- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

- i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

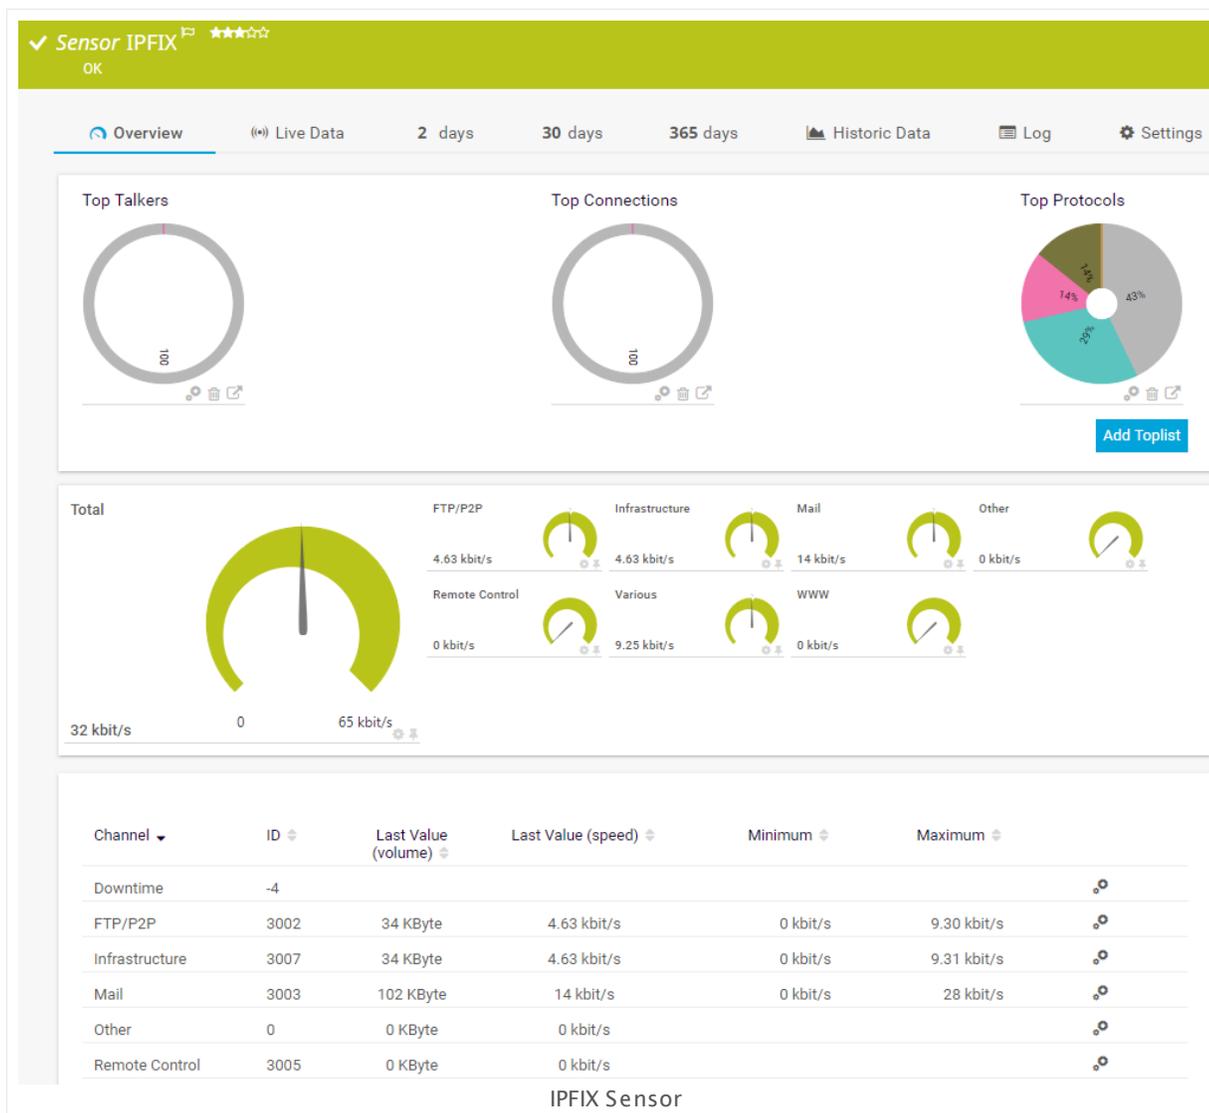

7.8.69 IPFIX Sensor

The IPFIX sensor receives traffic data from an IPFIX (Internet Protocol Flow Information Export) compatible device and shows traffic by type. There are several filter options available to divide traffic into different channels. Ensure your device supports IPFIX when using this sensor.

This sensor can show the following traffic types in kbit per second:

- Chat (IRC, AIM)
- Citrix
- FTP/P2P (file transfer)
- Infrastructure (network services: DHCP, DNS, Ident, ICMP, SNMP)
- Mail (mail traffic: IMAP, POP3, SMTP)
- NetBIOS
- Remote control (RDP, SSH, Telnet, VNC)
- WWW (web traffic: HTTP, HTTPS)
- Total traffic
- Other protocols (other UDP and TCP traffic)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Remarks

- You have to enable IPFIX export on the device for this sensor to work. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
- This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
- Knowledge Base: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)
- Knowledge Base: [What is the Active Flow Timeout in Flow sensors?](#)
- For a general introduction to the technology behind flow monitoring, please see manual section [Monitoring Bandwidth via Flows](#).

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IPFIX SPECIFIC SETTINGS

Receive IPFIX Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the IPFIX export options of your hardware router device. Please enter an integer value.
Sender IP	Enter the IP address of the sending device you want to receive the IPFIX data from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive IPFIX Packets on IP	<p>Select the IP address(es) on which PRTG listens to IPFIX packets. The list of IP addresses shown here is specific to your setup.</p> <p>To select an IP address, add a check mark in front of the respective line or in the top level box to select all. The IP address selected here must match the one configured in the IPFIX export options of your hardware router device.</p>
Active Flow Timeout (Minutes)	<p>Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data is received, the sensor may switch to an Unknown status. Please enter an integer value. We recommend you set this one minute longer than the respective timeout configured in your hardware router device.</p> <p> For more details about this setting, see this Knowledge Base article: What is the Active Flow Timeout in Flow sensors?</p> <p> If you set this value too low, flow information might be lost!</p>
Sampling Mode	<p>Define if you want to use the sampling mode. This setting must match the setting in the flow exporter. Choose between:</p> <ul style="list-style-type: none"> ▪ Off: The standard flow will be used. ▪ On: Switch into sampling mode and specify the sampling rate below.
Sampling Rate	This field is only visible when sampling mode is On above. Enter a number that matches the sampling rate in your exporter device. If the number is different, monitoring results will be incorrect. Please enter an integer value.
Log Stream Data to Disk (for Debugging)	Define if you want the probe to write a logfile of the stream and packet data to the data folder (see Data Storage ³⁷³⁴). Choose between:

IPFIX SPECIFIC SETTINGS

- **None (recommended):** Do not write additional logfiles. Recommended for normal use cases.
 - **Only for the 'Other' channel:** Only write logfiles of data that is not filtered otherwise and therefore accounted to the default **Other** channel.
 - **All stream data:** Write logfiles for all data received.
-  Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

CHANNEL CONFIGURATION

Channel Selection Define the categories the sensor accounts the traffic to. There are different groups of traffic available. Choose between:

- **Web:** Internet web traffic.
- **File Transfer:** Traffic caused by FTP.
- **Mail:** Internet mail traffic.
- **Chat:** Traffic caused by chat and instant messaging.
- **Remote Control:** Traffic caused by remote control applications, such as RDP, SSH, Telnet, and VNC.
- **Infrastructure:** Traffic caused by network services, such as DHCP, DNS, Ident, ICMP, and SNMP.
- **NetBIOS:** Traffic caused by NetBIOS communication.
- **Citrix:** Traffic caused by Citrix applications.
- **Other Protocols:** Traffic caused by various other protocols via UDP and TCP.

