG probe system's network cards to the switch's monitoring port, PRTG is able to analyze the complete traffic that passes through the switch.

Another option is to set up the PC running PRTG as the gateway for all other computers in the network.

Set Up Packet Sniffer Sensors

Find details on how to set up the different flow sensors in the following sections:

- [Packet Sniffer Sensor](#) 1484
- [Packet Sniffer \(Custom\) Sensor](#) 1497

Header Based Packet Sniffing

For packet sniffing, PRTG looks at the IP addresses and ports of source and destination to assess the protocol. This is a very fast method and saves system resources.

i Sometimes, this method is not fully accurate. For example, it is not possible to identify HTTP traffic on ports other than **80**, **8080**, and **443** as HTTP. HTTP traffic on non-standard ports would not be accounted as such.

Knowledge Base: How can I change the default groups and channels for xFlow and Packet Sniffer sensors?

- <https://kb.paessler.com/en/topic/60203>

11.5 Monitoring Bandwidth via Flows

Using flow protocols, you can monitor the bandwidth usage of all packets going through a device. In PRTG, you can view [Toplists](#) for all xFlow (NetFlow, IPFIX, sFlow, jFlow) sensors.

Flows are a type of monitoring data pushed from network devices to PRTG. You can use it to monitor where data is traveling to and from, and how much. This way it determines which machine, protocol, and user is consuming bandwidth. PRTG currently supports the following flow types:

- NetFlow v5/v9 and IPFIX: Originally introduced by Cisco and supported by several vendors
- jFlow: Traffic sampling technology introduced by Juniper networks
- sFlow: Short for sampled flow, introduced by HP. sFlow uses statistical sampling of the traffic at defined intervals to achieve scalability for high volume interfaces.

You can also use [packet sniffing](#) for bandwidth monitoring if your hardware does not support any of these flow versions.

How xFlow Monitoring works

You can measure bandwidth usage **by IP address** or **by application** in a network, using one of the xFlow (including IPFIX) protocols. They are the best choice especially for networks with high traffic (connections with hundreds of megabits or gigabits).

For xFlow monitoring, the router gathers bandwidth usage data (**flows**), aggregates them, and sends information about these flows to PRTG using UDP packets. When you use sampling (mandatory for sFlow), only information about every n-th packet is sent to PRTG, which reduces CPU load a lot. Because the switch already performs a pre-aggregation of traffic data, the flow of data to PRTG is much smaller than the monitored traffic. This makes xFlow the ideal option for high traffic networks that need to differentiate the bandwidth usage by network protocol and/or IP addresses.

NetFlow and IPFIX Monitoring

The NetFlow (and IPFIX) protocol is mainly used by Cisco devices. Once configured, the router sends for each data flow a NetFlow or IPFIX packet to the monitoring system running on a PRTG probe. You can filter and evaluate the data in PRTG. There are different NetFlow and IPFIX sensors available: The basic ones offer predefined channel definitions, the custom variants enable you to define your own channels.

The advantage of using NetFlow or IPFIX:

- Generates little CPU load on the router itself (according to Cisco, 10,000 active flows create about 7% additional CPU load; 45,000 active flows account for about 20% additional CPU load).
- Generates less CPU load on the PRTG core system compared to packet sniffer sensors.

i You must enable NetFlow or IPFIX export on the device you want to monitor. The device must send a flow data stream to the IP address of the PRTG probe system on which you set up the NetFlow or IPFIX sensor.

i You can monitor Juniper **jFlow** with the corresponding sensors as well. Basically they are adjusted NetFlow v5 sensors.

i **NetFlow Lite** monitoring is possible using the **Sampling Mode** of the [NetFlow V9 sensor](#)¹⁴³⁰ or of the [NetFlow V9 \(Custom\) sensor](#)¹⁴⁴⁴. You can turn on the sampling mode and define a suitable **Sampling Rate** in the [sensor settings](#)¹⁴³³. Please note that NetFlow Lite monitoring might not work in every case even with active sampling mode.

sFlow Monitoring

sFlow works similar to NetFlow monitoring. The router sends data flow packets to the monitoring system running on a PRTG probe. The most obvious difference between the two flow protocols: With sFlow, not all of the traffic is analyzed, but only every n-th packet. It is like having a river of traffic and you take a cup of water out of it ever so often and analyze it.

The advantage is clear: There is less data to analyze, there is less CPU load needed, and less monitoring traffic is generated. Nevertheless, you can get a good insight into your network bandwidth usage.

i PRTG supports sFlow version 5.

Set Up Flow Sensors

Find details on how to set up the different flow sensors in the following sections:

- [NetFlow V5 Sensor](#)¹⁴⁰³
- [NetFlow V5 \(Custom\) Sensor](#)¹⁴¹⁷
- [NetFlow V9 Sensor](#)¹⁴³⁰
- [NetFlow V9 \(Custom\) Sensor](#)¹⁴⁴⁴
- [IPFIX Sensor](#)¹¹⁸⁶
- [IPFIX \(Custom\) Sensor](#)¹²⁰⁰
- [sFlow Sensor](#)¹⁷⁴⁰
- [sFlow \(Custom\) Sensor](#)¹⁷⁵⁴
- [jFlow V5 Sensor](#)¹²²³
- [jFlow V5 \(Custom\) Sensor](#)¹²³⁷

Limitations

On a powerful 2008 PC (Dual Core, 2.5 Ghz), you can process about 100,000 flows per second for one xFlow stream. Using sampling, the number of actual flows can be much higher. When using complex filters, the value can be much lower. For example, with a router sending about 2,000 flows/second (which corresponds to mixed traffic at gigabit/second level without sampling) you can expect to configure up to 50 NetFlow sensors operating properly.

PRTG internally monitors its own NetFlow processing. You can see decreased values in the **Health** channels of the **Core Health**⁶⁵² and **Probe Health**¹⁵⁹⁰ sensors as soon as NetFlow packets are not processed due to an overload (you find these sensors on the local probe device).

If you experience an overload, please consider using sampling or setting up multiple probes and distribute the NetFlow streams to them. We recommend that you do not add more than 50 NetFlow sensors per PRTG probe.

This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.

 IPv6 flows are supported by NetFlow V9 and IPFIX sensors, other flow sensor types only support IPv4.

11.6 Bandwidth Monitoring Comparison

The following table shows the differences between the four bandwidth monitoring methods available in PRTG:

	WMI <small>3507</small>	SNMP <small>3489</small>	Packet Sniffer <small>3512</small>	xFlow (IPFIX, NetFlow, sFlow, jFlow) <small>3514</small>
Setup	Medium	Easy	Easy to complex (depending on filter rules used)	Can be complex (for example, the switch must be configured)
Traffic can be filtered	No	No	Yes	Yes
Differentiate bandwidth usage by protocol or IPs	No	No	Yes	Yes
PRTG can show Toplists (Top Talker, Top Connections, Top Protocols, custom)	No	No	Yes	Yes
Filter bandwidth usage by IP	No	No	Yes	Yes
Filter bandwidth usage by MAC address	No	No	Yes	No
Filter bandwidth usage by physical network port	Yes	Yes	No	No

	WMI <small>3507</small>	SNMP <small>3489</small>	Packet Sniffer <small>3512</small>	xFlow (IPFIX, NetFlow, sFlow, jFlow) <small>3514</small>
Monitor network parameters other than bandwidth usage	Yes	Yes	No	No
CPU load on the machine running PRTG	Low	Low	Higher, depends on the amount of traffic	Higher, depends on the amount of traffic
Excess bandwidth usage of monitoring	Small	Small	None (except when monitoring switch ports are used)	Depends on the traffic

11.7 Monitoring Quality of Service and VoIP

PRTG can monitor the Quality of Service (QoS) in a network with dedicated QoS sensors, as well as Cisco IP Service Level Agreement (SLA) and Cisco Class Based Quality of Service (CBQoS). Slight variations of network parameters like jitter, packet loss, or packet delay variation (PDV) usually have only little effect on TCP-based services (for example, HTTP and SMTP). But for UDP-based services like Voice over IP (VoIP) and video streaming, a steady stream of data packets is crucial. The sound quality of a VoIP call drops dramatically when UDP packets are not received in a timely fashion, or if packets are lost or out-of-order.

As a rule of thumb for good quality of service (from a VoIP perspective), you want low measurements for jitter (less than 20 to 50 ms) and PDV (less than 100 ms), and preferably **zero** measurements for packet loss, duplicated packets, or packets in wrong order.

For Quality of Service measurements, four sensor types are available:

- [QoS \(Quality of Service\) Sensor](#)^[1608]
Monitors VoIP-relevant network parameters by testing the network connection quality between two probes.
- [QoS \(Quality of Service\) Round Trip Sensor](#)^[1617]
Monitors VoIP-relevant network parameters by testing the network connection quality between a probe and a target device at the endpoint of the connection. Traffic is measured bidirectionally.
- [Cisco IP SLA Sensor](#)^[589]
Monitors VoIP-relevant network parameters through IP SLA results from Cisco devices (via SNMP).
- [SNMP Cisco CBQoS Sensor](#)^[1887]
Monitors VoIP-relevant network parameters by using Cisco's CBQoS (via SNMP).

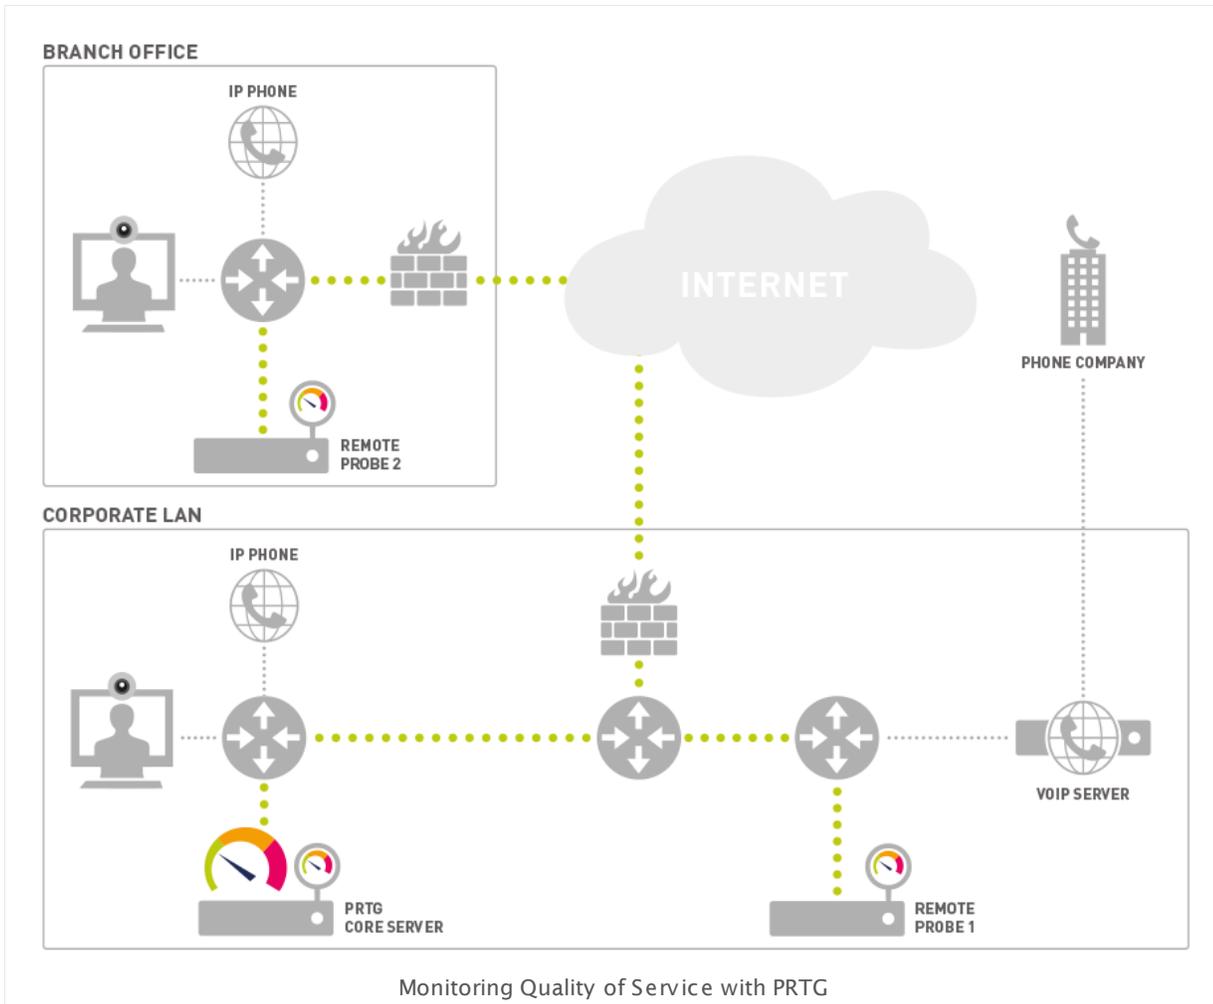

QoS (Quality of Service) Sensors

The QoS Sensors monitor the quality of a network connection by measuring the following parameters:

- Jitter in ms according to RFC 3550
- Packet delay variation (PDV) in ms according to RFC 3393
- Lost packets in %
- Out-of-order packets in %
- Duplicated packets in %

The QoS sensors measure quality of service by sending UDP packets between two probes. This means that you can test any network connection in your network by simply placing a [remote probe](#)^[3707] on (or near) each 'end' of the connection and measuring the connection quality between them. This is the perfect tool to find network issues that can affect VoIP sound quality or video streaming 'hiccups'.

 You can use the QoS Round Trip sensor also without installing a remote probe at the connection endpoint. See this Knowledge Base article for details about the PRTG QoS Reflector: [How can I monitor QoS roundtrips without using remote probes?](#)

The measurements for QoS monitoring are taken between two probes. So the first step is to place two PCs running a remote probe on (or near) both ends of the connection that you want to monitor. As an alternative, the local probe on the PC running the PRTG core can also be used as one end, or you can use the PRTG QoS Reflector (see the [Knowledge Base](#)) to bounce the packets when monitoring QoS roundtrips. If any firewalls, packet filters, or Network Address Translation (NAT) systems are en route, you must configure them as necessary so that the UDP packets can reach the target probe.

In PRTG, create a new QoS sensor on a **Probe Device**, or, if you use the roundtrip sensor, on any device. With the settings for number and for size of the packets, you can configure the test data stream. 1,000 packets of 172 bytes each is a good start, but if your applications use larger packets, you may want to enter other values here. Try to configure the test streams with parameters similar to that of the UDP services you are using across this connection.

 Find details about settings in the manual sections [QoS \(Quality of Service\) One Way Sensor](#)^[1608] and [QoS \(Quality of Service\) Round Trip Sensor](#)^[1617].

Cisco IP SLA Sensor

Wikipedia describes IP SLA as **a feature included in the Cisco IOS Software that can allow administrators the ability to Analyze IP Service Levels for IP applications and services. IP SLA uses active traffic-monitoring technology to monitor continuous traffic on the network. This is a reliable method in measuring over head network performance.** IP SLA is mostly used to monitor the sound quality of VoIP traffic.

If you have not done so already, add a device in PRTG for the Cisco device that you want to monitor. Then create a new **Cisco IP SLA** sensor on this device.

 Find details about settings in the [Cisco IP SLA Sensor](#)^[589] section.

This feature is only available in the more expensive Cisco devices. If you do not have IP SLA capable routers and switches, you can still get similar information with PRTG QoS sensors (see [above](#)^[3516]) that do not require any special hardware—just two PCs running Windows. If you own hardware that supports IP SLA, then PRTG brings you probably the least-cost monitoring solution for IP SLA. Most vendors charge extra for IP SLA support (a thousand bucks and more). Following Paessler's long term policy, we simply include this as one of our sensor types. With PRTG you can even use the PRTG on premises Freeware Edition to monitor IP SLA!

PRTG monitors the following parameters: Calculated Planning Impairment Factor (ICPIF), Mean Opinion Score (MOS), Average Jitter, Packets Lost, Packets Out Of Sequence, Packets Late, Average Round Trip Time (RTT), DNS RTT, TCP RTT, Transaction RTT.

Especially two of these parameters are interesting for VoIP: **Mean Opinion Score (MOS)** and **Calculated Planning Impairment Factor (ICPIF)**.

SNMP Cisco CBQoS Sensor

Cisco Class Based Quality of Service (CBQoS) provides information about QoS of Cisco network devices that support the **Modular QoS command line interface (MQC)**. With Classed Based QoS, you can obtain monitoring data that includes summary counts and rates by traffic class before and after the enforcement of QoS policies, according to Cisco's CBQoS Management Information Base (MIB) definition.

PRTG determines CBQoS data via Simple Network Management Protocol (SNMP). The corresponding sensor type is available out-of-the-box in PRTG version 13.x.5 or later. CBQoS is available in Cisco IOS by default as of version 12.4(4)T.

To monitor CBQoS, add a device to PRTG for the Cisco device that you want to monitor. Then create a new SNMP Cisco CBQoS sensor on this device.

 See section [SNMP Cisco CBQoS Sensor](#)^[1687] for more details.

This sensor type supports the following CBQoS classes:

- **Class Map:** statistical data about class maps, such as pre- and post-policy packets and sizes, drop packets and size, as well as no-buffer drop packets

- **Match Statement**: statistical data about match statement specific information, such as pre-policy packets and size
- **Queueing**: statistical data about queuing actions, such as current and maximum queue depth, drop packets, and drop size

You can select the desired CBQoS entries that you want to monitor while creating the sensor in PRTG. The available entries are given with their particular connections, their descriptions, and class types.

Voice over IP

For Mean Opinion Score (MOS) measurements, Cisco conducted a panel test where a wide range of listeners judged the quality of voice samples sent using particular codecs, on a scale of 1 (poor quality) to 5 (excellent quality). The Cisco device calculates the corresponding value for the current network connection based on the network parameter measurements like jitter and packet loss.

 The Cisco IP SLA sensor reads out the MOS directly from the Cisco device. For the QoS and the QoS Round Trip sensor, PRTG calculates the MOS by itself. For details, see this Knowledge Base article: [How does PRTG calculate the MOS score for QoS sensors?](#)

The values and their meanings are:

MOS	Quality	Expected Quality Impairment
5	Excellent	Imperceptible
4	Good	Perceptible, but not annoying
3	Fair	Slightly annoying
2	Poor	Annoying
1	Bad	Very annoying

The second interesting parameter ICPIF is the sum of measured impairment factors minus a user-defined access Advantage Factor that is intended to represent the user's expectations, based on how the call was placed (for example, a mobile call versus a land-line call) (quoted from Cisco's website).

Upper Limit for ICPIF	VoIP Call Communication Quality
5	Very good

Upper Limit for ICPIF	VoIP Call Communication Quality
10	Good
20	Adequate
30	Limiting case
45	Exceptional limiting case
55	Customers likely to react strongly (complaints, change of network operator)

11.8 Monitoring Email Round Trip

Email Round Trip sensors ensure the end-to-end delivery of emails and make it possible to monitor availability and performance of a complete email delivery process. There are two sensor types for this task:

- [SMTP&POP3 Round Trip Sensor](#) 1817
- [SMTP&IMAP Round Trip Sensor](#) 1805

Both initially deliver an email to a mail server using SMTP. Afterwards the receiving mailbox is scanned using Post Office Protocol version 3 (POP3) or Internet Message Access Protocol (IMAP) until the email arrives. The test email contains a unique code in the topic that is used to identify the email, such as **PRTG Roundtrip Mail: {6D136420-5A3E-46CF-871A-1DAF0C4F3D5D}**

When PRTG successfully receives an email in this email round trip cycle, it marks the respective message for deletion on the mail server. Usually, a mail server will then delete this email. For best performance, we recommend using a dedicated email accounts for email round trip sensors.

In the scenario shown above, there are three steps in the round trip:

- **Step 1**
PRTG delivers an email via the SMTP protocol to a mail server (just like an email client).

- **Step 2**
The SMTP server delivers the email to a POP3/IMAP server (which can be located at a remote site, in your local LAN, or on the same server as well).
- **Step 3**
Every few seconds PRTG connects to the POP3/IMAP server until the test email arrives.

Recommended Configuration

Here is a simple concept to check the delivery of email out of and into your organization:

1. Create a dedicated email account for this test in your mail system.
2. Set up an external email account (hosted mail server, free mail service, etc.) and configure it to send all emails back to this dedicated email account in your organization (that you created in [Step 1](#)).
3. Set up a PRTG round trip sensor to send an email to the external email account (that you created in [Step 2](#)) using your network's mail server and then check for the email account on your mail system (that you created in [Step 1](#)) for the arrival of the email.

With this technique, you are testing multiple aspects of your email server setup. As long as the sensor shows a green light, this means:

- Your email server accepts emails via SMTP.
- Emails are being sent to the outside world (internet connection works, MX lookups work, etc.).
- Emails from an external mail server can be delivered into your mail system (this includes aspects like the fact that the MX records for your domain are correct, your mail server can be reached from the outside world, your email filtering is working, etc.).
- Emails can be retrieved using POP3 (or IMAP).

Please use dedicated email accounts with this sensor type. If you use more sensors of this type, please make sure that each sensor uses its own email accounts.

Conclusion

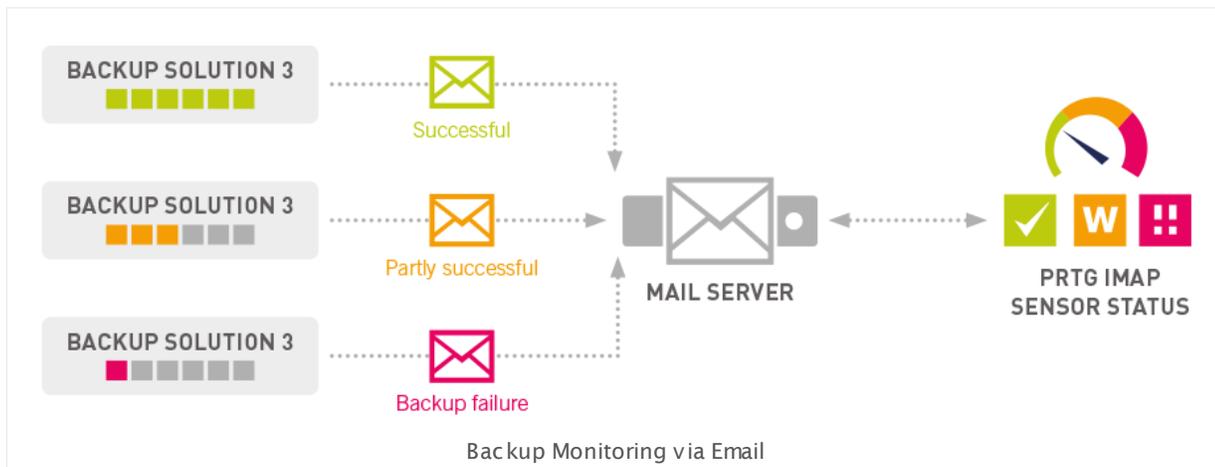

These two sensor types are a great tool to ensure the delivery of email from and to your mail servers. Compared to the standard SMTP, POP3, and IMAP sensors, which only check the availability of these services, the two roundtrip sensor types actually monitor the complete transaction from accepting the email on the first email server to the delivery of the email on the final POP3/IMAP server.

11.9 Monitoring Backups

Monitoring your backup software enables you to be sure that your recent backups succeeded. With PRTG you can check the email notifications of various backup jobs. You only need two things for backup monitoring:

1. Configure your backup software to send emails to a dedicated email account.
2. Configure the PRTG [IMAP Sensor](#)¹¹⁶² for backup monitoring.

PRTG will analyze the backup emails for you and set the status of the IMAP sensor accordingly. This way you will see the states of all your backup jobs at a glance.

Setting up Backup Monitoring

 Refer to our Knowledge Base for a step-by-step tutorial to monitor your backup jobs: [Monitoring Backup Solutions via Email](#)

11.10 Monitoring Virtual Environments

A highly flexible IT infrastructure is a common need nowadays and virtualization has become an important pillar of IT all over the world. Applications in your network might be distributed over many different servers, networks, and locations. They might also be in the cloud, and your computations can take place in datacenters spread over the whole world. So, if your network connection or any other corresponding hardware fails, hundreds of applications might be unavailable—an impact on your daily business processes that should be avoided at any costs.

Because of this, monitoring the physical infrastructure of your datacenter is still a must in times of virtual environments. With the layer of virtualization in addition to your physical equipment, your logical infrastructure also needs a close treatment. PRTG assists you in dealing with these advanced requirements and enables you to proactively react to issues before they affect your whole system. With PRTG you can monitor all layers of your IT infrastructure in a comprehensible way so you will significantly reduce issues related to dynamic IT environments.

Monitoring All Layers of Your IT Infrastructure

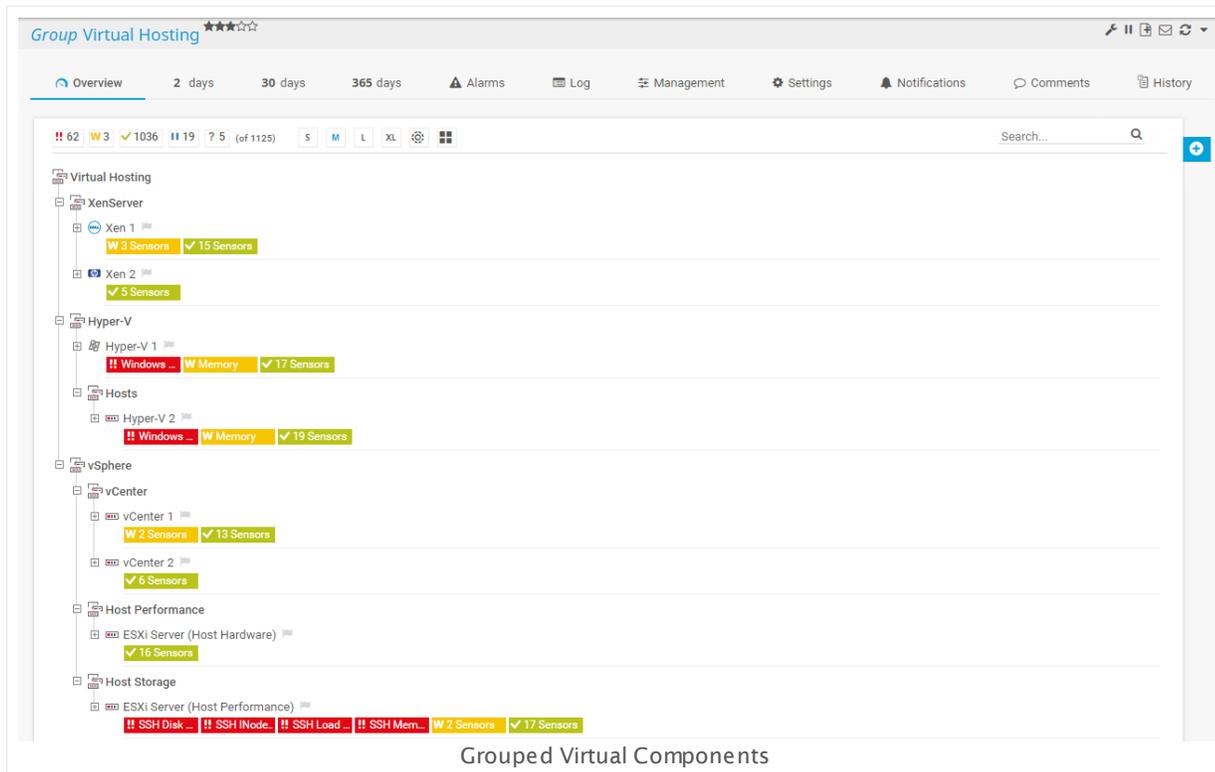

In general, you can assume that with the layer of virtualization, you have to monitor a total of four layers in your IT infrastructure:

- **Hardware (Server Racks):** Usually you will set up your monitoring in the common way and monitor most of the hardware components in your network with [PRTG's SNMP sensors](#)^[431]. You are able to gain monitoring data about many different device readings such as CPU load, memory, disk space with [this monitoring technology](#)^[3489], as well as information about network traffic and bandwidth usage of your routers and switches. It is absolutely mandatory for a working IT environment to monitor all hardware components in order to be alerted if something fails or hardware resources are running out. In addition, you can identify potential bottlenecks affecting your virtualized infrastructure. You can set up this monitoring in the usual way.
- **Host Server Hardware:** It is essential to explicitly monitor the host hardware of your virtualization solution. If you have issues with your virtual machines (VMs), the origin might be a host hardware failure. You should closely monitor your VM host servers to get alerted if the status is other than "normal". Besides the out-of-the-box hardware sensors, PRTG provides specific sensors for various virtualization host servers; the following monitoring data of your host servers will help you prevent issues in virtualized environments:
 - VMware: current reading and health status (via WBEM), a general status as shown in vSphere (via SOAP), and disk space of a VMware data store (via SOAP)
 - Hyper-V: host health critical values, deposited pages, network traffic, CPU usage of guests, hypervisor, and in total
 - Citrix XenServer: CPU, memory, and network usage, the number of running virtual machines on the host server, and load average

- **VMs from the "Outside":** The virtual machines run on their particular host servers. PRTG can show you the status of single virtual machines and several of their performance counters. It might be helpful to know which resources a single VM uses and needs, but monitoring single VMs is not advisable in every case because it has a noticeable influence on the overall performance. Often it will be sufficient to monitor only VMs that are critical for your network. If a VM reaches its capacity limits, PRTG can alert you and you can conduct the corresponding resolution steps like enhancing this VM's resources. Indicators for a healthy virtual machine that you can monitor with PRTG out of the box are:
 - VMware: CPU and memory usage, disk read and write speed, read and write latency, and network usage
 - Hyper-V: CPU usage, disk read and write speed
 - Citrix XenServer: CPU usage and free memory
- **VMs from the "Inside" (Operating Systems):** You can monitor the Windows operating system of a single VM with PRTG's standard [WMI sensors](#)^[433], for example. [With this technology](#)^[3507] you can access data of various Windows parameters. Other operating systems like Linux/macOS can make data available via [SSH](#)^[3510] and [SNMP](#)^[3489]. The status of the operating systems on your VMs can indicate potential issues of the same, just like the operating systems on your physical machines that are important for a reliably working IT infrastructure: You can monitor these with the same attention, depending on your application scenario, but be careful due to performance considerations. Especially many WMI sensors can result in load problems, so monitor only really important systems "from the inside". Furthermore, you do not need to monitor every item multiple times. For example, it might be sufficient to monitor free disk space only from the outside of the actual VM.

Monitoring the Virtual Infrastructure

To monitor your IT infrastructure, best practice is to set up the monitoring of the hardware layer of your datacenter first in PRTG, especially in order to find potential bottlenecks that might have an impact on your virtual servers. Then you can start monitoring your virtual environment itself. If you use several solutions for virtual hosting, it is also a good idea to group related host servers, their virtual machines, and the operating systems together. The screenshot below will give you an idea about how to organize this.

The screenshot above shows you the particular group "Virtual Hosting" of an entire PRTG setup. This is an example of how monitoring of virtual environments can look. The sample group contains several subgroups for the virtualization solutions Citrix "XenServer", Microsoft "Hyper-V", and VMware "vSphere". The vSphere group, for example, has three subgroups: we monitor the vCenter VMs and the vCenter Windows system, the performance of the host server, and the storage system of the host.

Devices for Physical Hosts

In PRTG, set up devices that represent the physical hosts of your virtual machines. For example, for your VMware hosts, add devices that represent the ESXi servers, for Hyper-V add devices that represent your Hyper-V host servers, for Citrix add devices that represent your Xen servers.

Then you can add suitable and expressive sensors to the host server devices. Running the PRTG [auto-discovery](#)^[282], many useful sensors will be created automatically. There are several pre-configured host hardware sensors available out of the box in PRTG:

- [VMware Host Hardware \(WBEM\) Sensor](#)^[2703]: monitors an ESXi server via Web-Based Enterprise Management (WBEM)
- [VMware Host Hardware Status \(SOAP\) Sensor](#)^[2713]: monitors a VMware host server via Simple Object Access Protocol (SOAP)
- [VMware Host Performance \(SOAP\) Sensor](#)^[2723]: monitors a VMware host server via Simple Object Access Protocol (SOAP)

- [Hyper-V Host Sensor](#)^[1121]: monitors via Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device
- [Citrix XenServer Host Sensor](#)^[599]: monitors via Hypertext Transfer Protocol (HTTP)

These sensor types monitor hardware-specific counters to ensure that no hardware issues affect your actual virtual machines. Additional sensor types can monitor the host hardware via SNMP (for example, traffic and custom requests), data storage on ESXi servers via SOAP, as well as sensors for network adapters and storage devices that are connected to a Hyper-V host server.

Devices for Virtual Machines

To monitor your actual virtual machines, add them to your host servers in PRTG. For a better overview, you might want to add another device to PRTG that represents your host server and add sensors for your VM there. The according sensors for virtual machines will show you the performance of single VMs as well as their usage of resources. This will help you identify VMs with poor performance and react proactively before one or more VMs crash. As mentioned above, you can additionally monitor your particular VMs from the inside (which means the operating systems on your VMs) if necessary. See the sections below for details about particular virtualization solutions.

VMware Virtual Machine

The [VMware Virtual Machine \(SOAP\) Sensor](#)^[2733] monitors VMs on a VMware host server via Simple Object Access Protocol (SOAP). With the VMware system, the general idea is to add a **vCenter** server as a device to PRTG and use the vCenter as parent device where you add the sensors for your virtual machines. So, in the case of **vMotion** when your VMs change their host server, PRTG will be able to follow these movements and will never lose the monitored VMs.

For this sensor type, you need the **Microsoft .NET Framework** version 4.5 or later running on the probe machine. If you use many VMware sensors, we also recommend adjusting the settings on your VMware host server to accept more incoming connections.

The screenshot displays the PRTG Network Monitor interface for a vSphere group. The interface is organized into several sections:

- vCenter:** Contains sensors for PING (0 msec), Memory (42%), HTTP (40 msec), RDP (16 msec), and various network and disk metrics.
- Host Performance:** Contains sensors for Power Supply (230 Volt), Processor (63 °C), and System Board (3,360 RPM).
- Host Storage:** Contains sensors for SSH Disk, SSH INode, SSH Load, and SSH Mem.

The status bar at the bottom indicates the overall health of the group, showing 62 critical issues, 3 warnings, 1036 OK, and 19 unknown sensors.

This screenshot shows a sample vSphere group in PRTG. As recommended, the VMware virtual machines are added to the vCenter device. There is also a dedicated device for the vCenter Windows operating system with common WMI sensors for CPU, memory, disk, and network usage. The ESXi host servers are organized in their own groups regarding performance and storage. In this example, PRTG monitors the hosts with the standard SNMP hardware sensors as well as with the specific VMware ESXi host sensors.

Microsoft Hyper-V Virtual Machine

The [Hyper-V Virtual Machine Sensor](#)¹¹³⁰ monitors VMs via Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device. With this hybrid approach, the sensor first tries to query data via performance counters and uses WMI as a fallback if there are no performance counters available. Performance counters generally need less system resources than WMI. We recommend using System Center Virtual Machine Manager (SCVMM) as parent device for this sensor type, because when your VMs change their physical host with **Live Migration**, this sensor will still be able to continue monitoring. You should also disable User Account Control (UAC) in the Windows operating system of the VM.

Part 11: Sensor Technologies | 10 Monitoring Virtual Environments

The screenshot displays the PRTG Network Monitor interface for a 'Group Hyper-V'. The top navigation bar includes options for Overview, 2 days, 30 days, 365 days, Alarms, Log, Management, Settings, Notification Triggers, Comments, and History. Below the navigation bar, there is a search bar and a status bar showing 62 errors, 1036 warnings, and 19 errors (of 1125). The main content area is organized into a tree view under the 'Hyper-V Group' heading. The tree includes:

- Cluster**: Contains two nodes, 'Larry' and 'Oliver'. 'Larry' has 12 sensors, including PING, Hardware S., Windows C., Windows P., WMI Free D., WMI Memo., CPU: Perce., Broadcom, CPU: Proce., and Memory Pa. 'Oliver' has 6 sensors.
- Hosts**: Contains two nodes, 'Hyper-V 1' and 'Hyper-V 2'. 'Hyper-V 1' has 4 sensors: PING, Hyper-V Ho., HV_Bridged., and Intel[R] Gig. 'Hyper-V 2' has 19 sensors, including Windows and Memory.
- System Center**: Contains two nodes, 'SCVMM' and 'Hyper-V Guests'. 'SCVMM' has 2 sensors: Ping 31 and Host: Hank. 'Hyper-V Guests' has 6 sensors: VM: Aurelio., VM: USATer., VM: V-WBE., VM: V-WBE., VM: V-WBE., and VM: V-WBE.
- Hyper-V Host 1**: Contains 3 sensors: Frank - HV., HV_Bridged., and Intel[R] Gig.

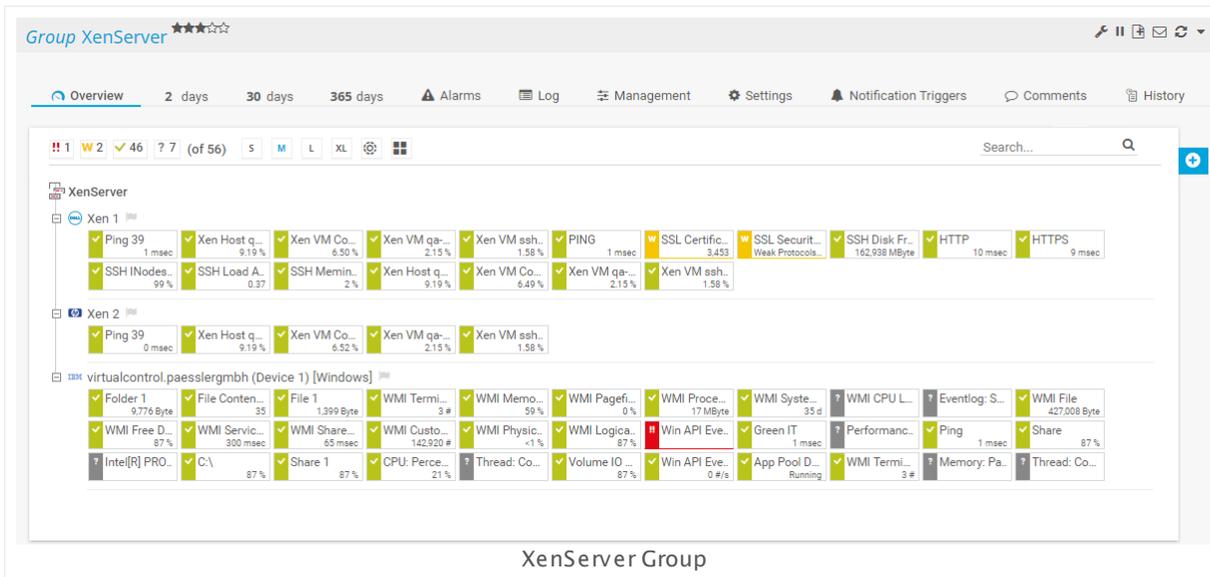

This screenshot shows a sample Hyper-V group in PRTG. There is a dedicated group for failover clustering where two nodes are monitored with several SNMP and WMI sensors, as well as [Hyper-V Host Server sensors](#)^[1121] and sensors for the Hyper-V virtual machines. This ensures that Hyper-V and failover clustering works without any issues. The Hyper-V hosts are monitored the same way, organized in a dedicated group for hosts.

Note that we recommend adding the particular virtual machines to the SCVMM server if possible! We pointed out above that you should add the VMs to an SCVMM server to avoid issues with Live Migration. You can see this in the group "System Center". The particular VMs are added to the dedicated device "Hyper-V Guests".

Citrix XenServer Virtual Machine

The [Citrix XenServer Virtual Machine Sensor](#)^[609] monitors VMs via Hypertext Transfer Protocol (HTTP). For this sensor type, you have to add a device to PRTG that represents a Citrix XenServer with version 5.0 or later. Another requirement is the **Microsoft .NET Framework**: You have to run .NET version 4.5 or later on the probe machine where you add this sensor.

In a XenServer pool, every host knows each running VM. Because of this, there is no central instance that provides all available data, so it does not matter on which host you query your VMs. All queries on any host are automatically forwarded to the pool master, which manages the XenServer pool. So it is sufficient to create the desired sensors for your XenServer VMs on a device that represents one host server of your pool. The XenServer sensors can figure out by themselves which host is running and retrieve the according data.

This screenshot shows a sample XenServer group in PRTG. There are two devices for XenServer hosts (Xen 1 and Xen 2), each with a [Citrix XenServer Host sensor](#)^[599] and several [Citrix XenServer Virtual Machine sensors](#)^[609] for the particular VMs on this host. Furthermore, the Windows operating system is represented as a dedicated device ("virtualcontrol") that is monitored with several WMI sensors regarding CPU, disk, memory, and network usage.

Conclusion

The sensor types described in this section monitor virtual machine specific counters to ensure that all your VMs have enough resources available. If a VM is overloaded, PRTG can notify you immediately and you can proactively take care of issues before a particular VM has an outage or other failures. Additionally, we have shown an idea for a structured virtual monitoring with several recommendations.

 You can find all available sensors for virtual servers and the according virtual machines in section [List of Available Sensor Types—Virtual Servers Sensors](#)^[435].

Performance Considerations

For best performance when monitoring virtual environments, we strongly recommend that you use a computer with **Windows Server 2012 R2** to run the PRTG probe with the according sensors. So for example, you can run up to 300 VMware sensors in a 60-second scanning interval on Windows 2012 R2, while you can only use 30 VMware sensors with the same interval on Windows 2008 R2.

More

Knowledge Base: I run PRTG on VMware. How can I obtain best performance?

- <https://kb.paessler.com/en/topic/49193>

11.11 Monitoring Databases

Monitoring your databases enables you to ensure that, on the one hand, database queries are processed in time, and, on the other hand, that the database itself performs within the defined parameters. Furthermore, database monitoring with PRTG makes it possible to be alerted via a corresponding sensor status if database queries return an unexpected result value.

PRTG comes with built-in native sensors for the most common databases:

- Microsoft SQL servers
- MySQL servers
- PostgreSQL servers
- Oracle SQL servers

It is also possible to monitor many other database servers. For this concern, PRTG uses the ActiveX Data Objects (ADO) interface.

There are two types of database sensors:

- [Sensors monitoring databases directly](#)^[3534]: Monitor databases from the user perspective. These sensors send a request to the database server and receive corresponding values. You can optionally process data tables and show values in individual channels or monitor transactions.
- [Sensors monitoring database performance](#)^[3537]: Monitor databases with a more abstract view on the servers. Usually, these sensors monitor performance counters via Windows Management Instrumentation (WMI).

Sensors Monitoring Databases Directly

PRTG provides several sensors that can "look into" the content of databases. Sensors of this type connect to the database server, execute a defined query, and show the execution time of the whole request and the query. You can use these sensors to process the data table and show requested values in individual channels.

The following sensor types are available for this kind of monitoring:

- [Microsoft SQL v2 Sensor](#)^[1267]: Monitor your Microsoft SQL server 2005 or later.
- [MySQL v2 Sensor](#)^[1284]: Monitor your MySQL server version 5.0 or later.
- [Oracle SQL v2 Sensor](#)^[1457]: Monitor your Oracle database server version 10.2 or later.
- [PostgreSQL Sensor](#)^[1574]: Monitor your PostgreSQL database version 7.x or later.

For these sensor types, you can define valid SQL statements that the sensors send to the database server. Define the queries in an SQL script file and store it into the respective `\Custom Sensors\sql\` subfolder of your PRTG installation (see section [Data Storage](#)^[3734] for details).

You can select this SQL script when you add the sensor to PRTG. With every [scanning interval](#) ³⁴⁵, the sensor executes this script with the defined query against the database and the database returns corresponding values in individual channels (see the [example](#) ³⁵³⁵ below for sample channel value selections). Use the [Sensor Channels Settings](#) ³¹⁶² to define limits for specific values.

i These sensor types need .NET 4.5 or later installed on the computer running the PRTG probe.

Alternatively, you can monitor almost all available database servers with the [ADO SQL v2 Sensor](#) ⁴⁶³ via an ActiveX Data Objects (ADO) connection.

Example: SQL Channel Value Selection

The SQL (v2) sensors determine their channel values by using column numbers, column names, row numbers, or key value pairs. This section shows which option you can choose to get the desired value from an SQL data table.

Consider the following data table that an SQL query might return from a database:

article_id	articles_available	first_listing	orders
00	12	2001	4
01	345	2005	56
02	678	2008	290
03	90	2012	32

This data table has four columns with the following numbering:

- Column 0 has the name "article_id"
- Column 1 has the name "articles_available"
- Column 2 has the name "first_listing"
- Column 3 has the name "orders"

The numbering of columns starts with 0, as well as the numbering for rows starts with 0. The table has four rows, each row contains the properties of one "article". The "articles" have the IDs 00, 01, 02, 03. This also illustrates the proper row numbering (0, 1, 2, 3).