For each traffic group, you can select how many channels will be used for each group, that is, how detailed the sensor divides the traffic. For each group, choose between:

- **No (X icon):** Do not account traffic of this group in its own channel. All traffic of this group is accounted to the default channel named **Other**.
- **Yes (check mark icon):** Count all traffic of this group and summarize it into one channel.

CHANNEL CONFIGURATION

- **Detail (magnifier icon):** Count all traffic of this group and further divide it into different channels. The traffic appears in several channels as shown in the **Content** column.

 Extensive use of this option can cause load problems on your probe system. We recommend setting specific, well-chosen filters for the data you really want to analyze.

 You can change the default configuration for groups and channels. For details, see this Knowledge Base article: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)

FILTERING

Include Filter

Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax.

 For detailed information, see section [Filter Rules](#) ¹¹⁹⁷ below.

Exclude Filter

First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax.

 For detailed information, see section [Filter Rules](#) ¹¹⁹⁷ below.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)^[3160] settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

PRIMARY TOPLIST

Primary Toplist

Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:

- **Top Talkers**
- **Top Connections**
- **Top Protocols**
- **[Any custom toplist you have added]**

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

SCANNING INTERVAL

- Scanning Interval** Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#) on PRTG on premises installations.
- If a Sensor Query Fails** Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:
- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail.

 For more information, see section [Toplists](#)³¹⁸⁶.

Filter Rules

The following filter rules apply to all xFlow, IPFIX, and Packet Sniffer sensors.

FIELD	POSSIBLE FILTER VALUES
IP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
Port	Any number
SourceIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
SourcePort	Any number
DestinationIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
DestinationPort	Any number

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
69 IPFIX Sensor

FIELD	POSSIBLE FILTER VALUES
Protocol	TCP, UDP, ICMP, OSPFIGP, any number
TOS	Type Of Service: any number
DSCP	Differentiated Services Code Point: any number

The following filter rules apply to IPFIX sensors only.

FIELD	POSSIBLE FILTER VALUES
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see Valid Data Formats)
SourceASI	Any number
DestinationASI	Any number
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address
Mask	Mask values represent subnet masks in with a single number (number of contiguous bits).
DestinationMask	Mask values represent subnet masks in with a single number (number of contiguous bits).

FIELD	POSSIBLE FILTER VALUES
NextHop	IP address or DNS name (see Valid Data Formats )
VLAN	VLAN values represent a VLAN identifier (any number)
SourceVLAN	VLAN values represent a VLAN identifier (any number)
DestinationVLAN	VLAN values represent a VLAN identifier (any number)

7.8.70 IPFIX (Custom) Sensor

The IPFIX (Custom) sensor receives traffic data from an IPFIX (Internet Protocol Flow Information Export) compatible device and shows the traffic by type. In this custom sensor, you can define your own channel definitions to divide traffic into different channels. Ensure your device supports IPFIX when using this sensor.

- This sensor can show traffic by type individually according to your needs.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

IPFIX Sensor

Sensor in Other Languages

Dutch: **IPFIX (aangepast)**, French: **IPFIX (Personnalisé)**, German: **IPFIX (Benutzerdef.)**,
Japanese: **IPFIX (カスタム)**, Portuguese: **IPFIX (customizado)**, Russian: **IPFIX (нестандартный)**,

Simplified Chinese: IPFIX (? ? ?), Spanish: **IPFIX (personalizado)**

Remarks

- In order for this sensor to work, you have to enable IPFIX export on the device. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
 - This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
 - Knowledge Base: [What is the Active Flow Timeout in Flow sensors?](#)
 - This sensor [does not support more than 50 channels](#)¹²⁰¹ officially.
 - For a general introduction to the technology behind flow monitoring, please see manual section [Monitoring Bandwidth via Flows](#)³⁵¹⁴.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Limited to 50 Sensor Channels

 PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IPFIX SPECIFIC SETTINGS

Receive IPFIX Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one configured in the IPFIX export options of your hardware router device. Please enter an integer value.
Sender IP	Enter the IP address of the sending device you want to receive the IPFIX data from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive IPFIX Packets on IP	Select the IP address(es) on which PRTG listens to IPFIX packets. The list of IP addresses shown here is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address selected here must match the one configured in the IPFIX export options of your hardware router device.

IPFIX SPECIFIC SETTINGS

Active Flow Timeout (Minutes) Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data is received, the sensor may switch to an **Unknown status** ^[195]. Please enter an integer value.

We recommend you set this one minute longer than the respective timeout configured in your hardware router device.

 For more details about this setting, see this Knowledge Base article: [What is the Active Flow Timeout in Flow sensors?](#)

 If you set this value too low, flow information might be lost!

Sampling Mode Define if you want to use the sampling mode. This setting must match the setting in the flow exporter. Choose between:

- **Off:** The standard flow will be used.
- **On:** Switch into sampling mode and specify the sampling rate below.

Sampling Rate This field is only visible when sampling mode is **On** above. Enter a number that matches the sampling rate in your device that exports the flows. If the number is different, monitoring results will be incorrect. Please enter an integer value.

Channel Definition Enter a channel definition to divide the traffic into different channels. Write each definition in one line. All traffic for which no channel is defined will be accounted to the default channel named **Other**.

 For detailed information, see section [Channel Definitions for xFlow and Packet Sniffer Sensors](#) ^[369].

 Extensive use of many filters can cause load problems on your probe system. We recommend defining specific, well-chosen filters for the data you really want to analyze.

Log Stream Data to Disk (for Debugging) Define if you want the probe to write a logfile of the stream and packet data to the data folder (see [Data Storage](#) ^[374]). Choose between:

- **None (recommended):** Do not write additional logfiles. Recommended for normal use cases.
- **Only for the 'Other' channel:** Only write logfiles of data that is not filtered otherwise and therefore accounted to the default **Other** channel.

IPFIX SPECIFIC SETTINGS

- **All stream data:** Write logfiles for all data received.

 Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

FILTERING

Include Filter	<p>Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax.</p>
----------------	--

FILTERING

 For detailed information, see section [Filter Rules](#)¹²¹⁰ below.

Exclude Filter

First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax.

 For detailed information, see section [Filter Rules](#)¹²¹⁰ below.

PRIMARY TOPLIST

Primary Toplist

Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:

- **Top Talkers**
- **Top Connections**
- **Top Protocols**
- **[Any custom toplists you have added]**

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail.

 For more information, see section [Toplists](#)³¹⁸⁶.

Filter Rules

The following filter rules apply to all xFlow, IPFIX, and Packet Sniffer sensors.

FIELD	POSSIBLE FILTER VALUES
IP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
Port	Any number
SourceIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
SourcePort	Any number
DestinationIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
DestinationPort	Any number

FIELD	POSSIBLE FILTER VALUES
Protocol	TCP, UDP, ICMP, OSPFIGP, any number
TOS	Type Of Service: any number
DSCP	Differentiated Services Code Point: any number

The following filter rules apply to IPFIX sensors only.

FIELD	POSSIBLE FILTER VALUES
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see Valid Data Formats)
SourceASI	Any number
DestinationASI	Any number
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address
Mask	Mask values represent subnet masks in with a single number (number of contiguous bits).
DestinationMask	Mask values represent subnet masks in with a single number (number of contiguous bits).

FIELD	POSSIBLE FILTER VALUES
NextHop	IP address or DNS name (see Valid Data Formats )
VLAN	VLAN values represent a VLAN identifier (any number)
SourceVLAN	VLAN values represent a VLAN identifier (any number)
DestinationVLAN	VLAN values represent a VLAN identifier (any number)

7.8.71 IPMI System Health Sensor

The IPMI System Health sensor monitors the status of a system via the Intelligent Platform Management Interface (IPMI).

It can show the following:

- Temperatures of, for example, the system or the peripheral temperature.
- Fan rotation per minute
- Voltages
- Status of a power supply

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **IPMI System Health**, French: **État du système IPMI**, German: **IPMI Systemzustand**, Japanese: **IPMI システムヘルス**, Portuguese: **Funcionamento do sistema via IPMI**, Russian: **Работоспособность системы IPMI**, Simplified Chinese: **IPMI ? ? ? ?**, Spanish: **Estado del sistema IPMI**

Remarks

- You have to explicitly specify the credentials of the IPMI in the sensor settings.
 - [Requires](#) ¹²¹⁴ .NET 4.5 or later on the probe system.
 - This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#) ³⁶⁹³.
 - This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, refer to the manual section [Sensor Channels Settings](#) ³¹⁶⁰.
 - Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#) ³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) ³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Before you can actually add this sensor, PRTG will ask you to provide your credentials for the Intelligent Platform Management Interface (IPMI) in the **Add Sensor** dialog. Enter the **Username** and the **Password** in the respective fields.

Select the metrics you want to monitor. PRTG will create one sensor for each metric you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

IPMI SPECIFIC

Group Select the measurements you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)^[181], as well as in [alarms](#)^[219], [logs](#)^[228], [notifications](#)^[3216], [reports](#)^[3252], [maps](#)^[3276], [libraries](#)^[3235], and [tickets](#)^[230].

Parent Tags Shows [Tags](#)^[139] that this sensor [inherits](#)^[140] from its [parent device, group, and probe](#)^[133]. This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#)^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IPMI CREDENTIALS

Username Enter the username for the Intelligent Platform Management Interface (IPMI). If not changed yet, this field shows the username that you defined during sensor creation.

Password Enter the password for the Intelligent Platform Management Interface (IPMI). If not changed yet, this field shows the encrypted password that you defined during sensor creation.

IPMI SPECIFIC

Group Shows the metric that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Logfile Results Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

7.8.72 jFlow V5 Sensor

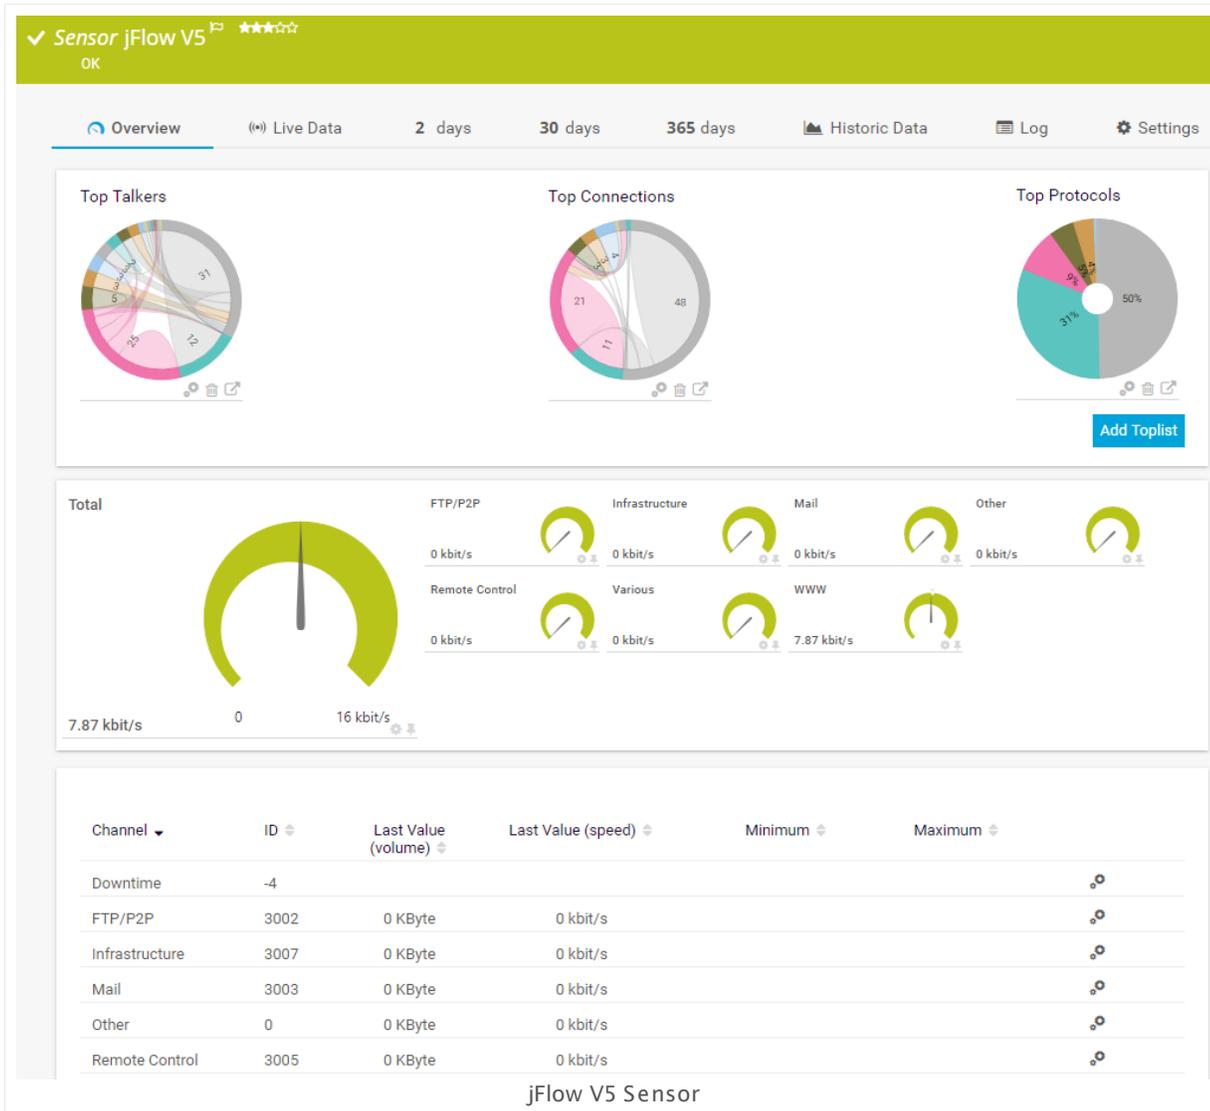

The jFlow V5 sensor receives traffic data from a jFlow V5 compatible device and shows the traffic by type. On your hardware device, ensure it matches jFlow V5! There are several filter options available to divide traffic into different channels.

This sensor can show the following traffic types in kbit per second:

- Chat (IRC, AIM)
- Citrix
- FTP/P2P (file transfer)
- Infrastructure (network services: DHCP, DNS, Ident, ICMP, SNMP)
- Mail (mail traffic: IMAP, POP3, SMTP)
- NetBIOS
- Remote control (RDP, SSH, Telnet, VNC)
- WWW (web traffic: HTTP, HTTPS)
- Total traffic
- Other protocols (other UDP and TCP traffic)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
72 jFlow V5 Sensor

Remarks

- You have to enable jFlow export of the respective version on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
 - This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
 - Knowledge Base: [What is the Active Flow Timeout in Flow sensors?](#)
 - For a general introduction to the technology behind flow monitoring, please see manual section [Monitoring Bandwidth via Flows](#).
- ☁ You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

JFLOW V5 SPECIFIC SETTINGS

Receive jFlow Packets on UDP Port	<p>Enter the UDP port number on which PRTG receives the flow packets. It must match the one you have configured in the jFlow export options of your hardware router device. Please enter an integer value.</p> <p> When you configure the export, make sure you select the appropriate jFlow version for this sensor.</p>
Sender IP	<p>Enter the IP address of the sending device you want to receive the jFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.</p>
Receive jFlow Packets on IP	<p>Select the IP address(es) on which PRTG listens to jFlow packets. The list of IP addresses you see here is specific to your setup. To select an IP address, add a check mark in front of the respective line. You can also select and deselect all items by using the check box in the table head.</p> <p>The IP address you select here must match the one you configured in the jFlow export options of your hardware router device.</p> <p> When you configure the export, make sure you select the appropriate jFlow version for this sensor.</p>
Active Flow Timeout (Minutes)	<p>Enter a time span in minutes after which the sensor must have received new flow data. If the timeout is reached and no new data came in, the sensor may switch to an Unknown status. Please enter an integer value. We recommend you set this one minute longer than the respective timeout configured in your hardware router device.</p> <p> For more details about this setting, see this Knowledge Base article: What is the Active Flow Timeout in Flow sensors?</p> <p> If you set this value too low, flow information might be lost!</p>
Sampling Mode	<p>Define if you want to use the sampling mode. This setting must match the setting in the flow exporter. Choose between:</p> <ul style="list-style-type: none">▪ Off: The standard flow will be used.▪ On: Switch into sampling mode and specify the sampling rate below.
Sampling Rate	<p>This field is only visible when sampling mode is On above. Enter a number that matches the sampling rate in your exporter device. If the number is different, monitoring results will be incorrect. Please enter an integer value.</p>