With the options for channel value selection in SQL sensors, you can read out the following values:

- All values that are in row 0 (here: 00, 12, 2001, 4)
- All values that are in column 0 (here: 00, 01, 02, 03)

- All values that are in column 1 (here: 12, 345, 678, 90)

It is not possible to get values from any other cell in a data table. If you need this, you have to re-construct your data table.

The following samples show possible results for channel value selections regarding this data table:

SAMPLE CHANNEL VALUE SELECTIONS

Channel Value Selection by Column Number

This channel will show the value in row 0 of the column you specify. Consider you define "1" as column number. Then the sensor channel value is "12" because it is the cell in column 1 and row 0.

Possible return values for this option are:

- Column number "0" returns "00"
- Column number "1" returns "12"
- Column number "2" returns "2001"
- Column number "3" returns "4"

Channel Value Selection by Column Name

This channel will show the value in row 0 of the column you specify. Consider you define "orders" as column name. Then the channel value is "4" because it is the cell in column "orders" and row 0.

Possible return values for this option are:

- Column name "article_id" returns "00"
- Column name "articles_available" returns "12"
- Column name "first_listing" returns "2001"
- Column name "orders" returns "4"

Channel Value Selection by Row Number

This channel will show the value in column 0 of the row you specify. Consider you define "1" as row number. Then the sensor channel value is "01" because it is the cell in row 1 and column 0.

Possible return values for this option are:

- Row number "0" returns "00"
- Row number "1" returns "01"
- Row number "2" returns "02"
- Row number "3" returns "03"

SAMPLE CHANNEL VALUE SELECTIONS

Channel Value Selection by Key Value Pair This channel will show the value in column 1 of the same row where the key in column 0 was found. Consider you define "02" as key. Then the sensor channel value is "678" because it is the cell in the same row in column 1 as the the key in column 0.

Possible return values for this option are:

- Key "00" returns "12"
- Key "01" returns "345"
- Key "02" returns "678"
- Key "03" returns "90"

This sample channel value selection illustrates how to choose the correct option to get needed values from an SQL data table and shows which cells the SQL sensors can address.

UDF: Counting Returned Rows

If you execute a **UDF (User Defined Function)** on the SQL server and want to know how many rows this UDF returns, follow these steps:

- A command to execute your UDF on the SQL server may look like this, for example:

```
exec myUDF
```

- To get the information how many rows this UDF returns, extend the query in your SQL script:

```
exec myUDF;  
select @@rowcount as row_count
```

- Create a new SQL v2 sensor and enable **Data Processing** during sensor creation.
- In the settings of your SQL sensor, choose the option **Select Channel Value by Column name**
- Enter **row_count** into the **Column Name** field of the channel to show the value from this column in the channel.
- To count table rows returned by a **SELECT** statement, choose the option **Count table rows** in the sensor settings section **Data Processing**.

Sensors Monitoring Database Performance

Performance sensors for database servers have a more "abstract" view on databases and regard performance "from the outside". They do not read out any values of the database, neither do they send SQL queries to databases. This sensor type is only available for Microsoft SQL.

The Microsoft SQL server sensors monitor performance via Windows Management Instrumentation (WMI). You can manually set up different performance counters for your server instances, for example, general statistics, access methods, buffer and memory manager, locks, and SQL statistics.

Microsoft SQL Server performance sensors are available for Microsoft SQL Server 2008, 2012, 2014, 2016, and 2017:

- [WMI Microsoft SQL Server 2008 Sensor](#)  2988
- [WMI Microsoft SQL Server 2012 Sensor](#)  3000
- [WMI Microsoft SQL Server 2014 Sensor](#)  3012
- [WMI Microsoft SQL Server 2016 Sensor](#)  3024
- [WMI Microsoft SQL Server 2017 Sensor](#)  3036

11.12 Monitoring Syslogs and SNMP Traps

PRTG is utilizable as a full-scale syslog server and SNMP trap receiver. Every PRTG installation includes this functionality so no additional software is needed. This manual section describes a sample configuration for PRTG's syslog and SNMP trap receiver and gives you an idea about how to use these features.

Syslog is a well-established standard for computer message logging. Many network devices support sending syslogs to communicate informational, analysis, and debugging messages that are intended for network management and security auditing. SNMP traps are asynchronous notifications from SNMP-enabled devices and can be used to report important incidents and data, just like syslog messages. Devices trigger these messages for various reasons, such as system events, outages, critical conditions, and many more.

PRTG provides two dedicated sensor types that work as full-scale syslog and SNMP trap receivers:

- [SNMP Trap Receiver Sensor](#)  2479
- [Syslog Receiver Sensor](#)  2656

Because both the syslog and the trap receiver are implemented as common sensor types, you do not need to install software in addition to PRTG (for example, you do not need an extra syslog server but only the PRTG web server). You can create the Syslog Receiver as well as the SNMP Trap Receiver sensors in the usual PRTG way via the [add sensor](#)  325 dialog. Then configure your syslog or SNMP trap-enabled device(s) to send messages to PRTG.

Under lab conditions, PRTG could handle about 10,000 syslog and trap messages per second on a quad core desktop machine when using a single sensor without filters.

 The number of messages PRTG can process actually depends on your configuration and system setup. It might be significantly fewer messages.

You can filter the incoming messages by various parameters so that PRTG will process only specific messages and purge other data right away. Processed messages are stored in an internal high-performance database on the particular probe machine and are available for review and analysis via the PRTG web interface. The main limiting factor for storing syslog and trap messages is the hard disk space on the machine running the PRTG probe with these sensors.

Sample Configuration

Follow the steps below for a sample configuration of Syslog and SNMP Trap Receiver sensors. You can apply these instructions to both the SNMP Trap Receiver as well as the Syslog Receiver because the setup works in a similar way for both.

1. [Adding the Receivers](#)  3540
2. [Configure the Source Devices](#)  3541
3. [Collect Messages](#)  3542
4. [Review and Analyze Messages](#)  3544

5. [Refine the Filters](#) ³⁵⁴⁴

6. [Create Notification Triggers](#) ³⁵⁴⁷

Step 1: Add a Syslog Receiver or SNMP Trap Receiver sensor to PRTG.

Both sensor types inherit an implicit filter from the IP address of the parent device. So, on the one hand, it is possible to add these sensors to a [probe device](#) ¹³⁵⁵. Then you will receive all messages from the system running the probe and can optionally filter for specific sources later. On the other hand, you can add these sensors directly to the source device. Then only messages from this device will be processed.

Add the receiver sensors to the desired device in the common way, for example, via the device's [context menu](#) ²⁵⁴¹. We recommend leaving the sensor's default settings unchanged for the first configuration (port, include and exclude filter, warning and error filter) to see what data actually comes in.

i Adding the sensor directly to a network device will increase its speed in comparison to a filter definition in the sensor settings. Distributing Syslog and SNMP Trap Receiver sensors over different probes will make the overall performance scalable and gives you flexibility with the [data storage](#) ³⁷³⁴ location.

i If you do not add the sensor to a probe device but to another device in PRTG, be careful with the configuration: Ensure that the IP address or DNS name of the parent device matches the proper sender. For example, if you want to receive syslog or trap messages from a Storage Area Network (SAN), you might have to add a device to PRTG using the IP address of a specific array member that sends the messages. Providing a DNS name that points to the IP address of a whole group might not work for SANs.

Add Sensor to Device Probe Device [127.0.0.1] (Step 1 of 2)

Syslog Receiver Sensor in the Add Sensor Dialog

Step 2: Appropriately configure your network device(s) that support sending syslogs or SNMP traps.

Configure your syslog or SNMP trap ready devices to send syslogs or traps (see the documentation of the respective device vendors). They have to address the PRTG probe where your Syslog or SNMP Trap Receiver sensor runs. So specify the IP address of the machine with the respective PRTG probe. If you keep your syslog or trap receiver's default settings, use the port 514.

- i The protocol is User Datagram Protocol (UDP).
- i The SNMP Trap Receiver does not support **SNMP v3** traps. Please use SNMP v1 or v2c instead.

Filter

Filter are formulas using AND , OR , NOT , brackets and the following fields:

Field	Parameters	Examples
source[ip]	Enter a UDP source IP, IP range, or IP hostmask	source[10.0.23.50] , source[10.0.23.10-50] , source[10.0.23.10/255]
facility[number]	Enter a number or range of the facility code, between 0 and 23	facility[2] , facility[5-7]
severity[number]	Enter a single number or range of the severity code, between 0 (Emergency) and 7 (Debug)	severity[4] , severity[1-3]
hostname[text]	Enter the hostname string to match (exact, case sensitive)	hostname[www.paessler.com]
tag[text]	Enter the tag string to match (exact, case sensitive)	tag[su]
appname[text]	Enter the app name string to match (exact, case sensitive)	appname[myproc]
procid[text]	Enter the process ID string to match (exact, case sensitive)	procid[8710]
msgid[text]	Enter the message ID string to match (exact, case sensitive)	msgid[ID47]
message[parttext]	Enter a substring to match the message field (partial, case insensitive)	message[Error]
data[parttext] data[id,param] data[id,param,value]	Enter a substring to match on structured data as displayed in the table (partial, case sensitive); or enter an ID and a parameter (comma separated) to check if the parameter exists in the ID element; or enter an ID, a parameter, and a value (comma separated) to match on a structured data value (RFC 5424)	data[exampleSDID@32473] , data[exampleSDID@32473,eventSource] , data[exampleSDID@32473,eventSource,Applicati...

Error Filter ⓘ severity[0-3]

Default Sensor Settings: Sufficient for the First Configuration

Step 3: Start collecting syslog or SNMP trap messages from your devices.

You do not have to complete any further configuration steps to use PRTG as a syslog server or SNMP trap receiver. When your device(s) send syslogs or SNMP traps to the specified PRTG probe machine, the messages appear automatically in the PRTG web interface. After each sensor scan (by default, the scanning interval is inherited from the parent device), PRTG will count the received syslogs or traps in the according channels (total number of messages during the last interval, error and warning messages, or dropped packets).

Let the syslog receiver or the SNMP trap receiver collect data for a while to see what comes in. By default, the respective sensor will go into a **Warning** status if there was at least one message with **severity 4** and into an **Error** status if there was at least one message with **severity 3 or lower** during the last sensor scan.

i Incoming messages are counted per scanning interval, so it might take a few moments to see the received syslogs and traps, depending on the remaining time until the next sensor scan. Of course, you can use **Scan Now** via the sensor's [context buttons](#) to perform an immediate scan and see corresponding data. The sensor states are also defined per scan. So, for example, a message that is classified as an error will count for the error channel only for one scanning interval. If there is no new error message in the following scanning interval, no message is shown in the error channel and the error **status** will disappear after the next sensor scan. The syslog or trap itself will still be accessible on the **Messages** tab.

<< < 0 to 0 > Loading 100%

Syslog Receiver Sensor with Error Messages

Step 4: Review and analyze the collected data.

All incoming messages that match the include filter are processed and stored in the internal high-performance database of PRTG. Review and analyze the received syslogs and traps via the PRTG web interface. For details, see the respective manual sections of [SNMP Trap Receiver Sensor](#)^[2489] and [Syslog Receiver Sensor](#)^[2667]. Then you can decide about further filtering of the incoming messages.

i The received data is also available in the PRTG [data folder](#)^[3734] as common files. One data file is created per hour.

■ In PRTG on premises you can add the Management Information Base (MIB) files of your devices to the `\MIB` subfolder to use them with the SNMP Trap Receiver sensor. This will result in Object Identifier (OID) resolution and makes trap messages more comprehensible. For example, instead of the OID `1.3.6.1.4.1.32446.1.1.2` you would see `SNMPv2-SMI-v1::enterprises.32446.1.1.2 = 0` (example from the PRTG MIB).

Received Syslogs on the Messages Tab

Source	Message	Hostname	Timestamp (Device)	Severity	Tag	Facility	App Name	Procid	Msg Id	Data
6/1/2017 12:44:38 PM	127.0.0.1	There is an emergency issue.	10.0.2.134	06-01 12:44:38	6	PRTG	19			
6/1/2017 12:41:43 PM	127.0.0.1	There is an emergency issue.	10.0.2.134	06-01 12:41:41	6	PRTG	19			
6/1/2017 12:39:18 PM	127.0.0.1	[PRTG Network Monitor	10.0.2.134	06-01 12:39:18	6	PRTG	23			
6/1/2017 12:35:38 PM	127.0.0.1	[PRTG Network Monitor	10.0.2.134	06-01 12:35:38	6	PRTG	23			
6/1/2017 11:24:16 AM	127.0.0.1	[PRTG Network Monitor	10.0.2.134	06-01 11:24:16	6	PRTG	1			
6/1/2017 11:17:32 AM	127.0.0.1	[PRTG Network Monitor	10.0.2.134	06-01 11:17:32	6	PRTG	17			

Step 5: (Optionally) refine the filters.

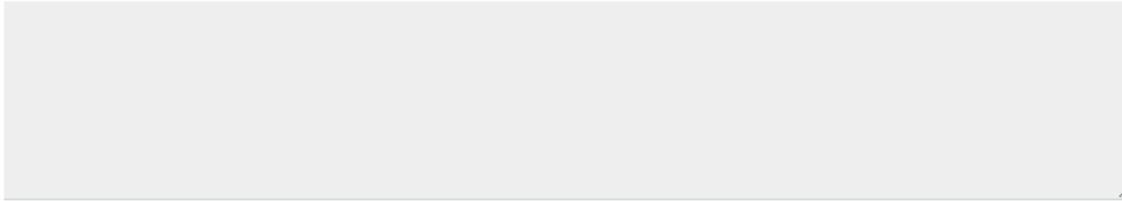

In order to increase productivity with your PRTG syslog servers and trap receivers, you can adjust the default filter settings. PRTG provides a comprehensible formula system that you can use to describe what kind of messages you want to process and which of them will count as error or warning messages. You can configure the following filters for received messages in the settings of the respective receiver:

- **Include filter:** Process and store specific types of messages only.
- **Exclude filter:** Do not process specific types of messages and discard them.
- **Warning filter:** Define rules to categorize received messages as warnings.
- **Error filter:** Define rules to categorize received messages as errors.

Use the syntax that is provided in the corresponding manual sections to define your individual filter rules: [SNMP Trap Receiver Sensor](#)²⁴⁸⁸ and [Syslog Receiver Sensor](#)²⁶⁶⁵.

 You can create filter rules with a few mouse clicks in the **Advanced Filter** on the **Messages** tab of a specific sensor and copy these rules into the sensor settings to apply them.

Advanced Filter

Filter are formulas using AND , OR , NOT , brackets and the following fields:

Field	Parameters	Examples
source[ip]	Enter a UDP source IP, IP range, or IP hostmask	source[10.0.23.50] , source[10.0.23.10-50] , source[10.0.23.10/255]
facility[number]	Enter a number or range of the facility code, between 0 and 23	facility[2] , facility[5-7]
severity[number]	Enter a single number or range of the severity code, between 0 (Emergency) and 7 (Debug)	severity[4] , severity[1-3]
hostname[text]	Enter the hostname string to match (exact, case sensitive)	hostname[www.paessler.com]
tag[text]	Enter the tag string to match (exact, case sensitive)	tag[su]
appname[text]	Enter the app name string to match (exact, case sensitive)	appname[myproc]
procid[text]	Enter the process ID string to match (exact, case sensitive)	procid[8710]
msgid[text]	Enter the message ID string to match (exact, case sensitive)	msgid[ID47]
message[parttext]	Enter a substring to match the message field (partial, case insensitive)	message[Error]
data[parttext] data[id,param] data[id,param,value]	Enter a substring to match on structured data as displayed in the table (partial, case sensitive); or enter an ID and a parameter (comma separated) to check if the parameter exists in the ID element; or enter an ID, a parameter, and a value (comma separated) to match on a structured data value (RFC 5424)	data[exampleSDID@32473] , data[exampleSDID@32473,eventSource] , data[exampleSDID@32473,eventSource,Application]

OK

Cancel

Advanced Filters on the Messages Tab

Step 6: (Optionally) create notification triggers.

By default, the warning and error channels of the Syslog and SNMP Trap Receiver sensors have a very low upper warning or error limit (0.00000001). The reason for this is that even when only one syslog or trap has been counted in the respective channel during a scanning interval, the overall status of the sensor will show this with the corresponding status. This way, you always recognize if there is something wrong on the monitored system.

Because of this sensor behavior, best practice would be to add a **State Trigger** on the **Notification Triggers**^[3216] tab of the sensor if you want to get a **notification**^[143] when a warning or error message type comes in. Define **0 seconds Down** or **Warning** time condition to not miss any warnings, errors, or any other messages. Another option would be a **Speed Trigger** for notifications regarding messages per second.

See also this Knowledge Base article: [How can I configure sensors using speed limits to keep the status for more than one interval?](#)

You can use syslog and trap specific placeholders in notification templates in order to see the messages when you receive a notification. See the **More**^[3547] section below for more information.

The screenshot shows the 'Notification Triggers' configuration page for a 'Sensor Syslog Receiver'. The 'Notification Triggers' tab is active, and a 'State Trigger' is configured. The rule is: 'When sensor state is Down for at least 0 seconds perform Ticket Notification (paused)'. The '0 seconds' value is circled in red. Below this, there are options for 'and repeat every 0 minutes' and 'When condition clears after a notification was triggered perform no notification'.

11.13 Monitoring via Push

PRTG provides the option to monitor passively received data. For this purpose, you can set up a device in a way that it automatically sends the data to PRTG. Specific sensor types can receive this data and alarm you based on your individual settings. For example, all Linux/Unix and most network devices support remote devices generating data, which has to be configured on each device, and sending the messages to a PRTG probe system. Usually, only the destination IP and port are required.

Push monitoring enables you to use webhooks to push messages to the PRTG server using Hypertext Transfer Protocol (HTTP). Wikipedia describes a webhook as a method of augmenting or altering the behavior of a web page or application with custom callbacks.

PRTG comes with built-in sensor types for push monitoring:

- [HTTP Push Count Sensor](#)^[1046]: counts the number of received messages.
- [HTTP Push Data Sensor](#)^[1056]: displays numerical values from received messages.
- [HTTP Push Data Advanced Sensor](#)^[1070]: shows received values and messages encoded in valid XML or JSON.

Use Cases

The push technology can be useful for monitoring in different cases, for example when target devices do not allow requests via the usual technologies. The following scenarios are good examples of where to use HTTP Push sensors.

- Devices that cannot run a PRTG probe
- Appliances that are not accessible via SSH or SNMP
- Web servers that can run certain scripts or PHP periodically
- Migrating a lot of EXE sensors into one EXE script that manages the HTTP Push sensors and sends data to them. Some coding is required, see this Knowledge Base article: [How can I monitor SCVMM hosts and VMs with PRTG?](#)
- When monitoring Linux services, see this Knowledge Base article: [How can I monitor and automatically restart a service on a Linux host?](#)
- If you need to push **a lot** of data into PRTG in short periods of time; the sensors have been tested with about 10,000 values pushed within one minute.

How to Use

Webhooks basically work like push messages. These are triggered by an event (for example, a new comment to a blog post) and send according information in real time to a specified URL. You can use this technology to push messages to the PRTG Probe, and monitor count and content with HTTP Push sensors. Because webhooks use HTTP, you can integrate them without having to add new infrastructure to your network.

Recommended Configuration

Follow the steps below for a sample configuration of the HTTP Push sensors.

1. Add the sensors.
2. Define the URLs.

Step 1: Add the HTTP Push Count, HTTP Push Data, and HTTP Push Data Advanced sensors to PRTG.

You can use the standard method to add sensors to your configuration.

1. Choose the Probe Device or a device of your own.
 -  A device of your own has no practical advantage with HTTP Push sensors but it might help you stay better organized.

2. Click **Add Sensor** and filter for **Push Message Receiver** under **Technology Used**.

3. Select one of the HTTP Push sensors that fits best to your intended usage.

 For more details, see section [Add a Sensor](#)³²⁵.

 These sensor types cannot be used in cluster mode. You can set them up on local probes or remote probes only, not on cluster probes.

Step 2: Define the corresponding URL to send HTTP requests to PRTG.

In order for the desired configuration to be properly sent to and received by PRTG, please use the following URL formats.

The **HTTP Push Count Sensor** uses the following URL:

`http://<probe_ip>:<port_number>/<token>`

Replace the parameters `<probe_ip>`, `<port_number>`, and `<token>` with the corresponding values.

- The `<probe_ip>` is the IP address of the system where the PRTG probe with the sensor is running.
- The `<port_number>` is where the sensor listens for incoming HTTP calls.
- The `<token>` is used to define the matching sensor.

Example:

```
http://192.0.2.0:5050/XYZ123
```

 You can use several sensors with the same port and identification token. In this case, the number of push messages will be shown in each of these sensors.

The **HTTP Push Data Sensor** uses the following URL:

http://<probe_ip>:<port_number>/<token>?value=<integer_or_float>&text=<text message>

Replace the parameters **<probe_ip>**, **<port_number>**, **<token>**, and **<integer_or_float>** with the corresponding values. The **&text** parameter is optional: You can omit it.

- You can define **port number** and **identification token** in the sensor settings.
- The **probe IP** is the IP address of the system on which your PRTG probe with this sensor is running.
- The **value** can be an integer or a float value, depending on the data of your application; you have to set the value type accordingly in the sensor settings. This parameter will be the sensor value.
 - ⚠ If this parameter is missing, the sensor will show a **down** status.
- You can **optionally** add a custom text message by replacing the parameter **<text message>** with it. The text will be shown as sensor message. If there is no value but only a text, the text will be shown as error message.
 - ⚠ This text message has to be URL encoded (for example, the whitespaces in the sample URL below); most browsers achieve this automatically.

Example:

```
http://192.0.2.0:5050/XYZ123?value=0&text=this%20is%20a%20message
```

- ⓘ You can use several sensors with the same port and identification token. In this case, the data of push messages will be shown in each of these sensors.

The **HTTP Push Data Advanced Sensor** uses the following URLs depending on the type of HTTP request.

- **GET requests:** **http://<probe_ip>:<port_number>/<token>?content=<valid XML_or_JSON>**

The XML encoded value of the content parameter has to match the format as defined in section [Custom Sensors](#)³⁶⁴¹.

- **POST requests:** **http://<probe_ip>:<port_number>/<token>**

This HTTP request method sends the XML or JSON encoded HTTP body as POST data. The body has to match the format as defined in section [Custom Sensors](#)³⁶⁴¹. We strongly recommend the HTTP content type **application/xml** or **application/json**.

Replace the parameters **<probe_ip>**, **<port_number>**, **<token>**, and **<valid XML_or_JSON>** (for GET requests) with the corresponding values:

- You can define **port number** and **identification token** in the sensor settings.
- The **probe IP** is the IP address of the system on which your PRTG probe with this sensor is running.
- The content of GET requests has to be valid XML or JSON in the PRTG API format.
 - ⚠ The content has to be URL encoded (for example, the whitespaces in the sample URL below); most browsers achieve this automatically.

Minimum example for the GET method that returns one static channel value:

```
http://127.0.0.1:5050/XYZ123?content=<prtg><result><channel>MyChannel</channel><value>10</value></result><
```

⚠ By default, values within the `<value>` tags in the returned XML or JSON must be **integers** to be processed. If **float** values are returned, you have to explicitly define this value type as defined in section [Custom Sensors](#) with `<float>` tags, otherwise the sensor will show **0** values in affected channels. Example:

```
http://127.0.0.1:5050/XYZ123?content=<prtg><result><channel>MyChannel</channel><value>10.45</value><float>
```

i You can use several sensors with the same port and identification token. In this case, the data of push messages will be shown in each of these sensors.

Conclusion

These sensor types are great tools to count and display HTTP push messages to the PRTG server and to keep you up-to-date with real-time information about your network.

11.14 Monitoring via HTTP

The Hypertext Transfer Protocol (HTTP) is a standard application layer protocol and the basis for data communication in the internet. HTTP is a request-response method for client-server architectures, where the client sends a request and the server processes and responds to the request.

Monitoring via HTTP is useful if you want to monitor websites or web servers. It enables you to keep an eye on the availability and download times of a website or the performance statistics of a web server. There are also a lot of other possible use cases for HTTP sensors. For example, you can request any Application Programming Interface (API) that is reachable via HTTP and monitor returned values. This approach makes it possible to include almost any type of device or application into your monitoring.

PRTG comes with built-in sensor types for HTTP monitoring:

- [Cloud HTTP Sensor](#)  619
- [Common SaaS Sensor](#)  644
- [HTTP Sensor](#)  955
- [HTTP Advanced Sensor](#)  965
- [HTTP Apache ModStatus PerfStats Sensor](#)  982
- [HTTP Apache ModStatus Totals Sensor](#)  992
- [HTTP Content Sensor](#)  1002
- [HTTP Data Advanced Sensor](#)  1014
- [HTTP Full Web Page Sensor](#)  1027
- [HTTP Push Count Sensor](#)  1049
- [HTTP Push Data Sensor](#)  1059
- [HTTP Push Data Advanced Sensor](#)  1070
- [HTTP Transaction Sensor](#)  1081
- [HTTP XML/REST Value Sensor](#)  1095
- [REST Custom Sensor](#)  1646

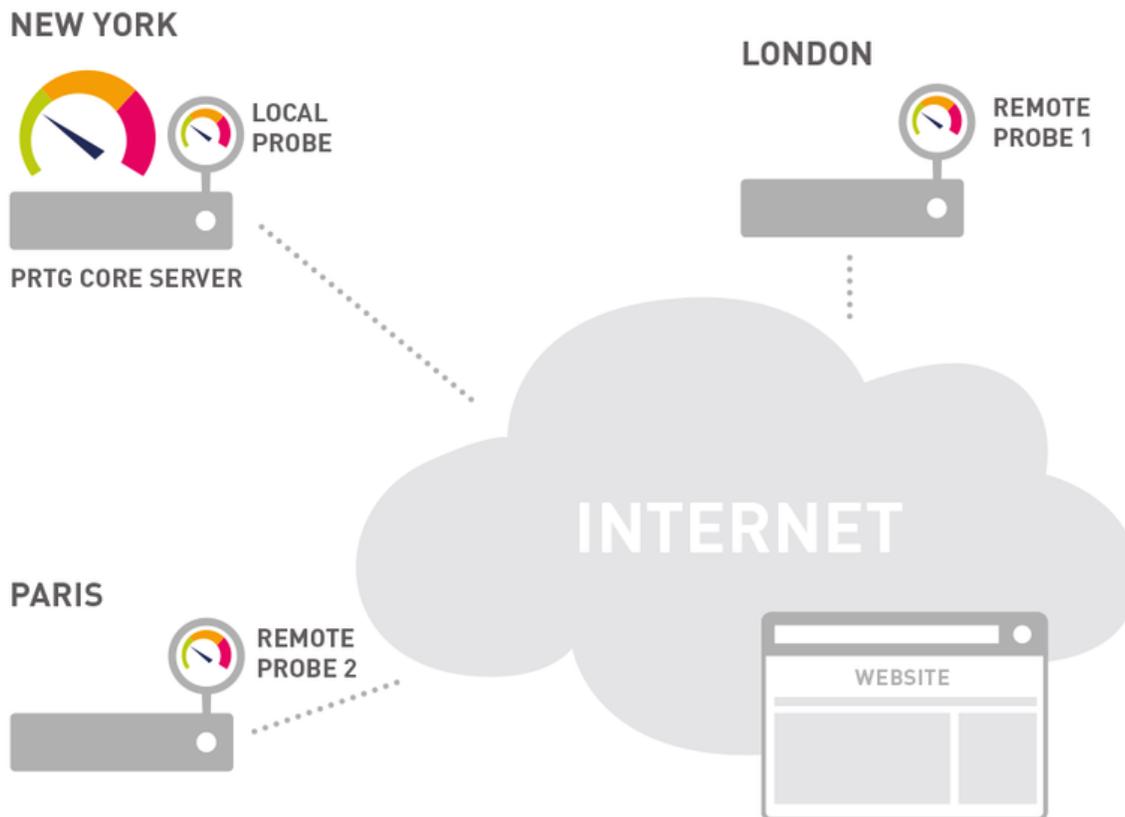

Use Cases

- Monitor the availability and loading times of a website
- Monitor the source code and specific content of a website
- Test the login, purchasing, and shipping processes of a web shop
- Monitor performance statistics and activity of Apache web servers

Types of HTTP Monitoring

Availability Monitoring

This type monitors the availability of a website or a specific website element. For example, the [HTTP sensor](#)^[955] shows how long the HTML code of a website takes to load. If the sensor shows a loading time that is much longer than expected, then the website may not be responding or may be unavailable.

Cloud HTTP Monitoring Provides Better Performance Statistics

The HTTP sensor uses different HTTP requests to request the given URL.

- **GET:** requests the website directly
- **POST:** sends post form data to the URL
- **HEAD:** requests the HTTP header only, without the actual webpage body, saving bandwidth

The [HTTP Advanced sensor](#)^[965] also monitors the availability of a website, along with other parameters such as bytes received, download bandwidth (speed), and time to first byte, which shows you how fast your web server responds. This sensor lets you use a (custom) user agent when connecting to the target URL and lets you send custom HTTP headers to the target URL.

The [Cloud HTTP sensor](#)^[619] monitors a web server from various locations across the globe. For example, the URL of a website to measure the loading time of a page's source code or the URL of a page asset to measure its availability and loading time. It also shows the global average response time.

The [Cloud Ping sensor](#)^[629] also monitors the availability of your website.

The [Common SaaS sensor](#)^[644] monitors the availability of your cloud services and is an important pillar for unified monitoring.

Content Monitoring

This type monitors internal values of a web server based application or changes to specific content on a website. The [HTTP Full Web Page sensor](#)^[1027] measures the time it takes to download a webpage including all embedded page elements, such as Flash content, images, etc.

i This monitoring option can create a lot of bandwidth traffic, depending on the page size and the scanning interval.

Additionally, the [HTTP Content sensor](#)^[1002] monitors a numerical value returned by an HTTP request. A 'change' notification can optionally be triggered to notify you of changes to the content.

Example: Content Monitoring

■ For example, consider a URL <http://www.example.com/status.html> that returns a PHP script with the current system status in a simple HTML page.

```
<html>
<body>
  Description: Script gives back current status of disk free (%) and CPU usage (%).
  [85.5][12.0]
</body>
</html>
```

You would configure the HTTP Content sensor using

- the script **URL** from above,
- value type **Float**,
- and number of channels **2**.

The sensor calls the URL with every scanning interval and only regards the two values in square brackets `[]`, handling each of them in one sensor channel. The additional description text and HTML tags are not necessary. In this example, they are added in case a human calls the URL.

i If you define the number of channels as **1**, the sensor will read only the first value. The second value will be ignored. Using **3** as number of channels will result in a sensor error message.

To be notified when the website content changes, you first need to configure a **Trigger 'change notification'** in the sensor's settings and then the notification itself.

See section [Sensor Notification Triggers Settings](#)^[3180] for more information.

Performance Monitoring

The HTTP Transaction sensor checks if a web shop is working as expected: with a series of requests, you can simulate the login, purchasing, and shipping processes, for example. Only if all actions can be completed successfully in a row, the check returns an "OK" message. If anything goes wrong, you are immediately alerted and can react instantly to avoid loss of earnings for your company because the web shop is unavailable or very slow.

Apache Web Server Monitoring

The HTTP Apache ModStatus PerfStats and HTTP Apache ModStatus Totals sensors monitor performance statistics and the activity of an Apache web server using `mod_status` over HTTP. Among other HTTP sensors, these sensors allow you to enter credentials for webpages that need authentication and allow you to choose the necessary authentication method.

Security Monitoring

PRTG also provides the option to monitor the security of your website by checking the status of SSL certificates and the security of a connection.

- **SSL Certificate Sensor:** monitors the certificate of a secure SSL/TLS connection. It displays whether a certificate has been revoked, or is trusted as root authority, or is self-signed, for example.
- **SSL Security Check Sensor:** monitors the SSL connectivity to the port of a device. It tries to connect to the specified TCP/IP port number of a device with various SSL/TLS protocol versions and shows if a specific protocol is supported.

Push Monitoring

PRTG provides the option to monitor passively received data. For this purpose, you can set up a device in a way that it automatically sends the data to PRTG. Specific sensor types can receive this data and alarm you based on your individual settings. For example, all Linux/Unix and most network devices support remote devices generating data, which has to be configured on each device, and sending the messages to a PRTG probe system. Usually, only the destination IP and port are required.

See section [Monitoring via Push](#)^[3548] for more information.

Other Data

You can also monitor other types of data from your website, for example the number of website visitors via the [HTTP XML/REST Value sensor](#)^[1095]. The sensor lets you monitor values within the returned XML code, provided your web analytics tool has an XML export option. The [HTTP Data Advanced sensor](#)^[1014] access a web server and retrieves XML or JSON encoded data.

The [REST Custom sensor](#)^[1646] queries a REST Application Programming Interface (API) endpoint and maps the JSON or XML result to sensor values. The mapping rule has to be available as a REST configuration file in JSON template (*.template) format according to the API definition.

 For details about the return value format, see section [Custom Sensors](#)³⁶⁴¹.

HTTP Status Codes

The HTTP sensors show their status depending on the HTTP status codes that they receive. By default, the sensor states are the following:

HTTP STATUS CODE	HTTP SENSOR STATUS
2xx Success	Up (Green)
3xx Redirection	Warning (Yellow, Down (Red) for too many redirects)
4xx Client Error	Down (Red)
5xx Server Error	Down (Red)

 You need to configure your HTTP sensor(s) manually only if you want to change these default reactions. In this case, you can change the sensor status based on limits and/or keyword checks.

Other HTTP Sensor Settings

- **Server Name Identification (SNI):** You can configure SNI, which has to be a Fully Qualified Domain Name (FQDN) and must match the configuration of the target server. For details, see the Knowledge Base article [My HTTP sensors fail to monitor websites which use SNI. What can I do?](#)
- **Protocol Version:** You can choose the HTTP protocol version that the sensor will use when connecting to the target URL.
- **Authentication Method:** You can define if the configured URL needs authentication, enter credentials, and choose an authentication method.
- **Custom User Agent:** You can enter a string to be used as user agent when connecting to the target URL.
- **Custom HTTP Headers:** You can send custom HTTP headers to the target URL.

HTTP Sensor Troubleshooting

See the following Knowledge Base articles for troubleshooting and other tips for monitoring with HTTP sensors.

- [Which user agent should I use in the HTTP Advanced sensor's settings?](#)

- [HTTP Full Web Page sensor is “unable to navigate”. What can I do?](#)
- [What to do when I see a CreateUniqueTempDir\(\) error message for my HTTP Full Webpage Sensor?](#)
- [Where can I find more information about the HTTP XML/REST Value Sensor?](#)
- [Why does my HTTP XML/REST Value sensor return a 404 error?](#)
- [My HTTP sensors could not create an SSL secure channel and are down. What can I do?](#)

Conclusion

These sensor types are great tools to monitor your website's availability and performance and to keep you up-to-date with real-time information.

Part 12

PRTG Administration Tool

12 PRTG Administration Tool

The **PRTG Administration Tool** is part of your PRTG installation and helps you edit administrative settings of your local probe and your remote probe installations.

You can launch the PRTG Administration Tool from the Windows start menu, on your core server, or on your remote probe server. If you start the PRTG Administration Tool on the PRTG core server, you can change settings that affect your whole PRTG installation and your local probe. If you run the PRTG Administration Tool on a system on which a remote probe runs, you can only change settings that are related to this probe.

All settings that you change will require a restart of the affected PRTG Windows services to apply any changes on the configuration. See the following sections for details.

i You can also change many administrative settings via the [Setup](#)³³⁰² in the [PRTG web interface](#)¹⁶⁶⁶. For probes, settings are also available on the [corresponding tab](#)³⁷¹¹ in the web interface.

i You can review the history of all changes to the settings of the PRTG Administration Tool in the **Logs (Debug)** directory. The name of the corresponding logfile is **PRTG Administration Tool Changelog.log**. For information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

12.1 PRTG Administration Tool on Core Server System

With the **PRTG Administration Tool** you can define various system-oriented settings that affect your PRTG installation, as well as restart services and view log information. You can also change many of these settings via the [system administration](#)^[3302] in the [PRTG web interface](#)^[168].

i This section describes the available settings in the PRTG Administration Tool when you open the tool on the **PRTG core server system**. This means that you can edit settings that regard your PRTG core or web server and the local probe, which is the probe on your core server. If you open the PRTG Administration Tool on a remote probe machine, only [probe related settings](#)^[3587] are available.

i All settings you define are only valid for the local installation that is running on the computer on which you start the Administration Tool. In order to change settings for another installation, for example, another cluster node installation, please log in to that computer and open the program there.

i Do you want to know how the PRTG Administration Tool relates to all other major parts of PRTG Network Monitor? To get familiar with the different components of PRTG, we recommend that you read the [Architecture](#)^[125] section. If you prefer a video introduction to the **PRTG Administration Tool**, see the [More](#)^[3586] section below for more information.

 This feature is not available in PRTG hosted by Paessler.

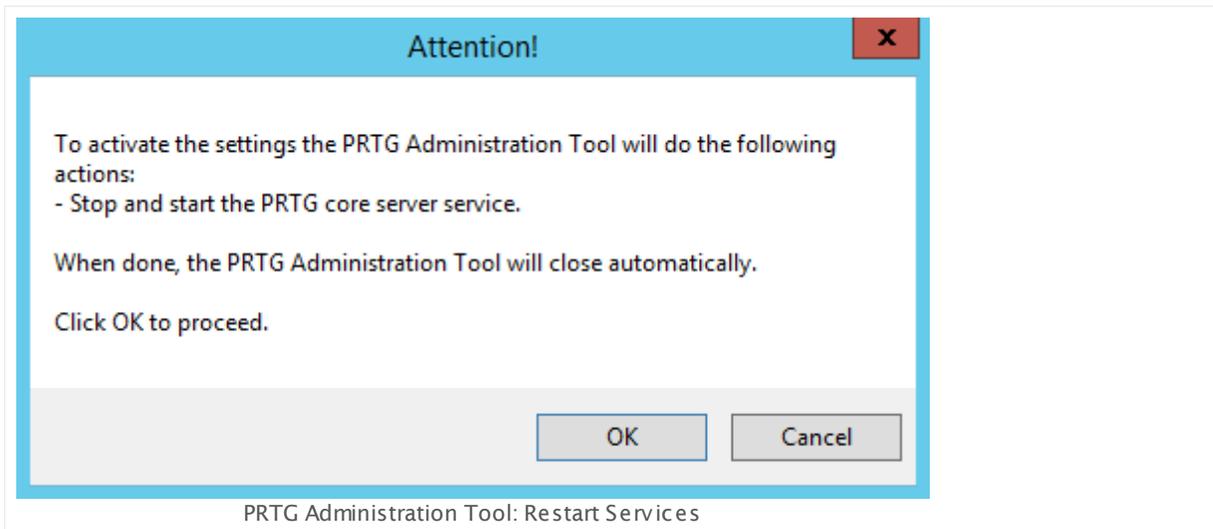

Start the PRTG Administration Tool

From the Windows start menu, select the **PRTG Network Monitor** group and click **PRTG Administration Tool** to open the application.

You can choose from these options in different tabs:

- [Web Server](#)^[3562]
- [Core Server](#)^[3566]
- [Cluster](#)^[3568]
- [Administrator](#)^[3574]
- [Probe Settings for Core Connection](#)^[3575]
- [Probe Settings for Monitoring](#)^[3579]
- [Service Start/Stop](#)^[3580]
- [Logs and Info](#)^[3583]

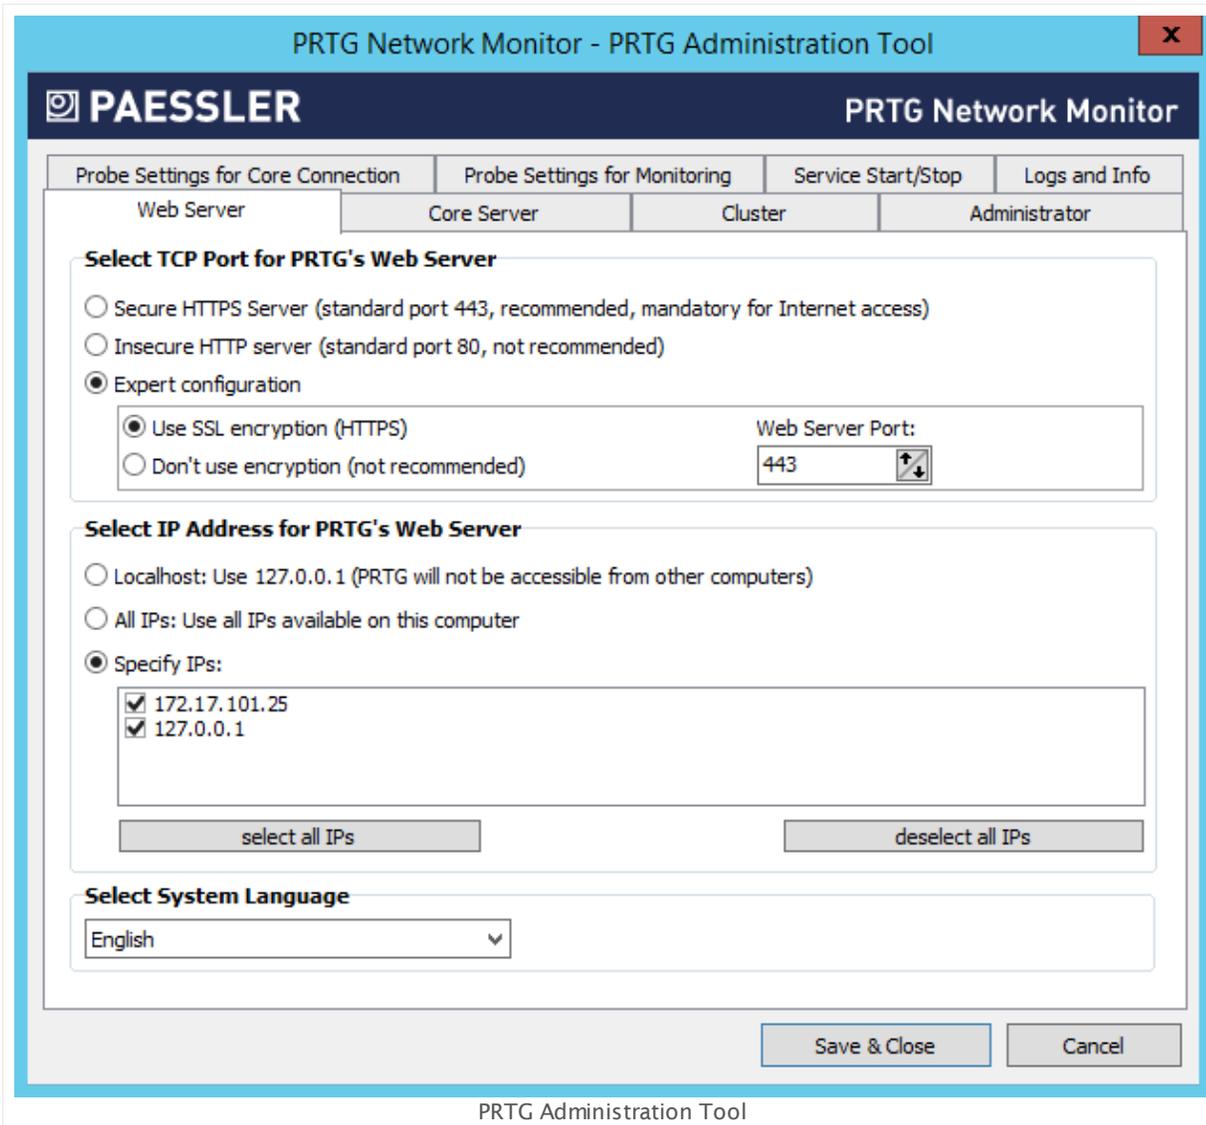

After you change settings, click the **Save & Close** button. A new window opens where PRTG asks you to agree to restart the PRTG core server service. Click **OK** if you do not want your changes to be ignored.

Web Server

Edit IPs, ports, access methods, and language for the [PRTG web interface](#)¹⁶⁶.

i You can also change all settings on the **Web Server** tab via the PRTG web interface in the [User Interface](#)³³⁴³ settings.

WEB SERVER

Select TCP Port for PRTG's Web Server

PRTG runs a web server in order to provide access via the web interface and the Enterprise Console. Please specify on which port this web server will run. Choose between:

WEB SERVER

- **Secure HTTPS server (recommended, mandatory for internet access):** We recommend this setting and you need it to access the PRTG server via the internet. Use a secure HTTPS connection that is encrypted via SSL on port 443.

 Although the connection is secure, you will see an [SSL Certificate Warning](#)^[172] in your browser when logging in to the PRTG web interface, because the default certificate is unknown to your browser. You can install another SSL certificate for PRTG later. Please see [Using Your Own SSL Certificate](#)^[376].

 If port 80 is free, PRTG will reserve it as well. When users try to connect on port 80 via HTTP, they will then be redirected to port 443 via HTTPS. You can change this behavior by using a registry setting.

If port 443 is not available, PRTG will try port 8443 as fallback. If this port is also not available, PRTG searches from port 32000 upwards for a free port. PRTG will send a [ticket](#)^[230] that shows you the currently used port number and will switch back to 443 as soon as it is available again.

- **Insecure HTTP server (standard port 80, not recommended):** Use a standard web server without SSL encryption on port 80. This setting is not recommended for WAN connections.
 -  If you use an insecure web server on the internet, attackers could potentially spy on credentials you enter into PRTG. We strongly recommend that you use this option in a LAN only.

- **Expert configuration:** This setting allows you to specify a custom web server port and the security of the connection. This option is intended for systems with an existing web server on the standard port. Define port and encryption below.

 If PRTG always uses a fallback port after a server restart, check for other programs that use the same port as PRTG. For example, the Microsoft IIS web server also uses the port 80 (443 for SSL) by default and blocks it. Please disable such programs and services on startup.

Expert Configuration:
SSL Encryption

You will see this setting only if you select **Expert configuration** above. Specify if you want to use an SSL encryption. Choose between:

- **Use SSL encryption (HTTPS):** Use a secure HTTPS connection that is encrypted via SSL on a custom port as defined above.
 -  Although the connection is secure, you will see an [SSL Certificate Warning](#)^[172] in your browser when you log in to the PRTG web interface, because the default certificate is unknown to your browser. You can install another SSL certificate for PRTG later. Please see [Using Your Own SSL Certificate](#)^[376].

WEB SERVER

- **Don't use encryption (not recommended):** This setting is not recommended for WAN connections. Use a standard web server without SSL encryption on a custom port as defined above.

 If you use a web server without encryption on the internet, attackers could potentially spy on credentials you enter into PRTG. We strongly recommend that you use this option in a LAN only.

Expert Configuration: Web Server Port

You will see this setting only if you select **Expert configuration** above. Enter the TCP port number you want the PRTG web server to run on. Please enter an integer value.

 If you use a secure connection and port 80 is free, PRTG will reserve it as well. When users try to connect on port 80 via HTTP, they will be redirected to the custom port via HTTPS. You can change this behavior by using a registry setting.

 If the defined port for a secure connection is not available, PRTG will try port 8443 as fallback. If this port is also not available, PRTG searches from port 32000 upwards for a free port. PRTG sends a [ticket](#)²³⁰¹ that shows you the currently used port number and will switch back to the original port as soon as it is available again.

Select IP Address for PRTG's Web Server

PRTG is running a web server in order to provide access via the web and Windows interface. Please specify the IP address this web server will run on. Later, you can log in to PRTG by simply pointing your browser to the specified IP address.

Choose between:

- **Localhost, 127.0.0.1 (PRTG will not be accessible from other computers):** Use **127.0.0.1** only. The PRTG web interface and the Enterprise Console will only be accessible from the computer PRTG is installed on. Either the selected port or at least one port in the range from **8080** to **8089** has to be available on **127.0.0.1**.

 If you run PRTG on localhost, please do not use the DNS name **http://localhost** to log in to the web server, as this may considerably slow down the PRTG web interface. Please use your local IP address or **http://127.0.0.1** instead.

- **All IPs available on this computer:** Use all IP addresses available on this computer and enable access to the web server for all of these addresses. The TCP port selected below must be free on every available IP address.

WEB SERVER

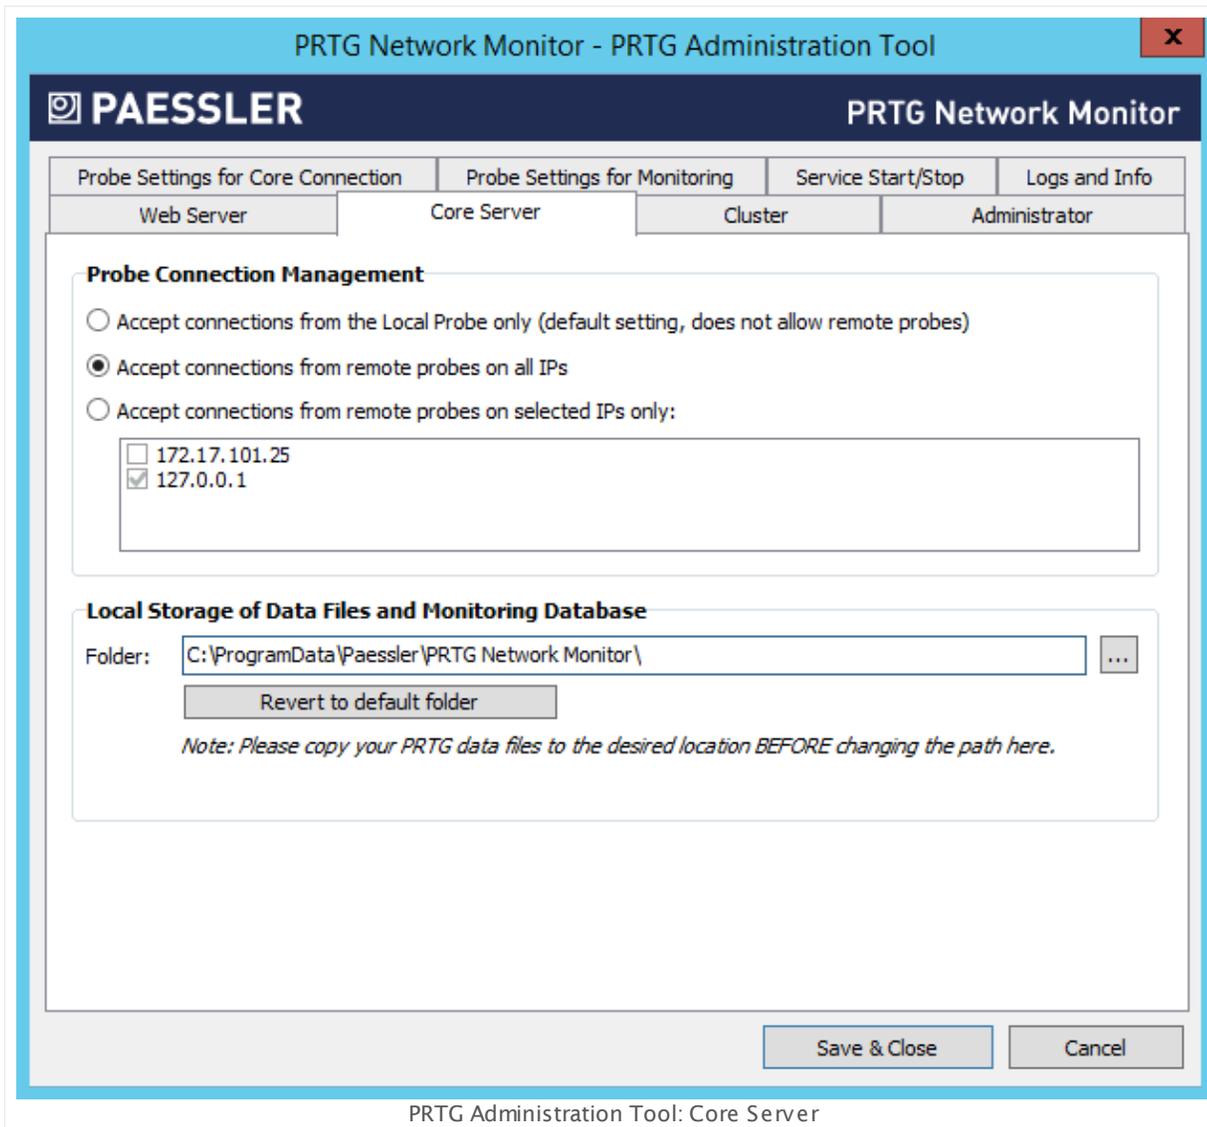

- **Specify IPs:** Select specific IP addresses on which the PRTG Web server will run. A list specific to your system is shown. Add a check mark in front of every IP address you want the PRTG web server to be available at. You can also select and deselect all addresses by clicking on the check box in the table header. Either the selected port or at least one port in the range from **8080** to **8089** has to be available on the specified IP address.
- ❗ Regardless of the selected setting above, one port in the range from **8080** to **8180** has to be available on the specified IP address so PRTG can create reports. The report engine will try to connect to the core server on one of these ports.
- ❗ If PRTG does not find a network card on startup it will switch the IP setting to **Localhost**. This setting will remain, even if a network card is available later on. If you disabled or removed the network card on the machine running the PRTG core server, please re-check this setting.

Select System Language

Choose the system language from the dropdown list. Default is **English**. Depending on your installation, you may be able to choose other languages here. This setting defines the language of the [PRTG web interface](#)¹⁶⁶, as well as of the [PRTG Administration Tool](#)³⁵⁶.

Core Server

Define settings for the core server.

CORE SERVER

Probe Connection Management

Define how PRTG will handle incoming connections from probes. Choose between the following options:

- **Accept connections from the Local Probe only (default setting, does not allow remote probes):** This is the default setting. Only local probe connections will be accepted by the PRTG core server. You cannot use [remote probes](#) with this setting enabled.
- **Accept connections from remote probes on all IPs:** Incoming connections from remote probes will always be accepted, no matter on which IP address of the core server they come in.

CORE SERVER

- **Accept connections from remote probes on selected IPs only:** Incoming connections from [remote probes](#)³⁷¹⁹ will only be accepted on the selected IP address(es) of the core server. In the list, select the IP addresses by adding a check mark in front of the desired IPs.

You can also change this setting in the PRTG web interface under [System Administration—Core & Probes](#)³³⁰⁹.

Local Storage of Data Files and Monitoring Database

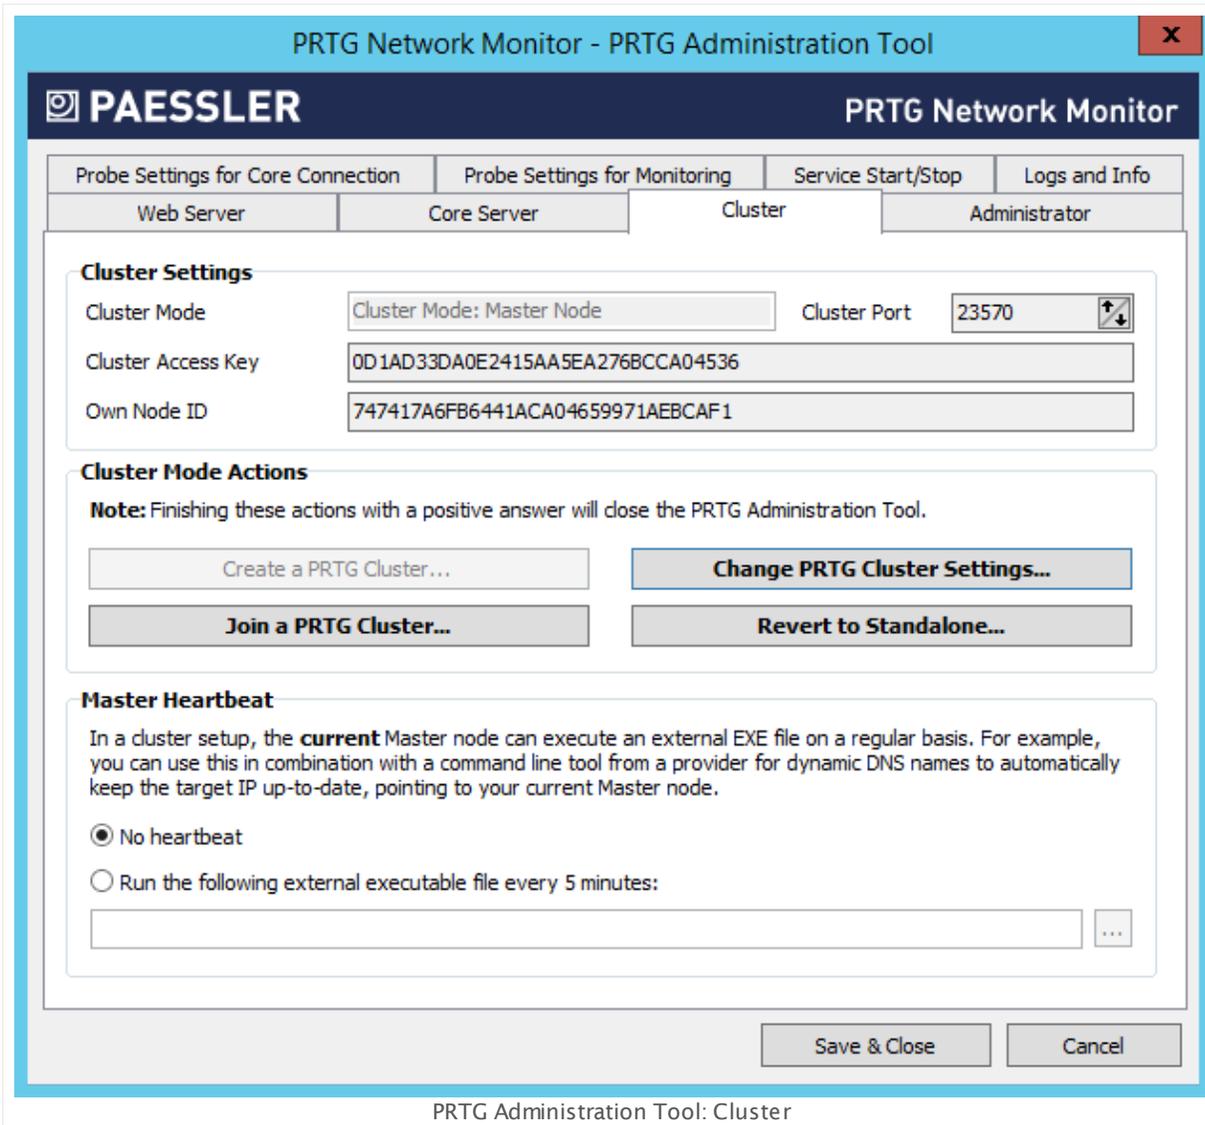

Define the data folder to which PRTG will store configuration and monitoring data. Click the ... button to choose another folder on your system.

 Before you change the path, make sure you stop both the core server and the probe services and copy all data to the new location.

Click **Revert to default folder** to reset to default.

Cluster

On the **Cluster** tab, you can manually change how the current core installation will behave in a cluster. Before changing settings here, please read the [Failover Cluster Configuration](#)³⁷²⁰ section.

CLUSTER

Cluster Settings

Depending on the current cluster settings, you will see different information here.

- **Cluster Mode:** Shows which cluster mode the current installation is running. This setting is shown for your information only and cannot be changed here. Possible values are **Standalone** (no cluster mode), **Cluster Mode: Master Node**, or **Cluster Mode: Failover Node**.
- **Cluster Port:** This field is only shown when PRTG is running in a cluster mode. This setting is shown for your information only and cannot be changed here.

CLUSTER

- **Cluster Access Key:** This field is only shown when PRTG is running in a cluster mode. This setting is shown for your information only and cannot be changed here.
- **Own Node ID:** This field is only shown when PRTG is running in a cluster mode. This setting is shown for your information only and cannot be changed here.

Cluster Mode Actions Depending on the current cluster settings, you see different active buttons here.

- **Create a PRTG Cluster...**
- **Join a PRTG Cluster...**
- **Change PRTG Cluster Settings...**
- **Revert to Standalone...**

 For details on these options, see [below this table](#) .

Master Heartbeat This section is only visible if you are running your PRTG installation in cluster mode. The **current** master can execute an external executable file on a regular basis. We call this a "heartbeat".

You can use this, for example, to report the IP address of the current master node to a dynamic DNS provider, so a DNS name is always redirected to the current PRTG master node in case the original master node fails and a failover node (running at a different IP address) takes over the master role.

Choose between:

- **No heartbeat:** Do not execute a file on a regular basis.
- **Run the following external executable file every 5 minutes:** Click the ... button to choose a file you want to execute. This can be, for example, a command line tool, or a batch file. It will be executed on the current master node only, with a fixed interval of five minutes. The interval cannot be changed.

 Please make sure that the selected file is available under the same (local) path on all failover nodes. In case one of your failover nodes becomes current master, the heartbeat can only be executed reliably if the executable file exists on all of your failover nodes.

Cluster Mode Actions

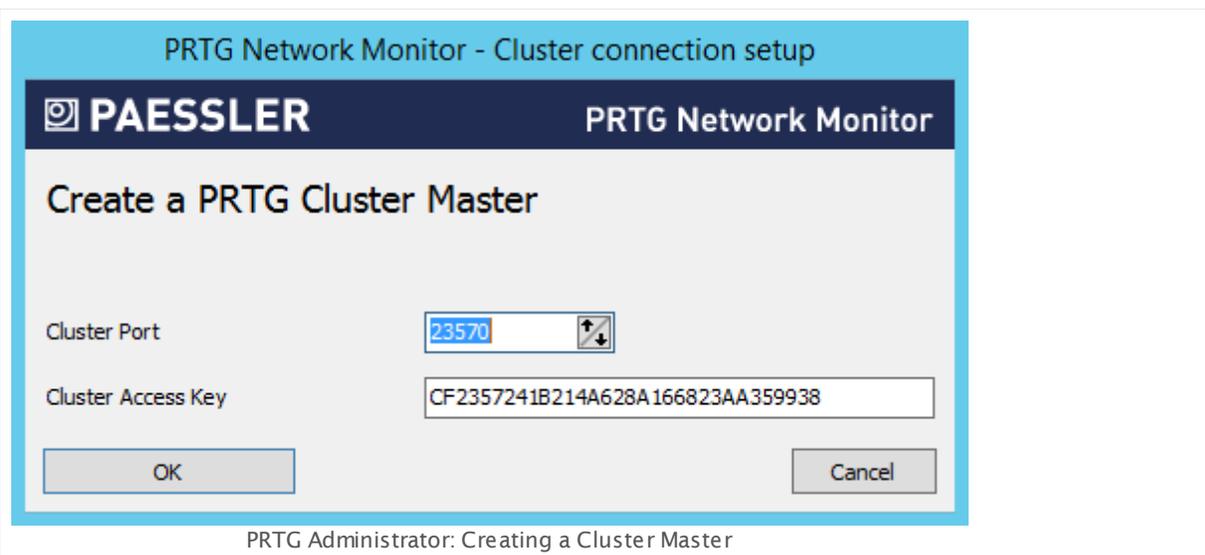

Follow these instructions to create or join a cluster, to change a cluster's settings, or to revert a cluster node to a standalone PRTG installation:

Create a PRTG Cluster...

- Click this button to start creating a cluster. The current PRTG core server will then be the **Master Node** of your cluster.
- Click **Yes** to confirm the conversion of this installation into a cluster master node.

- A new dialog box will appear.

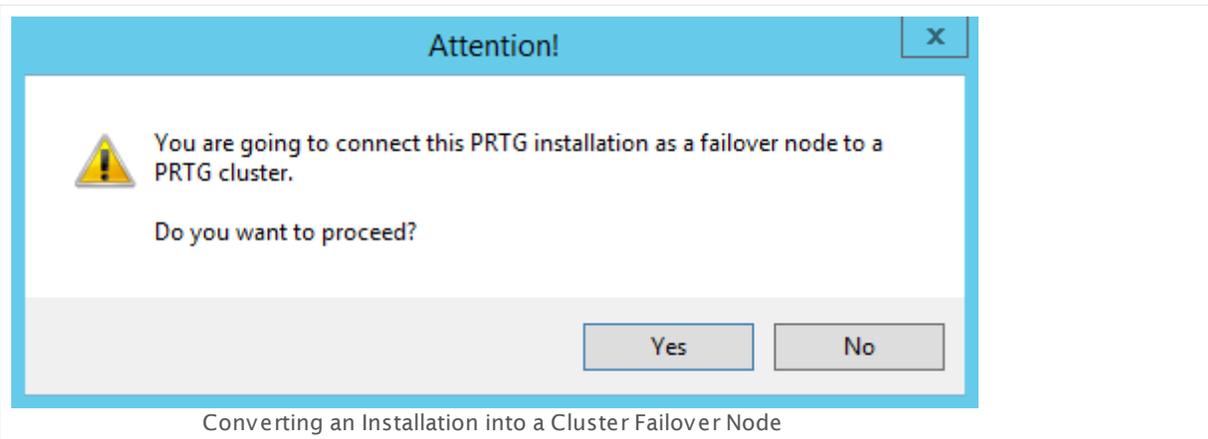

- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.
- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- We recommend that you use the default value.
- Save the **Cluster Access Key** so you have it at hand when configuring your **Failover Node(s)**.

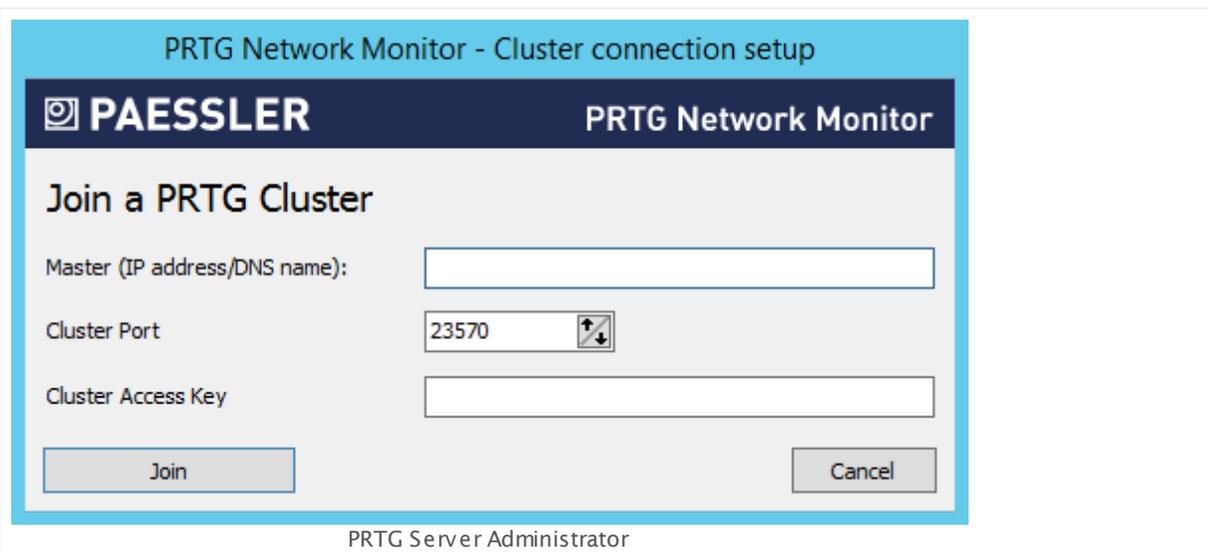

- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

Join a PRTG Cluster...

- Click this button to add this installation to an existing cluster that already has a **Master Node**. The current PRTG core server will then be a **Failover Node** in the cluster.
- This button is also available if you are currently running your PRTG installation in **Cluster Mode: Master Node**. This option will then change your master node to a failover node!
- Click **Yes** to confirm the conversion of this installation into a failover node.

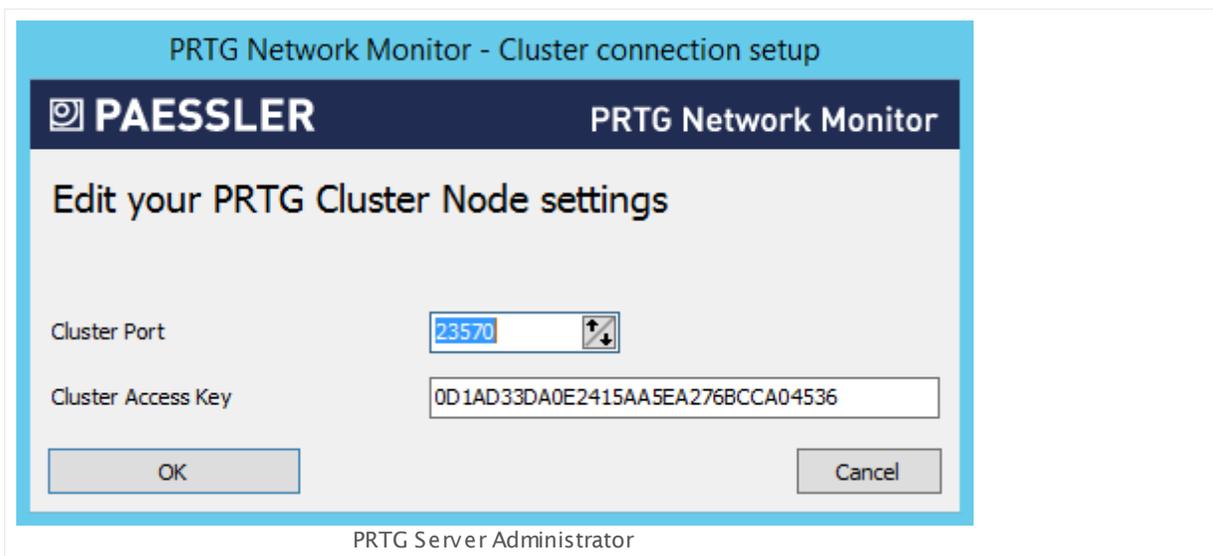

- A dialog box will appear.

- Enter a **Master IP address/DNS name** for your cluster. It must be reachable from the machine running the failover node.
- Enter the other settings as defined in the settings of your **Master Node**. Please make sure you use the same settings on all nodes in your cluster.

- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.
- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

Change PRTG Cluster Settings...

- If you are running your PRTG installation in cluster mode, you can change the settings here. A new window will appear.
- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.
- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- Please make sure you use the same settings on all nodes in your cluster.
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

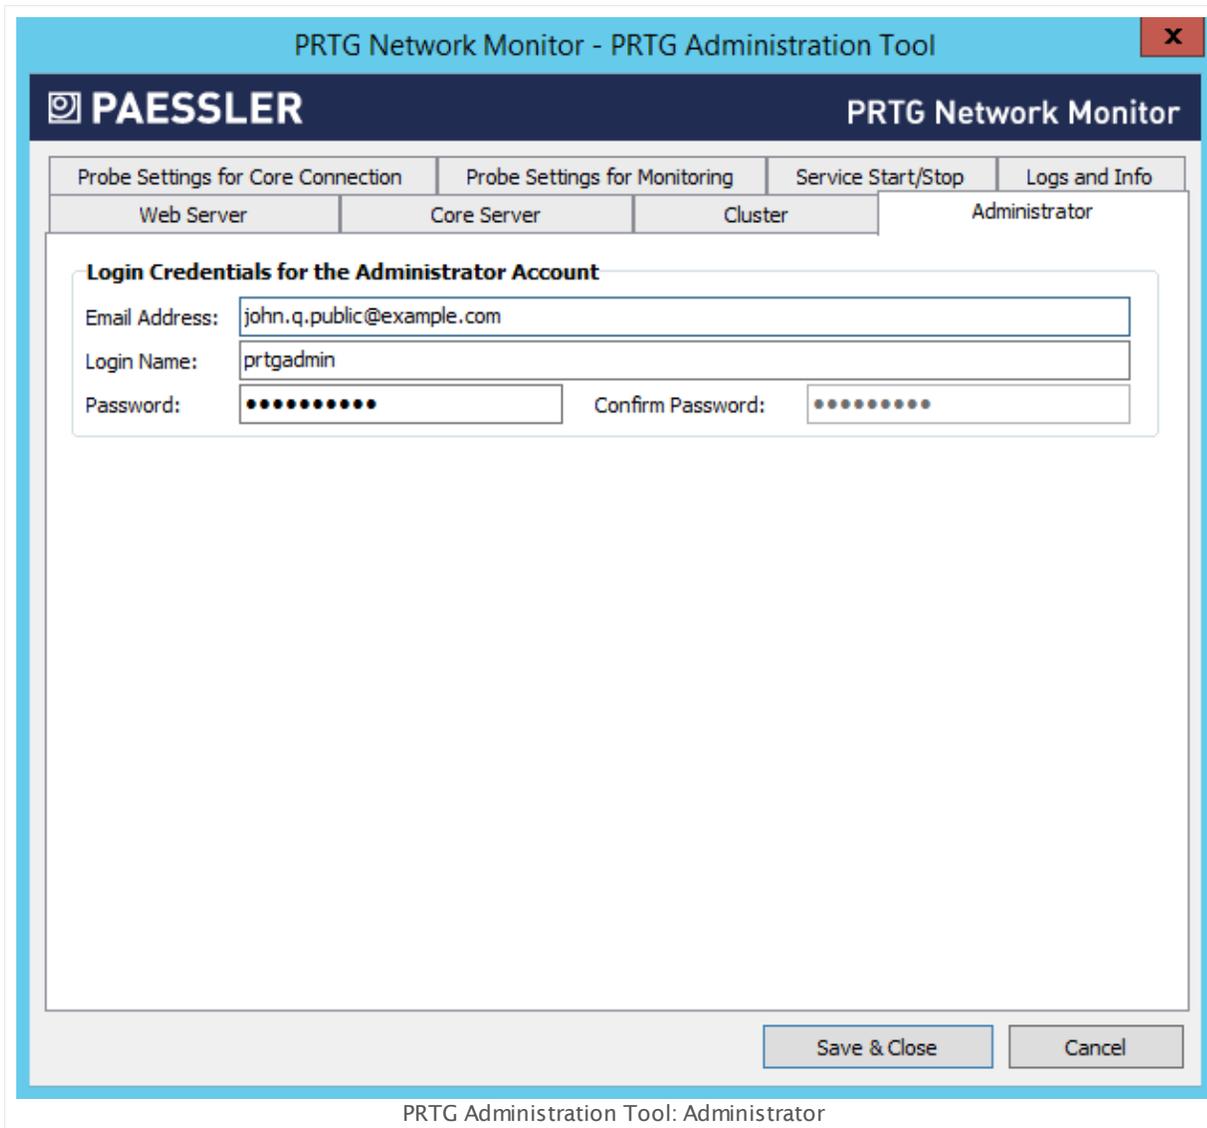

Revert to Standalone...

- If you are currently running your PRTG installation in cluster mode, you can change it to **Standalone** mode. If you do so, this node will no longer be part of a cluster.
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

Administrator

Change PRTG System Administrator specific settings.

- i** You can also change these settings in the [account settings](#)³⁵⁷⁷ of the **PRTG System Administrator** user in the PRTG web interface.

The screenshot shows the 'Administrator' tab within the 'PRTG Administration Tool' window. The window title is 'PRTG Network Monitor - PRTG Administration Tool'. The interface includes the PAESSLER logo and 'PRTG Network Monitor' text. A navigation bar contains tabs for 'Probe Settings for Core Connection', 'Probe Settings for Monitoring', 'Service Start/Stop', and 'Logs and Info'. Below this, there are sub-tabs for 'Web Server', 'Core Server', 'Cluster', and 'Administrator'. The 'Administrator' tab is active, displaying a section titled 'Login Credentials for the Administrator Account'. This section contains four input fields: 'Email Address' (with the value 'john.q.public@example.com'), 'Login Name' (with the value 'prtgadmin'), 'Password' (masked with dots), and 'Confirm Password' (also masked with dots). At the bottom right of the form are 'Save & Close' and 'Cancel' buttons. The caption below the screenshot reads 'PRTG Administration Tool: Administrator'.

LOGIN CREDENTIALS FOR THE ADMINISTRATOR ACCOUNT

Email Address

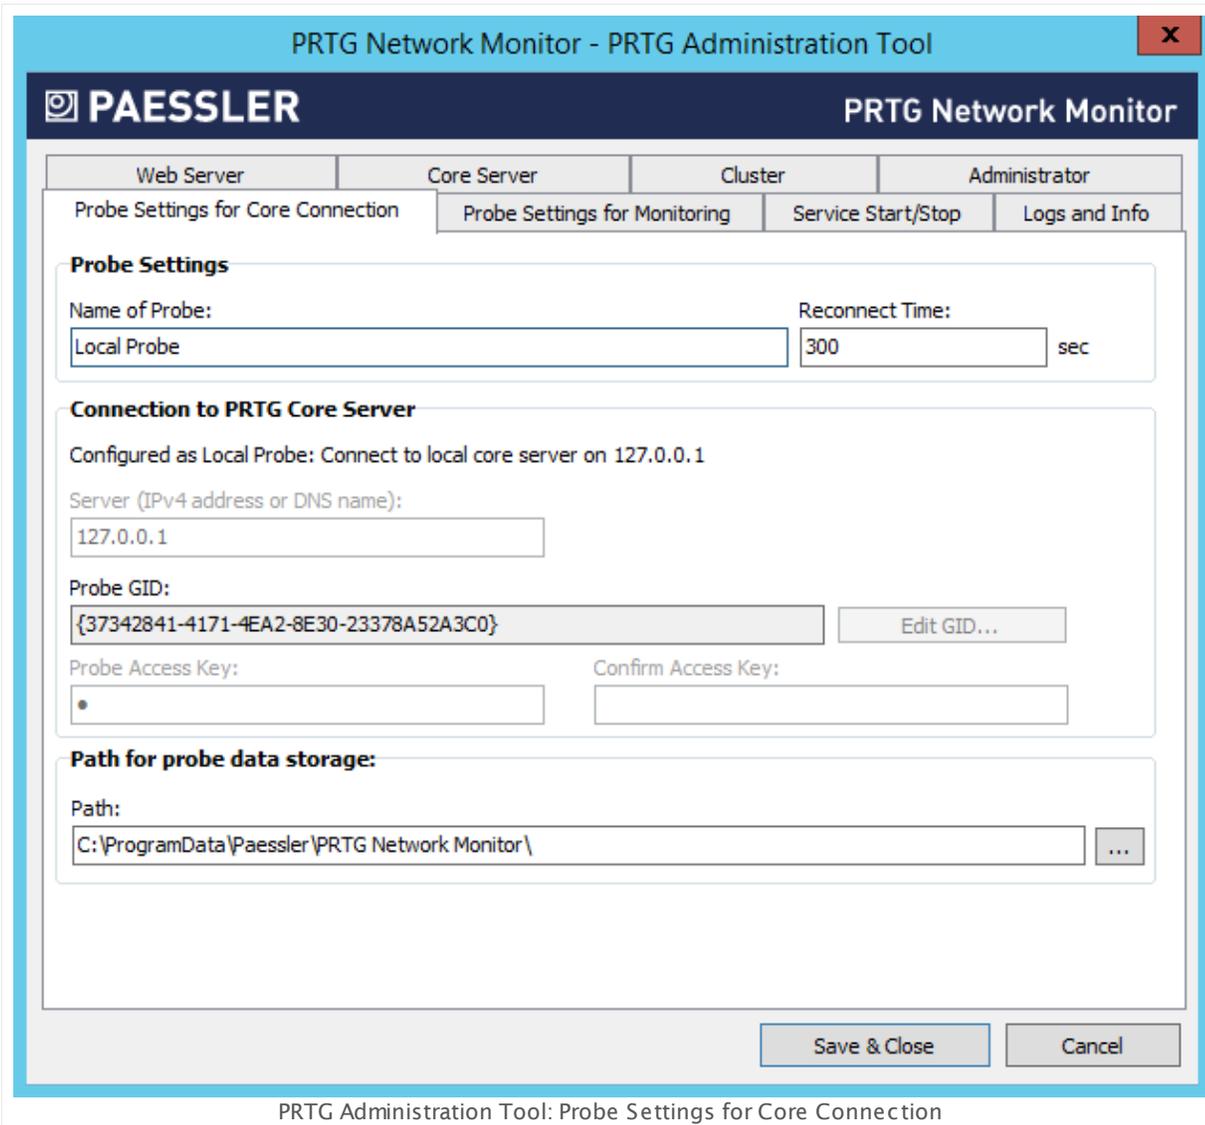

Enter a valid email address for the administrator. By default, PRTG will send notifications and important messages to this address.

LOGIN CREDENTIALS FOR THE ADMINISTRATOR ACCOUNT

Login Name	<p>Enter a name for the PRTG System Administrator login. This is your default login! You use it when you log in to the PRTG web interface or Enterprise Console.</p> <p> The default login name is prtadmin.</p>
Password	<p>Enter a password for the PRTG System Administrator login. This is your default login! You use it when you log in to the PRTG web interface or Enterprise Console.</p> <p> The default password is prtadmin.</p>
Confirm Password	<p>If you change your password, re-enter the password for the PRTG System Administrator login to confirm it.</p>

Probe Settings for Core Connection

Define general settings regarding the probe and probe connections.

PRTG Administration Tool: Probe Settings for Core Connection

PROBE SETTINGS

- Name of Probe** Enter a meaningful name to identify the probe. PRTG shows this name, for example, in the device tree, and in all alarms by default. Please enter a string.
- Reconnect Time** Define the time that PRTG will wait until the probe tries to reconnect to the core server if the connection fails. Please enter an integer value.

CONNECTION TO PRTG CORE SERVER

These settings affect the way the probe will connect to the core server. A probe is either a local probe, a hosted probe, or a remote probe. PRTG will automatically detect the type of probe and show the correct setting options.

Server (IPv4 address or DNS name)	<p>If this probe is configured as the Local Probe of the PRTG core installation, it will connect to the core via 127.0.0.1, which you cannot change.</p> <p>If this probe is configured as a Remote Probe, enter the IP address or DNS name of the core server.</p>
Probe GID	<p>The Probe GID (global ID (GID)) is a unique identifier for the probe. We recommend that you do not change it.</p> <p>Exception: Only if you substitute an existing remote probe from a different computer, you have to copy the GID from the old probe to the new probe. To do so, click the Edit GID... button and confirm the warning with Yes. You can then change the value. You cannot change the GID for a local probe.</p> <p>i You can deny GIDs under System Administration—Core & Probes in the PRTG web interface. If you remove a remote probe from the device tree or if you deny a remote probe after installation, its global ID (GID) will be automatically entered in the Deny GIDs list.</p>
Probe Access Key	<p>You do not need an access key for Local Probe connections.</p> <p>On a Remote Probe, the Probe Access Key must match one of the access keys configured in your PRTG core server installation. If it does not match, the remote probe will not be able to connect to the core server. See the System Administration—Core & Probes section for more information.</p> <p>i Check also allowed and denied IPs in System Administration—Core & Probes to ensure that the core server accepts the IP address of the remote probe.</p>
Confirm Access Key	<p>If you enter an access key for a remote probe, enter it in this field again to assure correctness.</p>

PATH FOR PROBE DATA STORAGE

Path	<p>Define the data folder to which PRTG will store configuration and monitoring data. Click the ... button to choose another folder on your system.</p>
------	---

PATH FOR PROBE DATA STORAGE

 Before you change the path, make sure you stop both the core server and the probe services and copy all data to the new location.

LANGUAGE FOR THE PRTG ADMINISTRATION TOOL FOR REMOTE PROBES

<your language>

Choose the language for the PRTG Administration Tool on your remote probe from the dropdown list. Default is **English**.

Probe Settings for Monitoring

PROBE SETTINGS FOR MONITORING

Define the IP address used for outgoing monitoring requests.

- If there is more than one IP on the current system available, you can specify the IP address that PRTG will use for outgoing monitoring requests of certain sensor types.
- This setting will be used for sensors using the following connection types: HTTP, DNS, FTP, IMAP, POP3, Port, Remote Desktop, SMTP, and SNMP.

PROBE SETTINGS FOR MONITORING

- The setting is valid for all monitoring requests sent from this PRTG probe.
- This setting is useful for devices that expect a certain IP address when queried.
- Default setting is **auto**. PRTG will select an IP address automatically.

 This feature does not support all sensor types for technical reasons.

 If you change this setting, some sensors might stop working. For example, sensors might show a **Down** status if the selected IP address is blocked on the way to or directly on the monitored device.

Outgoing IPv4 Define the IP address for outgoing requests using the IPv4 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**.

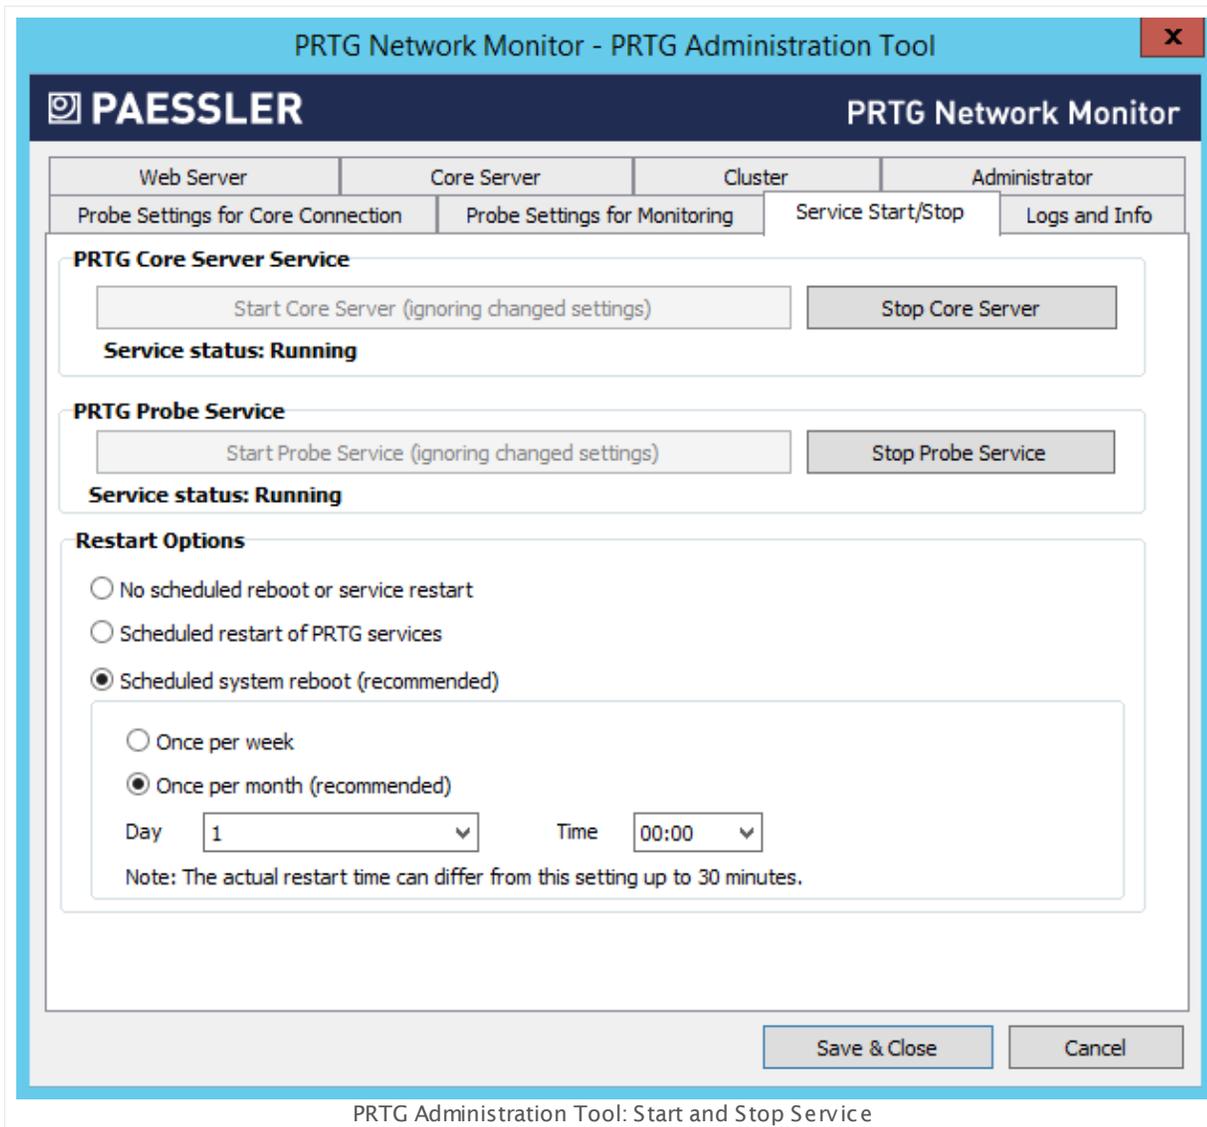

Outgoing IPv6 Define the IP address for outgoing requests using the IPv6 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**.

 For details about the basic concept of IPv6 in PRTG, see the [IPv6](#) ¹⁶³ section.

Service Start/Stop

You can stop and start PRTG Windows services manually. For connected probes, click **Start Core Server** to start the service or **Stop Core Server** to stop it. Both actions usually take from a few seconds up to several minutes to complete. You can also restart the core server and connected probes via the PRTG web interface under [Administrative Tools](#) ³³⁸⁸.

 We recommend that you set a schedule for automatic system restarts.

You can also define a restart schedule on the [Settings](#)³⁵¹ tab of a probe under **Restart Options**, in the PRTG web interface.