JFLOW V5 SPECIFIC SETTINGS

Log Stream Data to Disk (for Debugging)

Define if you want the probe to write a logfile of the stream and packet data to the data folder (see [Data Storage](#)³⁷³⁴). Choose between:

- **None (recommended):** Do not write additional logfiles. Recommended for normal use cases.
- **Only for the 'Other' channel:** Only write logfiles of data that is not filtered otherwise and therefore accounted to the default **Other** channel.
- **All stream data:** Write logfiles for all data received.

 Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

CHANNEL CONFIGURATION

Channel Selection

Define the categories the sensor accounts the traffic to. There are different groups of traffic available. Choose between:

- **Web:** Internet web traffic.
- **File Transfer:** Traffic caused by FTP.
- **Mail:** Internet mail traffic.
- **Chat:** Traffic caused by chat and instant messaging.
- **Remote Control:** Traffic caused by remote control applications, such as RDP, SSH, Telnet, and VNC.
- **Infrastructure:** Traffic caused by network services, such as DHCP, DNS, Ident, ICMP, and SNMP.
- **NetBIOS:** Traffic caused by NetBIOS communication.
- **Citrix:** Traffic caused by Citrix applications.
- **Other Protocols:** Traffic caused by various other protocols via UDP and TCP.

For each traffic group, you can select how many channels will be used for each group, that is, how detailed the sensor divides the traffic. For each group, choose between:

- **No (X icon):** Do not account traffic of this group in its own channel. All traffic of this group is accounted to the default channel named **Other**.

CHANNEL CONFIGURATION

- **Yes (check mark icon):** Count all traffic of this group and summarize it into one channel.
- **Detail (magnifier icon):** Count all traffic of this group and further divide it into different channels. The traffic appears in several channels as shown in the **Content** column.
 - ⚠ Extensive use of this option can cause load problems on your probe system. We recommend setting specific, well-chosen filters for the data you really want to analyze.
 - 💡 You can change the default configuration for groups and channels. For details, see this Knowledge Base article: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)

FILTERING

- Include Filter** Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax.
- 🔍 For detailed information, see section [Filter Rules](#)¹²³⁴ below.
- Exclude Filter** First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax.
- 🔍 For detailed information, see section [Filter Rules](#)¹²³⁴ below.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
- 📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)^[3160] settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

PRIMARY TOPLIST

Primary Toplist

Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:

- **Top Talkers**
- **Top Connections**
- **Top Protocols**
- **[Any custom toplists you have added]**

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

SCANNING INTERVAL

- Scanning Interval** Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#) ³³⁶⁵ on PRTG on premises installations.
- If a Sensor Query Fails** Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status** ¹⁹⁵¹. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:
- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) ³⁶⁸³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail.

 For more information, see section [Toplists](#)³¹⁸⁶.

Filter Rules

The following filter rules apply to all xFlow, IPFIX, and Packet Sniffer sensors.

FIELD	POSSIBLE FILTER VALUES
IP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
Port	Any number
SourceIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
SourcePort	Any number
DestinationIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
DestinationPort	Any number

FIELD	POSSIBLE FILTER VALUES
Protocol	TCP, UDP, ICMP, OSPFIGP, any number
TOS	Type Of Service: any number
DSCP	Differentiated Services Code Point: any number

The following filter rules apply to jFlow V5 sensors only.

FIELD	POSSIBLE FILTER VALUES
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see Valid Data Formats)
SourceASI	Any number
DestinationASI	Any number

7.8.73 jFlow V5 (Custom) Sensor

The jFlow V5 (Custom) sensor receives traffic data from a jFlow V5 compatible device and shows the traffic by type. On your hardware device, please make sure it matches jFlow V5! In this custom sensor, you can define your own channel definitions to divide traffic into different channels.

- This sensor can show traffic by type individually according to your needs.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

jFlow V5 Sensor

Sensor in Other Languages

Dutch: **jFlow V5 (Klant specifiek)**, French: **jFlow V5 (personnalisé)**, German: **jFlow V5 (Benutzerdef.)**, Japanese: **jFlow (カスタム)**, Portuguese: **jFlow V5 (customizado)**, Russian: **jFlow**

V5 (нестандартный), Simplified Chinese: jFlow V5 (? ? ?), Spanish: **jFlow V5 (personalizado)**

Remarks

- You have to enable jFlow export of the respective version on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
 - This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
 - Knowledge Base: [What is the Active Flow Timeout in Flow sensors?](#)
 - This sensor [does not support more than 50 channels](#)¹²³⁸ officially.
 - For a general introduction to the technology behind flow monitoring, please see manual section [Monitoring Bandwidth via Flows](#)³⁵¹⁴.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Limited to 50 Sensor Channels

 PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

JFLOW SPECIFIC SETTINGS

Receive jFlow Packets on UDP Port	<p>Enter the UDP port number on which PRTG receives the flow packets. It must match the one you have configured in the jFlow export options of your hardware router device. Please enter an integer value.</p> <p>i When you configure the export, make sure you select the appropriate jFlow version for this sensor.</p>
Sender IP	Enter the IP address of the sending device you want to receive the jFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.

JFLOW SPECIFIC SETTINGS

Receive jFlow Packets on IP	<p>Select the IP address(es) on which PRTG listens to jFlow packets. The list of IP addresses you see here is specific to your setup. To select an IP address, add a check mark in front of the respective line. You can also select and deselect all items by using the check box in the table head. The IP address you select here must match the one you configured in the jFlow export options of your hardware router device.</p> <p> When you configure the export, make sure you select the appropriate jFlow version for this sensor.</p>
Active Flow Timeout (Minutes)	<p>Enter a time span in minutes after which the sensor must have received new flow data. If the timeout is reached and no new data came in, the sensor may switch to an Unknown status. Please enter an integer value. We recommend you set this one minute longer than the respective timeout configured in your hardware router device.</p> <p> For more details about this setting, see this Knowledge Base article: What is the Active Flow Timeout in Flow sensors?</p> <p> If you set this value too low, flow information might be lost!</p>
Sampling Mode	<p>Define if you want to use the sampling mode. This setting must match the setting in the flow exporter. Choose between:</p> <ul style="list-style-type: none">▪ Off: The standard flow will be used.▪ On: Switch into sampling mode and specify the sampling rate below.
Sampling Rate	<p>This field is only visible when sampling mode is On above. Enter a number that matches the sampling rate in your device that exports the flows. If the number is different, monitoring results will be incorrect. Please enter an integer value.</p>
Channel Definition	<p>Enter a channel definition to divide the traffic into different channels. Write each definition in one line. All traffic for which no channel is defined will be accounted to the default channel named Other.</p> <p> For detailed information, see section Channel Definitions for xFlow and Packet Sniffer Sensors.</p> <p> Extensive use of many filters can cause load problems on your probe system. We recommend defining specific, well-chosen filters for the data you really want to analyze.</p>

JFLOW SPECIFIC SETTINGS

Log Stream Data to Disk (for Debugging)

Define if you want the probe to write a logfile of the stream and packet data to the data folder (see [Data Storage](#)³⁷³⁴). Choose between:

- **None (recommended):** Do not write additional logfiles. Recommended for normal use cases.
- **Only for the 'Other' channel:** Only write logfiles of data that is not filtered otherwise and therefore accounted to the default **Other** channel.
- **All stream data:** Write logfiles for all data received.

 Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

FILTERING

Include Filter

Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax.

 For detailed information, see section [Filter Rules](#)¹²⁴⁷ below.

Exclude Filter

First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax.

 For detailed information, see section [Filter Rules](#)¹²⁴⁷ below.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)^[316] settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

PRIMARY TOPLIST

Primary Toplist

Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:

- **Top Talkers**
- **Top Connections**
- **Top Protocols**
- **[Any custom toplists you have added]**

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

SCANNING INTERVAL

- Scanning Interval** Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#) ³³⁸⁵ on PRTG on premises installations.
- If a Sensor Query Fails** Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status** ¹⁹⁵¹. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:
- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) ³⁶⁸³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail.

 For more information, see section [Toplists](#)³¹⁸⁶.

Filter Rules

The following filter rules apply to all xFlow, IPFIX, and Packet Sniffer sensors.

FIELD	POSSIBLE FILTER VALUES
IP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
Port	Any number
SourceIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
SourcePort	Any number
DestinationIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
DestinationPort	Any number

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
73 jFlow V5 (Custom) Sensor

FIELD	POSSIBLE FILTER VALUES
Protocol	TCP, UDP, ICMP, OSPFIGP, any number
TOS	Type Of Service: any number
DSCP	Differentiated Services Code Point: any number

The following filter rules apply to jFlow V5 sensors only.

FIELD	POSSIBLE FILTER VALUES
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see Valid Data Formats)
SourceASI	Any number
DestinationASI	Any number

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.74 LDAP Sensor

The LDAP sensor monitors directory services using Lightweight Directory Access Protocol (LDAP), connecting to the server trying a "bind". If the server does not respond or authentication fails, it will show an error message.

- The sensor shows the response time of the server.

Remarks

- This sensor type does not support LDAP over SSL.
- This sensor type officially supports Microsoft implementations of LDAP. Other third-party LDAP implementations might work but are not officially supported.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

LDAP SPECIFIC

Port	Enter the LDAP port number, usually port 389 for unencrypted connections. Please enter an integer value.
------	--

LDAP SPECIFIC

Distinguished Name	Enter the Distinguished Name (DN) you want to authenticate to the LDAP server. Usually, this is the information for the user you want to authenticate with. For example, use the format cn=Manager,dc=my-domain,dc=com for a DN on an OpenLDAP server.
Password	Enter the password for the entered Distinguished Name .

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

- | | |
|-------------------------|--|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ^[336] on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> |

SCANNING INTERVAL

- ❗ If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- ❗ Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings.</p> <ul style="list-style-type: none"> ❗ Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <ul style="list-style-type: none"> ❗ To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies^[323] in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	<p>This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector^[240] to choose an object on which the current sensor will depend.</p>
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

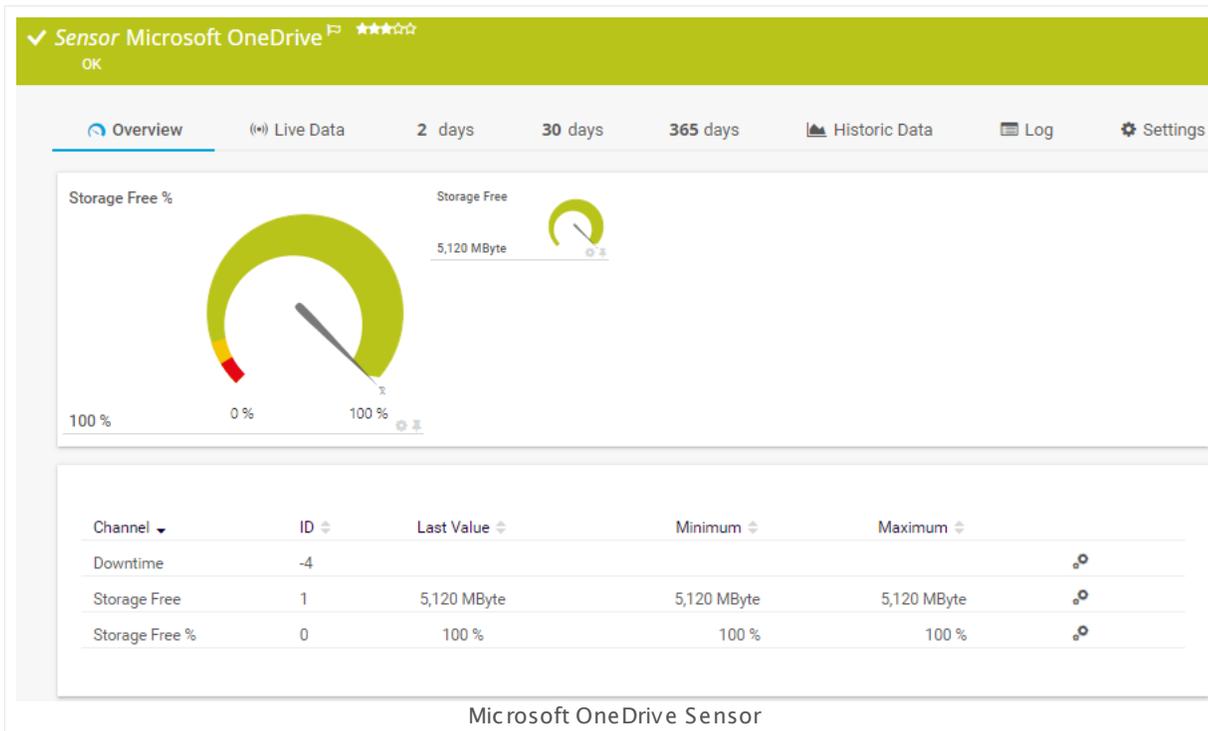

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.75 Microsoft OneDrive Sensor

The Microsoft OneDrive sensor monitors a Microsoft OneDrive Personal account using the OneDrive Application Programming Interface (API) and OAuth2. It shows the following:

- Free storage in bytes and percent

Remarks

- The minimum scanning interval for this sensor type is **30 minutes**.
- For details about OAuth2 authentication, see manual section [Authentication Using OAuth2](#).
- This sensor type only supports OneDrive Personal, it does not work with OneDrive Business.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

- PRTG requires OAuth2 authorization before you can actually add this sensor type. Provide the requested credentials in the appearing window.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

MICROSOFT CREDENTIALS

 This sensor type uses **OAuth2** authentication to get access to your Microsoft account. For details about the authentication approach, see section [Authentication Using OAuth2](#)^[1265].

OAuth URL Click the button **Get Access Code** to connect this sensor to your Microsoft account using **OAuth2**. This is necessary to allow the sensor to query data from OneDrive.

A new browser window appears. Please follow the steps there and confirm the permission for PRTG to connect to your OneDrive account. OneDrive forwards you to an empty page after completing the authorization process. Copy the complete **URL** of this empty page and paste it into the **OAuth Code** field below.

OAuth Code Paste the complete **URL** from the address bar of your browser on the empty page to which OneDrive forwards you. The empty page appears after completing the authorization process for PRTG at your OneDrive account. Click **OK** to define the [sensor settings](#)^[935].

 It is mandatory to connect this sensor to your OneDrive account to create this sensor. Please complete the OAuth approach first to get the OAuth code.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)^[181], as well as in [alarms](#)^[219], [logs](#)^[228], [notifications](#)^[3216], [reports](#)^[3262], [maps](#)^[3276], [libraries](#)^[3235], and [tickets](#)^[230].

BASIC SENSOR SETTINGS

Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

MICROSOFT CREDENTIALS

OAuth Code	Shows the authorization code that the sensor uses to get access to your OneDrive account. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
------------	--

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none">▪ Show channels independently (default): Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

i This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in [System Administration—Monitoring](#) are not available for this sensor.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>3311</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none">▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none">▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Authentication Using OAuth2

 This sensor type uses the OAuth2 security protocol to access the account from which you want to retrieve and monitor data. OAuth2 enables you to grant access to the target account without sharing your password with PRTG. The authorization approach of PRTG using OAuth2 works as follows.