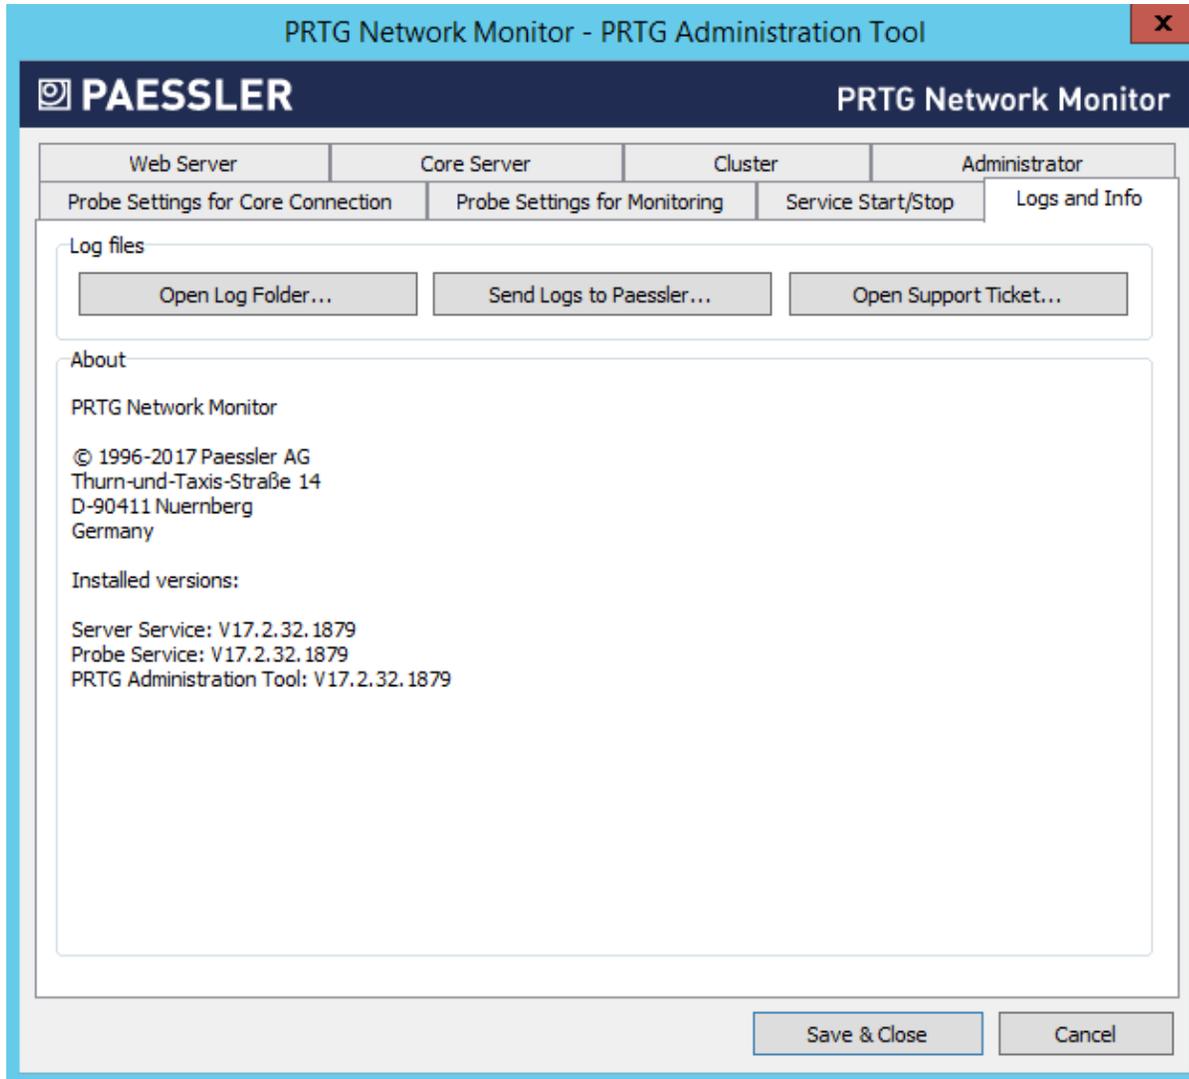

SCHEDULED RESTART SETTINGS

 This setting is not available on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SCHEDULED RESTART SETTINGS

Restart Options	<p>For best performance, we recommend that you regularly restart the Windows servers on which PRTG is running. To do this automatically for PRTG, you can schedule an automatic restart. Choose between the following options:</p> <ul style="list-style-type: none">▪ No scheduled reboot or service restart: Do not perform any scheduled restart of services automatically. We recommend a manual restart every few weeks. You can initiate a restart of your PRTG core server and probes under System Administration—Administrative Tools <small>3388</small> in the PRTG web interface.▪ Scheduled restart of PRTG services: Restart all PRTG services on the system where this probe runs on. If you choose this option on the local probe, the PRTG core server will restart as well. Define a schedule below.▪ Scheduled system reboot (recommended): We recommend this setting, although it is not set by default. Enter a schedule below. We recommend that you restart Windows servers once a month for best performance.
Restart Schedule	<p>You can only see this setting if you selected a schedule option above. Choose how often you want to restart PRTG services or the Windows server:</p> <ul style="list-style-type: none">▪ Once per week: Select a day of the week and a time below.▪ Once per month (recommended): Select a day of the month and a time below.
Specify Day	<p>You can only see this setting if you selected a schedule option above. Select a specific day of the week (Monday to Sunday) or month (1st to 30th or Last). If you select Last, the restart will always be executed on the last day of the month, regardless of how many days the month has.</p> <p>i If you select a date that does not exist in every month (for example, the 30th day in February), PRTG will automatically initiate the restart on the last day of this month.</p>
Specify Hour	<p>You can only see this setting if you selected a schedule option above. Select the time of day when PRTG will perform the restart.</p> <p>i You will get a Windows warning message 10 minutes before the restart to inform you if you are a currently logged in user. The actual restart time can differ up to 30 minutes from the settings you enter here.</p>

Logs and Info

PRTG Administration Tool: Logs and Info

LOG FILES

Open Log Folder...

Open the PRTG Network Monitor data directory on your hard disk drive to access all logfiles that PRTG creates.

Send Logs to Paessler...

Open an assistant to send logfiles to the Paessler Support Team. See [below for details](#).

You can send logfiles more easily with the support bundle via [Contact Support](#) in the PRTG web interface.

LOG FILES

Open Support Ticket... This will open the support form on the Paessler website in a browser window.

 If you need help, we recommend that you use the [Contact Support](#)  option in the PRTG web interface instead.

The **About** section shows information about the version of installed PRTG programs and copyright.

Send Logs to Paessler

 You can send logfiles more easily with the support bundle via [Contact Support](#)  in the PRTG web interface.

Send Logs to Paessler

PAESSLER
PRTG Network Monitor

Send Logs to Paessler

Name

Email

Ticket No.

Please supply your Paessler Ticket Number (PAEXXXX) if you already have an open support ticket.

Configuration Include Configuration file (contains passwords)

Note: while passwords are usually encrypted the configuration file contains SNMP communities and hostnames in plain text.

If you click the "Send" button, this program will upload the relevant log files and, if selected, the configuration file of your PRTG installation to Paessler's FTP server and support ticketing system.

Please ensure that outgoing FTP and HTTP connections are enabled on this machine.

Please note: Support communication can be provided in English or German only!

Send Logs to Paessler

If you open a support ticket, Paessler Support might ask you to send logfiles for further analysis. With the **Send Logs to Paessler...** button, PRTG will automatically collect, compress, and send your logfiles to our FTPS server.

SEND LOGS TO PAESSLER

Name

SEND LOGS TO PAESSLER

Email	Enter a valid email address. You can provide any of your addresses, but we recommend that you use the email address of your PRTG account, which is entered by default.
Ticket No.	<p>This field is optional. If you have already opened a ticket at Paessler Support, please provide the ticket number you received. Your files will then be associated with your ticket automatically.</p> <p>Please enter the ticket number starting with PAE followed by four or more digits, for example, PAE12345. If you do not have a ticket number, leave this field empty.</p>
Configuration	Define if you want to include the configuration file in the data. PRTG will remove all passwords from the config file before sending it to our support team.

Click the **Send** button to start the data upload. Ensure that FTPS and HTTP connections are allowed on this machine.

12.2 PRTG Administration Tool on Remote Probe Systems

If you start the **PRTG Administration Tool** on a system on which a PRTG [Remote Probe](#)^[3709] runs, you can define various probe related settings, restart services, and view log information. You can also change many of these settings via the [system administration](#)^[3302] and the [probe settings tab](#)^[371] in the [PRTG web interface](#)^[166].

-  This section describes the available settings in the PRTG Administration Tool when you open the tool on a **PRTG remote probe system**. This is not the complete set of available settings. If you need access to all possible settings regarding your whole PRTG installation, open the PRTG Administration Tool on the PRTG core server machine.
-  All settings you make here are valid only for the local installation running on the computer on which you open the PRTG Administration Tool. In order to change settings for another installation, for example, another remote probe installation, please log in to that computer and open the program there.
-  To get familiar with the different components of PRTG, we recommend that you read the [Architecture](#)^[125] section. If you prefer a video introduction to the **PRTG Administration Tool**, see the [More](#)^[3586] section below for more information.

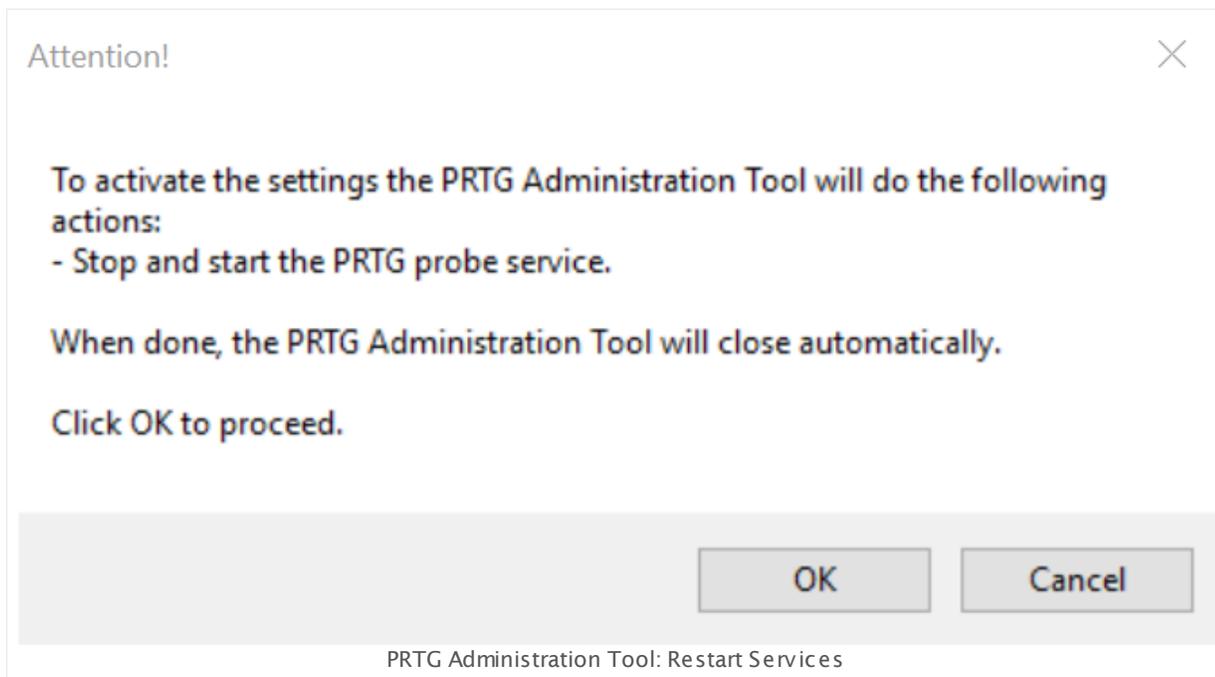

Start the PRTG Administration Tool

From the Windows start menu, select the **PRTG Network Monitor** group and click **PRTG Administration Tool** to open the application.

You can choose from these options in different tabs:

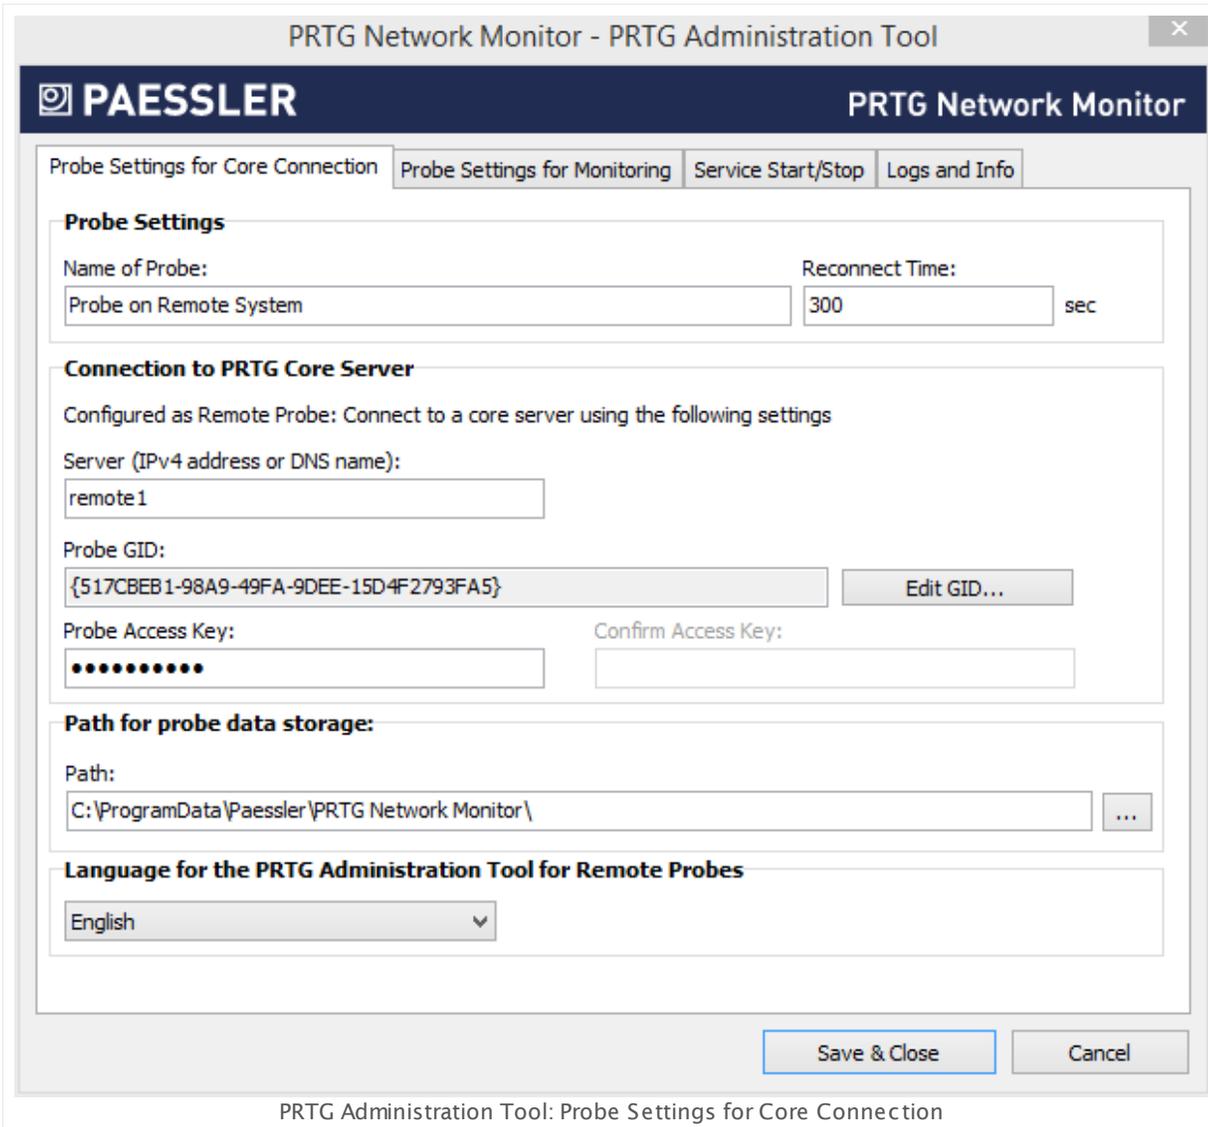

- [Probe Settings for Core Connection](#)^[3588]
- [Probe Settings for Monitoring](#)^[3592]
- [Service Start/Stop](#)^[3593]
- [Logs and Info](#)^[3596]

After you have changed settings, click the **Save & Close** button. A new window opens where PRTG asks you to agree to restart the PRTG core server service. Click **OK** if you do not want your changes to be ignored.

Probe Settings for Core Connection

Define general settings regarding the probe and probe connections.

PROBE SETTINGS

- Name of Probe Enter a meaningful name to identify the probe. PRTG shows this name, for example, in the device tree, and in all alarms by default. Please enter a string.

- Reconnect Time Define the time that PRTG will wait until the probe tries to reconnect to the core server if the connection fails. Please enter an integer value.

CONNECTION TO PRTG CORE SERVER

These settings affect the way the probe will connect to the core server. A probe is either a local probe, hosted probe, or a remote probe. PRTG will automatically detect the type of probe and show the correct setting options.

Server (IPv4 address or DNS name)	<p>If this probe is configured as the Local Probe of the PRTG core installation, it will connect to the core via 127.0.0.1, which you cannot change.</p> <p>If this probe is configured as a Remote Probe, enter the IP address or DNS name of the core server.</p>
Probe GID	<p>The Probe GID (global ID (GID)) is a unique identifier for the probe. We recommend that you do not change it.</p> <p>Exception: Only if you substitute an existing remote probe from a different computer, you have to copy the GID from the old probe to the new probe. To do so, click on the Edit GID... button and confirm the warning with Yes. You can then change the value. You cannot change the GID for a local probe.</p> <p>i You can deny GIDs under System Administration—Core & Probes^[3369] in the PRTG web interface. If you remove a remote probe from the device tree or if you deny a remote probe after installation^[107], its global ID (GID) will be automatically entered in the Deny GIDs list.</p>
Probe Access Key	<p>You do not need an access key for Local Probe connections.</p> <p>On a Remote Probe, the Probe Access Key must match one of the access keys configured in your PRTG core server installation. If it does not match, the remote probe will not be able to connect to the core server. See the System Administration—Core & Probes^[3369] section for more information.</p> <p>i Check also allowed and denied IPs in System Administration—Core & Probes^[3369] to ensure that the core server accepts the IP address of the remote probe.</p>
Confirm Access Key	<p>If you enter an access key for a remote probe, enter it in this field again to assure correctness.</p>

PATH FOR PROBE DATA STORAGE

Path	<p>Define the data folder to which PRTG will store configuration and monitoring data. Click the ... button to choose another folder on your system.</p>
------	---

PATH FOR PROBE DATA STORAGE

 Before you change the path, make sure you stop both the core server and the probe services and copy all data to the new location.

LANGUAGE FOR THE PRTG ADMINISTRATION TOOL FOR REMOTE PROBES

<your language>

Choose the language for the PRTG Administration Tool on your remote probe from the dropdown list. Default is **English**.

PRTG Administration Tool: Probe Settings for Monitoring

PROBE SETTINGS FOR MONITORING

Define the IP address used for outgoing monitoring requests.

- If there is more than one IP on the current system available, you can specify the IP address that PRTG will use for outgoing monitoring requests of certain sensor types.
- This setting will be used for sensors using the following connection types: HTTP, DNS, FTP, IMAP, POP3, Port, Remote Desktop, SMTP, and SNMP.
- The setting is valid for all monitoring requests sent from this PRTG probe.

PROBE SETTINGS FOR MONITORING

- This setting is useful for devices that expect a certain IP address when queried.
- Default setting is **auto**. PRTG will select an IP address automatically.

 This feature does not support all sensor types for technical reasons.

 If you change this setting, some sensors might stop working. For example, sensors might show a **Down** status if the selected IP address is blocked on the way to or directly on the monitored device.

Outgoing IPv4 Define the IP address for outgoing requests using the IPv4 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**.

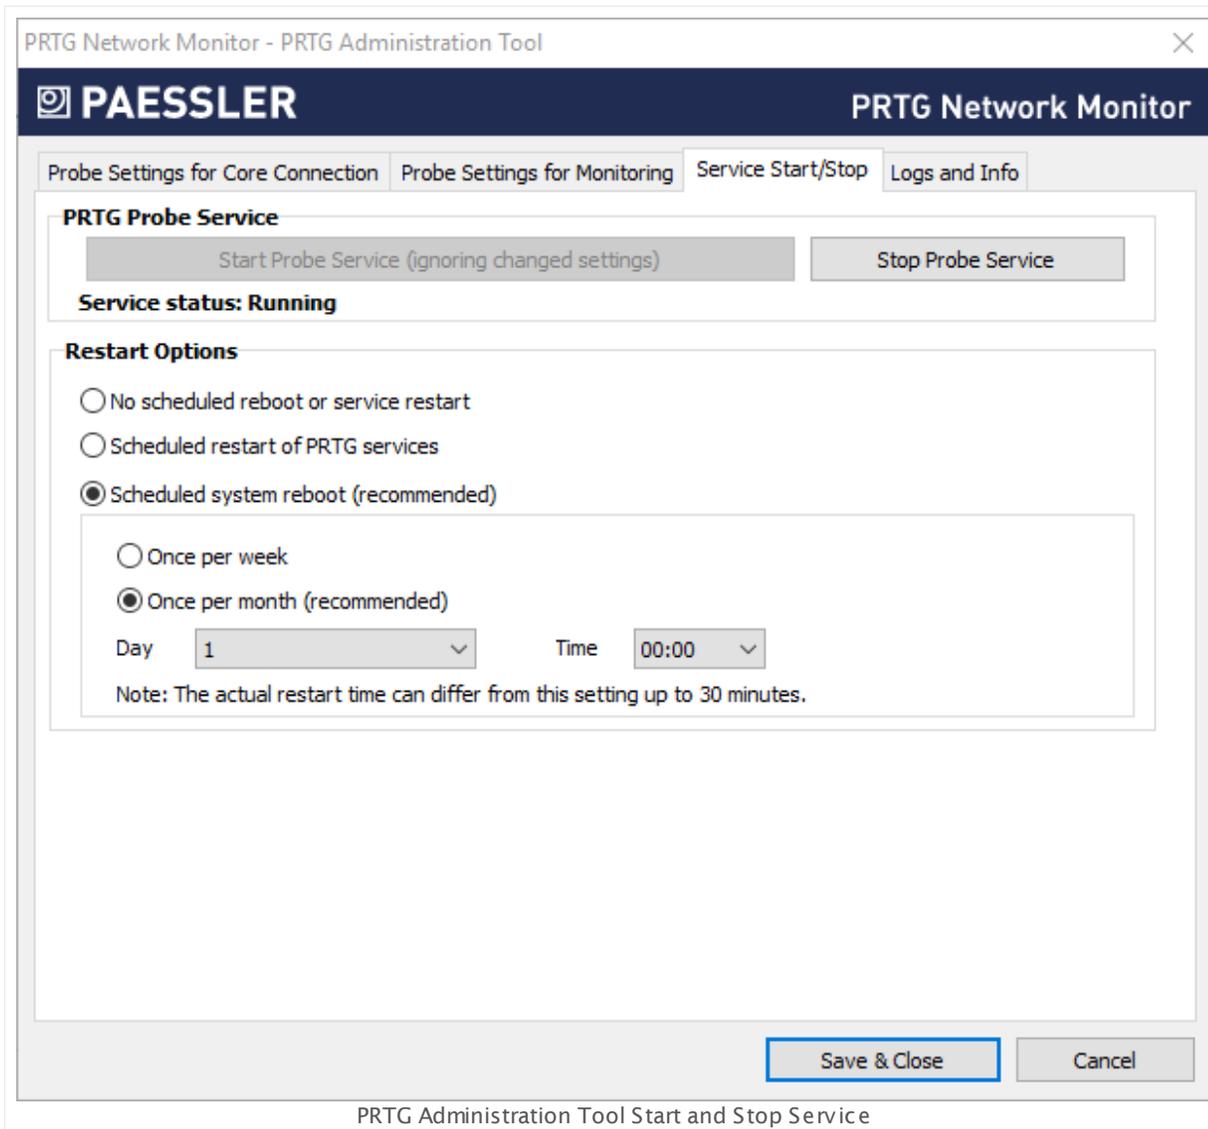

Outgoing IPv6 Define the IP address for outgoing requests using the IPv6 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**.

 For details about the basic concept of IPv6 in PRTG, see the [IPv6](#) section.

Service Start/Stop

You can stop and start PRTG Windows services manually. For connected probes, click **Start Probe Service** to start the service or **Stop Probe Service** to stop it. Both actions usually take from a few seconds up to several minutes to complete. You can also restart the core server and connected probes via the PRTG web interface under [Administrative Tools](#).

 We recommend that you set a schedule for automatic restarts.

You can also define a restart schedule on the [Settings](#)^[35] tab of a probe under **Restart Options**, in the PRTG web interface.

SCHEDULED RESTART SETTINGS

 This setting is not available on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SCHEDULED RESTART SETTINGS

Restart Options	<p>For best performance, we recommend that you regularly restart the Windows servers on which PRTG is running. To do this automatically for PRTG, you can schedule an automatic restart. Choose between the following options:</p> <ul style="list-style-type: none">▪ No scheduled reboot or service restart: Do not perform any scheduled restart of services automatically. We recommend a manual restart every few weeks. You can initiate a restart of your PRTG core server and probes under System Administration—Administrative Tools³³⁸⁸ in the PRTG web interface.▪ Scheduled restart of PRTG services: Restart all PRTG services on the system where this probe runs on. If you choose this option on the local probe, the PRTG core server will restart as well. Define a schedule below.▪ Scheduled system reboot (recommended): We recommend this setting, although it is not set by default. Enter a schedule below. We recommend that you restart Windows servers once a month for best performance.
Restart Schedule	<p>You can only see this setting if you selected a schedule option above. Choose how often you want to restart PRTG services or the Windows server:</p> <ul style="list-style-type: none">▪ Once per week: Select a day of the week and a time below.▪ Once per month (recommended): Select a day of the month and a time below.
Specify Day	<p>You can only see this setting if you selected a schedule option above. Select a specific day of the week (Monday to Sunday) or month (1st to 30th or Last). If you select Last, the restart will always be executed on the last day of the month, regardless of how many days the month has.</p> <p>i If you select a date that does not exist in every month (for example, the 30th day in February), PRTG will automatically initiate the restart on the last day of this month.</p>
Specify Hour	<p>You can only see this setting if you selected a schedule option above. Select the time of day when PRTG will perform the restart.</p> <p>i You will get a Windows warning message 10 minutes before the restart to inform you if you are a currently logged in user. The actual restart time can differ up to 30 minutes from the settings you enter here.</p>

i You can also define a restart schedule on the **Settings** tab of a probe, section [Scheduled Restart Settings](#)³⁷¹, in the PRTG web interface.

Logs and Info

LOG FILES

Open Log Folder...

Open the PRTG Network Monitor data directory on your hard disk drive to access all logfiles that PRTG creates.

Send Logs to Paessler...

Open an assistant to send logfiles to the Paessler Support Team. See [below for details](#).

Part 13

Advanced Topics

13 Advanced Topics

In this section, we cover topics that address more advanced PRTG users. If you already have some experience with PRTG, you might want to learn more about the following topics.

Advanced Topics

- [Active Directory Integration](#)  3683
- [Application Programming Interface \(API\) Definition](#)  3686
- [Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors](#)  3688
- [Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors](#)  3690
- [Define IP Ranges](#)  3692
- [Define Lookups](#)  3693
- [Regular Expressions](#)  3704
- [Add Remote Probe](#)  3707
- [Failover Cluster Configuration](#)  3720
- [Data Storage](#)  3734
- [Using Your Own SSL Certificate](#)  3736
- [Calculating Percentiles](#)  3706

13.1 Active Directory Integration

PRTG offers a detailed rights management via different user groups. For detailed information, see [User Access Rights](#)¹⁵⁸.

To make user management easier, you can integrate an existing Active Directory into PRTG in four steps. During this process, you connect an **Active Directory (AD)** group with a user group in PRTG. All members of your AD group can then log in to PRTG using their AD domain credentials.

 You cannot add single AD users to PRTG, but only allow access for entire groups. PRTG automatically creates a user account for each AD user who logs in to PRTG successfully.

 This feature is not available in PRTG hosted by Paessler.

Step 1: Prepare Your Active Directory

- In your Active Directory, ensure users you want to give access to PRTG are member of the same AD group.
- You can also organize users in different groups, for example, one group whose members will have administrator rights within PRTG, and another one whose members will have read-only rights within PRTG.

Step 2: Prepare Your PRTG Server

- Make sure the computer running PRTG is member of the domain you want to integrate it to. You can check this setting in your machine's **System Properties** (for example, **Control Panel | System and Security | System**, click **Change settings** link).

Step 3: Add Domain and Credentials (optional) to System Settings

- In the PRTG [web interface](#)¹⁶⁶, open the [System Administration—Core & Probes](#)³³⁷² settings.
- In section **Active Directory Integration**, enter the name of your local domain into the **Domain Name** field.
 -  You can only integrate one AD domain into PRTG.
- **Optional:** PRTG uses the same Windows user account that you use to run the **PRTG Core Server Service**. By default, this is the **local system** Windows user account. If this user does not have sufficient rights to query a list of all existing groups from the Active Directory, provide credentials of a user account with full AD access by using the **Use explicit credentials** option as **Access Type**.
 -  If you cannot save changes to **Core & Probes** settings because you get an **Error (Bad Request)** with the message **Active Directory Domain not accessible**, change from "local user" to **Use explicit credentials** for **Active Directory Integration** and provide the correct credentials for your domain.
- **Save** your settings.

Step 4: Add a New User Group

- Switch to the **User Groups** tab (see [System Administration—User Groups](#)^[338]).
- Hover over  and click **Add User Group** to add a new PRTG user group.
- In the dialog appearing, enter a meaningful name and set the **Use Active Directory** setting to **Yes**.
- From the **Active Directory Group** dropdown menu, select the group of your Active Directory whose members will have access to PRTG. If you have a very large Active Directory, you will see an input field instead of a dropdown. In this case, you can enter the group name only; PRTG will add the prefix automatically.
- With the **New User Type** setting, define the [access rights](#)^[158] a user from the selected Active Directory group will have when logging in to PRTG for the first time. You can choose between **Read/Write User** or **Read Only User** (latter is useful to show data only to a large group of users).
- **Save** your settings.

Done

That's it. All users in this Active Directory group can now log in to PRTG using their AD domain credentials. Their user accounts will use the PRTG security context of the PRTG user group you just created.

Notes and Limitations

- Active Directory users can [log on to the web interface](#)^[168] using their Windows username and password (please do not enter any domain information in PRTG's **Login Name** field). When such a user logs in, PRTG will automatically create a corresponding local account on the PRTG core server. Credentials are synchronized every hour.
- All requests to the Active Directory servers are cached for one hour, for performance reasons. If a password is changed in the Active Directory, you must either wait for 1 hour or clear the cache manually by clicking on the **Clear Caches** button on the [System Administration—Administrative Tools](#)^[338] page in the [Setup](#)^[3302] menu).
- By default, there are not set any rights for the new PRTG user group. Initially, users in this group will not see any objects in the PRTG device tree. Edit your device tree [object's settings](#)^[217] and set access rights for your newly created user group in the **Inherit Access Rights** section.
 - ❗ The easiest way is to set access rights in the [Root Group Settings](#)^[331].
- PRTG only supports explicit group rights. If your AD uses groups that are member of another group, PRTG will **not** regard inherited implicit rights of the parent group and therefore refuse login for members of those groups.
- PRTG ignores AD information about **Organizational Units (OUs)**. These values cannot be read by PRTG. However, if you use the AD in an [auto-discovery group](#)^[285], you can restrict the search to computers that are part of an OU.
- PRTG does not support SSO (single sign-on).
- You can integrate only one AD domain into PRTG.

- PRTG does not support trusted domains or AD subdomains.
- For very large Active Directories, you will see an input field instead of a dropdown when you add or modify a user group. In this case, you can enter the group name only. PRTG will add the prefix automatically.
- A PRTG user account for an AD user is only created if this AD user successfully logs in to PRTG! So if you want to send [email notifications](#) to an AD user group (using the option "Send to User Group" in the notification settings), for example, by choosing the default notification "Email to all members of group [AD group name]", a member of this AD group has to log in to PRTG at least once to be able to receive an email notification. If you want to avoid these single logons of your AD group members to create user accounts, enter the email address of the AD group into the "Send to Email Address" field in the notification settings and choose "None" for the "Send to User Group" option.
- If you want to delete an AD group from PRTG (due to some changes to the AD, for example), you have to delete all users that are in this PRTG user group first. This is because AD users always have this group as their primary group, which cannot be changed.
- If you want to reflect changes to your AD in PRTG, you have to delete the AD user group and all members first. Then add the AD group anew. This is because PRTG does not synchronize with your AD automatically.

13.2 Application Programming Interface (API) Definition

The PRTG Application Programming Interface (API) enables you to access monitoring data and manipulate objects using HTTP requests, run your own written sensors and notifications, and implement Mini Probes.

-  An interactive documentation of the API is also integrated into your PRTG installation: [Login to the web interface](#) ¹⁶⁸ and select **Setup | PRTG API** from the main menu.

The following sections introduce the available options within the PRTG API:

- [HTTP API](#) ³⁶⁰⁷
- [Live Data](#) ³⁶¹⁰
- [Live Graphs](#) ³⁶²⁵
- [Historic Data](#) ³⁶²⁸
- [Object Manipulation](#) ³⁶³¹
- [Custom Sensors](#) ³⁶³⁷
- [Custom Notifications](#) ³⁶⁵⁸
- [Mini Probe API](#) ³⁶⁶⁰

The documentation that comes with your PRTG installation fits exactly the PRTG version you are using.

Knowledge Base: How can I share my self-written PRTG script/program with other PRTG users?

- <https://kb.paessler.com/en/topic/63737>

Knowledge Base: Where can I find PRTG Mini Probes which are ready to use?

- <https://kb.paessler.com/en/topic/61215>

13.2.1 HTTP API

All calls to the PRTG HTTP API are performed by HTTP GET requests. The URLs consist of a path to the API function and some parameters.

- If you are accessing the API inside your secure LAN, you can simply use HTTP. In insecure environments (for example, when accessing your PRTG server across the internet), you should **use HTTPS requests** to make sure that your parameters and passwords are encrypted. This way all communication between the PRTG server and your client is SSL-encrypted.
- For every API call, the default limit of items is **500**. If you want to receive more items per call, add a **count=xxx** parameter with enough room for all sensors.
- Authentication with username and [passhash](#)³³⁰⁵ (or username and password) must always be included in each request. See section [Authentication](#)³⁶⁰⁷ for more information.
- All data in the GET parameters must be **UTF-8** encoded and **URL** encoded.

Here are two example API calls:

Examples

```
https://yourserver/api/table.xml?content=sensors&columns=sensor
```

or:

```
https://yourserver/api/table.xml?content=sensors&columns=sensor
```

The example URLs consist of the following elements:

- **yourserver**: the name of your PRTG server.
- **/api/table.xml**: addresses an API function. Here the function renders a table in Extensible Markup Language (XML) format.
- **content=sensors**: parameter for additional control. In this case, it includes all sensors in the table.
- **columns=sensor**: parameter for additional control. In this case, only the names of all sensors are shown in the table.

Authentication

All requests to the API are stateless, which means that there is no multi-step login process of an kind. The authentication with username and [passhash](#)³³⁰⁵ (or username and password) must always be included in each request by using the username and passhash (or username and password) parameters.

Examples

```
https://yourserver/api/table.xml?content=sensors&columns=sensor&username=myuser&passw
```

or:

```
https://yourserver/api/table.xml?content=sensors&columns=sensor&username=myuser&passw
```

The example URLs now also contain the credentials for authentication purposes:

- **username=myuser&passhash=hash** (or **password=mypassword**)

You can request the passhash for an account with the following API call:

```
https://yourserver/api/getpasshash.htm?username=myuser&password=mypassword
```

- ⓘ Make sure that the username and password are URL encoded.

Versioning

Most XML replies from the API contain a **<version>** field that contains the program version and buildnumber of the server's PRTG installation. Your client must look at this version number and compare it to the version number that was used to develop the client. Do not accept version numbers older (smaller) than this one. You should display a warning to the user (or stop processing) if the version number differs by **0.1** or more (for example, version **18.1** vs. **18.2**, or version **17.x** vs. **18.x**). API conventions or parameters may have changed between versions.

- ⓘ Newer versions of the same major version of PRTG will reply to API calls just as previous versions have.

Error Handling

Depending on whether your API call was processed successfully or not, the PRTG server will reply with the following HTTP status codes:

HTTP STATUS CODE	MEANING	COMMENTS
200	OK	The API call was completed successfully, the XML response contains the result data.
302	Found	The API call was completed successfully and a new object was created (the redirection URL contains the new object id).
400	Bad Request	The API call could not be completed successfully. The XML response contains the error message.

HTTP STATUS CODE	MEANING	COMMENTS
401	Unauthorized	The username/password credentials cannot be accepted.

For 400 error codes, the error XML document will include the error message as follows:

```
<?xml version="1.0" encoding="UTF-8" ?>
  <prtg>
    <version>18.1.37.10127+</version>
    <error>Sorry, there is no object with the specified id.</error>
  </prtg>
```

More

Knowledge Base: How can I use the PRTG Application Programming Interface (API)?

- <https://kb.paessler.com/en/topic/593>

13.2.2 Live Data

You can access live data and live status data of objects using the PRTG Application Programming Interface (API).

 Authentication with username and [passhash](#)³³⁰⁵ (or username and password) must always be included in each PRTG API request. See section [Authentication](#)³⁶⁰⁷ for more information.

Getting One Single Property or Status of an Object

You can get the properties or settings of an object (name, hostname, url) as well as status information (lastvalue, downtime) using the following API calls:

Examples

Get an object property/setting:

```
/api/getobjectproperty.htm?id=objectid&name=propertyname
```

 For **propertyname**, look at the name of the INPUT fields while editing an object.

Get object status:

```
/api/getobjectstatus.htm?id=objectid&name=columnname
```

 For **columnname**, see section [Supported Output Columns \("columns=" Parameter\)](#)³⁶¹⁶.

The XML result looks like this:

```
<?xml version="1.0" encoding="UTF-8" ?>
<prtg>
  <version>18.1.37.10127+</version>
  <result>True</result>
</prtg>
```

Sensor Details

 You need the sensor ID to get details about a sensor. You can find the ID on the sensor's [overview](#)¹⁹⁸ tab or by hovering over a sensor in the device tree, for example.

Examples

Get details about a sensor in XML:

```
/api/getsensordetails.xml?id=sensorid
```

Get details about a sensor in JSON:

```
/api/getsensordetails.json?id=sensorid
```

Getting Property or Status of Multiple Objects

Most data that you can request from the API is available in data tables in XML, JSON, and CSV format (using XML format is recommended). The API function `/api/table.xml` is used to access data in tables. Here are some sample calls (URLs are shown without authentication parameters to improve readability).

 The example URLs only show the XML URLs. Use the API function `/api/table.csv` or the `output=csvtable` parameter to select CSV format, or `/api/table.json` to return JSON format.

Examples

A hierarchical list of all groups, devices, and sensors with their current status information:

```
/api/table.xml?content=sensortree
```

All sensors (with current status information):

```
/api/table.xml?content=sensors&columns=objid,group,device,sensor,status,message,last
```

All recent log entries:

```
/api/table.xml?content=messages&columns=objid,datetime,parent,type,name,status,message
```

 **sensortree** does not support JSON output.

You will have the easiest start if you use the [XML table query builder](#)  or click the XML icon that most data tables have in the PRTG web interface. Simply navigate to the information that you want to use, click the XML icon, and you will be taken to a URL that renders the content of the table in XML format. You can now use the URL as it is or change various parameters to suit your needs.

 For more information on possible raw message status values returned by table-based API calls, see the Knowledge Base article [Is there a list of log status values for the PRTG API?](#)

XML Table Query Builder

You can use the query builder tool to experiment with the API and to fine-tune your queries. You can find it in the web interface under **Set up | PRTG API**, section **Live Data**.

Output Data Format

XML data from the PRTG API contains the fields that you have requested in the **columns** parameter. In most cases, numerical values will be included twice: One field contains the value in human-readable format and an additional "RAW" field contains the value as a number, which is better suited for further processing and calculations.

Example

```
<status>Up</status>
<status_RAW>3</status_RAW>
<lastvalue>98 %</lastvalue>
<lastvalue_RAW>97.7583</lastvalue_RAW>
<message>Created.<br/>18.3.43.1360</message>
<message_RAW>Created. 18.3.43.1360</message_RAW>
```

- The **status** field shows the value **Up** (the according RAW value is **3**).
- The **lastvalue** field shows the value **98%** (the according RAW value is **97.7583**).
- The **message** field shows the text **Created.
18.3.43.1360** (the according RAW value is **Created. 18.3.43.1360**).

RAW Date/Time Format

For columns with date/time value, the RAW value is defined as follows: The integral part of a value is the number of days that have passed since Dec 30th, 1899. The fractional part of a value is a fraction of a 24-hour day that has elapsed. To find the fractional number of days between two dates, simply subtract the two values. Similarly, to increment a date and time value by a certain fractional number of days, add the fractional number to the date and time value.

Here are some examples of date/time RAW values and their corresponding dates and times:

RAW DATE/ TIME VALUE	DESCRIPTION
0	12/30/1899 00h00m (12:00 midnight)
2.75	1/1/1900 18h00m (6:00 pm)
35065	1/1/1996 00h00m (12:00 midnight)

Common Data Table Parameters

The following parameters are common to all data table API calls:

PARAMETER	DESCRIPTION	POSSIBLE VALUES
content	Selects what objects you want to have in your table	sensortree (JSON output not supported), devices, sensors, tickets, ticketdata, messages, values, channels, reports, storedreports, toplists
columns	Comma-separated list of columns per record	see Supported Output Columns ("columns=" Parameter)
output	Controls the output format	<ul style="list-style-type: none"> ▪ xml: default format (recommended) ▪ xmltable: an HTML table in XML format ▪ csvtable: comma-separated format ▪ html: HTML table ▪ json: JSON format ▪ jsontable: a table in JSON format
count	Maximum number of items (default 500)	1-50000
start	Start with this entry number (can be used with "count" to request the data page-by-page)	any

Filtering by Object ID

Add an ID parameter (for example, `id=1`) to the API URL to select a subset of items for the data table, for example, to reduce the amount of data transferred for each data table API call). The data table will only contain information for this object ID and its child objects.

 Some table types require an ID. If you omit the ID parameter or it has the value zero (0), all available objects will be used.

TABLE TYPE (CONTENT =)	ID REQUIRED OR OPTIONAL	DESCRIPTION	OBJECT TYPES ALLOWED FOR THE ID
sensortree	optional	You will only get a part of the tree (the object with the given ID and all child objects below it).  JSON output is not supported.	Probe or group
sensors devices	optional	You will only get the object with the given ID and all child objects below it.	Probe, group, or device
tickets messages	optional	You will only get tickets or logfile entries that are related to the object with the given ID or any child objects below it.	Any object
values channels	required	You will get the data values (or channels) of the sensor with the given ID.	Sensor
reports	not used	This data table will always include all reports.	n/a
storedreports	required	You will get a list of stored PDF files of the report selected by the ID.	Report
ticketdata	required	You will get the history of the ticket selected by the ID.	Ticket

Sorting and Advanced Filtering

There are various options to further filter and to sort the data for each data table API call:

PARAMETER	DESCRIPTION	POSSIBLE VALUES
filter_drel	Only include records younger than this setting  For content=messages and content=tickets only.	today, yesterday, 7days, 30days, 12months, 6months

PARAMETER	DESCRIPTION	POSSIBLE VALUES
filter_status	<p>Only include sensors with a specific status. Using multiple filter_status fields performs a logical OR.</p> <p> For content=sensors only.</p>	<p>Unknown=1, Collecting=2, Up=3, Warning=4, Down=5, NoProbe=6, PausedbyUser=7, PausedbyDependency=8, PausedbySchedule=9, Unusual=10, PausedbyLicense=11, PausedUntil=12, DownAcknowledged=13, DownPartial=14</p>
filter_tags	<p>Only include sensors with a specific tag. Using multiple filter_tag fields performs a logical OR.</p> <p> For content=sensors only.</p>	<p>@tag(tagname)</p>
filter_xyz	<p>Filters the data. (Samples: filter_type=ping, filter_favorite=1). Using multiple filter_xyz fields performs a logical OR.</p> <p>Filtering using columns is only possible for tree objects. You cannot use columns to filter objects like messages or tickets, for example. For content=tickets, you can use the special filter terms filter_status, filter_user, and filter_type (this corresponds to column tickettype).</p> <p>Like for messages, you can also use filter_drel, filter_dstart, and filter_dend.</p> <p> Multiple filters are not available for tickets.</p>	<p>filter_xyz where xyz is any column name used in the columns parameter</p> <p>Substrings: use filter_xyz=@sub (substring1,substring2)</p> <p>Values not equal/above/below: use filter_xyz=@neq(value), filter_xyz=@above (value), filter_xyz=@below(value)</p>

PARAMETER	DESCRIPTION	POSSIBLE VALUES
sortby	Sorts the data. If this parameter is omitted, the table will be sorted based on the first column. Add a leading "-" to reverse sort order. (Samples: sortby=name, sortby=lastvalue, sortby=-lastvalue, sortby=uptime)	Any column name used in the columns parameter.  Log tables with content=messages are always sorted by descending date.