1. Authorization Request

First, you have to request authorization for this sensor to access service resources from your account. For this purpose you are asked to get an access code for this sensor in the **Add Sensor** dialog. Click the **Get Access Code** button to start the authorization process using OAuth2. A new browser window will open on the authorization server of the target service.

2. Verifying Identity

This new window contains a login form for your account that you want to monitor. Log in to your account using your credentials for this service to authenticate your identity. This is a common login to your account on the target server so PRTG will not see your password. The service will forward you to the authorization page and asks you to permit PRTG to access the data in your account.

 If you are already logged in to the service with a user account, you do not have to enter credentials in this step and get directly to the access permission page.

3. Authorizing PRTG

Permit PRTG to access information on your account. Note that this permission holds only for this specific sensor, not for other sensors of this type or PRTG as a whole. For each sensor of this type you add, you have to confirm the access permission anew. You can change the account permissions at any time in your account at the target service.

4. Getting Authorization Code

Permitting PRTG to access your account data forwards you to a page where the service provides an **authorization code**. Copy this code and switch back to the **Add Sensor** dialog in PRTG.

-  The code is only valid a short period of time and expires after a few minutes. You can use a particular code only once.

5. Providing Authorization Code

Paste the authorization code into the **OAuth Code** field and complete the **Add Sensor** dialog. You do not have to go through further configuration steps manually. The sensor will accomplish the following steps automatically.

6. Requesting Access Token

After receiving the authorization code, PRTG will request an access token from the API of the target service. For this purpose, PRTG transmits the authorization code together with several authentication details. The API checks if the authorization is valid and returns the access token to PRTG. Access tokens are specific for one account and one application (here: PRTG). The authorization process to read data from your account is now complete.

7. Retrieving Data

The sensor transmits the access token with each sensor scan in the defined scanning interval to authenticate with your account. It is not necessary to use the original account credentials anew. The used tokens will refresh automatically from time to time.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

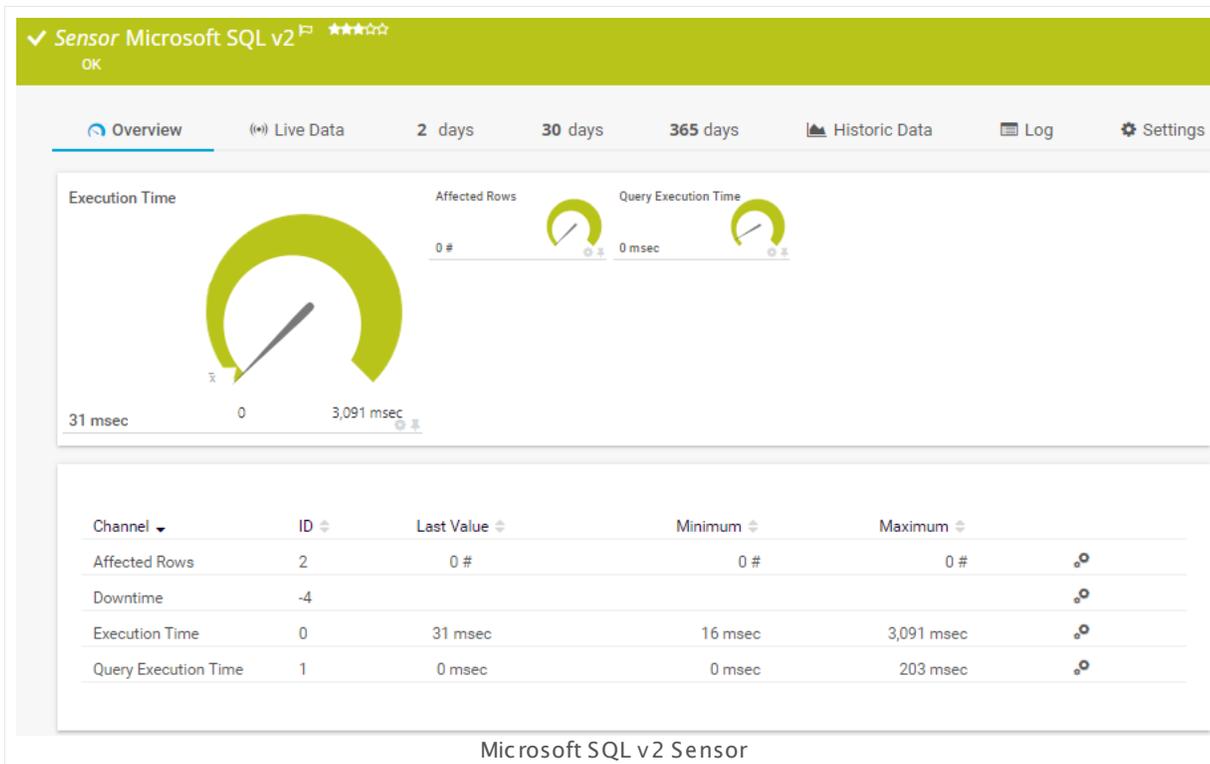

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.76 Microsoft SQL v2 Sensor

The Microsoft SQL v2 sensor monitors a database on a Microsoft SQL server and executes a defined query.

It can show the following:

- Execution time of the whole request (including connection buildup, query execution, transaction handling, disconnection)
- Execution time of the given query
- Number of rows that were addressed by the query (including **select** statements if you process data tables)
- It can also process the data table and show defined values in individual channels.

Remarks

- [Requires](#) ¹²⁶⁰ .NET 4.5 or later on the probe system.
- Define credentials, custom port (if required), and timeout in settings section [Credentials for Database Management Systems](#) ⁴¹³ of the parent device, or in the settings of a group or probe above.
- Your SQL query must be stored in a file on the system of the probe the sensor is created on. If you use it on a remote probe, store the file on the system running the remote probe. In a cluster setup, copy the file to every cluster node.

- PRTG Manual: [Monitoring Databases](#)^[3534] (includes an [example](#)^[3535] for channel value selection)
 - Knowledge Base: [How to setup the SQL v2 sensors in PRTG? Is there a guide?](#)
 - Knowledge Base: [How can I monitor strings from an SQL database and show a sensor status depending on it?](#)
 - Knowledge Base: [How can I monitor error tables in SQL databases?](#)
 - Knowledge Base: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)
 - Save the SQL script with the query into the `\Custom Sensors\sql\mssql` subfolder of your PRTG installation. See manual section [Data Storage](#)^[3731] for more information about how to find this path.
 - This sensor type supports Microsoft SQL server 2005 or later.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DATABASE SPECIFIC

Database	Enter the name of the SQL database to which the sensor connects. For example, such a database's name could be MyDatabase . This is a logical entity on the database server where database objects like tables or stored procedures exist.
SQL Server Instance	<p>Define if you want to use an instance name for the database connection. Choose between:</p> <ul style="list-style-type: none"> ▪ No instance name required (default): Use the default instance for the connection. ▪ Use instance name: Use a named instance that you can specify below.

DATABASE SPECIFIC

- Instance Name** This field is only visible if you enable instance name usage above. Enter the named instance you want to monitor.
- Encryption** Define encryption usage for the database connection. Choose between:
- **Use server defaults (default):** The database connection is only encrypted if enforced by the database server.
 - **Enforce encryption but do not validate server certificate:** Choose this option to make sure the database connection is encrypted.
 - **Enforce encryption and validate server certificate:** Choose this option to force encryption and to validate the database server certificate. This approach provides highest security, for example, it helps prevent "man in the middle" attacks.
 The sensor validates the certificate only if the database server enforces encryption!