Examples

Here are some samples for filtered API calls:

All sensors that are not up (with their current state and downtime information):

```
/api/table.xml?content=sensors&columns=objid,downtimesince,device,sensor,lastvalue,status
```

Fastest Ping sensors:

```
/api/table.xml?content=sensors&columns=objid,sensor,lastvalue,status,message&sortby=lastvalue
```

Log entries of the last 7 days for object id 2003:

```
/api/table.xml?content=messages&id=2003&start=0&filter_drel=7days&columns=objid,date
```

Supported Output Columns ("columns=" Parameter)

You can use the following column names for the **columns** parameter (separated by comma, for example, **columns=objid,name,type**).

COLUMN NAME	DESCRIPTION	CAN BE USED FOR
objid	ID of the current object	all object tables
type	Displays the object type (group, device, report, etc.), or the sensor type (ping, http, etc.), or event type for tickets (relevant for ToDo tickets)	all object tables
name	Name of the object or channel. For log messages/tickets: the name of the related object.	all object tables, channels, messages, storedreports, toplists, tickets

COLUMN NAME	DESCRIPTION	CAN BE USED FOR
	For stored reports: the name of the report file.	
tags	List of all tags (for tickets: tags for the related object). This includes tags from the object itself plus those inherited from parent objects.	all object tables
active	Displays true/false depending on whether an object is set to paused by a user (for tickets: related object). For notifications that are paused by schedule, it also displays the end of the schedule.	all object tables
downtime	Cumulated downtime of a sensor (displayed as percentage of uptime+downtime)	sensors
downtime	Cumulated downtime of a sensor (in minutes/hours)	sensors
downtimesince	Elapsed time since last UP of a sensor	sensors
uptime	Cumulated uptime of a sensor (displayed as percentage of uptime+downtime)	sensors
uptime	Cumulated uptime of a sensor (in minutes/hours)	sensors
uptimesince	Elapsed time since last DOWN of a sensor	sensors
knowntime	Sum of cumulated uptime and downtime of a sensor	sensors
cumsince	Timestamp when accumulation of uptimes/downtimes began	sensors
sensor	Name of the sensor	sensors, toplists

Part 13: Advanced Topics | 2 Application Programming Interface (API) Definition
2 Live Data

COLUMN NAME	DESCRIPTION	CAN BE USED FOR
interval	This displays the effective interval setting for a sensor	sensors
lastcheck	Timestamp of the last sensor result	sensors
lastup	Timestamp of the most recent UP status	sensors
lastdown	Timestamp of the most recent DOWN status	sensors
device	Name of the associated device	sensors, devices
group	Name of the associated group	sensors, devices, groups
probe	Name of the associated probe	sensors, devices, groups, probes
grpdev	Name of associated device and group separated by slash	sensors, devices
notifiesx	Number of each trigger type defined for this sensor tree object	probes, groups, devices, sensors
intervalx	Displays either 'inherited' or the current interval setting of that object	probes, groups, devices, sensors
access	Displays the access rights of the current user for a sensor tree object	probes, groups, devices, sensors
dependency	Displays the name of an associated dependency or 'parent'	probes, groups, devices, sensors
probegroupdevice	Complete object hierarchy with names of associated device, group, and probe separated by slash. If more than one group is in the object hierarchy, these are displayed with '..'	sensor, device, group, probe

COLUMN NAME	DESCRIPTION	CAN BE USED FOR
status	<p>For sensor tree objects: status of the object (1=Unknown, 2=Scanning, 3=Up, 4=Warning, 5=Down, 6=No Probe, 7=Paused by User, 8=Paused by Dependency, 9=Paused by Schedule, 10=Unusual, 11=Not Licensed, 12=Paused Until, 13=Down Acknowledged, 14=Down Partial)</p> <p>For messages: category of the log message</p> <p>For tickets: status of ticket (open, resolved, closed)</p>	sensors, devices, groups, probes, messages, tickets
message	Detailed message of a sensor tree object (for example, last error of a sensor) or a history entry, log entry, ticket subject	sensors, devices, groups, probes, messages, tickets, ticketdata, history
priority	Displays the priority setting of a sensor tree object or the priority of a log entry/ticket	sensors, devices, groups, probes, messages, tickets
lastvalue	<p>Last sensor result value or channel values.</p> <p>When used with channels, the 'lastvalue_' has to be used to automatically display volumes and speed</p>	sensors, channels
upsens	<p>Number of sensors currently in UP state.</p> <p>Only the sensor itself or sensors in the hierarchy below the displayed object are counted</p>	all sensors, devices, groups, probes
downsens	<p>Number of sensors currently in DOWN state.</p> <p>Only the sensor itself or sensors in the hierarchy below the displayed object are counted</p>	all sensors, devices, groups, probes

COLUMN NAME	DESCRIPTION	CAN BE USED FOR
downacksens	<p>Number of sensors currently in DOWN (ACKNOWLEDGED) state.</p> <p>Only the sensor itself or sensors in the hierarchy below the displayed object are counted</p>	all sensors, devices, groups, probes
partialdownsens	<p>Number of sensors currently in PARTIAL DOWN state.</p> <p>Only the sensor itself or sensors in the hierarchy below the displayed object are counted</p>	all sensors, devices, groups, probes
warnsens	<p>Number of sensors currently in WARNING state.</p> <p>Only the sensor itself or sensors in the hierarchy below the displayed object are counted</p>	all sensors, devices, groups, probes
pausedsensors	<p>Number of sensors currently in a PAUSED state. This includes all PAUSED states (paused by user', 'paused by dependency, 'paused by schedule', etc.)</p>	all sensors, devices, groups, probes
unusualsens	<p>Number of sensors currently in UNUSUAL state.</p> <p>Only the sensor itself or sensors in the hierarchy below the displayed object are counted</p>	all sensors, devices, groups, probes
undefinedsens	<p>Number of sensors currently in UNDEFINED state.</p> <p>Only the sensor itself or sensors in the hierarchy below the displayed object are counted</p>	all sensors, devices, groups, probes
totalsens	<p>Number of sensors.</p> <p>Only the sensor itself or sensors in the hierarchy below the displayed object are counted</p>	all sensors, devices, groups, probes

COLUMN NAME	DESCRIPTION	CAN BE USED FOR
value	Displays a channel value or a toplist value. Should only be used as 'value_', because then it will be expanded for all visible channels/toplist columns	values, topdata
coverage	Displays the sensor coverage of a time span in a value table	values
favorite	Displays an exclamation mark when the sensor tree object is marked as favorite	sensors, devices, groups, probes
user	Displays the user responsible for a history entry or the user (or user group) a ticket is assigned to	history, tickets, ticketdata
parent	Name of the parent object of the associated object of a log message	messages
datetime	Timestamp or timespan of an object (for tickets: last modification)	messages, tickets, ticketdata, values, history, storedreports, topidx
dateonly	Like datetime but only the date part	messages, tickets, history, values
timeonly	Like datetime but only the time part	messages, tickets, history, values
schedule	For sensor tree objects: displays the name of an associated schedule For reports: displays the report generation schedule	probes, groups, devices, sensors, reports
period	Displays the period of a report (day, week, etc.)	reports
email	Displays the email address of a report	reports

Part 13: Advanced Topics | 2 Application Programming Interface (API) Definition
2 Live Data

COLUMN NAME	DESCRIPTION	CAN BE USED FOR
template	Displays the template used by a report	reports
lastrun	Timestamp of the last generation of a report	reports
nextrun	Timestamp of the next generation of a report	reports
size	Size of a stored report	size of a stored report
minigraph	Numerical data for the minigraphs. Numbers are 5-minute averages for the last 24 hours (must be scaled to the maximum of the series). There are two datasets: " " separates measured value series and error series.	sensors
deviceicon	Device icon	devices
comments	Object comments For tickets: related object	all objects
host	Hostname or IP address	devices
devices	For probes: probe status (0=Disconnected, 1=Unauthorized, 2=Connected, 3=Banned, 4=Init) For groups: auto-discovery status	probes, groups
basetype	Object type (string)	all tree objects
baselink	URL of the object	all tree objects
icon	URL of the device icon	devices
parentid	ID of the parent object or ID of a ticket	all tree objects, tickets

COLUMN NAME	DESCRIPTION	CAN BE USED FOR
location	Location property (used in Geo Maps)	devices
fold	Sub-objects are folded up (true) or down (false) For tickets: user (or user group) to which a ticket is assigned read it since last change	probes, groups, tickets
groupnum devicenum	Number of groups/devices in a probe/group node	probes, groups
tickettype	Type of the ticket: user, notification, todo	tickets
modifiedby	User who edited the ticket most recently	tickets, ticketdata
actions	Types of all ticket edits	ticketdata
content	The text of the ticket that was added with the last edit	ticketdata

Requesting Current System Status

The following API calls are lightweight options to get status data like number of alarms or messages.

Examples

Current system status in XML format:

```
/api/getstatus.xml?id=0
```

Current system status in JSON format:

```
/api/getstatus.htm?id=0
```

All currently used sensor types in JSON format:

```
/api/sensortypesinuse.json
```

Current number of all sensor states:

Part 13: Advanced Topics | 2 Application Programming Interface (API) Definition
2 Live Data

```
/api/gettreenodestats.xml
```

Requesting Current Ticket Status and Message

The following API calls return status and message of a ticket.

Examples

The status of a ticket:

```
/api/getticketstatus.htm?id=ticketid
```

The subject and assignee of a ticket:

```
/api/getticketmessage.htm?id=ticketid
```

More

Knowledge Base: How can I use the PRTG Application Programming Interface (API)?

- <https://kb.paessler.com/en/topic/593>

13.2.3 Live Graphs

You can use live sensor graphs from PRTG in other web pages using the PRTG API. PRTG renders graphs as PNG or SVG files. You can include them in other web pages.

i Authentication with username and [passhash](#)^[3305] (or username and password) must always be included in each PRTG API request. See section [Authentication](#)^[3607] for more information.

Examples

Live graph as PNG:

```
/chart.png?type=graph&width=300&height=160&graphid=2&id=0
```

Live graph as SVG:

```
/chart.svg?type=graph&width=300&height=160&graphid=2&id=0
```

i To switch between PNG and SVG, just change the file extension of `/chart` to `.png` or `.svg`.

i The URL does not start with `/api`. When placing these URLs on web pages, keep in mind that the URLs contain the account username and password/passhash. This can imply security concerns. We recommend that you set up a dedicated [read-only](#)^[158] user account in PRTG that is member of a dedicated user group, for example, that only has read rights for the root group and all underlying entries or, even better, only for the object IDs that are used for graph URLs.

Parameters for Live Graph URLs (`chart.png` or `chart.svg`)

PARAMETER	DESCRIPTION
type	Must be graph
graphid	Selects time span of the graph: 0=live, 1=last 48 hours, 2=30 days, 3=365 days
width	Width of the image in pixels
height	Height of the image in pixels
id	The object ID of the desired graph object. This is usually the ID of a sensor.
graphstyling	Allows control of some graph styles: <ul style="list-style-type: none"> Display legend: <code>graphstyling=showLegend%3D%271%27</code>

PARAMETER	DESCRIPTION
	<ul style="list-style-type: none"> ▪ Hide legend: <code>graphstyling=showLegend%3D%270%27</code> ▪ Control font size: <code>graphstyling=baseFontSize%3D%27XX%27</code> (XX is the font size) ▪ Control legend and font size at the same time: <code>graphstyling=showLegend%3D%271%27+baseFontSize%3D%275%27</code>
<code>bgcolor</code>	<p>Background color of the PNG image, for example, <code>#ffffff</code>. This affects the area that surrounds the graph.</p> <p> The value must be URL-encoded, for example, <code>%23ffffff</code>.</p>
<code>plotcolor</code>	<p>Color of the graph's plot area, for example, <code>#ffffff</code>. This affects the whole area within the graph box.</p> <p> The value must be URL encoded, for example, <code>%23ffffff</code>.</p>
<code>plotcolor1</code>	<p>Alternating color of the graph's plot area, for example, <code>#ffffff</code>. This affects the tiles within the graph box alternating with <code>plotcolor2</code>. The result is a striped graph box.</p> <p> The value must be URL encoded, for example, <code>%23ffffff</code>.</p> <p> This parameter is overwritten when using the parameter <code>plotcolor</code>.</p>
<code>plotcolor2</code>	<p>Alternating color of the graph's plot area, for example, <code>#ffffff</code>. This affects the tiles within the graph box alternating with <code>plotcolor1</code>. The result is a striped graph box.</p> <p> The value must be URL encoded, for example, <code>%23ffffff</code>.</p> <p> This parameter is overwritten when using the parameter <code>plotcolor</code>.</p>
<code>gridcolor</code>	<p>Color of gridlines in the graph's plot area, for example, <code>#ffffff</code>. This affects the horizontal and vertical lines within the graph box.</p> <p> The value must be URL encoded, for example, <code>%23ffffff</code>.</p>
<code>hide</code>	<p>Do not show defined channels in the graph. Use the ID of a channel to hide it. For example, use <code>hide=-4</code> to not show the downtime channel in the graph. To hide more than one channel, use commas to separate the IDs.</p>

Retrieving Chart Legends (JSON)

You can show the legend of a sensor graph (channel IDs, colors, units, channel names) in JSON format.

Example

Chart legend in JSON format:

```
/api/chartlegend.json?id=sensorid
```

More

Knowledge Base: How can I use the PRTG Application Programming Interface (API)?

- <https://kb.paessler.com/en/topic/593>

13.2.4 Historic Data

You can download the historic monitoring data for one sensor in XML or CSV format using the following API calls. You can either request the results of each single monitoring request (called raw data) or you can let PRTG calculate averages of the data (for example, hourly or daily averages).

To avoid potential server overload, the number of requestable values per API call is limited by means of automatic averaging as follows:

MINIMUM LEVEL OF DETAIL (AVERAGE INTERVAL)	MAXIMUM TIMEFRAME PER API CALL
Raw data (all single monitoring requests)	For up to 40 days per API request
60 minutes/1 hour averages	40 to 500 days per API request

i If you try to use a larger time span than 500 days, PRTG will reduce it to 365 days automatically.

i API calls for historic data are limited to 5 requests per minute.

API Calls for Historic Data

i Authentication with username and [passhash](#) (or username and password) must always be included in each PRTG API request. See section [Authentication](#) for more information.

The API calls for historic data tables look like this:

Examples

XML:

```
/api/historicdata.xml?id=objectid&avg=0&sdate=2018-01-20-00-00-00&edate=2018-01-21-00-00-00
```

CSV:

```
/api/historicdata.csv?id=objectid&avg=0&sdate=2018-01-20-00-00-00&edate=2018-01-21-00-00-00
```

JSON:

```
/api/historicdata.json?id=objectid&avg=0&sdate=2018-01-20-00-00-00&edate=2018-01-21-00-00-00
```

i You must supply the object ID of a sensor as well as a start date/time **sdate** and end date/time **edate**.

- i** If you use the JSON call, additionally provide the parameter **usecaption=1** to get more information than just the raw data table.

API Call for Historic Graphs

Historic graphs are also available (in PNG format):

Example

PNG:

```
/chart.png?id=objectid&avg=15&sdate=2018-01-20-00-00-00&edate=2018-01-21-00-00-00&wic
```

Common Parameters for Historic Data API Calls

The following parameters can be used for the graphs and the data tables:

PARAMETER	DESCRIPTION	POSSIBLE VALUES
id	ID of the specific sensor	integer value
sdate	Start of the time span (date and time)	yyyy-mm-dd-hh-mm-ss
edate	End of the time span (date and time)	yyyy-mm-dd-hh-mm-ss
avg	Average interval in seconds; use 0 to download raw data (= results of all single monitoring requests)	integer value
width/height	Width and height of the graph in pixels	integer value
graphstyling	baseFontSize='x' sets the size of the font showLegend='x' enables (1) or disables (0) the graph legend	baseFontSize='x'% 20showLegend='x'

Historic Data Query Builder

You can also use the [historic data function](#) ^[204] to manually generate and analyze historic sensor data via the PRTG web interface.

More

Knowledge Base: How can I export historic data from the PRTG API?

- <https://kb.paessler.com/en/topic/76768>

Knowledge Base: How can I export raw sensor data automatically from PRTG?

- <https://kb.paessler.com/en/topic/343>

13.2.5 Object Manipulation

You can use the following functions to manipulate existing objects (URLs are shown without username/passhash to improve readability).

Here are quick links for ease of use.

- [Changing Object Settings](#) 
- [Switch Inheritance Off/On](#) 
- [Changing Properties of Channels](#) 
- [Pausing/Resuming](#) 
- [Error Handling, Rescanning](#) 
- [Rescanning, Triggering Auto-Discovery](#) 
- [Reordering Objects in the Sensor Tree](#) 
- [Report-related](#) 
- [Notification-related](#) 
- [Adding/Deleting Objects](#) 
- [Duplicating Sensors and Changing Clone Settings](#) 
- [Setting Geo Location](#) 

Changing Object Settings

 Authentication with username and [passhash](#)  (or username and password) must always be included in each PRTG API request. See section [Authentication](#)  for more information.

Examples

Rename an object:

```
/api/rename.htm?id=objectid&value=newname
```

Set priority of an object (valid values for x are 1 to 5):

```
/api/setpriority.htm?id=objectid&prio=x
```

Change properties of objects:

```
/api/setobjectproperty.htm?id=id_of_object&name=property_name&value=new_value
```

 This function can change most string and number properties of objects (names, numerical values, OIDs, etc.) and should be used with caution. The **property_name** parameter can be discerned by opening the **Settings** page of an object and looking at the HTML source of the INPUT fields. For example, the INPUT field for the tags of an object has the name **tags_**. Leave away the **_** and use the rest (**tags**) as a value for the **property_name** parameter.

Switch Inheritance Off/On

This API call sets the "inherit" setting of objects (location, credentials, compatibility options, proxy settings, scanning interval, access rights, channel unit). In general, this works like changing properties for any other object.

Example

Replace the parameter **inheritType** with the name of the inheritance type:

```
/api/setobjectproperty.htm?id=id_of_object&name=inheritType_&value=0_or_1
```

i This internal name must be followed by an underscore (_), in contrast to changing properties above. Use the value **0** for switching off inheritance, and **1** for switching on inheritance. For example, the inheritance type for the scanning interval setting has the name **intervalgroup_**; thus, this specific part in the URL is **&name=intervalgroup_&value=0** (switches off inheritance for scanning interval).

i This call does not work with the schedules, dependencies, and maintenance window.

Changing Properties of Channels

With this API call, you can change a sensor's [channels settings](#)³¹⁶⁰. In general, this works like changing properties of any other object. To set channel properties via the API, you need to provide

- the ID of a sensor (parameter id)
- a subtype (channel for channels), and
- a subid (ID of the channel you want to edit).

Example: Enabling and Setting Limits for Channels

Enable limits for channels:

```
/api/setobjectproperty.htm?id=sensorid&subtype=channel&subid=0&name=limitmode&value=1
```

i You have to enable the limits for a channel before you can set limits.

Set limits for channels:

```
/api/setobjectproperty.htm?id=sensorid&subtype=channel&subid=0&name=limitmaxerror&value=25
```

For example, the following API call sets the upper error limit of a channel with the ID 0 of a sensor with the ID 2970 to the value 25.

```
/api/setobjectproperty.htm?id=2970&subtype=channel&subid=0&name=limitmaxerror&value=25
```

i For toplists, you can use the subtype **toplist** to change the properties. When using this subtype, **subid** is the ID of a toplist.

Pausing/Resuming

Examples

Pause a sensor or object indefinitely:

```
/api/pause.htm?id=objectid&pausemsg=yourmessage&action=0-00
```

Pause a sensor or object for x minutes:

```
/api/pauseobjectfor.htm?id=objectid&pausemsg=yourmessage&duration=x
```

i The pause message is optional. You can leave out the parameter **&pausemsg=yourmessage** if you do not want to display a message.

Pause and simulate a down status for a sensor:

```
/api/simulate.htm?id=objectid&action=1
```

Resume monitoring of a sensor or object:

```
/api/pause.htm?id=objectid&action=1
```

Error Handling (Acknowledge Alarm)

Example

Acknowledge a down status:

```
/api/acknowledgealarm.htm?id=objectid&ackmsg=yourmessage
```

Rescanning, Triggering Auto-Discovery

Examples

Scan a sensor now:

```
/api/scannow.htm?id=objectid
```

Run an auto-discovery for an object:

```
/api/discovernow.htm?id=objectid&template=filename
```

i Template for auto-discovery is optional. You can leave out the parameter **&template=filename** to run the auto-discovery with the options defined in the object's settings.

i If you use a template, provide the whole filename including file extension surrounded by double quotes and encode whitespaces, if necessary. Example: **&template="Linux%20SNMP.odt"**

Reordering Objects in the Sensor Tree

Example

Move an object in the sensor tree (x can be **up**, **down**, **top**, **bottom**):

```
/api/setposition.htm?id=objectid&newpos=x
```

Report-related

Example

Add a group, device, or sensor to a report:

```
/api/reportaddsensor.htm?id=reportid&addid=objectid
```

Notification-related

Example

Test a notification:

```
/api/notificationtest.htm?id=objectid
```

Adding/Deleting Objects

Adding and deleting objects in your PRTG configuration is the most complex and potentially most "dangerous" process when using the API. Keep in mind that add/delete activity is much better guided in the normal web interface with more warnings and alerts.

-  We recommend that you use the web interface for adding and deleting objects if possible.

Deleting Objects

-  API calls to the delete function immediately delete the referenced object including all subobjects, if there are any. For example, deleting a group deletes all its devices and sensors! There is no way to undo a deletion so use this function with care.

Example

Delete an object:

```
/api/deleteobject.htm?id=objectid&approve=1
```

Adding Objects

Adding completely new objects from scratch is not supported via the API due to the complexity of object creation and its parameters. To add new objects to PRTG, create a "master" object that will be cloned into new objects.

Examples

Duplicate a group:

```
/api/duplicateobject.htm?id=id_of_group_to_clone&name=new_name&targetid=id_of_target_
```

Duplicate a device:

```
/api/duplicateobject.htm?id=id_of_device_to_clone&name=new_name&host=new_hostname_or_
```

Duplicate a sensor:

```
/api/duplicateobject.htm?id=id_of_sensor_to_clone&name=new_name&targetid=id_of_target_
```

i If the **duplicateobject** succeeds, the PRTG server will reply with a redirect to the URL of the new object (for example, **/sensor.htm?id=1234**), so your application should parse the new object ID from this URL.

i When an object is cloned, it will initially be set to "paused" so you have the chance to edit parameters as desired. You must resume it with an API call afterwards.

Duplicating Sensors and Changing Clone Settings

The following process duplicates a sensor, changes some settings, and then starts monitoring:

Example

Duplicate the sensor (the server replies with a redirect to the new object's webpage, for example **/sensor.htm?id=10214**, parse id **10214** from the URL):

```
/api/duplicateobject.htm?id=2002&name=mynewsensor&targetid=2001
```

Rename the new sensor:

```
/api/setobjectproperty.htm?id=10214&name=name&value=anothernewname
```

Change the OID (in this example for an [SNMP Custom sensor](#)¹⁹⁴⁹):

```
/api/setobjectproperty.htm?id=10214&name=oid&value=1.2.3.4.5.6.7
```

Resume monitoring for the new sensor:

```
/api/pause.htm?id=10214&action=1
```

Setting Geo Location

You can set the location of any object via an API call. Provide the object ID together with parameters for location and/or longitude and latitude.

If only the location parameter is given, the PRTG core server will execute the geo location lookup (this can take up to three minutes). Provide the name of the location, for example, **New York**. It will be shown in the **Location** settings, no matter the longitude/latitude.

If the longitude/latitude parameter is given, the marker in the map will be set to this position, no matter of the location parameter. Provide longitude and latitude separated by a comma, for example **-73.998672,40.714728**.

Example

Set the geo location of an object:

```
/api/setlonlat.htm?id=objectid&location=name_of_object_location&lonlat=longitude,latitude
```

Knowledge Base: How can I use the PRTG Application Programming Interface (API)?

- <https://kb.paessler.com/en/topic/593>

13.2.6 Custom Sensors

Custom sensors allow a number of monitoring tasks to be performed that go far beyond the standard sensor set. Apart from parameterized versions of SNMP, Packet Sniffer, and NetFlow sensors, you can create your own sensors using WQL or Python, by compiling an EXE file, using any Windows software development tool, and you can request any REST API that returns JSON or XML and map the results to sensor channels.

The following documentation describes the custom [EXE/Script](#)^[834], [Python Script](#)^[1597], and [SSH Script](#)^[2607] sensors. The defined XML and JSON formats for the advanced sensors are also used for advanced HTTP data sensors and the [REST Custom](#)^[1646] sensor.

 For more information about custom sensors based on SNMP, WMI, Packet Sniffing, and xFlow, see the respective [custom sensor types](#)^[3152].

 For each sensor interval, PRTG can run an external process. The process can be a Windows EXE file, or a DLL, BAT, CMD, VBS, or PowerShell file, as well as a Python or SSH script.

Here are quick links for ease of use.

- [Standard and Advanced EXE/Script Sensor](#)^[3637]
- [Standard and Advanced SSH Script Sensor](#)^[3638]
- [Interface Definition for EXE/BAT/CMD/VBS/PowerShell/SSH Sensors](#)^[3638]
- [Return Values for EXE/BAT/CMD/VBS/PowerShell/SSH Sensors](#)^[3639]

- [Advanced Script, HTTP Data, and REST Custom Sensors](#)^[3641]
- [Advanced Script, HTTP Data, and REST Custom Sensors: Elements](#)^[3642]
- [Interface Definition for DLL Sensors](#)^[3653]
- [Command Line Parameters](#)^[3654]
- [Escape Special Characters and Whitespaces in Parameters](#)^[3655]
- [Environment Values](#)^[3656]
- [PRTG Script World](#)^[3656]

Standard and Advanced EXE/Script Sensor

 You must create the sensor as a file and place it in a specific folder on the system running the PRTG probe. This means that if you are using remote probes, the files must be copied to the remote system, in a PRTG cluster setup on each cluster node.

Place executables (.EXE, .DLL), batchfiles (.CMD, .BAT), VBS scripts (.VBS), or PowerShell scripts (.PS1) into a subfolder of the PRTG program directory. For the standard [EXE/Script sensor](#)^[834], this is the following subfolder of your PRTG program directory:

```
Custom Sensors\EXE
```

If your executable or script returns XML or JSON, you will use it with the [EXE/Script Advanced sensor](#)^[847]. In this case, store your file in the following subfolder of the PRTG program directory:

```
Custom Sensors\EXEXML
```

You will find a sample set of demo sensors in these folders, too. As soon as a file is placed into the folders mentioned above, you can create your own custom EXE sensor and select the new file from the list of files.

The probe will then execute the file on the probe system using the account configured for the PRTG probe service ("system" is the default). The local probe will run the file on the local PRTG core server system. For remote probes, the file will actually run on the remote system.

- ⚠ If your custom sensor code relies on other files (for example, DLLs, .NET framework, Windows PowerShell) you must copy/install these files on the probe machine manually!
- ⚠ EXE sensors will fail if they attempt to open any graphical user interface windows using the Win32 APIs. This is not allowed for processes that are started by a system service.

Standard and Advanced SSH Script Sensor

- ⓘ You must create the sensor as an SSH script and place it in a specific folder on the target system running your Linux/Unix installation where the script will be executed.

Place your SSH script files for the standard [SSH Script sensor](#)^[2607] in the following directory of the target system:

```
/var/prtg/scripts
```

If your SSH script returns XML or JSON, you will use it with the [SSH Script Advanced sensor](#)^[2622]. In this case, store your file in the following directory of the target system:

```
/var/prtg/scriptsxml
```

As soon as a file is placed into the respective folder, you can create your own SSH script sensor and select the new script file from the list of scripts.

- ⓘ With each scanning interval, PRTG will execute the script on the target system and receive the result as a sensor result.

Interface Definition for EXE/BAT/CMD/VBS/PowerShell/SSH Sensors

Every time the sensor is run, the selected file is executed. The string entered in the **Parameters** field of the sensor's settings is used as command line (you can use placeholders, see [Command Line Parameters](#)^[3654]). The executable file must send the results to the Standard OUT. For the format of returned data, see below.

- ⓘ If the EXE does not return control to the PRTG process, it is killed as soon as the timeout value set for this sensor is reached.

You can test the EXE file you want to use for the sensor very easily on the command line (cmd.exe). Simply start the EXE file and pipe the results into a file.

Example

```
sensorexex parameter > result.txt
```

The results are written into the file **result.txt** and you can check the results with notepad or any other text editor.

Remarks

- For PowerShell scripts, make sure that they may be executed by either signing the files or changing the security policy for Powershell.exe accordingly.
- In SSH scripts, you can use alphanumeric characters and the special characters ".", "_", "-", "=", and "/" outside of quoted strings in the **Parameters** field of the sensor's settings.
- The API interface for custom EXE sensors is compatible with the custom EXE sensors provided by PRTG Network Monitor.

Return Values for EXE/BAT/CMD/VBS/PowerShell/SSH Sensors

The expected return values are different, depending on the type of [EXE/Script sensor](#)^[834] used. The standard sensor needs a simple **value:message** pair; the [EXE/Script Advanced sensor](#)^[847] processes an XML or JSON return value. When using the standard [SSH Script sensor](#)^[2607], it will expect **returncode:value:message** as result. See details below.

Standard EXE/Script Sensor

The returned data for standard EXE/Script sensors must be in the following format:

```
value:message
```

i Value has to be a 64-bit integer or float. It will be used as the resulting value for this sensor (for example, bytes, milliseconds) and stored in the database. The message can be any string (maximum length: 2000 characters).

The exit code of the EXE has to be one of the following values:

VALUE	DESCRIPTION
0	OK
1	WARNING

VALUE	DESCRIPTION
2	System Error (for example, a network/socket error)
3	Protocol Error (for example, web server returns a 404)
4	Content Error (for example, a web page does not contain a required word)

Standard SSH Script Sensor

The returned data for standard SSH Script sensors must be in the following format:

```
returncode:value:message
```

i Value has to be a 64-bit integer or float. It will be used as the resulting value for this sensor (for example, bytes, milliseconds) and stored in the database. The message can be any string (maximum length: 2000 characters).

The SSH script **returncode** has to be one of the following values:

VALUE	DESCRIPTION
0	OK
1	WARNING
2	System Error (for example, a network/socket error)
3	Protocol Error (for example, web server returns a 404)
4	Content Error (for example, a web page does not contain a required word)

Advanced Script, HTTP Data, and REST Custom Sensors

The returned data for the [EXE/Script Advanced](#), [Python Script Advanced](#), [SSH Script Advanced](#), [HTTP Push Data Advanced](#), [HTTP Data Advanced](#), and [HTTP IoT Push Data Advanced](#) sensors must be in XML or JSON format, the REST configuration file for the [REST Custom sensor](#) must be available as JSON template. Most parameters have a default value and are not required.

The following minimum examples leave most parameters to their default values and return two static channel values.

Examples

XML Return Format: Minimum Example:

```
<prtg>
  <result>
    <channel>First channel</channel>
    <value>10</value>
  </result>
  <result>
    <channel>Second channel</channel>
    <value>20</value>
  </result>
</prtg>
```

To return an error, the XML format is:

```
<prtg>
  <error>1</error>
  <text>Your error message</text>
</prtg>
```

JSON Return Format: Minimum Example

```
{
  "prtg": {
    "result": [
      {
        "channel": "First channel",
        "value": "10"
      },
      {
        "channel": "Second channel",
        "value": "20"
      }
    ]
  }
}
```

To return an error, the JSON format is:

```
{
  "prtg": {
    "error": "1",
    "text": "Your error message"
  }
}
```

i You can find a more detailed demo script for the EXE/Script Advanced sensor in the **Custom Sensors\EXEXML** subfolder of your PRTG installation. You will find demo files for other sensors in the **Custom Sensors** folder as well.

Advanced Script, HTTP Data, and REST Custom Sensors: Elements

You can optionally define the encoding of your XML file at the beginning of the document. For example, to define UTF-8, you would use:

```
<?xml version="1.0" encoding="UTF-8" ?>
```

The following elements can be used in the section between **<result>** and **</result>**. In each section, you can return one sensor channel. You may define a maximum of **50** sensor channels.

i If you exceed this limit, PRTG will try to display all sensor channels. However, be aware that this is an unsupported procedure and you will experience limited usability and performance.

i The tag names are not case-sensitive. For example, "VALUE" and "value" can both be used.

TAG (CASE INSENSITIVE)	MANDATORY	DESCRIPTION	POSSIBLE CONTENT
<Channel>	Yes	Name of the channel as displayed in user interfaces.  This parameter is required and must be unique for the sensor.	Any string
<Value>	Yes	The value as integer or float.  Make sure the <Float> setting matches the kind of value provided. Otherwise PRTG will show 0 values.	Integer or float value
<Unit>	No	The unit of the value. Default is Custom. This is useful for PRTG to be able to convert volumes and times.	BytesBandwidth BytesDisk Temperature Percent TimeResponse TimeSeconds Custom Count CPU: This is a % unit that is accounted to the CPU load in index graphs. BytesFile SpeedDisk SpeedNet TimeHours
<CustomUnit>	No	If Custom is used as unit, this is the text displayed behind the value.	Any string (keep it short)

Part 13: Advanced Topics | 2 Application Programming Interface (API) Definition
6 Custom Sensors

TAG (CASE INSENSITIVE)	MANDATORY	DESCRIPTION	POSSIBLE CONTENT
<SpeedSize> <VolumeSize>	No	Size used for the display value. For example, if you have a value of 50000 and use Kilo as size, the display is 50 kilo #. Default is One (value used as returned). For the Bytes and Speed units, this is overridden by the setting in the user interface.	One Kilo Mega Giga Tera Byte KiloByte MegaByte GigaByte TeraByte Bit KiloBit MegaBit GigaBit TeraBit
<SpeedTime>	No	See above, used when displaying the speed. Default is Second.	Second Minute Hour Day
<Mode>	No	Select if the value is an absolute value or counter. Default is Absolute.	Absolute Difference
<Float>	No	Define if the value is a float. Default is 0 (no). If set to 1 (yes), use a dot as decimal separator in values.  Define decimal places with the <DecimalMode> element.	0 (= no, integer) 1 (= yes, float)

TAG (CASE INSENSITIVE)	MANDATORY	DESCRIPTION	POSSIBLE CONTENT
<DecimalMode>	No	<p>Init value for the Decimal Places option. If 0 is used in the <Float> element (use integer), the default is Auto; otherwise (for float) the default is All.</p> <p> You can change this initial setting later in the sensor's channel settings³¹⁸⁰.</p>	<p>Auto</p> <p>All</p>
<Warning>	No	<p>If enabled for at least one channel, the entire sensor is set to "Warning" status. Default is 0 (no).</p>	<p>0 (= no)</p> <p>1 (= yes)</p>
<ShowChart>	No	<p>Init value for the Show in Graphs option. Default is 1 (yes).</p> <p> The values defined with this element will be considered only on the first sensor scan, when the channel is newly created; they are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings³¹⁸⁰.</p>	<p>0 (= no)</p> <p>1 (= yes)</p>
<ShowTable>	No	<p>Init value for the Show in Tables option. Default is 1 (yes).</p>	<p>0 (= no)</p> <p>1 (= yes)</p>

TAG (CASE INSENSITIVE)	MANDATORY	DESCRIPTION	POSSIBLE CONTENT
<LimitMaxError>	No	<p>i The values defined with this element will be considered only on the first sensor scan, when the channel is newly created; they are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings³¹⁶⁰.</p> <p>Define an upper error limit for the channel. If enabled, the sensor will be set to a "Down" status if this value is overrun and the LimitMode is activated.</p> <p>i Provide the limit value in the unit of the base data type, just as used in the <Value> element of this section. While a sensor shows a "Down" status triggered by a limit, it will still receive data in its channels.</p>	Integer

TAG (CASE INSENSITIVE)	MANDATORY	DESCRIPTION	POSSIBLE CONTENT
<LimitMaxWarning>	No	<p>i The values defined with this element will be considered only on the first sensor scan, when the channel is newly created; they are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings³¹⁶⁰.</p> <p>Define an upper warning limit for the channel. If enabled, the sensor will be set to a "Warning" status if this value is overrun and the LimitMode is activated.</p> <p>i Provide the limit value in the unit of the base data type, just as used in the <Value> element of this section. While a sensor shows a "Down" status triggered by a limit, it will still receive data in its channels.</p>	Integer

TAG (CASE INSENSITIVE)	MANDATORY	DESCRIPTION	POSSIBLE CONTENT
<LimitMinWarning>	No	<p>i The values defined with this element will be considered only on the first sensor scan, when the channel is newly created; they are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings³¹⁶⁰.</p> <p>Define a lower warning limit for the channel. If enabled, the sensor will be set to a "Warning" status if this value is undercut and the LimitMode is activated.</p> <p>i Provide the limit value in the unit of the base data type, just as used in the <Value> element of this section. While a sensor shows a "Down" status triggered by a limit, it will still receive data in its channels.</p>	Integer

TAG (CASE INSENSITIVE)	MANDATORY	DESCRIPTION	POSSIBLE CONTENT
<LimitMinError>	No	<p>i The values defined with this element will be considered only on the first sensor scan, when the channel is newly created; they are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings³¹⁶⁰.</p> <p>Define a lower error limit for the channel. If enabled, the sensor will be set to a "Down" status if this value is undercut and the LimitMode is activated.</p> <p>i Provide the limit value in the unit of the base data type, just as used in the <Value> element of this section. While a sensor shows a "Down" status triggered by a limit, it will still receive data in its channels.</p>	Integer

TAG (CASE INSENSITIVE)	MANDATORY	DESCRIPTION	POSSIBLE CONTENT
<LimitErrorMsg>	No	<p>i The values defined with this element will be considered only on the first sensor scan, when the channel is newly created; they are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings³¹⁶⁰.</p> <p>Define an additional message. It will be added to the sensor's message when entering a "Down" status that is triggered by a limit.</p>	Any string
<LimitWarningMsg>	No	<p>i The values defined with this element will be considered only on the first sensor scan, when the channel is newly created; they are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings³¹⁶⁰.</p> <p>Define an additional message. It will be added to the sensor's message when entering a "Warning" status that is triggered by a limit.</p>	Any string

TAG (CASE INSENSITIVE)	MANDATORY	DESCRIPTION	POSSIBLE CONTENT
<LimitMode>	No	<p>i The values defined with this element will be considered only on the first sensor scan, when the channel is newly created; they are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings³¹⁶⁰.</p> <p>Define if the limit settings defined above will be active. Default is 0 (no; limits inactive). If 0 is used the limits will be written to the sensor channel settings as predefined values, but limits will be disabled.</p> <p>i This setting will be considered only on the first sensor scan, when the channel is newly created; it is ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings³¹⁶⁰.</p>	<p>0 (= no) 1 (= yes)</p>

Part 13: Advanced Topics | 2 Application Programming Interface (API) Definition
 6 Custom Sensors

TAG (CASE INSENSITIVE)	MANDATORY	DESCRIPTION	POSSIBLE CONTENT
<ValueLookup>	No	Define if you want to use a lookup file (for example, to view integer values as status texts). Enter the ID of the lookup file you want to use, or omit this element to not use lookups.  This setting will be considered only on the first sensor scan, when the channel is newly created; it is ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings ³¹⁶⁰ .	Any string
<NotifyChanged>	No	If a returned channel contains this tag, it will trigger a change notification that you can use with the Change Trigger ³¹⁸⁰ to send a notification.	No content required

The following elements can be used in the section between <prt g> and </prt g>, outside the <result> section.

 The tag names are not case-sensitive. For example, "TEXT" and "text" can both be used.

TAG (CASE INSENSITIVE)	MANDATORY	DESCRIPTION	POSSIBLE CONTENT
<Text>	No	Text the sensor returns in the Message field with every scanning interval. There can be one message per sensor, regardless of the number of channels. Default is OK .  This element has to be provided outside of the <result> element.	Any string; Maximum length: 2000 characters
<Error>	No	If enabled, the sensor will return an error status. This element can be combined with the <Text> element in order to show an error message. Default is 0 .  This element has to be provided outside of the <result> element. A sensor in this error status cannot return any data in its channels; if used, all channel values in the <result> section will be ignored.	0 (= no) 1 (= yes, set sensor to error; ignore <result> section)

-  Each run (sensor scan) may return either any number of channels (<result>...</result>) or one error response. It is not possible to mix result and error entries.
-  You can either write the XML output to standard OUT line by line, or give back the entire expression in one line without breaks.

Interface Definition for DLL Sensors

Every time the sensor is to be checked, a function in the selected DLL file is called. The DLL must export one function:

```
function perform(para,msg:pchar):integer; stdcall;
```

para and **msg** are zero-terminated strings. The allocated buffer for **msg** is 255 bytes, the DLL must make sure that fewer bytes are returned. **Msg** must be in the following format:

```
value:message
```

Value has to be an 32-bit integer and will be used as the resulting value for this sensor (for example, bytes, milliseconds, etc.), **message** can be any string and will be stored in the database.

 The integer return value of the perform function has to conform to the same rules as the EXE exit code mentioned above.

 If the function call in the DLL does not return control, it could block the whole PRTG system. Make sure to handle your own timeouts and build in a reliable error management. For this reason EXE sensors are recommended.

Command Line Parameters

In the **parameter** field you can use the following placeholders:

PLACEHOLDER	DESCRIPTION
%sensorid	The ID of the EXE/Script sensor.
%deviceid	The ID of the device the sensor is created on.
%groupid	The ID of the group the sensor is created in.
%probeid	The ID of the probe the sensor is created on.
%host	The IP address/DNS name entry of the device the sensor is created on.
%device	The name of the device the sensor is created on.
%group	The name of the group the sensor is created in.
%probe	The name of the probe the sensor is created on.

PLACEHOLDER	DESCRIPTION
%name or %sensor	The name of the EXE/Script sensor.
%windowsdomain	The domain for Windows access (may be inherited from parent).
%windowsuser	The user name for Windows access (may be inherited from parent).
%windowspassword	The password for Windows access (may be inherited from parent).
%linuxuser	The user name for Linux access (may be inherited from parent).
%linuxpassword	The password for Linux access (may be inherited from parent).
%snmpcommunity	The community string for SNMP v1 or v2 (may be inherited from parent).

 You need to escape special characters and whitespaces in your parameters and surround them with double quotes. See section [Escape Special Characters and Whitespaces in Parameters](#)²⁶¹⁹ for details. In Secure Shell (SSH) scripts, you can use alphanumeric characters and the special characters ".", "_", "-", "=", and "/" outside of quoted strings.

 See section [Inheritance of Settings](#)¹³⁷ for more information on inherited settings.

Escape Special Characters and Whitespaces in Parameters

 You need to escape special characters in parameters that you pass to an executable or script and surround them with quotation marks to make sure the characters are interpreted correctly. Especially PowerShell scripts require adequate escaping so that the parameters are passed in a valid PowerShell syntax. To make escaping easy and secure, PRTG automatically does most of the escaping for you.

Please follow these rules to escape special characters and whitespaces in the parameters fields:

- Use quotes for parameters that contain whitespaces.

```
-name "Mr John Q Public"
-name 'Mr John Q Public'
```

- Use double quotes for parameters that contain single quotes.

```
-name "Mr 'John Q' Public"
```

- Use single quotes for parameters that contain double quotes.

```
-name 'Mr "John Q" Public'
```

- Use a backslash (\) to escape and pass a literal double quote.

```
-name pub\"lic
```

- Use double quotes for parameters that contain double **and** single quotes and escape double quotes.

```
-name "pu'b\"lic"
```

In Secure Shell (SSH) scripts, you can use alphanumeric characters and the special characters ":", "_", "-", "=", and "/" outside of quoted strings.

 We recommend that you do not pass passwords in parameters. Use PRTG placeholders instead. See section [Custom Sensors](#) for details.

Environment Values

If the **Set placeholders as environment values** option is enabled in the sensor's settings, the values of all placeholders available for [command line parameters](#) are additionally provided as "Environment Variables" during runtime, so you can use them in your executable or script file. The variables' names are the same as for placeholders mentioned above, with the prefix **prtg_** and without the % character. For example, refer to the sensor's own name by using the variable **prtg_name**.

Additionally, the following variables are available:

VARIABLE	DESCRIPTION
prtg_version	The version number of your PRTG installation.
prtg_url	The IP address/DNS name of your PRTG installation.
prtg_primarychannel	The ID of the sensor's current primary channel (1 if not set).

PRTG Script World

Find useful scripts for custom sensors in the [PRTG Script World](#), written by dedicated PRTG customers around the world and Paessler!

More

You can find sample projects for these custom sensors and more information about custom scripts here:

- In the **PRTG Network Monitor\custom sensors\EXE** subfolder of your PRTG installation.
- In the Knowledge Base on the Paessler website at <https://kb.paessler.com> (tag custom-script-exe).
- This Knowledge Base article will help you set up your PowerShell sensors: [Guide for PowerShell Based Custom Sensors](#).

13.2.7 Custom Notifications

In addition to the various standard methods for notifications, you can also define your own notifications that can trigger desired actions. The possibilities of these notifications go far beyond just sending out messages, because you can perform almost any action you like whenever the notification is triggered.

The following documentation describes these custom notifications. Different notification methods can also be combined in one notification.

 For more general information about notifications based on email, messaging, and others, see section [Notifications](#)³²¹⁶.

Execute HTTP Action

This notification method executes a GET request or sends any POST, PUT, or PATCH data to a custom URL. You can execute specific actions on a web server or control any web service that accepts commands via one-time HTTP requests. Whenever a notification of this kind is triggered, the HTTP action is sent.

With this method, you can also call any API function of the PRTG web interface. For example, you can set PRTG to automatically pause a sensor, or acknowledge an alarm.

 Authentication with username and [passhash](#)³³⁰⁵ (or username and password) must always be included in each PRTG API request. See section [Authentication](#)³⁶⁰⁷ for more information.

Examples

To automatically pause the sensor that triggers the notification, enter the following HTTP action:

```
http://yourserver/api/pause.htm?id=%sensorid&action=0&username=myuser&password=mypas
```

To use the notification to automatically acknowledge the alarm that triggered it, enter this HTTP action:

```
http://yourserver/api/acknowledgealarm.htm?id=%sensorid&ackmsg=Auto-Acknowledged&use
```

 For more information about authentication within the URL and for other possible actions you can configure, see sections [HTTP API](#)³⁶⁰⁷ and [Object Manipulation](#)³⁶³¹.

Execute Program

With this notification method, you can execute a script or a program as an external process. It can be a Windows executable file or a BAT, CMD, or PowerShell file. You can use EXE, COM, BAT, CMD, VBS, or PS1 files.

 You must create the notification as a file and place it in a specific folder on the PRTG core server system (in a cluster, copy the files to every node).

Place executables (.EXE, .COM), batch files (.CMD, .BAT), VBS scripts (.VBS), or PowerShell scripts (.PS1) into the folder:

```
\Notifications\EXE
```

As soon as a file is placed into the folder, you can create or edit your own custom execute program notification and select the new file from the list of files. You can also enter start parameters and use PRTG placeholders for this.

Notes

- PRTG will execute the file on the local PRTG core server system using the account configured for the PRTG core server service ("system" is the default).
- If your custom notifications code relies on other files (for example, DLLs, .NET framework, or Windows PowerShell), you must copy/install these files on the PRTG core server machine manually!
- Make sure the return code of the executable is 0 (zero). Otherwise PRTG assumes something went wrong with the notification and will try to send it up to 3 times.
- When running PRTG in a cluster, copy the respective files to every single node to make sure the notification also works when the primary master is not reachable.
- EXE notifications will fail if they attempt to open any graphical user interface windows using the Win32 APIs (this is not allowed for processes that are started by a system service).

Placeholders

 For more information about the placeholders you can use, see the Paessler Knowledge Base [What placeholders can I use with PRTG?](#)

PRTG Script World

Find useful scripts for custom notifications in the [PRTG Script World](#), written by dedicated PRTG customers around the world and Paessler!

More

 For more information about custom notifications, see the Paessler Knowledge Base, tag-set "[custom-notification](#)".

13.2.8 Mini Probe API

IMPORTANT NOTICE

We do not further develop the Mini Probe API because we plan major changes to the underlying API in PRTG. You can still use the Mini Probe API "as is" but please note that it may be deprecated at any time.

 Knowledge Base: [Where can I find PRTG Mini Probes which are ready to use?](#)

PRTG Mini Probes allow PRTG users to create small probes on any device to meet specific needs. In general, probes are the part of PRTG that run monitoring processes and deliver monitoring results back to the PRTG core server. Mini Probes help gather monitoring data from platforms where it is not possible or is inapplicable to use the common local and remote probes of PRTG. Mini Probes have a less complex implementation than standard probes so that you can create them on any platform. The only requirement is HTTPS connectivity to send monitoring data to your PRTG core server.

Basically, this takes the [Custom Sensors](#)³⁶³⁷ concept to a higher level; you will have a very broad range of possibilities and you can implement amazing functions to get an even better network monitoring experience!

 With the current version of PRTG, you can use the Mini Probe interface with your custom code to implement solutions to special scenarios that you might have in your network. Please note that there are major changes planned to the underlying API in PRTG. Therefore, any code you write now will likely need to be changed later, so it can be used for future versions of PRTG. For example, if the available HTTP Push sensors are not sufficient for your needs, you can still use the Mini Probe API. We will provide further news about changing interfaces as soon as there are more detailed plans available.

 Because the PRTG Mini Probe requires an SSL-secured connection to the PRTG core server, it is not possible by default to connect if SSL is deactivated for PRTG. This is necessary because probably unencrypted passwords will be transferred between probe and core. So it is important to encrypt the connection even on internal routes. If your network setup ensures security in another way (for example, VPN), you can use a registry key option for disabling SSL in order to get a connection to your Mini Probe.

 For more details, see this Knowledge Base article: [How can I disable SSL for Mini Probes?](#)

 The Mini Probe API is not available in PRTG hosted by Paessler.

Here are quick links for ease of use.

PRTG Mobile Probe for Android

Initially we released a mobile probe for Android devices to gather local monitoring data with mobile devices. This mobile probe is a subtype of the Mini Probe. With the PRTG Mobile Probe for Android, you can monitor, for example, wireless LAN (WLAN) coverage, location, battery, HTTP response times, and environmental data such as temperature, pressure, humidity, or light intensity. The available data depends on the available measurement components on the device.

PRTG Mobile Probes for Android usually connect via WLAN and monitor your network from the mobile perspective.

Differences Between Probe Types

The following table shows technical specifications of the two probe types in PRTG.

FUNCTIONALITY	LOCAL AND REMOTE PROBES	PRTG MINI PROBE
Connection Protocol from Probe to Core	Protocol from PRTG	HTTPS
Security	Data is secured with SSL and an access key. New probe connections must be approved by the PRTG administrator. IP and GUID filtering is possible.	The same security level as for local and remote probes.
Estimated Limit for Sensors per Probe	Several thousand sensors	Less than 100 sensors
Estimated Limit for Probes per Installation	Hundreds of probes	Less than 100 probes
Estimated Minimum Scanning Interval	Some seconds	At least 60 seconds

FUNCTIONALITY	LOCAL AND REMOTE PROBES	PRTG MINI PROBE
Estimated Number of Sensor Types	More than 200	A few
Updates to New PRTG Versions by the Core Server	Yes	No
Complexity	High	Very low
Documented API	No	Yes
Supported Platforms	Windows 7 or later (32-bit/64-bit)	Any platform
Scheduling of Sensor Requests Performed by	Probe	Probe
Code Managed by	Paessler AG	Writer of the probe
Probe Supports Pre-Scans for Available Measurements	Yes	No
Sensors Support Inheritance of Settings ¹³⁷	Yes	No
Limitations by Administrator for Allowed Sensor Types that a PRTG User Can Create	Yes	No

The PRTG Mini Probe Protocol

The PRTG Mini Probe Protocol (PMPP) is a simple, lightweight protocol that extends PRTG with custom remote probes. It can be implemented in a variety of programming languages and runs on any kind of platform. These include, for example, Linux, Android, macOS, and iOS.

 PRTG Mini Probes are not intended for high performance monitoring and support only the sensor types that you implement.

The PRTG Mini Probe Protocol—Communication and Security

The PMPP uses GET and POST requests via HTTPS in order to communicate with the PRTG server. All requests are sent to the defined TCP port for the common PRTG web server (default is 443 for SSL), or you specify an extra port explicitly for Mini Probe connections in the [PRTG System Administration—Core & Probes](#)³³⁶³. PRTG Mini Probes use the GET method to receive tasks, and the POST method to send information about the probe and the monitoring results to the PRTG core.

 The data format of some HTTP fields has to be JSON encoded. See [Data Format: JSON Definitions](#)³³⁶³ for data definitions that require JSON. All exchanged data is secured with SSL.

The PRTG Mini Probe Protocol—Authentication

The PMPP uses the same authentication methods as the common PRTG remote probes. The authentication includes the following steps:

- Allow and deny IPs filter
- Deny GIDs filter
- Access key
- Unique GID that must be approved in the PRTG web interface
- In addition, Mini Probes must be allowed to connect in the PRTG Probe connection settings! Additionally, you have to provide the Mini Probe's IP in the **Allow IPs** field (or enter any).

There are no sessions on the server: Every request must contain the required authentication information.

 For more details, see section [System Administration—Core and Probes](#)³³⁶³.

The PRTG Mini Probe Protocol—HTTP Requests

The PMPP includes three different HTTP requests that are sent to the PRTG web server:

- **announce**: An announce request is sent once when the probe starts. Afterwards, the task and data commands are run in a scheduled manner.
- **tasks**: With a tasks request, the probe requests a list of tasks to perform.
- **data**: The data request sends the monitoring results to the core.

All requests of the Mini Probe to the PRTG server must contain the following HTTP fields:

- **gid**: The unique GID of the probe. We recommend a GUID that is generated by the operating system. This identifier must stay the same for as long as the probe installation exists. You can use any string. If you clone a probe, you have to update this field to a new value.
- **key**: An access key as defined in the probe settings of the PRTG server. The key has to be encoded in SHA1 hash (for example, **key=a94a8fe5ccb19ba61c4c0873d391e987982fbbd3**).

- **protocol:** The version of the protocol you use. Currently, this value is "1"

All requests return common HTTP response codes.

 For more information, see section [HTTP API](#)³⁶⁰⁷.

Announce Request

The announce request uses the POST method and provides all required information about the capabilities of the Mini Probe for the PRTG core. The target URL is **https://<yourPRTGserver>/probe/announce**

 This HTTP request must be sent at least once to be able to add sensors. We recommend sending this request every time the probe starts. You should NOT send it with every scanning interval!

The announce request must contain the following HTTP fields:

- **name:** The name of the Mini Probe. PRTG uses this name to create a corresponding node in the device tree.
- **version:** The version number of the Mini Probe you have implemented. This is a single integer number, for example, "1".
- **baseinterval:** The number of seconds between two calls of the task/data requests. We recommend 60 or 300 seconds; depending on the usage, higher or lower values are possible.
- **sensors:** The definition of supported sensors in JSON format.
 See [Data Format: JSON Definitions—Sensor Definition](#)³⁶⁶⁵ for more information.
- **icon** (optional): You can optionally send the file name of a device icon to show it for the mini probe device in the PRTG web interface.
 For details, see our Knowledge Base article [How can I add my own device icons for use in the PRTG web interface?](#)

 If you change the definition of a sensor that has already been announced, these changes will only be active after the next start of PRTG. An existing definition never changes while PRTG is running. However, there is one exception: Setting the "deprecated" flag works without any restart. Because of this, you can replace an existing sensor with a new one that uses another definition.

Tasks Request

The tasks request uses the GET method and is sent from your Mini Probe in the defined scheduler interval to the PRTG core server (for example, every 5 minutes). The target URL is

```
https://<PRTGserver>/probe/tasks
```

This HTTP request returns a list of tasks in JSON format that have to be run by the Mini Probe.

 See [Tasks Definition](#)³⁶⁷² for more information.

Data Request

The data request uses the POST method and contains the HTTP field data. This HTTP field contains any number of sensor results in JSON format. The target URL is

```
https://<PRTGserver>/probe/data
```

You can split the results of one tasks list into several result requests (for example, if some sensors are faster than others). The Mini Probe should combine as many results as possible into one request but keep the time between measurement and reporting of the value at a low level.

See [Data Definition](#) ³⁶⁷³ for more information.

Data Format: JSON Definitions

All data definitions of sensors, tasks, and result data of PRTG Mini Probes are JSON encoded. JSON is a language-independent data format that is used to transmit data objects consisting of attribute-value pairs between a server and an application. Refer to the JSON documentation for a general overview of this data format.

Data Format: JSON Definitions—Sensor Definition

This section shows how you can define the available sensor types for your Mini Probe. Sensor definitions are given in the HTTP field "sensors" of the announce request.

Basic Structure

The sensor types definition is a JSON array where each sensor type is defined in one array element as a JSON object. A JSON object denoting a sensor definition consists of the following JSON name/value pairs:

NAME	MANDATORY	DESCRIPTION	POSSIBLE VALUE
kind	X	Unique identifier for the sensor type in the Mini Probe. Used in the tasks definition to identify the sensor type.  Underscore "_" is not allowed here.	Any string
name	X	The display name of the sensor.	Any string
deprecated	—	You can flag the sensor to status deprecated. A flagged sensor can still run but this kind of sensor will not be shown when you add new sensors to the probe.	1 (= deprecated) 0 (= not deprecated)

NAME	MANDATORY	DESCRIPTION	POSSIBLE VALUE
description	—	A short description of the sensor that is shown in the Add Sensor ³²⁷¹ dialog in the PRTG web interface.	Any string
help	—	A help text that is shown in a popup in the Add Sensor ³²⁷¹ dialog in the PRTG web interface.	Any string
tag	—	A default tag for the sensor that will automatically be added to the sensor.	Any string
default	—	A sensor of this type will automatically be created with the probe if set to "default".	(= set to default) 0 (= not default)
groups	—	In the "groups" array, available settings for this sensor type are defined.	An array of grouped settings JSON objects.  See Definition of Setting Groups Objects ³⁶⁶⁶ for more information.

Definition of Setting Groups Object s

One settings group definition (one element of the "groups" array) consists of three elements:

NAME	MANDATORY	DESCRIPTION	POSSIBLE VALUE
name	X	The internal name of the settings group.	Any unique string

NAME	MANDATORY	DESCRIPTION	POSSIBLE VALUE
caption	X	The label of the settings group as shown in the PRTG web interface.	Any string
fields	X	The available settings of the settings group.	An array of field definition objects. ⓘ See Parameters for Setting Fields for more information.

Parameters for Setting Fields

The following table shows available JSON name/value pairs for setting fields:

NAME	MANDATORY	DESCRIPTION	AVAILABLE IN TYPE	POSSIBLE VALUE
type	X	Type of the field. This defines the possible content.	All	Edit Password Integer Radio ⓘ See Definition of Setting Fields: Field Types for more information.
name	X	The internal name of the field. The name has to be unique per sensor. It is sent with the settings of the probe in the task request.	All	Any unique string

Part 13: Advanced Topics | 2 Application Programming Interface (API) Definition
 8 Mini Probe API

NAME	MANDATORY	DESCRIPTION	AVAILABLE IN TYPE	POSSIBLE VALUE
caption	X	The label of the field. It is displayed left of the field.	All	Any string
required	—	If a field is defined as required, this field has to be set when adding or editing the sensor settings. Default is not required.	All	0 (= not required) 1 (= required)
default	—	The default value of the field.	All	Any string or integer (depending on the field type)
help	—	A help text that is displayed right of the field.  You can use limited BBCode: "[b]" and "[/b]" for bold, "[i]" and "[/i]" for italics, and "[br]" for linebreak.	All	Any string
maximum	—	The maximum value that is allowed for this field.	Integer	Integer
minimum	—	The minimum value that is allowed for this field.	Integer	Integer

NAME	MANDATORY	DESCRIPTION	AVAILABLE IN TYPE	POSSIBLE VALUE
options	—	A JSON array that provides several radio buttons to choose a desired option.	Radio	"name":"value" pairs. See Example below.

Example

"name":"value" pairs that define radio button options:

```
{
  "1": "This is option 1",
  "2": "This is option 2",
  "XYZ": "Another option"
}
```

Definition of Setting Fields: Field Types

A sensor type can have any number of setting fields that are organized in groups of settings. One field is one element in the "fields" array of a settings group. Currently, PRTG Mini Probes support four different field types for settings:

- **edit**: One line edit field.
- **password**: An edit field with masked characters.
- **integer**: A number field with optional minimum/maximum selection.
- **radio**: A selection of multiple options with radio buttons.

Example

The following is a detailed example that shows the JSON object definition of a sensor type that is used in the HTTP field sensors of the announce request.

This sensor type is called **Sample Sensor** and is from the type **Sample**. It has a description, a help text, and a default tag. There are two setting groups, **Group** and **group2**, with several setting fields (six in the first group, one in the second group). The example also shows how you can use the available JSON name/value pairs in the **fields** array object.

Part 13: Advanced Topics | 2 Application Programming Interface (API) Definition
8 Mini Probe API

```
[
  {
    "kind": "Sample",
    "name": "Sample Sensor",
    "description": "This is a sample demo sensor",
    "help": "This is the help text of the demo sensors",
    "tag": "demosensor",
    "groups": [
      {
        "name": "Group",
        "caption": "Group",
        "fields": [
          {
            "type": "edit",
            "name": "simpleedit",
            "caption": "Edit Field",
          },
          {
            "type": "edit",
            "name": "extendededit",
            "caption": "Edit Field 2",
            "required": "yes",
            "default": "Default Value",
            "help": "Help text displayed to the right of the field"
          },
          {
            "type": "integer",
            "name": "simplenumber",
            "caption": "Number",
          },
          {
            "type": "integer",
            "name": "number2",
            "caption": "Number 2",
            "required": "1",
            "minimum": 23,
            "maximum": 99,
            "help": "Number field with limit 23-99"
          }
        ]
      }
    ]
  }
]
```

```
    },
    {
      "type": "password",
      "name": "password",
      "caption": "Password",
      "help": "This is a password field"
    },
    {
      "type": "radio",
      "name": "radiotest",
      "caption": "Radio test",
      "help": "This is a radio selection field",
      "options": {
        "1": "This is option 1",
        "2": "This is option 2",
        "3": "This is option 3"
      },
      "default": "2"
    },
  ],
  {
    "name": "group2",
    "caption": "Group 2",
    "fields": [
      {
        "name": "testfield2",
        "caption": "Test2",
        "type": "edit"
      }
    ]
  }
]
]
```

Data Format: JSON Definitions—Tasks Definition

A tasks definition is a JSON array where each task is one object. Tasks contain all name/value pairs as defined in the sensor settings definition, which are filled with the values you have provided. Additionally, the following information is included:

NAME	MANDATORY	DESCRIPTION	POSSIBLE VALUE
kind	X	The type of the sensor.	String
sensorid	X	The ID of the sensor.	Integer
host	X	The IP address/DNS name of the parent device as specified for this device. For the probe device, it is 127.0.0.1 by default.	IP/DNS name
all defined fields	X	All fields that are defined in the sensor setting group objects are included in the tasks definition as name/value pairs.	name/value pairs

 This data comes from PRTG, so the mandatory JSON objects are included automatically.

Example

Definition of two tasks, the first one is the simplest possible one without any values, and the second one uses the sensor settings objects as defined above:

```
[
  {
    "sensorid": "2009",
    "kind": "ping",
    "host": "www.google.com"
  }
  {
    "sensorid": "2010",
    "kind": "sample",
    "host": "www.paessler.com",
    "simpleedit": "Test2",
    "extendededit": "Extended Test",
    "simplenumber": "3",
    "number2": "42",
    "password": "masked text",
    "radiotest": "1",
    "testfield2": "This is test 3"
  }
]
```

Data Format: JSON Definitions—Data Definition

A data definition is a JSON array where each result of a task is one object. Every array element contains the following name/value pairs:

NAME	MANDATORY	DESCRIPTION	POSSIBLE VALUE
sensorid	X	The ID of a specific sensor.	Integer

NAME	MANDATORY	DESCRIPTION	POSSIBLE VALUE
time	—	<p>The time of measurement in UTC/ GMT timezone as JSON number in Unix time format (in milliseconds since Unix epoch, which is 00:00:00 UTC on January 1, 1970). Time values must be strictly chronological, so the Unix time of each measurement must be greater than the one before. The time values should be close to the current time (which is now) to prevent gray sensors.</p> <p> If no time value is provided, the current time (now) is used.</p>	JSON number defining Unix time
message	—	An optional text message.	Any string
channel	X	The channel result values.	<p>An array of name/ value pairs.</p> <p> See Parameters for Data Definitions: Channel Result Values ³⁶⁷⁵ for more information.</p>

 **Examples**

Data definition object with sensor status **OK**:

```
[
  {
    "sensorid": "2003",
    "message": "Optional Message",
    "channel": [
      {
        "name": "Time",
        "mode": "integer",
        "unit": "TimeResponse",
        "value": 6
        "showchart": 1
        "showtable": 1
      }
      {
        "name": "Pages",
        "mode": "counter",
        "unit": "Custom",
        "customunit": "Pages",
        "value": 99
      }
    ]
  }
]
```

Data definition object with sensor status error:

```
[
  {
    "sensorid": "2003",
    "error": "Response",
    "code": 10,
    "message": "Error Message"
  }
]
```

Parameters for Data Definitions: Channel Result Values

The following table shows name/value pairs that can be used in the "channel" array objects of data definition objects:

Part 13: Advanced Topics | 2 Application Programming Interface (API) Definition
 8 Mini Probe API

NAME	MANDATORY	DESCRIPTION	POSSIBLE VALUE
Name	X	The name of the channel as displayed in user interfaces.	Any string
Value	X	Any number without quotation marks.	An integer, float, or counter value
Mode	—	The type of the value.  Make sure that it matches the provided value, otherwise PRTG will show 0 values.	Integer, float, or counter
Unit	—	The unit of the value.  Setting the correct unit type instead of custom units helps PRTG display received values in a better way.	BytesBandwidth BytesMemory BytesDisk BytesFile TimeResponse TimeSeconds TimeHours Temperature Percent Count CPU: This is a % unit that is accounted to the CPU load in index graphs. Custom (define the name of the unit using the additional field customunit)
ShowChart	—	Init value for the Show in Graphs option.	0 (= do not show graph) 1 (= show graph)

NAME	MANDATORY	DESCRIPTION	POSSIBLE VALUE
ShowTable	—	<p>i The values defined with this element will be considered only on the first sensor scan when the channel is newly created; they are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings^[3160].</p> <p>Init value for the Show in Tables option.</p>	<p>0 (= do not show table)</p> <p>1 (= show table)</p>
SpeedSize VolumeSize	—	<p>i The values defined with this element will be considered only on the first sensor scan when the channel is newly created; they are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings^[3160].</p> <p>Size used for the display value. For example, if you have a value of 50000 and use Kilo as size, the display is 50 kilo #. Default is One (value used as returned).</p> <p>i For the Bytes and Speed units, this is overridden by the setting in the user interface.</p>	<p>One</p> <p>Kilo</p> <p>Mega</p> <p>Giga</p> <p>Tera</p> <p>Byte</p> <p>KiloByte</p> <p>MegaByte</p> <p>GigaByte</p> <p>TeraByte</p>

Part 13: Advanced Topics | 2 Application Programming Interface (API) Definition
8 Mini Probe API

NAME	MANDATORY	DESCRIPTION	POSSIBLE VALUE
			Bit KiloBit MegaBit GigaBit TeraBit
SpeedTime	—	See above, used when displaying the speed. Default is Second.	Second Minute Hour Day
decimalMode	—	Init value for the Decimal Places option. If 0 is used in the float mode (use integer), the default is Automatic; otherwise (for float) default is All. ⓘ You can change this initial setting later in the sensor's channel settings ³¹⁶⁰ .	Automatic All Custom
decimalDigits	—	If you define Custom as decimalMode, specify the number of digits after the delimiter.	Integer
ValueLookup	—	Define if you want to use a lookup file (for example, to view integer values as status texts). Enter the ID of the lookup file you want to use, or omit this element to not use lookups.	Any string

NAME	MANDATORY	DESCRIPTION	POSSIBLE VALUE
LimitMaxError	—	<p> See section Define Lookups  for more information.</p> <p> This setting will be considered only on the first sensor scan, when the channel is newly created; it is ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p> <p>Define an upper error limit for the channel. If enabled, the sensor will be set to a "Down" status if this value is overrun and the LimitMode is activated.</p> <p> Provide the limit value in the unit of the base data type, just as used in the <Value> element of this section. While a sensor shows a "Down" status triggered by a limit, it will still receive data in its channels.</p>	Integer

NAME	MANDATORY	DESCRIPTION	POSSIBLE VALUE
LimitMaxWarning	—	<p>i The values defined with this element will be considered only on the first sensor scan, when the channel is newly created; they are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings³¹⁶⁰.</p> <p>Define an upper warning limit for the channel. If enabled, the sensor will be set to a "Warning" status if this value is overrun and the LimitMode is activated.</p> <p>i Provide the limit value in the unit of the base data type, just as used in the <Value> element of this section.</p> <p>i The values defined with this element will be considered only on the first sensor scan, when the channel is newly created; they are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings³¹⁶⁰.</p>	Integer

NAME	MANDATORY	DESCRIPTION	POSSIBLE VALUE
LimitMinWarning	—	<p>Define a lower warning limit for the channel. If enabled, the sensor will be set to a "Warning" status if this value is undercut and the LimitMode is activated.</p> <p>i Provide the limit value in the unit of the base data type, just as used in the <Value> element of this section.</p> <p>i The values defined with this element will be considered only on the first sensor scan, when the channel is newly created; they are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	Integer
LimitMinError	—	<p>Define a lower error limit for the channel. If enabled, the sensor will be set to a "Down" status if this value is undercut and the LimitMode is activated.</p> <p>i Provide the limit value in the unit of the base data type, just as used in the <Value> element of this section.</p>	Integer

NAME	MANDATORY	DESCRIPTION	POSSIBLE VALUE
		<p>i The values defined with this element will be considered only on the first sensor scan, when the channel is newly created; they are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings³¹⁶⁰.</p>	
LimitErrorMsg	—	<p>Define an additional message. It will be added to the sensor's message when entering a "Down" status that is triggered by a limit.</p> <p>i The values defined with this element will be considered only on the first sensor scan, when the channel is newly created; they are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings³¹⁶⁰.</p>	Any string
LimitWarningMsg	—	<p>Define an additional message. It will be added to the sensor's message when entering a "Warning" status that is triggered by a limit.</p>	Any string

NAME	MANDATORY	DESCRIPTION	POSSIBLE VALUE
LimitMode	—	<p>i The values defined with this element will be considered only on the first sensor scan, when the channel is newly created; they are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings <small>[3160]</small>.</p> <p>Define if the limit settings defined above will be active. Default is 0 (no; limits inactive). If 0 is used, the limits will be written to the sensor channel settings as predefined values, but limits will be disabled.</p>	<p>0 (= no) 1 (= yes)</p>
Warning	—	<p>i The values defined with this element will be considered only on the first sensor scan, when the channel is newly created; they are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings <small>[3160]</small>.</p> <p>If enabled for at least one channel, the entire sensor is set to "Warning" status. Default is 0 (no).</p>	<p>0 (= no) 1 (= yes)</p>

Part 13: Advanced Topics | 2 Application Programming Interface (API) Definition
8 Mini Probe API

NAME	MANDATORY	DESCRIPTION	POSSIBLE VALUE
Message	—	Text the sensor returns in the Message field with every scanning interval. There can be one message per sensor, regardless of the number of channels. Default is OK.	Any string
Error	—	The type of error.  The type is not necessarily shown in PRTG.	Data: The monitored device returned a value but the sensor could not process it. Response: The monitored device reported an error. This includes timeouts, HTTP response codes, etc. Exception: Error in sensor handling. Socket: Socket error.
Code	—	The error code that is stored in the database.	Integer

13.3 Filter Rules for xFlow, IPFIX and Packet Sniffer Sensors

You can use filter rules for the **Include Filter**, **Exclude Filter**, and **Channel Definition** fields of [Packet Sniffer](#)³⁶⁸⁵, [xFlow, and IPFIX](#)³⁶⁸⁶ sensors. The filter rules are based on the following format:

```
field[filter]
```

Here are quick links for ease of use.

- [All Sensors](#)³⁶⁸⁵
- [Packet Sniffer Sensors](#)³⁶⁸⁶
- [NetFlow v5 and jFlow v5 Sensors](#)³⁶⁸⁶
- [NetFlow v9 and IPFIX Sensors](#)³⁶⁸⁷
- [sFlow Sensors](#)³⁶⁸⁸
- [Valid Data Formats](#)³⁶⁸⁸
- [Examples](#)³⁶⁸⁸

Valid Fields for All Sensors

FIELD	POSSIBLE FILTER VALUES
IP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁸)
Port	Any number
SourceIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁸)
SourcePort	Any number
DestinationIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁸)
DestinationPort	Any number
Protocol	TCP, UDP, ICMP, OSPFIGP, any number
TOS	Type Of Service: any number
DSCP	Differentiated Services Code Point: any number

Additional Fields for Packet Sniffer Sensors Only

FIELD	POSSIBLE FILTER VALUES
MAC	Physical address (see Examples <small>(3686)</small>)
SourceMAC	Physical address
DestinationMAC	Physical address
EtherType	IPV4, ARP, RARP, APPLE, AARP, IPV6, IPXold, IPX, any number
VlanPCP	IEEE 802.1Q VLAN Priority Code Point
VlanID	IEEE 802.1Q VLAN Identifier
TrafficClass	IPv6 Traffic Class: corresponds to TOS used with IPv4
FlowLabel	IPv6 Flow Label

Additional Fields for NetFlow v5 and jFlow v5 Sensors Only

FIELD	POSSIBLE FILTER VALUES
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see Valid Data Formats <small>(3686)</small>)
SourceASI	Any number
DestinationASI	Any number

Additional Fields for NetFlow v9 and IPFIX Sensors Only

FIELD	POSSIBLE FILTER VALUES
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	<p>IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel.</p> <p>Possible values: IP address or DNS name (see Valid Data Formats)</p>
SourceASI	Any number
DestinationASI	Any number
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address
Mask	Mask values represent subnet masks in with a single number (number of contiguous bits).
DestinationMask	Mask values represent subnet masks in with a single number (number of contiguous bits).
NextHop	IP address or DNS name (see Valid Data Formats)
VLAN	VLAN values represent a VLAN identifier (any number)
SourceVLAN	VLAN values represent a VLAN identifier (any number)
DestinationVLAN	VLAN values represent a VLAN identifier (any number)

Additional Fields for sFlow Sensors Only

FIELD	POSSIBLE FILTER VALUES
Interface	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see Valid Data Formats)
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address

Valid Data Formats

- IP fields support wildcards (*), range (10-20) and hostmask (/10, /255.255.0.0) syntax, as well as DNS names.
 -  IPv6 wildcards, IPv6 ranges, and IPv6 hostmasks are not supported.
- Number fields support range (80-88) syntax.
- Protocol and EtherType fields support numbers and a list of predefined constants.

 For detailed information on IP ranges, see section [Define IP Ranges](#).

Examples

All of the following filter rules are valid examples:

```
SourceIP[10.0.0.1]
SourceIP[10.*.*.*]
SourceIP[10.0.0.0/10]
DestinationIP[10.0.0.120-130]
DestinationPort[80-88]
Protocol[UDP]
MAC[00-60-50-X0-00-01]
DSCP[46]
```

You can create more complex expressions using parentheses () and the words **and**, **or**, or **and not**. For example, these are valid filter rules:

```
Protocol[TCP] and DestinationIP[10.0.0.1]
```

This filters for all TCP traffic with the destination IP 10.0.0.1.

```
Protocol[TCP] or DestinationIP[10.0.0.1]
```

This filters for all TCP traffic and all traffic with the destination IP 10.0.0.1.

```
Protocol[TCP] and (DestinationIP[10.0.0.1] or SourceIP[10.0.0.120-130])
```

This filters for all TCP traffic with either the destination IP 10.0.0.1 or the source IP range 10.0.0.120-130.

```
Protocol[TCP] and not (DestinationIP[10.0.0.1] or SourceIP[10.0.0.120-130])
```

This filters for all TCP traffic that has not the destination IP 10.0.0.1 and not the source IP range 10.0.0.120-130.

13.4 Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors

When adding [Custom xFlow sensors](#), [Custom IPFIX](#), or [Custom Packet Sniffing sensors](#), you have the option to provide a **Channel Definition**. In this field enter your channel definitions using the following syntax (one entry per channel):

```
#<id>:<Name>
<Rule>
```

Syntax

- The **<id>** needs to be 1 or a higher number and must be unique for the sensor. This means each channel definition must have a unique ID.
 - ❗ The maximum channel ID you can use is 2147483648 (2^{31}). Higher IDs are not supported. We recommend that you use channel IDs like 1, 2, 3, and so on.
- The **<id>** is linked to the historic data.
 - ❗ As soon as you change the ID, you will lose the history for this particular channel that the ID was linked to.
- One rule can span multiple lines.
- The next rule starts with a # as first character in a line.
- The **<name>** is the channel's display name.
- The rules are processed top to bottom (the number does not matter) and the data is accounted to the first match.
- PRTG adds one channel named **Other** automatically. This channel counts all traffic for which you have not defined a channel.
- After the name you can use an optional [**<unit>**] to override the automatic unit, which is based on the source sensors.

The **<Rule>** syntax is identical to the one described in the [Filter Rules for xFlow and Packet Sniffer Sensors](#) section. Because data is accounted to the first match, make sure you start with the most specific rule at the top and get less specific to the bottom.

❗ We recommend that you write the rules list in an external editor first and then paste it into the **Channel Definition** field of the sensor in PRTG. Otherwise, if the rules contain an error, the entries will be removed when you add the rules in case!

⚠ You cannot delete channels of an existing sensor, even if you remove a channel from the channel definition. You also cannot change the display name of channels using the channel definition of custom flow sensors. Renaming is only possible via [channel settings](#).

Example

General example:

```
#5:HTTP
Protocol[TCP] and
(SourcePort[80] or DestinationPort[80] or SourcePort[8080] or
DestinationPort[8080])
```

Channel definition example for differentiating by protocol:

```
#1:TCP
Protocol[TCP]

#2:UDP
Protocol[UDP]

#3:ICMP
Protocol[ICMP]
```

13.5 Define IP Ranges

In some setting fields, you can either enter a host name or single IP address, or you can define IP ranges. PRTG follows a common syntax for this. IP ranges are available, for example, for [xFlow and Packet Sniffer sensors](#)^[430] and for [probe connection settings](#)^[389].

 For the supported syntax of the automatic network discovery functionality in PRTG, see section [Auto-Discovery](#)^[285] (**IP Selection Method**).

Available Options

OPTION	DESCRIPTION	SYNTAX	EXAMPLE(S)
Simple	Enter a fixed IP address.	a.b.c.d	10.0.10.9
Hostname	Enter a hostname. PRTG will resolve it to an IP address in your network.	hostname	device-xyz
Hostmask	Enter a hostmask. A hostmask defines the relevant bits of the IP address.	a.b.c.d/h or a.b.c.d/e.f.g.h	10.0.0.0/255
Range	Enter an IP address range. Replace each of a , b , c , d by either <ul style="list-style-type: none"> ▪ * (asterisk) for any value; corresponds to 0-255 —or— ▪ x-y for any range between 0 and 255. 	a.b.c.d	10.0.0.1-20 or 10.*.0.* or 10.0.0-50.*

13.6 Define Lookups

PRTG uses **lookups** for some sensor types and for some sensors with custom channels. In general, lookups make data more human friendly because they map status values as returned by a device (usually integers) to more informative expressions in words that show you the status of a monitored device as a clear message.

Additionally, lookups can also define the [sensor status](#) that will be shown in correlation with certain status codes, just like [sensor channel limits](#) can define a sensor status, too. For example, for a printer, PRTG can show a sensor in a yellow **Warning** status with channel values, provided by lookups, like "Toner Low" instead of simple status codes, like "1".

You can customize lookups individually and define your own texts that a sensor channel can show. See the section [Customizing Lookups](#) below.

If a channel uses lookups, you can individually define how to control the sensor status, either using the lookup definition or using limits for numerical values returned by the device. For details, see [Sensor Channels Settings](#), section **Alerting and Limits**.

-  Lookups do not change data in the PRTG database, but they merely change the way sensor channels are shown. Any change to lookup definition files will apply to historic data as well as to live data.
-  Some exceptions apply to the [SNMP Custom String Lookup Sensor](#) that basically does an "inverse lookup". It does not map an integer to a text message but looks only for matching strings in the lookup definition and shows a status based on this text value.

 Customizing lookups is not possible on PRTG hosted by Paessler.

Requirement: Channel Unit "Custom"

All sensor channels with enabled **Value Lookup** need to use the channel **Unit "Custom"**. For details, refer to the section [Sensor Channels Settings](#).

 There are sensors that provide the unit **Value Lookup** for channels in their sensor settings. Do **not** use the "custom" unit for channels of these sensors if you want to use lookups! This would result in malfunctioning lookup channels. For the following sensor types, choose the unit **Value Lookup** in the sensor settings and select your lookup file directly when adding the sensor:

- [Google Analytics Sensor](#)
- [Microsoft SQL v2 Sensor](#)
- [MySQL v2 Sensor](#)
- [Oracle SQL v2 Sensor](#)
- [PostgreSQL Sensor](#)
- [SNMP Custom Advanced Sensor](#)
- [SNMP Custom Table Sensor](#)

Visualization of Lookup Channels

PRTG can display gauges or switches for channels that use lookups. We recommend that you stay below 120 lookup values to display informative gauges for primary channels. Non-primary channels have an upper limit of around 40 lookup values for gauges.

- i** The various states displayed in gauges always follow the clockwise order **Up** (green) < **Warning** (yellow) < **Down** (red) < **Unknown** (gray / black).

Lookups Directory and Format

Lookups are defined in XML format in files ending in `.ovl`. PRTG standard lookup files are located in the [PRTG program directory](#)³⁷³⁴ in the `\lookups` subfolder. These files are maintained by PRTG itself. In each of the files lookups are defined for one or more sensors. Furthermore, the lookups folder contains the `\custom` subfolder to store your customized lookups.

The files follow a basic principle. For each numeric value you can define:

- A message that the sensor will look up and show instead of the numerical value
- The status that the sensor will show

- i** Use the [SNMP Custom String Lookup Sensor](#)¹⁹⁸² to map a string into a corresponding status. Please use the [lookup type](#)³⁷⁰⁰ `SingleInt` for this purpose.

☁ You cannot access this directory on PRTG hosted by Paessler instances.

Example

The following code illustrates the lookup definition for the toner status of the [SNMP HP LaserJet Hardware](#) sensor:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="oid.paessler.hplaserjet.tonerstatus" desiredValue="1" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <Lookups>
    <SingleInt state="Ok" value="0">Toner Okay</SingleInt>
    <SingleInt state="Warning" value="1">Toner Low</SingleInt>
    <SingleInt state="Error" value="2">No Toner Cartridge Loaded</SingleInt>
  </Lookups>
</ValueLookup>
```

The schema in the example provides an insight how lookups are defined:

- The `<?xml>` tag in the first line defines the content as XML.
- The `<ValueLookup>` tag in the second line contains:
 - The **ID** that is shown in the [Sensor Channels Settings](#).
 - The `desiredValue` attribute contains the value that is used for the calculation of the "Coverage". In this example, **1** is defined as desired value.
 - The `xsi` attributes refer to PRTG's predefined XML schema definitions (which allow easy editing of lookup files with supported editors). We recommend that you use the default value.
- Between the tags `<Lookups>` and `</Lookups>` the particular lookups for the sensor data are defined:
 - A lookup entry starts with a tag containing the type of the status value, the **lookup type** (in this example, this is always `<SingleInt>`).
 - Separated by whitespace, the **state** attribute defines the status the sensor will show. Allowed values are: **Ok**, **Warning**, **Error**, and **None** ("None" does not trigger a status change).
 - The **value** attribute defines which numeric value will trigger the lookup. This is the value that PRTG will receive from the device.
 - The **text** defines the substitution text that is shown instead of the value. For example, this can be a status message.
- The same way all other possible lookups are defined. The lookup definitions are closed by the tag `</Lookups>`. The file closes with `</ValueLookup>`.

In our example, the lookup file will have the following effect:

Value as Reported from HP Printer	Value Shown in PRTG (Sensor Channel)	Sensor Status Shown by PRTG
0	Toner Okay	Up
1	Toner Low	Warning
2	No Toner Cartridge Loaded	Down

The XML Schema

An exemplary schema of the XML files containing the lookup definitions can be sketched like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="..." desiredValue="..." undefinedState="..." xmlns="..." xsi="...">
  <Lookups>
    <SingleInt state="..." value="...">status text</SingleInt>
    <Boolean state="..." value="...">status text</Boolean>
    <BitField state="..." value="...">status text</BitField>
    <Range state="..." from="..." to="...">status text</Range>
    [several other lookup definitions]
  </Lookups>
</ValueLookup>
```

Element	Description	Attributes, Value Assignment, and Content
<code><?xml></code> <code>content</code>	This is the XML declaration. Every XML file begins with it.	<ul style="list-style-type: none"> ▪ version and encoding are "1.0" resp. "UTF-8" ▪ content: <code><ValueLookup>contentValueLookup</ValueLookup></code>
<code><ValueLookup></code> <code>contentValueLookup</code> <code></ValueLookup></code>	Defines the ID of the channel, what desiredValue is used, the status for undefined values (undefinedState), and links to PRTG's predefined schema definitions, which allow editing of lookup files with supported editors.	<ul style="list-style-type: none"> ▪ id: Specifies how the name of the lookup file is shown in the Sensor Channels Settings³¹⁶⁰. ▪ desiredValue³⁶⁹⁹: Please see below. ▪ undefinedState: Optionally define a status for values that are not defined in the lookup file. If the target device returns a value that is not included in the lookup definition, the sensor will show this status (Ok, Warning, Error, or None) with an according message. Without a definition of "undefinedState", the sensor will only show the returned value. ▪ xmlns:xsi/xsi: refers to predefined XML schema definition ▪ contentValueLookup: lookup definitions <code><Lookups>contentLookups</Lookups></code>
<code><Lookups></code> <code>contentLookups</code> <code></Lookups></code>	Defines the particular lookups for the sensor data.	<ul style="list-style-type: none"> ▪ contentLookups: one or more lookup entries, see below
<code><SingleInt></code> <code>status text</code> <code></SingleInt></code>	Each element defines one lookup entry. There can be one or more entries in this format. SingleInt , Boolean , BitField , and Range are lookup types ³⁷⁰⁰ .	<ul style="list-style-type: none"> ▪ state: defines the state the sensor will show; allowed values: Ok, Warning, Error, None
<code><Boolean></code> <code>status text</code> <code></Boolean></code>		<ul style="list-style-type: none"> ▪ value: defines the value that triggers the lookup. Please enter an integer value. <ul style="list-style-type: none"> ⓘ Range needs always both values "from" and "to".
<code><Bit Field></code> <code>status text</code> <code></Bit Field></code>		<ul style="list-style-type: none"> ▪ status text: defines a status text that will be used as substitution text and shown instead the integer value. For example, a status message
<code><Range></code> <code>status text</code> <code></Range></code>		

Because all the XML files containing lookup definitions are delivered in a pre-given schema as indicated above, you can customize lookups accordingly.

Customizing Lookups

If you want to change the status definitions of a specific sensor channel, you basically have to do the following:

- 1) Find out the (file) name of the lookup file in the [settings of the sensor channel](#)³¹⁶⁰ you want to change the behavior for.
- 2) From the [PRTG program directory](#)³⁷³⁴ subfolder `\lookups`, copy this file into the `\lookups\custom` subfolder (ensure you do not change the file name!).
- 3) Change the duplicated file as you like. See the example below.

 This feature is not available in PRTG hosted by Paessler.

All default lookup files are located in the `\lookups` subfolder in the [PRTG program directory](#)³⁷³⁴. To customize existing lookups, copy the desired lookup file from the `lookups` folder to the `\lookups\custom` subfolder or create a new `.ovl` file there. When using the same ID in the `ValueLookup` tag, the files in the `\lookups\custom` folder will have a higher priority than the original files in the `\lookups` folder. This way, PRTG handles your customizations preferably instead of the original lookup settings. If you want to use custom lookup definitions **in addition** to the existing lookups, define a new ID in the lookup file that is not used by another lookup file. PRTG identifies lookup definitions via this ID, it does **not** use the file name.

Open the file with an XML or text editor and adjust the lookups to your personal preferences. You can define your own messages as well as you can customize sensor states for the particular return values. For example, if you do not want show an "Error" (a sensor **Down** status) for the return value "2" but only a warning, then you can replace "Error" with "Warning".

 The possible states are given in the `LookupState.xsd` file in the custom directory. Following the schema of the XML files that are delivered with PRTG enables you to edit the lookups in a safe way.

 If you [imported an oidlib file](#)²²⁴² that contains [lookups](#)³⁶⁹³ (you can see this in section **Lookup** in the MIB Importer), you can define your own sensor states for returning values. If you add an [SNMP Library Sensor](#)²²³⁷ using this oidlib, PRTG will create a lookup definition file using the `lookupname` of the chosen library as `id` parameter. Override this lookup definition with your own custom lookup as described in this section. This is important because lookups that are added via an oidlib will not contain any state definitions and result in a **Warning status**¹⁹⁵¹ of the sensor by default because of the entry `undefinedState="Warning"`.