DATA

- SQL Query File** Select an SQL script file that includes a valid SQL statement to execute on the server. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
- The script will be executed with every scanning interval. The list contains SQL scripts from the database management system specific **\Custom Sensors\sql** subfolder of your PRTG installation. Store your script there. If used on a remote probe, the file must be stored on the system running the remote probe. If used on a cluster probe, you must store the file on all servers running a cluster node!
-  For more information on how to find this path, see section [Data Storage](#). By default, there is the demo script **Demo Serveruptime.sql** available that you can use to monitor the uptime of the target server.
- For example, a correct expression in the file could be: **SELECT AVG (UnitPrice) FROM Products**. If you want to use transactions, separate the individual steps with semicolons ";".
-  Please be aware that with each request, the full result set will be transferred, so use filters and limits in your query.

DATA

 See also this Knowledge Base article: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)

SQL Variables

You can use the following variables in your query file to have them replaced by an input parameter. This is useful if you have various SQL sensors with queries that differ in only one parameter.

- Microsoft SQL, MySQL, PostgreSQL: **@prtg**
- Oracle SQL: **:prtg**
- ADO SQL: **?** (question mark)

@prtg, **:prtg**, and **?** behave like common SQL variables, so consider the general rules for SQL variables. For example, you cannot use a variable for a table in the FROM statement of a query.

Example for variables usage: **SELECT * FROM Table WHERE @prtg**

Use Input Parameter

Define if you want to pass a parameter to your SQL query file. This will replace the variables **@prtg** (Microsoft SQL, MySQL, PostgreSQL), or **:prtg** (Oracle SQL), or **?** (ADO SQL) in the SQL query, considering the general rules for SQL variables. Choose between:

- **Don't use input parameter (default):** Execute the SQL query file without using variables.
- **Use input parameter:** Execute an SQL query file that contains a variable. Provide the parameter you want to use in the query below.

Input Parameter

This field is only visible if you choose **Use input parameter** above. Enter the parameter you want to pass to the SQL query file. This parameter will replace the variable **@prtg** or **:prtg** or **?** in the SQL query, considering the general rules for SQL variables.

You can also use PRTG placeholders for custom sensors (command line parameters) as input parameter, for example, **%sensorid** or **%deviceid**. For details, see section [Custom Sensors](#) ³⁶⁵².

 Provide strings as they are and do not surround them with quotation marks. PRTG will correctly insert string parameters into the query automatically.

Use Transaction

Define if you want to use transactions and if they will affect the database content. Choose between:

- **Don't use transaction (default):** No transactions will be executed.

DATA

- **Use transaction and always rollback:** Choose this option to ensure that no data in the database will be changed by the query. In the SQL query file, separate the single steps of the transaction with semicolons.
- **Use transaction and commit on success:** Choose this option to perform changes on the database with the query. The changes will only apply if all execution steps succeed without any errors. In the SQL query file, separate the single steps of the transaction with semicolons.

Data Processing

Define if you want to process data from the database. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

- **Just execute the query:** If you select this option, the sensor will only show information about the number of affected rows and the execution time of the query. Affected rows are rows that were changed somehow with the query (for example, created, deleted, edited).
- **Count table rows:** Choose this option if you perform a **SELECT** statement and want to monitor how many rows of the data table this statement returns.
- **Process data table:** Select this option to read and analyze the queried data table. If you select this option, the sensor will count rows with **SELECT** statements as well.

Handle DBNull in Channel Values as

This setting is only visible if you select **Process data table** above. Define the sensor behavior if **DBNull** is returned by the query. Choose between:

- **Error:** The sensor will show a **Down** status if **DBNull** is reported.
- **Number 0:** The sensor will recognize the result **DBNull** as a valid value and interpret it as the number **0**.

Select Channel Value by

This setting is only visible if you select **Process data table** above. Define how the desired cell in the database table will be selected. This is necessary to configure the cells that will be used in the sensor channels. Choose between:

- **Column number:** The channel value will be determined by using the value in row 0 of the column whose number you specify below.
- **Column name:** The channel value will be determined by using the value in row 0 of the column whose name you specify below.
- **Row number:** The channel value will be determined by using the value in column 0 of the row whose number you specify below.

DATA

- **Key value pair:** The channel value will be determined by searching in column 0 for the key you specify below and returning the value in column 1 of the same row where the key value was found.

The option you choose here also defines the method to optionally determine a value for the sensor message. For details, see setting **Use Data Table Value in Sensor Message** below.

 See manual section [Monitoring Databases](#)  for an [example](#)  for channel value selection.

Sensor Channel #x This setting is only visible if you select **Process data table** above. You can define up to 10 different channels for the data processing of this sensor. You have to define at least one data channel if you process the data table, so you will see all available settings for **Channel #1** without enabling it manually. For all other possible channels, choose between:

- **Disable:** This channel will not be added to the sensor.
- **Enable:** This channel will be added to the sensor. Define the settings as described above.

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Channel #x Name This setting is only visible if you select **Process data table** above. Enter a unique name for the channel. Please enter a string. Channels will be generated dynamically with this name as identifier. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Channel #x Column Number This setting is only visible if you select **Column number** above. Provide the number of the column that will be used to determine the channel value in row 0. Please enter an integer value.

Sensor Channel #x Column Name This setting is only visible if you select **Column number** above. Provide the name of the column that will be used to determine the channel value in row 0. Please enter a string.

Sensor Channel #x Row Number This setting is only visible if you select **Row number** above. Provide the number of the row that will be used to determine the channel value in column 0. Please enter an integer value.

DATA

Sensor Channel #x Key This setting is only visible if you select **Key value pair** above. Provide the key to search for in column 0 of the data table. The value in column 1 of the same row where the key value was found will be used to determine the channel value. Please enter a string.

Sensor Channel #x Mode This setting is only visible if you select **Process data table** above. Define how to display the determined value in the channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

- **Absolute (recommended):** Shows the value as the sensor retrieves it from the data table.
- **Difference:** The sensor calculates and shows the difference between the last and the current value returned from the data table. This mode is not compatible with the unit **Value Lookup**.

Sensor Channel #x Unit This setting is only visible if you select **Process data table** above. Define the unit of the channel value. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

- BytesBandwidth
- BytesMemory
- BytesDisk
- Temperature
- Percent
- TimeResponse
- TimeSeconds
- TimeHours
- Count
- CPU
- BytesFile
- SpeedDisk
- SpeedNet
- Custom
- Value Lookup

 For more information about the available units, see section [Custom Sensors](#)³⁶⁴².

DATA

 To use [lookups](#) with this channel, choose **Value Lookup** and select your lookup file below. Do not use **Custom** for using lookups with this sensor!

 Using the unit **Value Lookup** is not possible when you choose the **Difference** mode. You will not be able to create the sensor in this case.

Sensor Channel #x
Custom Unit This setting is only visible if you select **Custom** above. Define a unit for the channel value. Please enter a string.

Sensor Channel #x
Value Lookup This settings is only visible if you select **Value Lookup** above. Select a [lookup](#) file that you want to use with this channel.

Use Data Table Value in
Sensor Message This setting is only visible if you select **Process data table** above. Define if the sensor message will show a value from the data table. Choose between:

- **Disable:** Do not use a custom sensor message.
- **Enable:** Define a custom sensor message with a defined value of the data table. Define the value selection below.

The method to determine a value for the sensor message is defined in setting **Select Channel Value by** above.

Sensor Message
Column Number This setting is only visible if you select **Column number** and **Use Data Table Value in Sensor Message** above. Enter the number of a column. The sensor message will show the value in row 0 of this column. Please enter an integer value.

 Columns and rows start with index 0.

Sensor Message
Column Name This setting is only visible if you select **Column name** and **Use Data Table Value in Sensor Message** above. Enter the name of a column. The sensor message will show the value in row 0 of this column. Please enter a string.

 Columns and rows start with index 0.

Sensor Message Row
Number This setting is only visible if you select **Row number** and **Use Data Table Value in Sensor Message** above. Enter the number of a row. The sensor message will show value in column 0 of this row. Please enter an integer value.

 Columns and rows start with index 0.