 If you use an [SNMP Custom String Lookup Sensor](#)¹⁹⁸², you can create a new custom lookup definition in the `\lookups\custom` directory with the expected return values. In this case, use the `lookupname` of the chosen library as `id` parameter to override the lookups from the oidlib file.

 When you save an edited lookup, make sure that it is saved as an `.ovl` file. Otherwise, the lookup might accidentally be saved as a `.txt` file and might not be loaded.

Example for Lookups Customization

For example (just for illustration purposes), imagine you would like

- 1) to have the status "Warning" for all undefined values that the target device might return,
- 2) to change the status for the return value "2" from "Down" to "Warning",
- 3) and to add the status "None" to the [example](#) above.

Then do the following:

- Copy the file `oid.paessler.hplaserjet.tonerstatus` to the `\lookups\custom` subfolder of your PRTG installation.
- Open this file with an editor.
- Leave the ID value unchanged to prioritize the customized lookup to the original file.
- Insert the status definition for undefined values into the ValueLookup element:
undefinedState="Warning"
- Replace "Error" with "Warning" for value "2".
- Add a "SingleInt" element with status "None" for the (hypothetical) return value "3".
- Save the file and [reload](#) the custom lookup folder in PRTG.

The customized lookup file will finally look like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="oid.paessler.hplaserjet.tonerstatus" desiredValue="1" undefinedState="Warning" xmlns:xsi=
  <Lookups>
    <SingleInt state="Ok" value="0">Toner Okay</SingleInt>
    <SingleInt state="Warning" value="1">Toner Low</SingleInt>
    <SingleInt state="Warning" value="2">No Toner Cartridge Loaded</SingleInt>
    <SingleInt state="None" value="3">Unknown status of toner</SingleInt>
  </Lookups>
</ValueLookup>
```

- See also [SNMP Custom String Lookup Sensor—Example](#) for a lookup definition that maps a string value to a sensor status.

desiredValue Attribute

It is necessary to define a **desiredValue** in the lookup files. The desiredValue corresponds to a status value triggering a lookup. PRTG calculates the percentage of time this specific state has been monitored. The result is displayed for all data tables and graphs that show averaged values.

Considering the example above where the desiredValue is "1", PRTG will calculate the percentage of time the toner status has been "Warning". If in a time span of five minutes four of five sensor scans returned a "Warning" status, PRTG would show an average of 80% for this time span, because in 80% of the time the sensor showed a "Warning".

Lookup Types: SingleInt, Boolean, BitField, Range

Besides the lookup type **SingleInt** as seen above, there are three other lookup types: **Boolean**, **BitField** and **Range**. Using these types you can define lookup values beyond simple integers.

Lookup Type	Description	Syntax
SingleInt	Uses an integer to define a lookup for one status value.	value="int"  The full 32-bit integer range is supported.
Boolean	Uses 0 or 1 to define a lookup for two different status values.	value="0" value="1"
BitField	Uses a bit field for multiple status values.	Only use it if you have basic knowledge about bitmasks. See the section More below for a general introduction.  Every value has to equal a power of two (for example, 1, 2, 4, 8, 16, 32, 64, etc.).  The SNMP Custom String Lookup Sensor does not support BitFields.
Range	Uses an inter range from-to to define a lookup for several status values.	from="int" to="int"  Using ranges, the parameters "from" and "to" always have to be defined. If you want to query only one single value in a range file, this value must be set as parameter for "from" and "to" (for example, from="2" to="2").  The SNMP Custom String Lookup Sensor does not support ranges.  The full 32-bit integer range is supported.

 You can use only **one** kind of lookup type in **one** lookup file. This means, only or **SingleInts**, or **Boolean**, or **BitField**, or **Ranges**. Different lookup types in one file are not allowed.

Define Lookup Files in Sensor Channel Settings

For each sensor with a custom channel, you can define a lookup file to use with the option **Value Lookup** in the [sensor channel settings](#)^[3160]. This option is visible for many **SNMP sensors**, some **application sensors**, and always for the following sensor types:

- [EXE/Script Sensor](#)^[834]
- [EXE/Script Advanced Sensor](#)^[847] (if a **Custom** unit is defined)
- [SNMP Custom Sensor](#)^[1949]

 For details, see section [Sensor Channel Settings](#)^[3160].

Loading Lookups

You can (re)load the defined lookups in the custom folder by clicking the **Load Lookups** button in the PRTG web interface under **Setup | System Administration | Administrative Tools**^[3388].

 A sensor whose lookup file you have modified and reloaded will not re-evaluate this lookup before the next sensor scan. For sensors with large scanning intervals, use the **Scan Now** option from the [context menu](#)^[259] to immediately apply the new lookup definition and to avoid an incorrect sensor status.

Debugging—What will happen if...?

- A return value is defined in the lookups that never will be returned by a device because the value is not assigned: The value will never be triggered, so PRTG simply ignores this entry.
- PRTG receives a return value that is not defined for lookups: No substitution message can be found. PRTG will just show the return value. You can optionally define a status for unknown values with a definition of **undefinedState** in the **ValueLookup** element (see section [Define Lookups—The XML Schema](#)^[3696] above).
- Different lookup types are in one lookup file: This is not allowed and PRTG will discard this lookup definition. If you use miscellaneous lookup types in one file, for example, ranges and singleInts together, the PRTG system will create a ticket when loading lookups or restarting the PRTG server with the following error message: **Value lookup file "[...]" could not be loaded (" " is not a valid integer value)**.
- Incorrect XML code: PRTG will create a new ticket when loading lookups or restarting the PRTG server with a corresponding error message and discard this lookups definition.
- A lookup file has a file ending other than .ovl: The file will not be loaded.
- Alerting is disabled or based on limits: Error and warning states defined in the lookup will not apply. Please ensure you choose the option **Enable alerting based on lookups** in the [channel settings](#)^[3160] if you want to use the lookup definition to control the sensor status.

- http://en.wikipedia.org/wiki/Bit_mask

13.7 Regular Expressions

For some sensors (for example, some [HTTP sensors](#)^[430] and [email sensors](#)^[435]), you can use regular expressions to match a search pattern. PRTG supports **Perl Compatible Regular Expressions (PCRE)**.

⊘ PRTG does not support regex options or regex flags like, for example, `/g` (global), or `/s` (single line), or `/gs`, and will not correctly search for the target string if you try to set options.

See below for examples with the most [common patterns](#)^[3704] and an [example](#)^[3704] for possible matches.

Common Search Patterns

Find matches containing the word **error** or **alarm**:

```
\b(error|alarm)\b
```

Find matches containing the words **error** and **alarm** in any order:

```
(?=.*\berror\b)(?=.*\balarm\b).*
```

Find matches containing all of the words **t**ree, **f**lower, **l**eam, and **b**ug, in any order:

```
(?=.*\btree\b)(?=.*\bflower\b)(?=.*\bleaf\b)(?=.*\bbug\b).*
```

ⓘ It is not possible to match an empty string using the PRTG regex search with sensors.

Example

The search pattern

```
(?=.*\berror\b)(?=.*\balarm\b).*
```

will match the following expressions:

- alarm error
- error alarm
- I am an error and I evoke an alarm
- I am an alarm and I indicate an error
- An alarm combined with an error indeed!
- An error combined with an alarm, too!

13.8 Calculating Percentiles

PRTG not only monitors your network and informs you in the case of issues that are worth you taking a closer look at in the here and now. PRTG also stores a lot of historic measurement data gathered from your sensors. This means that you have a great base for statistical analysis and evaluation of what is and was happening in your network.

When creating a [Report](#)³²⁵² with PRTG, you get raw data, sums, averages, and percentages of your monitoring data.

Additionally, PRTG also offers percentile calculation. This statistical method puts your data in order, for example, from the lowest value to the highest value, and calculates the percentile you want, optimally informing you about the distribution of your network-relevant data.

 For example, if you request the 95th percentile, you know that 95 percent of the measured data is below a certain value, and thanks to PRTG, you know what this certain value is.

 If applied, for example, to bandwidth, you know what values you are talking about when talking about the 5 percent of unusually high bandwidth consumption and which value your users do not exceed 95 percent of the time. Service providers often use percentiles to offer fairer billing that excludes infrequent usage peaks.

 If you want to know more about the formula that PRTG uses for percentile calculation, see this Knowledge Base article: [What are percentiles and what differences do they make in PRTG reports?](#)

Create a report for several sensors and device groups using the [Report](#)³²⁵² feature or create reports for single sensors using the [Historic Data Reports](#)²⁰⁴.

- <https://kb.paessler.com/en/topic/9563>

13.9 Add Remote Probe

* Why are remote probes helpful for monitoring with PRTG? Because you can extend your monitoring.

- Remote probes allow you to monitor different sub-networks that are separated by a firewall from your PRTG on premises core server and to keep an eye on remote locations. You can install [one or more remote probes](#)³⁷⁰⁹.
- Remote probes are useful if you want to distribute monitoring load by taking it from the system running the PRTG core server and putting it on one or more remote probe machines.
- You will need a remote probe if you want to monitor your local network using a PRTG hosted by Paessler instance.
- Remote probes may be suitable monitoring components in several individual scenarios that depend on your custom network setup.

Extend Your Monitoring Now

See the sections linked below for further instructions.

- Background: [Remote Probes and Multiple Probes](#)³⁷⁰⁹
- Installing: [Remote Probe Quick Install](#)³⁷¹³
- Step by Step: [Remote Probe Setup](#)³⁷¹⁹

More

Video Tutorial: Core Server and Remote Probes

- https://www.paessler.com/support/video_tutorials/distributed_monitoring

13.9.1 Remote Probes and Multiple Probes

Upon installation, PRTG creates the first probe automatically, the **Local Probe** in PRTG on premises and the **Hosted Probe** in PRTG hosted by Paessler. They run on the same machine as the PRTG core server and monitor all reachable devices, servers, and services from this system, using the sensors you have configured.

Working only with a local probe should suffice for Local Area Network (LAN) monitoring with PRTG on premises and if you want to monitor one location only. For LAN monitoring with PRTG hosted by Paessler, at least one remote probe is required because the hosted probe can only reach targets that are publicly available via the internet.

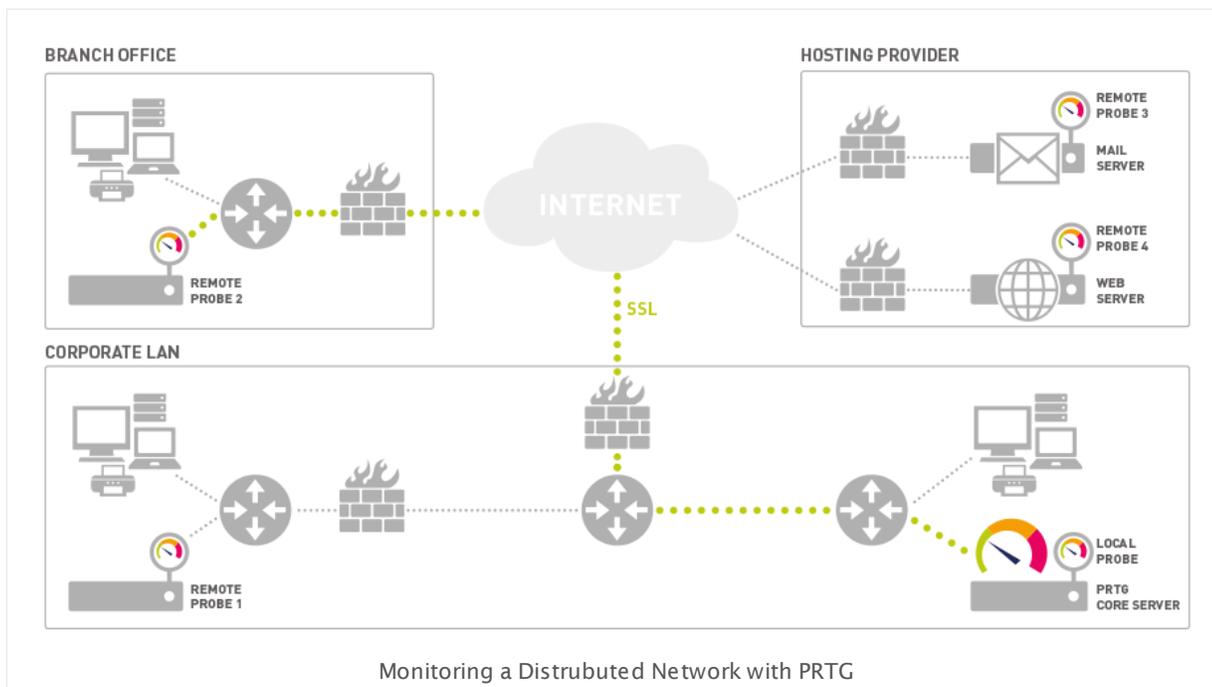

Scenarios Requiring Remote Probes

There are several situations that make it necessary to work with **Remote Probes** in the same LAN or in remote locations. Among these situations are the following:

- You run a PRTG hosted by Paessler instance and want to monitor your local network.
- You have more than one location and you need to make sure that services are available from all locations.
- Your network is separated in several LANs by firewalls, and the local probe cannot monitor specific services across the firewalls.
- You want to monitor systems in a secure network, and you need a secure connection between the PRTG server and this network.
- You want to sniff packets on another computer.
- You want to monitor NetFlow data on another computer.
- You experience performance issues with CPU intensive sensors like packet sniffer or NetFlow sensors and need to distribute the load over more than one PC.

The following chart shows an example for a remote probe scenario.

Part 13: Advanced Topics | 9 Add Remote Probe
1 Remote Probes and Multiple Probes

The PRTG core server inside the **Corporate LAN** (bottom right) is able to monitor:

- Services inside the **Corporate LAN** using the **Local Probe**.
- Services behind a firewall in the **Corporate LAN** using **Remote Probe 1**.
- Secured services inside the **Branch Office** (top left) using **Remote Probe 2**.
- Secured services on **Mail Server** and **Web Server** using **Remote Probe 3** and **Remote Probe 4** installed directly on these servers.
- Public services on the internet using any of the probes.

How Probes Work

As soon as a probe is started, it automatically connects to the [PRTG core server](#)¹²⁶, downloads the sensor configuration, and begins its monitoring tasks. The core server sends new configuration data to a probe as soon as the monitoring configuration is changed by the user. Probes monitor autonomously and send the monitoring results back to the core server for each check they have performed.

If the connections between core and probe fail for any reason (for example, a reboot of the computer running the core server) the probe continues monitoring and stores the results. During a connection loss a buffer stores a maximum of 500,000 sensor results in the RAM memory of the remote probe system (up to 50 - 200 MB). This means that for 100 sensors with one minute interval the monitoring results of up to 3 days can be buffered (or 52 minutes for 10,000 sensors with one minute interval). The probe automatically reconnects to the core as soon as it is available again and transmits all monitoring results gathered during the connection loss.

The connection between probe and core is initiated by the probe, secured using Transport Layer Security (TLS). This means that the data sent back and forth between core and probe is not visible to someone capturing data packets. The core server provides an open TCP/IP port and waits for connection attempts from probes. If a new probe connects for the first time, the administrator will receive a ToDo [ticket](#)^[230] and will then see the new probe in the device tree.

As a security precaution, the probe must be manually acknowledged by the administrator in the device tree before any sensors can be created and monitored. The administrator can also deny a probe, which will then be disconnected. No further connection attempts will be accepted and the probe IP is added to the **Deny IPs** list in the probes system settings (see [System Administration—Core & Probes](#)^[338] section). This ensures that unauthorized probes cannot connect to a core server.

Because the probe initiates the connection, you must ensure that a connection can be established from the outside world to your core server. For example, you may need to open any necessary ports in your firewall and you may need to specify a Network Address Translation (NAT) rule for your network. The process is the same as if you wanted to allow access to the web server provided by the PRTG core server via port 443, for example. Make sure that you have the TCP port **23560** open or forwarded on both your PRTG core server side and probe side.

If you run PRTG in a cluster installation, remote probes also connect to your failover node(s) in addition to the master node and send monitoring data. This works as described above for a single PRTG server. If your master node fails, you can still see monitoring data on your failover (s). You can define the **Cluster Connectivity** of each probe in its [Administrative Probe Settings](#)^[371].

Automatic Probe Update

Whenever a new version of PRTG is installed on the core server, all remote probes will automatically download and install the updated version of the probe as soon as they reconnect to the updated core installation.

The local probe has already been updated during the core installation. All remote probes automatically download the new binaries using the TLS-secured probe or core connection. The download of the 4 MB file takes anywhere from a few seconds (in a LAN) to a few minutes (via internet connections), depending on the available bandwidth. As soon as the update has been downloaded the probe disconnects, installs the update, and reconnects to the core server. This takes between 20 and 100 seconds. Please note that during the update phase the monitoring of the local probe can be affected due to the bandwidth required for the downloads.

i If the automatic update of a remote probe fails for some reason, please update the remote probe manually by [downloading and executing the installer](#)^[371] on the probe computer. If a remote probe keeps being disconnected after an update, please check if the server with the remote probe has two network connections with different IP addresses. Make sure these addresses are in the list of allowed IPs in the [Core & Probes settings](#)^[338].

Video Tutorial: Core Server and Remote Probes

- https://www.paessler.com/support/video_tutorials/distributed_monitoring

13.9.2 Remote Probe Quick Setup

Install a PRTG Remote Probe directly by right-clicking on a device in the PRTG device tree. This semi-automatic installation mechanism is an alternative to the [Remote Probe Setup Using Installer](#)^[101].

 This is an experimental feature. It may not work in all situations. In this case, please see [Debugging](#)^[3718] and try the [standard remote probe installation](#)^[101].

 This feature is not available in PRTG hosted by Paessler.

 To install a Remote Probe directly from the device tree in the PRTG web interface, follow the steps below.

- [Step 1: Meet the Requirements](#)^[3713]
- [Step 2: Prepare the Core Server](#)^[3714]
- [Step 3: Provide Credentials](#)^[3715]
- [Step 4: Install the Remote Probe](#)^[3716]
- [Step 5: Approve the New Remote Probe](#)^[3717]

Before you start, take a closer look at the requirements in the first three steps.

 Do you run PRTG Network Monitor in a cluster? Then mind this [important note](#)^[3715].

Step 1: Meet the Requirements

 To install a probe remotely on a computer please ensure that the following conditions are true.

- The target computer runs the operating system Windows 7 or later.
- The target computer is accessible through Remote Procedure Call (RPC). This is usually the case when your PRTG server and the target computer are located in the same LAN segment. Otherwise, open Windows `services.msc` on the target computer and start the Remote Procedure Call (RPC) service.
- Programs are allowed to communicate through your Windows Firewall. Open the settings of your Firewall and choose **Allow programs to communicate through Windows Firewall**. Mark the check box for **Remote Service Management**, and the checkbox **Public** in the corresponding line.
- Connections between remote probes and the PRTG core server require port **23560**. Please open or forward this port in your firewall configuration.

 You cannot install a remote probe on the local probe or hosted probe device and the Remote Probe Quick Setup is also not available for devices on remote probes. Please use the [Remote Probe Installer](#)^[3719].

 You cannot install a remote probe on the computer the PRTG core server runs on because the core server already includes a local probe service or hosted probe service respectively.

Step 2: Prepare the Core Server

! Because your remote probe needs to connect to your PRTG core server, PRTG needs to accept incoming remote probe connections. So, on PRTG on premises, prepare your PRTG server first when you want to install the remote probe.

Edit the relevant settings in [System Administration—Core & Probes](#)³³⁶⁸. From the main menu in the [PRTG web interface](#)¹⁶⁸⁸, select **Setup | System Administration | Core & Probes** to access the probes settings and go to the **Probe Connection Settings**.

The screenshot shows the 'System Administration' web interface. The 'Core & Probes' tab is active. Under 'Proxy Configuration', the 'Use Proxy Server' option is set to 'No, use direct connection to the internet (default)'. Under 'Probe Connection Settings', the 'Probe Connection IPs' option is set to 'All IPs available on this computer'. The 'Access Keys' field contains a list of GUIDs. The 'Allow IPs' field is set to 'any'. The 'Deny IPs' and 'Deny GIDs' fields are empty. The 'Mini Probes' option is set to 'Allow Mini Probes to connect to an extra port'. The 'Mini Probe Port' is set to 8090. A 'Save' button is visible next to the 'Probe Connection IPs' options.

Probe Connection Settings in System Administration

Step 1: Probe Connection IPs

By default, a core server accepts connections from the **Local Probe only** (IP address **127.0.0.1**). This setting is the most secure setting, but it does not allow any remote probe to connect to your PRTG core server.

To accept remote probes, choose one of the following settings:

- **All IPs available on this computer:** Any IP on your core server system accepts incoming probe connections.
- **Specify IPs:** Specify selected IP addresses that accept incoming connections.

Step 2: Allow IPs

In the **Allow IPs** field, you can enter the IP address of the computer you want to install a remote probe on. To make things easier, you can also enter the word **any**. Any will set the PRTG core server to accept remote probes connecting from any IP address.

 If you use **any**, make sure you write the word in lower case only! Any other variations will not be valid!

Changing other settings is not required. For details about the fields for **Access Keys**, **Deny IPs**, and **Deny GIDs** see section [System Administration—Core & Probes](#).

When you are done, click **Save** to save your settings.

 If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears that asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the [Enterprise Console](#), or of [PRTG Apps for Mobile Network Monitoring](#) will be disconnected and reconnected.

 To edit the core-probe connection settings you can also use the [PRTG Administration Tool](#) on your core server.

PRTG Cluster and Remote Probes Outside the LAN

 If you use the [Clustering](#) feature of PRTG and you want to run remote probes outside your local network, you have to make sure your cluster nodes and the addresses they use are reachable from the outside! Check your cluster node settings under [System Administration—Cluster](#) before installing a remote probe outside your local network. Enter addresses (DNS names or IPs) that are valid for both cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. Remote probes outside your LAN cannot connect to your cluster nodes if they use local addresses.

 If you already have a remote probe installed outside your LAN and the probe is disconnected because of this, please follow these steps:

1. Uninstall the current remote probe.
2. Update the [cluster node settings](#) with addresses that are reachable from outside your LAN.
3. Restart your PRTG core servers.
4. Install the remote probe again. It will then obtain the IP address or DNS name entries that it can reach.

 See also section [Failover Cluster Configuration—Remote Probes in Cluster](#).

Step 3: Provide Credentials

If not done yet, [add a device](#) to PRTG that represents the target computer on which you want to install the remote probe. Set the correct Windows credentials for this device.

Part 13: Advanced Topics | 9 Add Remote Probe 2 Remote Probe Quick Setup

- Open the [Device Settings](#)^[402].
- In the **Credentials for Windows Systems** section, provide **Domain or Computer Name**, **User**, and **Password** for the target computer.
- You can also [inherit](#)^[137] the credentials from the settings of a parent object in the device tree.

Make sure this user account has administration rights on the target computer.

Step 4: Install the Remote Probe

- In the device tree overview, open the [context menu](#)^[254] of the target device.
- Choose **Device Tools | Install Remote Probe...**
 - ❗ This option is only available on devices on the PRTG on premises local probe.
- The install assistant will appear on a new page.

[Install Remote Probe on Device Workstation \(home\)](#)

Please note: This is an experimental feature, it may not work in all situations. Please send your feedback to support@paessler.com.

You are about to install a PRTG Remote Probe on the computer "Workstation (home)". This will allow PRTG to monitor this computer locally instead of using remote monitoring features. This can be a good workaround for performance or authentication problems (for example, for WMI sensors) sometimes. Additionally, this will allow you to use some probe-only sensors like Packet Sniffing, NetFlow, and others.

Details

Device Name	Workstation (home) (wdf)
Status	OK
Priority	★★★★☆
Parent Probe	Local Probe (Local Probe) ...
Parent Group	Local Probe (Local Probe) ...
Sensors by State	(Total: 0)

[Prerequisites](#)

Please make sure you fulfill the following conditions.

- The target device must be a computer with a **supported Windows version**.
- The target computer must be accessible through **RPC** (this is usually the case when your PRTG server and the target computer are located in the same LAN segment).
- Open or forward **port 23560** in your firewall to allow connections between the probe and your PRTG core server.
- Windows credentials must be set in the **device settings** or its parents' settings (current user name: paesslergmbh\Testadmin) and the user account must have administration rights on the target machine.
- You have to allow remote probe connections to your PRTG core server. Open the **Core & Probes** tab in the System Administration of your PRTG web interface. In section **Probe Connection Settings** choose the option **All IPs available** on this computer or specify IPs for the setting **Probe Connection IPs**. Do not use the "Local Probe only" (127.0.0.1) setting! (Current setting: 172.17.101.192,127.0.0.1)

[Start Probe Installation](#)

The installation will take between 10 and 100 seconds.

[Install Remote Probe on "Workstation \(home\)"](#)

Remote Probe Installation Assistant

The installation assistant is divided into four sections:

- Experimental feature notice and short introduction
- **Details:** Overview about the device: name, status, priority, parent probe, parent group, and sensor states in place with their number
- **Prerequisites:** For details, see [Step 1](#)^[3713].
- **Start Probe Installation:** Time estimation for installation and installation start button

Make sure you meet the following requirements. If not, PRTG cannot start the installation process. Open requirements are highlighted in red.

Prerequisites

Please make sure you fulfill the following conditions.

- The target device must be a computer with a supported Windows version.
- The target computer must be accessible through RPC (this is usually the case when your PRTG server and the target computer are located in the same LAN segment).
- Open or forward port 23560 in your firewall to allow connections between the probe and your PRTG core server.
- You cannot install a remote probe on a probe device.
- Windows credentials must be set in the device settings or its parents' settings (current user name: test\test) and the user account must have administration rights on the target machine.
- **Please correct before proceeding:** You have to allow remote probe connections to your PRTG core server. Open the Core & Probes tab in the System Administration of your PRTG web interface. In section Probe Connection Settings choose the option All IPs available on this computer or specify IPs for the setting Probe Connection IPs. Do not use the "Local Probe only" (127.0.0.1) setting! (Current setting: 127.0.0.1)

Installation Unable to Start because Prerequisites Are Not Met

If everything is okay you can install the remote probe on the target computer by clicking the button **Install Remote Probe on "[device name]"**. Wait until the process has ended.

- ✓ If the installation was successful, the following message will appear in the **Start Probe Installation** section: **Done. Result is: OK.**
- ⓘ Every time you start an installation, PRTG automatically adds a new key to **Access Keys** in [System Administration—Core & Probes](#)³³⁶⁸, no matter if the installation has been successful or not.

Step 5: Approve the New Remote Probe

If the installation was successful, you will receive further instructions after the result message. As indicated, go back to the [device tree](#)¹⁸¹ and acknowledge the new probe. The approval button will appear under the node of the new remote probe. You will also receive a new [ToDo ticket](#)²³⁰.

Click **Approve and auto-discover new probe** to acknowledge the created remote probe and instantly start an [Auto-Discovery](#)²⁸² in this network. Click **Approve new probe** to acknowledge the remote probe without running an auto-discovery. You can also discard the probe by clicking **Deny new probe**.

- ⓘ When denying or removing a remote probe, this device's global ID (GID) will be included into **Deny GIDs** in [System Administration—Core & Probes](#)³³⁶⁸. Future probe connections from this device will be denied automatically.
- ⓘ Denying the remote probe in the PRTG device tree does **not** uninstall the probe, but only denies access to the core server. The probe will continue to run on the target system until you uninstall it manually.

After approving, the approval button will turn into a **Working** status. Please wait while the probe connects. Once approved, PRTG automatically creates a set of sensors for the probe to ensure that bottle-necks on the probe will always be noticed. We recommend that you keep these sensors. Now you can create groups, devices and sensors to customize your monitoring via the new probe.

Debugging

- Please note that installing a remote probe directly from the device tree in the PRTG web interface is an experimental feature. It may be the case that this approach is not possible in all situations.
- Please follow the steps of this chapter closely when encountering problems with the Remote Probe Quick Install. Especially consider the conditions as described in [Step 1](#)³⁷¹³ of this section like Windows Firewall settings.
- If the quick installation procedure described in this section does not work with your setup, please install your remote probes manually and see how to do so in [Remote Probe Setup Using Installer](#)³⁷¹⁹.

- <https://kb.paessler.com/en/topic/65084>

13.9.3 Remote Probe Setup Using Installer

In section [Install a PRTG Remote Probe](#)^[101], we accompany your remote probe installation using the [Remote Probe Installer](#).

These are the [Steps to Go](#)^[101]:

1. [Prepare the PRTG Core Server](#)^[102]
2. [Download the Remote Probe Installer](#)^[104]
3. [Install the Remote Probe](#)^[105]
4. [Approve New Probe and Start Monitoring](#)^[107]

Moreover, there is a [Debugging Remote Probe Connection Problems](#)^[109] section in case you are facing issues after the installation.

 For a semi-automatic installation of a Remote Probe directly from the device tree in the PRTG web interface, see section [Remote Probe Quick Setup](#)^[3713].

 Do you run PRTG in a cluster? Then mind this [important note](#)^[103].

More

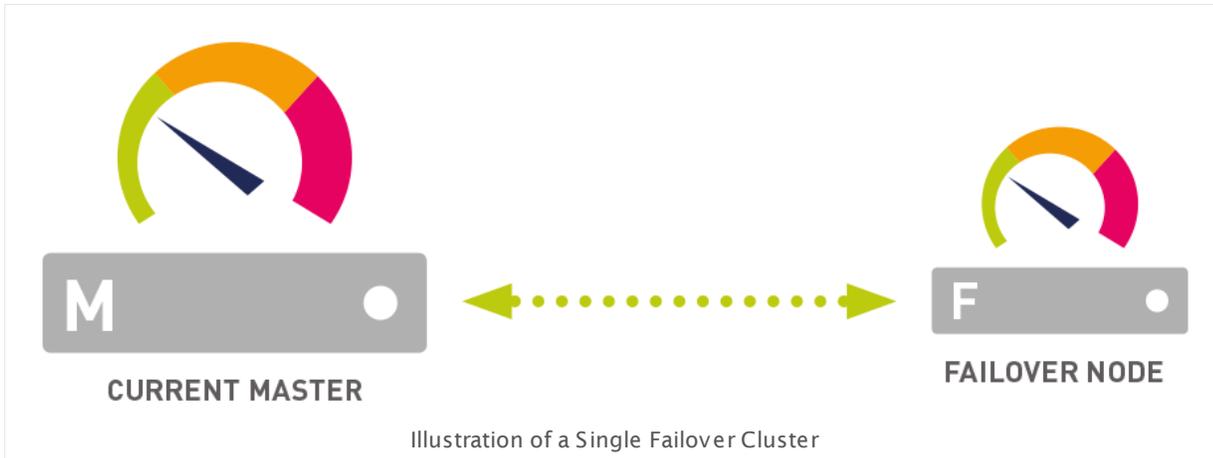

Knowledge Base: How can I customize PRTG's ports for core-probe-connections?

- <https://kb.paessler.com/en/topic/65084>

13.10 Failover Cluster Configuration

PRTG offers single failover clustering in all licenses—even in the freeware edition. A single failover cluster consists of two servers (**Current Master** node and **Failover** node), each of them running one installation of PRTG. They are connected to each other and exchange configuration and monitoring data.

☁ This feature is not available in PRTG hosted by Paessler.

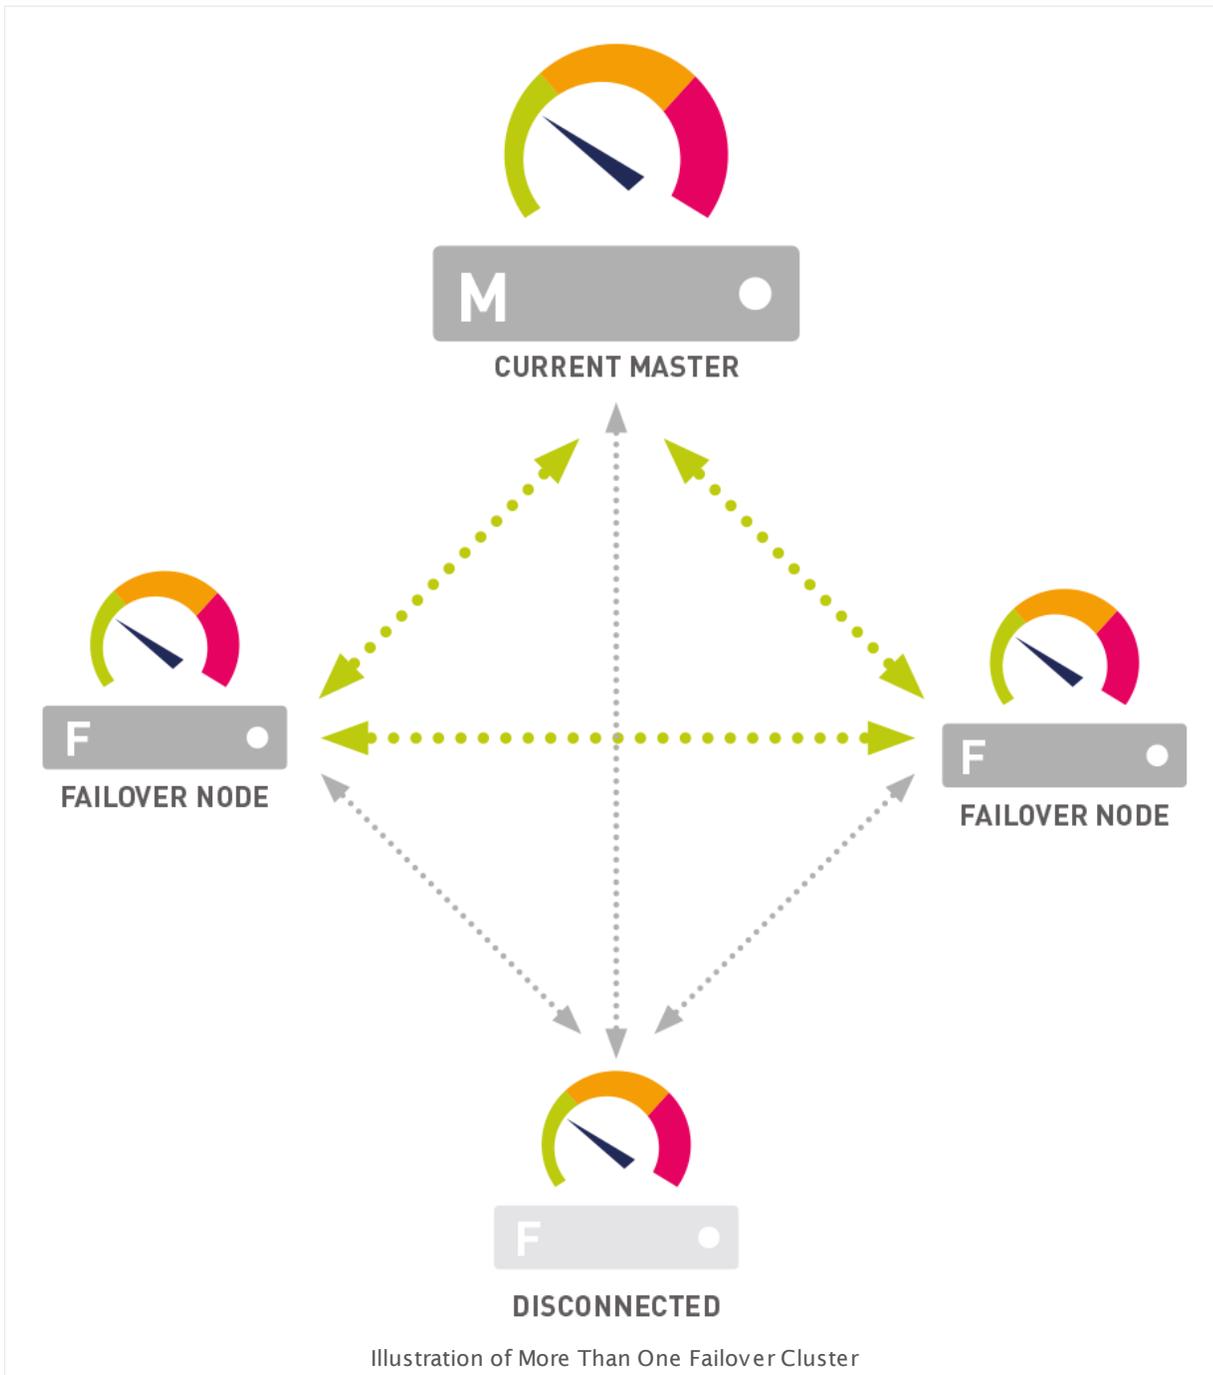

To set up a cluster you need two or more servers. One [PRTG core server installation](#)^[89] is necessary on each of them—with different settings configured for each type of node. In return, you benefit from seamless, highly available monitoring with automatic failover and multi-location monitoring.

In a cluster, you can run:

- **1 Master Node**
On the master node, you set up your devices and configuration. Notifications, reporting, and many other things are also handled by the master node.
- **Up to 4 Failover Nodes**
You can install one, two, three, or four additional nodes for fail-safe, gapless monitoring. For more than one failover node, [you need additional licenses](#)^[3732]. Each of these nodes can monitor the devices in your network independently, collecting their own monitoring data. You can review the data in a summarized way that enables you to compare monitoring data from different nodes.

i During an outage of one node, you will see data gaps for the time of the outage on that node. However, data for that time span will still be available on all other cluster nodes.

Before Getting Started: Cluster Notes

Configuring a cluster with one failover node is the most common way to set up seamless network monitoring with PRTG. You will need two servers that run any Windows version (Windows 7 or later). Your servers can be real hardware (strongly recommended!) or virtual machines.

For details, see section [Detailed System Requirements](#)^[26].

Please consider the following notes about PRTG clustering.

- Your servers must be up and running.
- Your servers must be similar in regard to the system performance and speed (like CPU, RAM memory).
- In a cluster setup, each of the cluster nodes will individually monitor the devices added to the **Cluster Probe**. This means that monitoring load will increase with every cluster node. Please make sure your devices and network can handle these additional requests. Often, a larger scanning interval for your entire monitoring is a good idea. For example, set up a scanning interval of 5 minutes in the [Root Group Settings](#)^[331].
- We recommend that you install PRTG on dedicated real-hardware systems for best performance.
- Please bear in mind that a server running a cluster node may in rare cases be rebooted automatically without notice (for example, because of special software updates).
- Both servers must be visible for each other through the network.
- Communication between the two servers must be possible in **both directions**. Please make sure that no software or hardware firewall blocks communication. All communication between nodes in the cluster is directed through one specific TCP port. You will define it during cluster setup (by default, it is **TCP port 23570**).
- **Email notifications for failover:** The **Failover Master** will send notifications if the **Primary Master** is not connected to the cluster. To ensure that PRTG can deliver emails in this case, please configure the [Notification Delivery](#)^[336] settings so that PRTG can use them to deliver emails from your failover node as well. For example, use the option to set up a secondary Simple Mail Transfer Protocol (SMTP) email server. This fallback server must be available for the failover master so that it can send emails over it independently from the first email server.
- Make your servers safe! From every cluster node, there is full access to all stored credentials as well as other configuration data and the monitoring results of the cluster. Also, PRTG software updates can be deployed through every node. So, please make sure you take security precautions to avoid security attacks like hackers and Trojans. Secure every node server the same careful way as the master node server.
- Run the nodes in your cluster either on 32-bit or 64-bit Windows versions only. Avoid using both 32-bit and 64-bit versions in the same cluster, as this configuration is not supported and may result in an unstable system. Also, ZIP compression for the cluster communication will be disabled and you may encounter higher network traffic between your cluster nodes.
- If you run cluster nodes on Windows systems with different timezone settings and use [Schedules](#)^[338] to pause monitoring of defined sensors, schedules will apply **at the local time of each node**. Because of this, the overall status of a particular sensor will be shown as **Paused** every time the schedule matches a node's local system time. Please use the same timezone setting on each Windows with a cluster node to avoid this behavior.
- The password for the **PRTG System Administrator** login to PRTG is not automatically synchronized on cluster nodes. You need to manually change it on each node. On a failover node, open the [PRTG Administration Tool](#)^[3574] and change the password on the **Administrator** tab. Click **Save&Close** to save your new password.

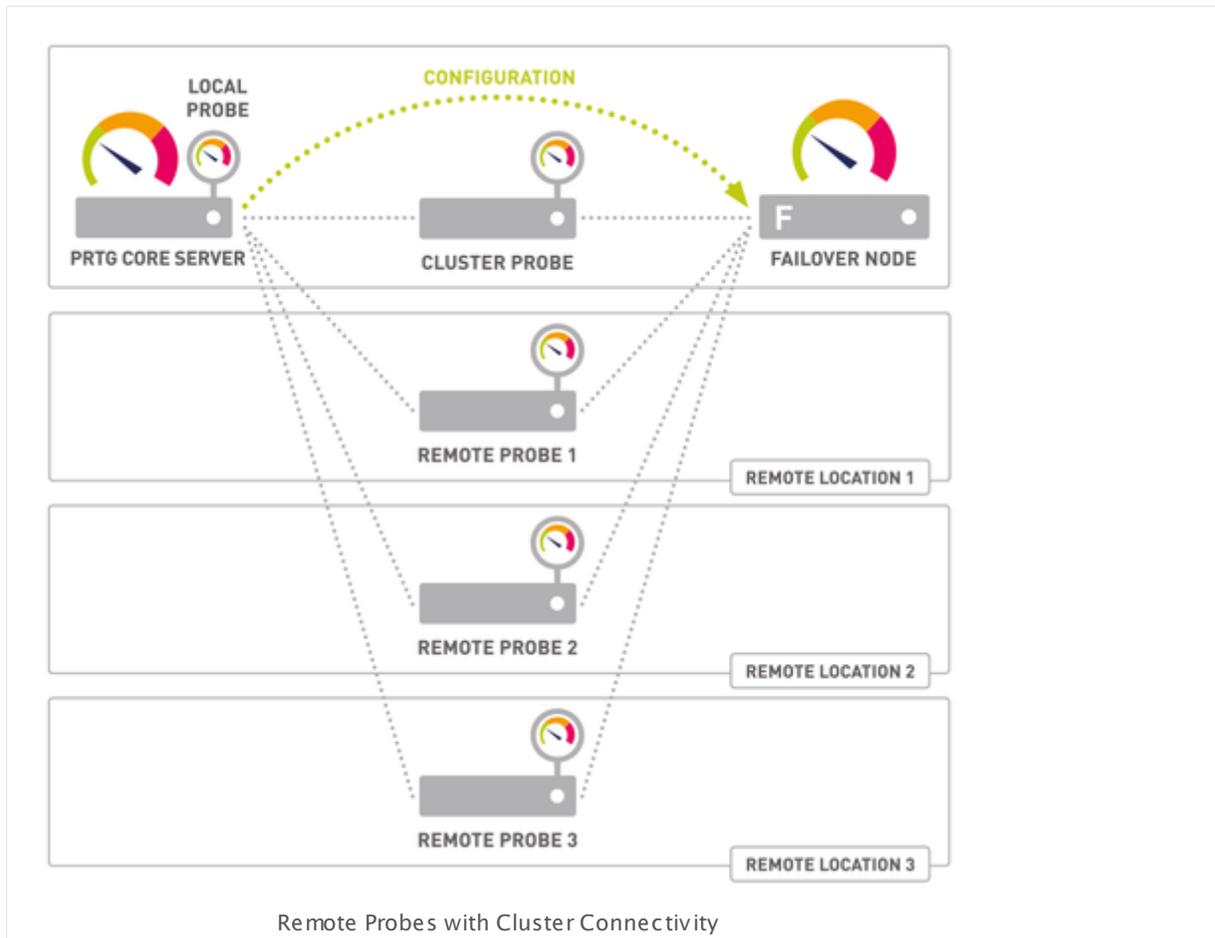

- Stay below 2,500 sensors per cluster for best performance in a single failover. Clusters with more than 5,000 sensors are not officially supported. For each additional failover node, divide the number of sensors by two.

In cluster mode, you cannot use sensors that wait for data to be received. Because of this, you can use the following sensor types only on a [local or remote probe](#)¹²⁶:

- [HTTP Push Count](#)¹⁰⁴⁹
- [HTTP Push Data](#)¹⁰⁵⁹
- [HTTP Push Data Advanced](#)¹⁰⁷⁰
- [IPFIX](#)¹¹⁸⁶ and [IPFIX \(Custom\)](#)¹²⁰⁰
- [jFlow V5](#)¹²²³ and [jFlow V5 \(Custom\)](#)¹²³⁷
- [NetFlow V5](#)¹⁴⁰³ and [NetFlow V5 \(Custom\)](#)¹⁴¹⁷
- [NetFlow V9](#)¹⁴³⁰ and [NetFlow V9 \(Custom\)](#)¹⁴⁴⁴
- [Packet Sniffer](#)¹⁴⁹⁴ and [Packet Sniffer \(Custom\)](#)¹⁴⁹⁷
- [sFlow](#)¹⁷⁴⁰ and [sFlow \(Custom\)](#)¹⁷⁵⁴
- [SNMP Trap Receiver](#)²⁴⁷⁹
- [Syslog Receiver](#)²⁶⁵⁶

Remote Probes in Cluster

PRTG provides cluster support for remote probes. This means that all your probes can connect to all your cluster nodes, the primary master node as well as the failover node. Because of this you can still see monitoring data of remote probes and sensor warnings and errors even when your master node fails.

✘ Please consider the following notes about PRTG clustering with remote probes.

- You have to allow remote probe connections to your failover nodes. To do so, log in to each server in your cluster and open the [PRTG Administration Tool!](#)³⁵⁶⁶. On the **Core Server** tab, define to accept connections from remote probes on each cluster node.
- If you use **remote probes outside your local network**: You have to use IP addresses or DNS names for your cluster nodes that are valid for both the cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. Open the [System Administration—Cluster](#)³³⁹⁴ settings and adjust the entries for cluster nodes accordingly so that these addresses are reachable from the outside. New remote probes try to connect to these addresses but cannot reach cluster nodes that use private addresses.
- If you use Network Address Translation (NAT) with **remote probes outside this NAT**: You have to use IP addresses or DNS names for your cluster nodes that are reachable from the outside. If your cluster nodes are inside the NAT and the cluster configuration only contains internal addresses, your remote probes from outside the NAT will not be able to connect. The PRTG core server must be reachable under the same address for both other cluster nodes and remote probes.
- A remote probe only connects to the PRTG core server with the defined IP address when starting. This PRTG server must be the **Primary Master!**

- Initially, existing remote probes are not visible on failover nodes. You need to set their **Cluster Connectivity** first in the [Administrative Probe Settings](#)³⁷¹ to be visible and working with all cluster nodes. Choose option **Probe sends data to all cluster nodes** for each remote probe that you want to connect to all cluster nodes.
- Newly connected remote probes are visible and working with all cluster nodes immediately after you have acknowledged the probe connection. The connectivity setting **Probe sends data to all cluster nodes** is default for new probes.
- As soon as a probe is activated for all cluster nodes, it connects automatically to the correct IP addresses and ports of all cluster nodes.
- Once a remote probe has connection data from the Primary Master, it can connect to all remaining cluster nodes also when the Primary Master fails.
- Changes to connection settings of cluster nodes are automatically sent to your remote probes.
- If a PRTG server (which is a cluster node) in your cluster is currently not running, your probes will [deliver monitoring data](#)³⁷¹⁰ after the restart of this server. This happens individually for each PRTG server in your cluster.
- If you switch on cluster connectivity for a probe, it will not deliver monitoring data from the past when cluster connectivity was off. For sensors using difference values, the difference between the current value and the last value is shown with the first new measurement (if the respective sensor previously sent values to the PRTG server).
- Except for this special case, all PRTG servers show the same values of sensors on devices you add to the Cluster Probe.
- The responsible PRTG server for the configuration and management of a remote probe is always the master that is currently active. This means that all tasks of the PRTG core server are only executed by the current master. If you use a split cluster with several master nodes, only the master that appears first in the cluster configuration is responsible.

i You can use remote probes in a cluster as described above, which is showing monitoring data of all your probes on all nodes in your cluster. However, you cannot cluster a remote probe itself. To ensure gapless monitoring for a specific remote probe, install a second remote probe on a machine in your network next to the existing probe, and create all devices and sensors of the original probe on it. For example, you can [clone](#)³¹⁹³ the devices from the original probe. The second probe would be a copy of the first probe then and you can still monitor the desired devices if the original probe fails.

i Probes that send data to all cluster nodes result in increased bandwidth usage. Choose the option **Probe sends data only to primary master node** in the [Administrative Probe Settings](#)³⁷¹ for one or more remote probes to lower bandwidth usage if necessary.

i Please explicitly check on each cluster node if a remote probe is connected. PRTG does not notify you if a remote probe is disconnected from a node in the cluster. For example, log in to the PRTG web interface on a cluster node and check in the device tree if your remote probes are connected.

Start Now!

Paessler Blog: Cluster Support for Remote Probes: Failover Nodes Show Remote Probe Data

- <https://www.paessler.com/blog/2015/07/02/all-about-prtg/cluster-support-for-remote-probes>

13.10.1 Failover Cluster Step by Step

This section will guide you through a step-by-step process to set up a failover cluster. Please follow these instructions carefully to successfully integrate two or more PRTG installations into one failover cluster.

 Before getting started, please make sure you consider the information in section [Failover Cluster Configuration](#)³⁷²⁰.

 This feature is not available in PRTG hosted by Paessler.

Step 1: Install Core Servers

We will start with setting up a single failover cluster, consisting of two PRTG core server installations, each running on an individual server. Please use your license key twice to install the PRTG core server on two different computers.

If you already run an installation of PRTG, this will be your future Master Node. In this case, please install a second core server on another computer only. Make sure you use the same license key for both installations.

Before you start to set up a cluster, please make sure you run exactly the same PRTG version (build number) on all (future) nodes (install updates for existing installations, if necessary).

 Once the cluster is established, any updates you install on one node will be deployed to all other cluster nodes automatically.

 For details about the installation process, see [Install a PRTG Core Server](#)⁸⁹¹.

Step 2: Configure Master Node

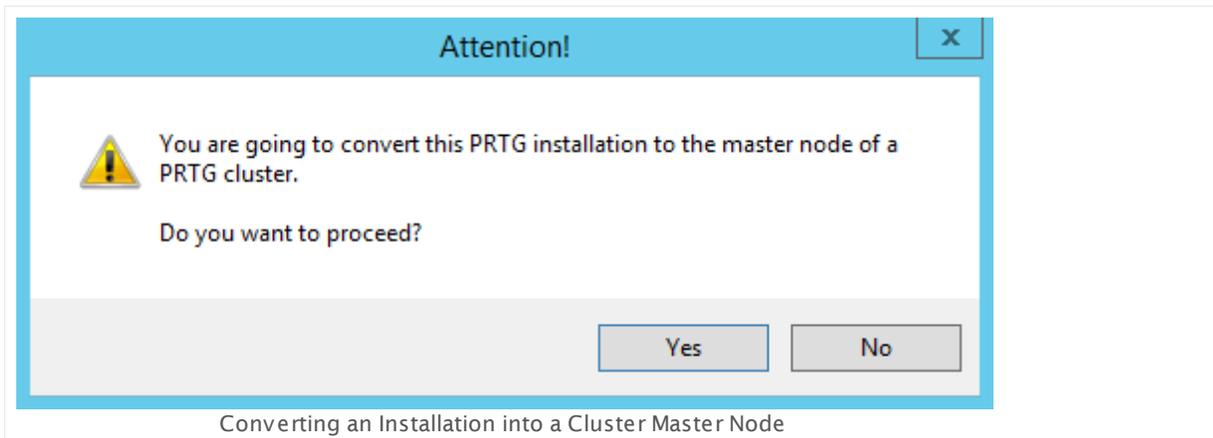

Decide which of your PRTG core server installations will be your future Master Node. If you already run an installation of PRTG in your network for some time, this should be your master, so your existing monitoring configuration is being kept.

On the Master Node server, from the Windows start menu, open the [PRTG Administration Tool](#)³⁵⁶⁸. On the Cluster tab, click on the following button:

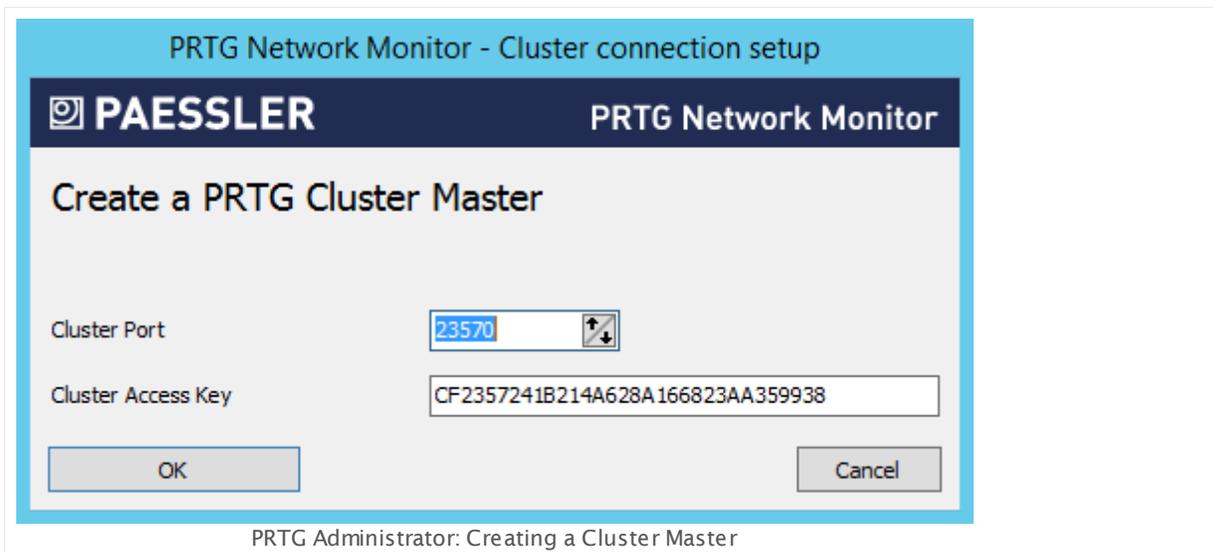

Create a PRTG Cluster...

- Click this button to start creating a cluster. The current PRTG core server will then be the **Master Node** of your cluster.
- Click **Yes** to confirm the conversion of this installation into a cluster master node.

Part 13: Advanced Topics | 10 Failover Cluster Configuration
1 Failover Cluster Step by Step

- A new dialog box will appear.

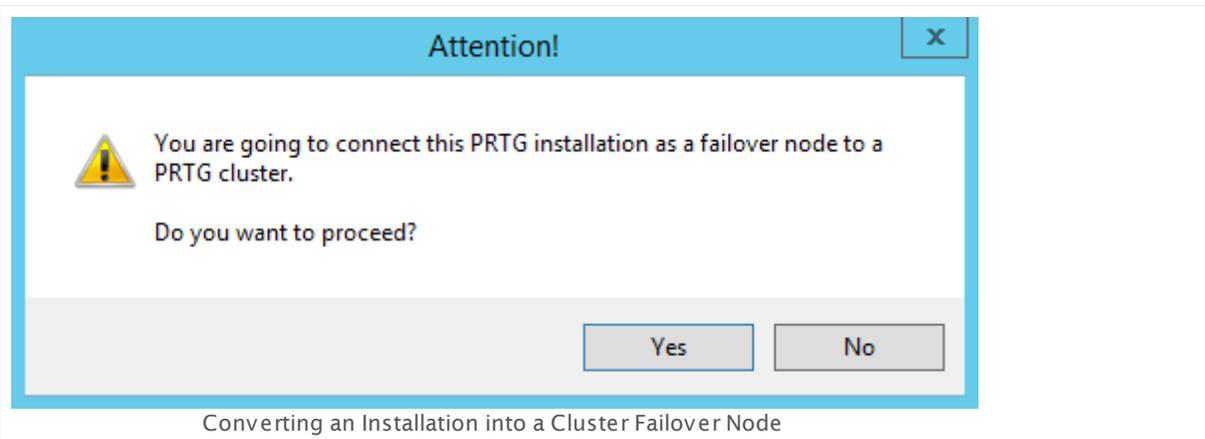

- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.
- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- We recommend that you use the default value.
- Save the **Cluster Access Key** so you have it at hand when configuring your **Failover Node(s)**.
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

Step 3: Configure Failover Node

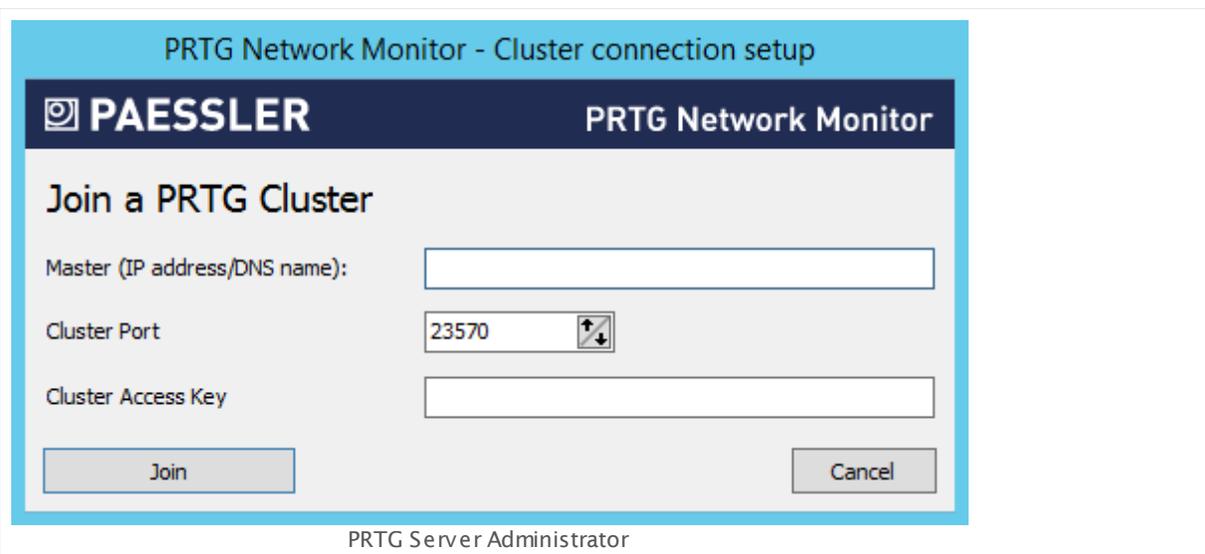

On the server that will be your Failover Node, open the [PRTG Administration Tool](#)³⁵⁶⁸. On the Cluster tab, click the following button:

Join a PRTG Cluster...

- Click this button to add this installation to an existing cluster that already has a **Master Node**. The current PRTG core server will then be a **Failover Node** in the cluster.
- This button is also available if you are currently running your PRTG installation in **Cluster Mode: Master Node**. This option will then change your master node to a failover node!
- Click **Yes** to confirm the conversion of this installation into a failover node.

- A dialog box will appear.

- Enter a **Master IP address/DNS name** for your cluster. It must be reachable from the machine running the failover node.
- Enter the other settings as defined in the settings of your **Master Node**. Please make sure you use the same settings on all nodes in your cluster.
- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.

Part 13: Advanced Topics | 10 Failover Cluster Configuration

1 Failover Cluster Step by Step

- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

Step 4: Confirm Failover Node

Now you need to confirm the new failover node by setting it to **Active** in the master node's settings.

In a browser window, log in to the PRTG [web interface](#)^[168] of the **Master Node** server.

In the [System Administration—Cluster](#)^[3394] settings, you will see your “Master Node” server in the first line of the cluster list and your “Failover Node” server below.

i If you use [remote probes](#)^[3709] outside your local network, for each core server in the cluster use a DNS name or IP address that the probes can reach from the outside. Enter the entries in the [Cluster Node Setup](#)^[3394] table accordingly (see below). The addresses must be valid for both the cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. Remote probes outside your LAN cannot reach private IP addresses or DNS names!

Node Name	Node ID	Node State	IPs/DNS Names used for Connections Between Nodes
1 PRTG Network Monitor (10.0.1)	85F...	Active	#2 ⇒ #1 10.0.10.34
2 Node 10.0.10.35	CF0...	<input type="radio"/> Active <input checked="" type="radio"/> Inactive	#1 ⇒ #2 10.0.10.35
3		<input type="radio"/> Active <input checked="" type="radio"/> Inactive	#1 ⇒ #3 #2 ⇒ #3
4		<input type="radio"/> Active <input checked="" type="radio"/> Inactive	#1 ⇒ #4 #2 ⇒ #4
5		<input type="radio"/> Active <input checked="" type="radio"/> Inactive	#1 ⇒ #5 #2 ⇒ #5

IPs/DNS Names used for Connections

#2 ⇒ #1
10.0.10.34

#1 ⇒ #2
10.0.10.35

System Administration: Cluster Node Setup

For the “Failover Node”, set the radio button for **Node State** to **Active** and **Save** the changes. The nodes will now connect and exchange configuration data. This may take a few minutes.

Step 5: Check Cluster Connection

In two browser windows, log in to the PRTG web interfaces of **both** of your PRTG installations. Open the cluster status page in both windows by clicking on the narrow cluster information bars at the top of each window. You should see a cluster status with your two nodes in a **Connected** state after a few minutes.

Node 1: PRTG Network Monitor (10.0.10.34)		
Primary Node (Current Master)		Start Maintenance Mode
Connection To	IP	State
⇒ Node 10.0.10.35	10.0.10.35	Connected
Node 2: Node 10.0.10.35		
Secondary Node (Failover Node, Version: 50186)		Start Maintenance Mode
Connection To	IP	State
⇒ PRTG Network Monitor (10.0.10.34)	10.0.10.34	Connected

PRTG Cluster Status

Step 6: Trouble Shooting

Having any problems? If your nodes cannot connect, please see

- the cluster log entries on the [PRTG Status—Cluster Status](#) ³⁴¹² page of the web interface
- the core server logfile, a text file in the logs directory of your PRTG data folder (see section [Data Storage](#) ³⁷³⁴).

In the latest entries of these logs, you can see messages about any errors that might have occurred. These will give you hints on where to find a solution.

If you encounter connection problems between the two cluster nodes, please make sure no software or hardware firewall is blocking communication on the cluster port defined during cluster setup. Communication between the nodes must be possible in **both directions** in order for the cluster to work properly.

Step 7: Move Sensors to the Cluster Probe Now

That's it. You have successfully set up your failover cluster. All devices that you create or move under the **Cluster Probe** are monitored by both servers.

To monitor your existing configuration via all cluster nodes, on your master node, please move your groups, devices, and sensors from the local probe to the cluster probe! Objects, including their settings, will then be transferred to all cluster nodes automatically.

Step 8: Move Custom Content to Failover Nodes

On startup of the cluster master node, [maps](#) and [custom lookups](#) are automatically transmitted to the failover nodes. While changes to maps are automatically synchronized, you have to manually [\(re-\)load lookups](#) on all nodes. Other custom content has to be copied manually from the according [folders](#) on the master node to the same folders on the failover nodes:

- [Device templates](#): \devicetemplates subfolder of PRTG
- [Custom sensors](#): \Custom Sensors subfolder of PRTG
- [MIB files](#): \MIB subfolder of PRTG
- [SNMP libraries](#): \snmplibs subfolder of PRTG
- [Notifications](#): \Not ifications subfolder of PRTG
- The \webroot subfolder of PRTG if you customized the PRTG web interface, for example

Add More Failover Nodes

If you want to add an additional failover node to your cluster, you will need an additional license key for two and three failover nodes, and two additional license keys to run four failover nodes.

i In a cluster, only core servers running on the same size of [license](#) can be combined. For example, you can use several "PRTG 5000" licenses or several "PRTG 1000" licenses in one cluster. To add another failover node to your cluster, please set up a new PRTG core server installation on a new server, using an additional license key. Then proceed with [Step 3](#) and following. Use a second license key to set up both your second and third failover node, and use a third license key to set up your fourth failover node. Each failover cluster is technically limited to five cluster nodes: as a maximum, you can run one master node and four failover nodes in one cluster.

i Stay below 2,500 sensors per cluster for best performance in a single failover. Clusters with more than 5,000 sensors are not supported. For each additional failover node, divide the number of sensors by two.

13.11 Data Storage

PRTG stores the monitoring configuration, monitoring data, logs, tickets, and reports, as well as support and debug data into different folders on the core server or the system running a [Remote Probe](#)³⁷⁰⁷. Additionally, there is data from PRTG in the program directory (for example, scripts for your [custom sensors](#)³¹⁵⁵) and in the Windows registry.

 You can find data in different locations. For detailed information, see this Knowledge Base article: [How and where does PRTG store its data?](#)

 You cannot access these directories on the PRTG hosted by Paessler core server system.

PRTG Program Directory

32-bit systems:

```
%programfiles%\PRTG Network Monitor
```

64-bit systems:

```
%programfiles(x86)%\PRTG Network Monitor
```

 These are the default paths. If you specified another installation directory, you will find your data there.

PRTG Data Folder

On Windows Vista (not officially supported), Windows 7, Windows 2008 R2, Windows 8, and Windows 2012:

```
%programdata%\Paessler\PRTG Network Monitor
```

On Windows XP and Windows Server 2003 (both are not officially supported):

```
%ALLUSERSPROFILE%\Application data\Paessler\PRTG Network Monitor
```

 These are the default paths, depending on your Windows version. If you specified a custom path for data storage, please look it up in the [PRTG Administration Tool](#)³⁵⁶⁶. Open this application and switch to the **Core Server** tab. You will find the path there.

Windows Registry

System settings on 32-bit systems:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Paessler\PRTG Network Monitor
```

System settings on 64-bit systems:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Paessler\PRTG Network Monitor
```

Enterprise Console settings:

```
HKEY_CURRENT_USER\Software\Paessler\PRTG Network Monitor\WinGUI
```

HTTP Full Web Page Sensor: Cached Files

If you use the HTTP Full Web Page Sensor, files might be cached in this directory;

```
C:\Windows\System32\config\systemprofile\AppData\Local\Microsoft\Windows\Temporary Internet Files\Content.
```

13.12 Using Your Own SSL Certificate with PRTG's Web Server

This section gives you a brief overview on how to use your own trusted SSL certificate files with the PRTG web server.

 This only applies to PRTG on premises instances, not to PRTG hosted by Paessler.

What is SSL?

PRTG supports Secure Sockets Layer (SSL) to encrypt all data entered and shown in the [Web Interface](#)^[166], in the [Enterprise Console](#)^[3430], or in the [Smartphone Apps](#)^[3484]. This ensures that no sensitive information can be intercepted when sending data between the PRTG core server and your client software.

By default, PRTG is already delivered with an SSL certificate so you can use secure connections to your PRTG core server. However, these certificate files are not signed by a valid authority, which is why browsers show an [SSL Certificate Warning](#)^[172] when you try to access the web interface. Despite this warning your connection is still encrypted successfully.

To remove the browser warning, you can obtain a certificate that is valid for your own domain name and signed by a valid authority. You can request your own trusted certificate from an issuer like GoDaddy, DigiCert, or InstantSSL, for example. The certificate must be provided in a suitable format and you have to import it correctly for your PRTG server.

Importing Trusted SSL Certificates for PRTG

There are many different issuers for certificates, and there are different formats certificates can be provided in. PRTG needs three different files, named correctly, containing data in the expected encoding and format. This can make the manual import of an issued certificate slightly complicated, because there are various certificate files that you must retrieve from a [certificate authority \(CA\)](#). So, to ease the installation of a trusted certificate, we provide the freeware tool **PRTG Certificate Importer**.

The PRTG Certificate Importer combines and converts all files that a CA bundle contains automatically for the use with PRTG and stores the certificate files into the correct path on your PRTG server. In the best case, you just provide the path to your received CA bundle and let the tool do the rest. We strongly recommend that you use the PRTG Certificate Importer if you want to install a trusted certificate for PRTG!

 For more information about this tool and a download link, see the Paessler website: [PRTG Certificate Importer](#)

Manual Certificate Import

Although we recommend that you use the PRTG Certificate Importer because it is much more comfortable, you still can import your trusted certificate manually. If you do so, please note that PRTG requires three different certificate files in a PEM encoded format and an unencrypted private key:

- **prtg.crt**: This is the certificate for your PRTG server. It has to be stored in **PEM** encoded format.

- **prtg.key**: This is the private key matching your server certificate. It has to be stored in **PEM** encoded format and may not be encrypted! Please make sure that you provide this file in **decrypted** format! The best way to check this is to open the file in a text editor. If you find a line containing the word "ENCRYPTED", the file still needs to be decrypted before you can use it with PRTG. Please decrypt using an SSL tool (for example, OpenSSL) and your key password.
- **root.pem**: This is the public root certificate of your certificate's issuer. It has to be stored in **PEM** encoded format and must contain all necessary root certificates of your issuer in one file. If there is more than one PEM encoded root certificate, please use a text editor to copy all of them into a single file (the order does not matter).

 PEM encoded files must not contain Unix line breaks! Only Windows line breaks are supported.

Once ready, copy these three files to the **/cert** sub folder of your PRTG program directory (please backup existing files) and restart your PRTG core server service (see [PRTG Administration Tool](#)³⁵⁸⁷).

 PRTG services will not be able to start if the files are not provided in exactly the expected format!

 For detailed instructions and examples, installation descriptions for various certificates (including **Wildcard** certificates), as well as links to certificate tools and converters, see the [More](#)³⁷³⁷ section below.

Part 14

Appendix

14 Appendix

Please find further information about PRTG and used terms in the following sections.

- [Glossary](#) 
- [List of Abbreviations](#) 
- [List of Icons](#) 
- [Support and Troubleshooting](#) 
- [Legal Notices](#) 
- [Differences between PRTG on premises and PRTG hosted by Paessler](#) 

14.1 Glossary

This section explains special words used in the context of PRTG Network Monitor.

i Here, only explanations are given. For information on where to find detailed instructions for a specific key word, see the **Index** section.

Alarms

The alarms list shows all [sensors](#) that are currently in a **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** [status](#). This is useful for keeping track of all irregularities in your network.

Auto-Discovery

The auto-discovery process scans your network for [devices](#) using Ping (for [groups](#) only), it assesses the device type for all discovered devices, and it creates [sensor](#) sets that match the discovered device types based on built-in templates or your custom device templates.

Channel

The monitoring data of a [sensor](#) is shown in sensor channels. For example, for sensors that measure network traffic, there is one channel each for traffic **in**, traffic **out**, and traffic **total**. You can set various [triggers](#) for each channel, so you can define [sensor status](#) changes or [notifications](#) based on the monitoring data received.

Cluster

You can configure PRTG as a failover cluster for fail-safe monitoring. In a cluster, one or more [core servers](#) work together in one configuration. Every [node](#) can monitor every [device](#) in a network for gapless monitoring, so you can additionally compare monitoring results measured from different perspectives. This feature is not available in PRTG hosted by Paessler.

Cluster Node

Sometimes used as synonym for [Node](#).

Cluster Probe

When running PRTG in [cluster](#) mode, a cluster probe is automatically created. All [objects](#) created on the cluster probe or below in the [device tree](#) are monitored by all [nodes](#) in the cluster. Create or move [objects](#) there to monitor them fail-safely. If one node fails, the other nodes will continue to monitor them. You can add [groups](#) and [devices](#) to the cluster probe. On a PRTG installation, the cluster probe runs as part of this installation's [local probe](#). Your [remote probes](#) can send monitoring data to your cluster nodes so you can view the data of each probe on each cluster node.

Core Server

The central unit of PRTG. It receives monitoring data from the [probe\(s\)](#) and handles reporting and notifications, provides the web server for the user interfaces, and many other things. In a [cluster](#), one core server is installed on every node. The core server is configured as a Windows service that is permanently run by the Windows system without the requirement for a logged in user

Dashboard

In the **Home** menu of the web interface, there are several pre-configured dashboards available that show a quick overview of the overall status of your monitoring configuration. You can create custom dashboards using the [Maps](#) function.

Device

A device in PRTG represents a "real" physical device in the network. For an easily understandable tree structure, you usually create one PRTG device for each physical device you want to monitor (exceptions apply to some sensors that you can only create on the [local probe](#) device, and for sensor types that are not bound to a certain device, such as HTTP sensors, which are also usually created on the local probe). You can add one or more [sensors](#) on every device.

Device Template

If you want to add a certain [device](#) several times, you can create a device template from an existing device in your [device tree](#). When creating a device template, PRTG will save information for nearly all [sensors](#) on this device to a template file that you can later use in combination with [Auto-Discovery](#) (restrictions apply for a few sensor types).

Device Tree

The configuration of PRTG is represented in a hierarchical tree structure, the device tree, containing all [objects](#). While building the tree, you can relate to your network's topology to make your monitoring setup easy to understand.

Enterprise Console

The Enterprise Console (in old PRTG versions called "Windows GUI") is one alternative interface that you can use to connect to the PRTG [core server](#) to configure your setup, view monitoring results, and keep an eye on your network. It is a native Windows application for fast access to data and monitoring management.

Failover Master (Node)

If the [primary master](#) node fails, a [failover node](#) is promoted to current failover master and takes over the master role until the primary master node re-joins the [cluster](#).

Failover Node

In a [cluster](#), a failover node monitors all [sensors](#) on the [cluster probe](#), providing monitoring data for the [core server](#). Additionally, it serves as a backup in case the [master node](#) fails.

Geo Maps

Geo Maps show the different locations of your [devices](#) on a map, depending on the location data that you provide in the settings of [probes](#), [groups](#), or devices. The tiles on the maps that represent your devices also show the overall status of a location. This is useful for monitoring distributed networks.

Group

A group is an organizational unit in your PRTG tree structure that helps to arrange your [devices](#). You can add devices or additional sub-groups to existing [groups](#). This way you can model your physical network's topology within the PRTG configuration. You can use groups to arrange similar objects so that they inherit the same settings.

Hosted Probe

The hosted probe relates to PRTG hosted by Paessler like the [local probe](#) relates to PRTG on premises. When creating a PRTG hosted by Paessler instance, the system automatically adds the hosted probe. The hosted probe is always running on the PRTG [core server](#) system that we host for you and shows monitoring values of your PRTG instance hosted by Paessler. You can use the hosted probe to monitor [devices](#), servers, and services that are publicly accessible in the internet like, for example, websites. To monitor your Local Area Network (LAN), you need at least one [remote probe](#) installation in your network. The local probe is not available in PRTG hosted by Paessler.

Library

Libraries are a way to show parts of your [device tree](#) in a different layout or with different filters enabled. There is an editor available that allows you to create libraries directly in your browser.

Library Node

[Libraries](#) use library nodes to reference [objects](#) in your monitoring setup. Library nodes can show a subtree of the [device tree](#) in the library or they can show a collection of filtered [sensors](#) in the library.

Local Probe

When installing PRTG on premises, the PRTG local probe is installed together with the PRTG [core server](#). All [objects](#) created on the local probe, or below it in the [device tree](#), are monitored by the local core system. You can add [groups](#) and [devices](#) to the probe. If you use PRTG hosted by Paessler, the [hosted probe](#) replaces the local probe. There are some [differences between PRTG hosted by Paessler and PRTG on premises](#).

Lookup

PRTG uses lookups for some [sensor](#) types and for some sensors with custom [channels](#). In general, lookups make data more human friendly because they map status values as returned by a [device](#) (usually integers) to more informative expressions in words that show you the status of a monitored device as a clear message.

Map

Maps (sometimes referred to as "[dashboard](#)") are a way to present monitoring data the way you want to arrange it. There is an editor available that allows creating maps directly in your browser. Using this unique concept, you can also make your overview pages of live data publicly available.

Master Node

In a [cluster](#), the master node controls the settings and cluster management. It also takes over notifications. All changes to the monitoring configuration are made on the master node, which distributes the changes to all other nodes in real time.

Meta-Scan

Sensors that use the meta-scan function, for example SNMP sensors, first look at the [device](#) to find what can be monitored. This can be tables, OIDs, or disks, for example. When the meta-scan is done, the second step of the [Add Sensor](#) dialog shows you the parameters that you can monitor. Some sensors require basic information before they can perform a meta-scan. Provide the requested information, such as credentials, in the appearing window. PRTG will then scan and recognize all parameters available for monitoring based on your input.

Mini Probe

PRTG Mini Probes allow you to create small [probes](#) on any [device](#) (not just on Windows systems).

Node

In a [cluster](#), there is one [master node](#) and one or more [failover nodes](#). On each node, one PRTG [core server](#) installation is running independently. All nodes are connected to each other, exchanging configuration and monitoring data.

Notification

PRTG uses notifications to send you alerts whenever PRTG discovers a defined status, such as slow or failing [sensors](#)^[3747], or when sensor [channels](#)^[3741] breach threshold values. You can define an unlimited number of notifications allowing the use of one, or more, of several communication channels like email, text messaging, push notifications to Android and iOS devices, and many more.

Object

All different items in the [device tree](#)^[3742] are generally referred to as objects or monitoring objects. An object can be a [probe](#)^[3745], a [group](#)^[3743], a [device](#)^[3742], or a [sensor](#)^[3747].

Object Hierarchy

All [objects](#)^[3745] are arranged in a hierarchical order that makes it easier to navigate and arrange settings. The object hierarchy is used to define common settings for groups of objects.

Object Selector

The object selector enables you to browse all [objects](#)^[3745] in your configuration and select an object in two steps. The left-hand side shows your [device tree](#)^[3742]. If you have selected a [device](#)^[3742], the right hand side shows the [sensors](#)^[3747] on the device.

Primary Master (Node)

The **primary** master node in a [cluster](#)^[3741] is the [node](#)^[3744] that is master by configuration. Only if it fails, one of the [failover nodes](#)^[3743] becomes [failover master](#)^[3742] and takes over the master role until the primary master node re-joins the cluster.

Probe

On a probe, the actual monitoring takes place. A probe can run as [local probe](#)^[3744] on the local system where the [core server](#)^[3742] is installed. There are also [cluster probes](#)^[3741], [remote probes](#)^[3746], and [hosted probes](#)^[3743].

Probe Device

This is an internal system device that PRTG automatically adds to the [local probe](#)^[3744]. It has access to the computer where the probe is running and monitors its health parameters using several [sensors](#)^[3747].

PRTG Administration Tool

The PRTG Administration Tool is part of your PRTG installation and helps you edit administrative settings of your [local probe](#)^[3744] and your [remote probe](#)^[3746] installations. You can launch the PRTG Administration Tool from the Windows start menu, on your [core server](#)^[3742], or on your remote probe server.

PRTG Application Programming Interface (API)

The PRTG Application Programming Interface (API) enables you to access monitoring data and manipulate [objects](#) using HTTP requests, run your own written [sensors](#) and [notifications](#), and implement [Mini Probes](#).

PRTG hosted by Paessler

PRTG hosted by Paessler is the PRTG cloud solution where we at Paessler run the [core server](#) and [hosted probe](#) for you. No core server installation inside your network is necessary. The PRTG web interface for monitoring configuration and reviewing monitoring data is the same for both PRTG hosted by Paessler and PRTG on premises.

PRTG on Premises

PRTG on premises is a powerful network monitoring application for Windows-based systems that allows you to monitor your entire network. A [core server](#) installation inside your network is necessary. The PRTG web interface for monitoring configuration and reviewing monitoring data is the same for both PRTG on premises and PRTG hosted by Paessler.

Recommended Sensors Detection

With the [sensor](#) recommendation engine, PRTG can analyze [devices](#) in your network and suggest sensors that are still missing for a complete monitoring. The analysis runs with low priority in the background when you add a new device, when the last analysis was executed more than 30 days ago, or when you manually start it.

Release Channel

PRTG updates are delivered in different release channels. With PRTG on premises, you can choose between maximum stability (Stable), or most early access to new features (Canary or Preview). PRTG hosted by Paessler does not have release channels. Instead, we roll out the latest stable version to PRTG hosted by Paessler instances in stages, so your instance automatically updates to the latest stable version.

Remote Probe

A remote probe is a small piece of software installed on a computer in the local or remote network. It scans the network from there and sends monitoring results to the [core server](#). Once the connection is established, the remote probe is shown in the PRTG tree structure. All [objects](#) created on the remote probe, or below it in the [device tree](#), are monitored by the remote system running the remote probe. You can add [groups](#) and [devices](#) to the probe. In a [cluster](#), remote probes can connect to all cluster nodes so you can view monitoring data of a probe on all nodes.

Root Group

The root group is the topmost instance in the [object hierarchy](#) of PRTG. It contains all other [objects](#) in your setup. All other objects inherit the settings of the root group, making configuration easier later on.

Schedule

You can use schedules to pause monitoring/notification for certain time periods or at certain times. You can also use schedules to define the time periods that are to be covered when creating reports.

Sensor

A sensor monitors one aspect of a [device](#). For example, monitoring if a device responds to a Ping request is done by one sensor. Monitoring the traffic of one Ethernet port of a router device is done by another sensor. For monitoring the CPU load of the local system yet another sensor is set up, and so on. The data of sensors is shown in their respective [channels](#). Each sensor has at least one channel.

Sensor States

The color of a [sensor](#) always shows its current status. There are 8 different sensor states: **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, **Unusual**, **Up**, **Paused**, and **Unknown**.

Sensor Tree

Sometimes used as synonym for [device tree](#).

Similar Sensors Detection

Similar sensors detection enables PRTG to analyze [sensor](#) data for similarities. The detection will run in the background with low priority. The recommended setting for similar sensors detection is to let PRTG automatically decide how many [channels](#) will be analyzed.

Tickets

[Tickets](#) are created by the system or a PRTG user and contain important messages or action steps for the administrator or another specific user to take. Every ticket should be viewed to take appropriate action. You can access the list of tickets from the main menu.

Toplist

Packet Sniffer and xFlow [sensor](#) types can break down the traffic by IP address, port, protocol, and other parameters. The results are shown in graphs that are known as Toplists.

Trigger

PRTG sends a [notification](#) when a defined event evokes it. These events are known as triggers. The following events can trigger notifications: [sensor status](#) changes, [sensor](#) value threshold breaches, speed threshold breaches, volume threshold breaches, and sensor value changes.

Unusual Detection

The unusual detection can set [sensors](#) to an **Unusual status** when there are values that are untypical for the time span in which they are measured. PRTG compares the current average values to the historic monitoring results for this purpose. If the current values show a big difference to the values that are normally retrieved by a sensor, this sensor will indicate this with the **Unusual** status.

xFlow

Paessler designates all kinds of flow protocols as xFlow. Currently, PRTG supports NetFlow V5 and V9, IPFIX, sFlow V5, and jFlow V5.

14.2 List of Abbreviations

Please see below for a list of abbreviations used in this documentation.

ADO: ActiveX Data Objects (ADO)

ADSL: Asymmetric Digital Subscriber Line (ADSL)

AJAX: Asynchronous Java Script and XML (AJAX)

API: Application Programming Interface (API)

CBQoS: Class Based Quality of Service (CBQoS)

cDOT: clustered Data ONTAP (cDOT)

CGI: Common Gateway Interface (CGI)

CIFS; Common Internet File System (CIFS)

CLI: command-line interface (CLI)

CoS: Class of Service (CoS)

CSV: Comma Separated Values (CSV)

DAG: Database Availability Group (DAG)

DHCP: Dynamic Host Configuration Protocol (DHCP)

DMZ: Demilitarized Zone (DMZ)

DSCP: Differentiated Services Code Point (DSCP)

DNS: Domain Name Service (DNS)

DSCP: Differentiated Services Code Point (DSCP)

FAT: File Allocation Table (FAT)

FTP: File Transfer Protocol (FTP)

FTPS: FTP over SSL (FTPS)

FQDN: Fully Qualified Domain Name (FQDN)

GID: global ID (GID)

GUI: Graphical User Interface (GUI)

GUID: Globally Unique Identifier (GUID)

HTTP: Hypertext Transfer Protocol (HTTP)

HTTPS: Hypertext Transfer Protocol Secure (HTTPS)

ICMP: Internet Control Message Protocol (ICMP)

ICPIF: Impairment Calculated Planning Impairment Factor (ICPIF)

iDRAC: Integrated Dell Remote Access Controller (iDRAC)

IIS: Microsoft Internet Information Services (IIS)

iLO: HP Integrated Lights-Out (iLO)

IMAP: Internet Message Access Protocol (IMAP)

IPFIX: IPFIX (Internet Protocol Flow Information Export)

IPMI: Intelligent Platform Management Interface (IPMI)

IPsec: Internet Protocol Security (IPsec)

iRMC: integrated Remote Management Controller (iRMC)

iSCSI: internet Small Computer System Interface (iSCSI)

JSON: JavaScript Object Notation (JSON)

LAN: Local Area Network (LAN)

LDAP: Lightweight Directory Access Protocol (LDAP)

MIB: Management Information Base (MIB)

MoID: Managed Object ID (MoID)

MOS: Mean Opinion Score (MOS)

MSP: Managed Service Provider (MSP)

NAS: Network Attached Storage (NAS)

NAT: Network Address Translation (NAT)

NFS: Network File System (NFS)

NSA: Network Security Appliance (NSA)

NTFS: New Technology File System (NTFS)

NTLM: NT LAN Manager (NTLM)

OID: Object Identifier (OID)

OMSA: OpenManage Server Administrator (OMSA)

PDF: Portable Document Format (PDF)

PDV: Packet Delay Variation (PDV)

POP3: Post Office Protocol version 3 (POP3)

QoS: Quality of Service (QoS)

RADIUS: Remote Authentication Dial-In User Service (RADIUS)

REST: Representational State Transfer (REST)

RMON: Remote Monitoring (RMON)

RPC: Remote Procedure Call (RPC)

RTT: Round Trip Time (RTT)

SaaS: Software as a Service (SaaS)

SAN: Storage Area Network (SAN)

SASL: Simple Authentication and Security Layer (SASL)

SCVMM: System Center Virtual Machine Manager (SCVMM)

SIP: Session Initiation Protocol (SIP)

SLA: Service Level Agreement (SLA)

S.M.A.R.T.: Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.)

SMB: Server Message Block (SMB)

SMTP: Simple Mail Transfer Protocol (SMTP)

SNI: Server Name Identification (SNI)

SNMP: Simple Network Management Protocol (SNMP)

SNTP: Simple Network Time Protocol (SNTP)

SOAP: Simple Object Access Protocol (SOAP)

SPAN: Switched Port Analyzer (SPAN)

SQL: Structured Query Language (SQL)

SRP: Secure Remote Password (SRP)

SSH: Secure Shell (SSH)

SSL: Secure Sockets Layer (SSL)

SSO: Single Sign-On (SSO)

TCP: Transport Control Protocol (TCP)

TFTP: Trivial File Transfer Protocol (TFTP)

TLS: Transport Layer Security (TLS)

UAC: User Account Control (UAC)

UCS: Unified Computing System (UCS)

UDP: User Datagram Protocol (UDP)

UNC: Uniform Naming Convention (UNC)

UPnP: Universal Plug and Play (UPnP)

UTC: UTC (Coordinated Universal Time)

UUID: Universally Unique Identifier (UUID)

VoIP: Voice over IP (VoIP)

VPN: Virtual Private Network (VPN)

WAN: Wide Area Network (WAN)

WBEM: Web-Based Enterprise Management (WBEM)

WMI: Windows Management Instrumentation (WMI)

WQL: Windows Management Instrumentation Query Language (WQL)

WSUS: Windows Server Update Services (WSUS)

XML: Extensible Markup Language (XML)

14.3 List of Icons

Please see below for a list of icons used in this documentation.

There is more detailed information on how this feature works exactly.

This feature is in beta status and may not function properly in all situations.

There is more information on this topic in another section in the PRTG manual.

There is more information on this topic in the Paessler Knowledge Base.

Notes that contain information about potential errors and that offer tips on how to keep them from occurring.

Notes that contain extremely critical information. Pay close attention to these notes, otherwise they could have serious consequences.

Notes that contain critical information. Pay close attention to these notes, otherwise PRTG might not function properly.

Notes that contain additional information.

Step-by-step instructions.

Examples on how to use a feature.

Calls to action. These contain tips, requirements, or instructions on what you need to enter in certain fields, or inform you that certain programs or apps need to be installed.

This information is relevant for PRTG hosted by Paessler.

This information is relevant for PRTG on premises.

14.4 Support and Troubleshooting

Need help with PRTG? There are several ways to get support and troubleshoot.

Video Tutorials

A video says more than a thousand words—watch tutorials for PRTG from Paessler and other PRTG users.

- <https://www.paessler.com/support/videos>

Paessler Knowledge Base

In the Knowledge Base, you can search in hundreds of articles about PRTG. You can post your own questions and answers, too!

- <https://kb.paessler.com>

Open a Support Ticket

Users that have purchased a license can open support tickets, which will usually be answered by Paessler's staff in less than 24 hours on business days. Please use the [support form](#)³⁴²⁴ that is available in PRTG to contact our support team. This is the best way to get detailed help quickly. If you cannot use this form, contact us via our webpage.

- <https://shop.paessler.com/en/openticket>

14.5 Differences between PRTG on Premises and PRTG Hosted by Paessler

Please see below for the differences between the settings and features that PRTG on premises and PRTG hosted by Paessler have to offer.

Licensing, Payment, Infrastructure

TOPIC	PRTG ON PREMISES	PRTG HOSTED BY PAESSLER
Trial Period	30 days	10 days
Freeware	freeware (100 sensors) available	no freeware, smallest edition is PRTG 500
Payment	one-time license fee plus yearly maintenance	monthly fee
PRTG Edition Size Flexibility	upgrade only	upgrade or downgrade
Max. Installation Size	unrestricted	5,000 sensors
PRTG Update Management	done by user	done by Paessler
Enterprise Console	full support	not supported: connections are not possible

Features

FEATURE	PRTG ON PREMISES	PRTG HOSTED BY PAESSLER
Local Probe	☺	☹
Hosted Probe	☹	☺
Cluster	☺	☹

FEATURE	PRTG ON PREMISES	PRTG HOSTED BY PAESSLER
Customizations (CSS, HTML, lookups, maps, device icons)	😊	🚫