DATA

Sensor Message Key	<p>This setting is only visible if you select Key value pair and Use Data Table Value in Sensor Message above. Enter a key to search for in column 0 of the data table. The sensor message will show the value in column 1 of the row where the key has been found. Please enter a string.</p> <p> Columns and rows start with index 0.</p>
Sensor Message	<p>This setting is only visible if you select Use Data Table Value in Sensor Message above. Define the sensor message. Please enter a string. Use the placeholder {0} at the position where the value will be added.</p> <p>Example: The message is {0}</p>
If Sensor Message Changes	<p>Define what this sensor will do when the sensor value changes. You can choose between:</p> <ul style="list-style-type: none"> ▪ Ignore changes (default): The sensor takes no action on change. ▪ Trigger 'change' notification: The sensor sends an internal message indicating that its value has changed. In combination with a Change Trigger, you can use this mechanism to trigger a notification ³¹⁷⁰ whenever the sensor value changes.
Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none">  For more information on how to find the folder used for storage, see section Data Storage ³⁷³⁴. <p> This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.77 MySQL v2 Sensor

The MySQL v2 sensor monitors a database on a MySQL server and executes a defined query.

It can show the following:

- Execution time of the whole request (including connection buildup, query execution, transaction handling, disconnection)
- Execution time of a given query
- Number of rows that were addressed by the query (including `select` statements if you process data tables)
- It can also process the data table and show defined values in individual channels.

Remarks

- [Requires](#) ^[1268] .NET 4.5 or later on the probe system.
- Define credentials, custom port (if required), and timeout in settings section [Credentials for Database Management Systems](#) ^[413] of the parent device, or in the settings of a group or probe above.
- Your SQL query must be stored in a file on the system of the probe the sensor is created on. If you use it on a remote probe, store the file on the system running the remote probe. In a cluster setup, copy the file to every cluster node.
- PRTG Manual: [Monitoring Databases](#) ^[3534] (includes an [example](#) ^[3535] for channel value selection)

- Knowledge Base: [How to setup the SQL v2 sensors in PRTG? Is there a guide?](#)
 - Knowledge Base: [How can I monitor strings from an SQL database and show a sensor status depending on it?](#)
 - Knowledge Base: [How can I monitor error tables in SQL databases?](#)
 - Knowledge Base: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)
 - Save the SQL script with the query into the `\Custom Sensors\sql\mysql` subfolder of your PRTG installation. See manual section [Data Storage](#)^[373] for more information about how to find this path.
 - This sensor type supports MySQL server version 5.0 or later and might also work with previous versions.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[370]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DATABASE SPECIFIC

Database	<p>Enter the name of the MySQL database to which the sensor connects. For example, such a database's name could be MyDatabase. This is a logical entity on the database server where database objects like tables or stored procedures exist.</p> <p>The database name of a MySQL server also reflects a physical directory structure where your database objects are stored. Enter the appropriate string, which is the same as you would supply when invoking the mysql.exe admin tool (with the command line switch -p) or after the login with mysql.exe with the command use.</p>
----------	---

DATA

SQL Query File

Select an SQL script file that includes a valid SQL statement to execute on the server. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

The script will be executed with every scanning interval. The list contains SQL scripts from the database management system specific `\Custom Sensors\sql` subfolder of your PRTG installation. Store your script there. If used on a remote probe, the file must be stored on the system running the remote probe. If used on a cluster probe, you must store the file on all servers running a cluster node!

 For more information on how to find this path, see section [Data Storage](#). By default, there is the demo script **Demo Serveruptime.sql** available that you can use to monitor the uptime of the target server.

For example, a correct expression in the file could be: **SELECT AVG (UnitPrice) FROM Products**. If you want to use transactions, separate the individual steps with semicolons ";".

 Please be aware that with each request, the full result set will be transferred, so use filters and limits in your query.

 See also this Knowledge Base article: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)

SQL Variables

You can use the following variables in your query file to have them replaced by an input parameter. This is useful if you have various SQL sensors with queries that differ in only one parameter.

- Microsoft SQL, MySQL, PostgreSQL: **@prt g**
- Oracle SQL: **:prt g**
- ADO SQL: **?** (question mark)

@prt g, **:prt g**, and **?** behave like common SQL variables, so consider the general rules for SQL variables. For example, you cannot use a variable for a table in the FROM statement of a query.

Example for variables usage: **SELECT * FROM Table WHERE @prt g**

Use Input Parameter

Define if you want to pass a parameter to your SQL query file. This will replace the variables **@prt g** (Microsoft SQL, MySQL, PostgreSQL), or **:prt g** (Oracle SQL), or **?** (ADO SQL) in the SQL query, considering the general rules for SQL variables. Choose between:

DATA

- **Don't use input parameter (default):** Execute the SQL query file without using variables.
- **Use input parameter:** Execute an SQL query file that contains a variable. Provide the parameter you want to use in the query below.

Input Parameter

This field is only visible if you choose **Use input parameter** above. Enter the parameter you want to pass to the SQL query file. This parameter will replace the variable `@prtg` or `:prtg` or `?` in the SQL query, considering the general rules for SQL variables.

You can also use PRTG placeholders for custom sensors (command line parameters) as input parameter, for example, `%sensorid` or `%deviceid`. For details, see section [Custom Sensors](#).

 Provide strings as they are and do not surround them with quotation marks. PRTG will correctly insert string parameters into the query automatically.

Use Transaction

Define if you want to use transactions and if they will affect the database content. Choose between:

- **Don't use transaction (default):** No transactions will be executed.
- **Use transaction and always rollback:** Choose this option to ensure that no data in the database will be changed by the query. In the SQL query file, separate the single steps of the transaction with semicolons.
- **Use transaction and commit on success:** Choose this option to perform changes on the database with the query. The changes will only apply if all execution steps succeed without any errors. In the SQL query file, separate the single steps of the transaction with semicolons.

Data Processing

Define if you want to process data from the database. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

- **Just execute the query:** If you select this option, the sensor will only show information about the number of affected rows and the execution time of the query. Affected rows are rows that were changed somehow with the query (for example, created, deleted, edited).
- **Count table rows:** Choose this option if you perform a **SELECT** statement and want to monitor how many rows of the data table this statement returns.

DATA

- **Process data table:** Select this option to read and analyze the queried data table. If you select this option, the sensor will count rows with **SELECT** statements as well.

Handle DBNull in Channel Values as

This setting is only visible if you select **Process data table** above. Define the sensor behavior if **DBNull** is returned by the query. Choose between:

- **Error:** The sensor will show a **Down** status if **DBNull** is reported.
- **Number 0:** The sensor will recognize the result **DBNull** as a valid value and interpret it as the number **0**.

Select Channel Value by

This setting is only visible if you select **Process data table** above. Define how the desired cell in the database table will be selected. This is necessary to configure the cells that will be used in the sensor channels. Choose between:

- **Column number:** The channel value will be determined by using the value in row 0 of the column whose number you specify below.
- **Column name:** The channel value will be determined by using the value in row 0 of the column whose name you specify below.
- **Row number:** The channel value will be determined by using the value in column 0 of the row whose number you specify below.
- **Key value pair:** The channel value will be determined by searching in column 0 for the key you specify below and returning the value in column 1 of the same row where the key value was found.

The option you choose here also defines the method to optionally determine a value for the sensor message. For details, see setting **Use Data Table Value in Sensor Message** below.

 See manual section [Monitoring Databases](#)  for an [example](#)  for channel value selection.

Sensor Channel #x

This setting is only visible if you select **Process data table** above. You can define up to 10 different channels for the data processing of this sensor. You have to define at least one data channel if you process the data table, so you will see all available settings for **Channel #1** without enabling it manually. For all other possible channels, choose between:

- **Disable:** This channel will not be added to the sensor.
- **Enable:** This channel will be added to the sensor. Define the settings as described above.

DATA

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Channel #x Name This setting is only visible if you select **Process data table** above. Enter a unique name for the channel. Please enter a string. Channels will be generated dynamically with this name as identifier. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Channel #x Column Number This setting is only visible if you select **Column number** above. Provide the number of the column that will be used to determine the channel value in row 0. Please enter an integer value.

Sensor Channel #x Column Name This setting is only visible if you select **Column number** above. Provide the name of the column that will be used to determine the channel value in row 0. Please enter a string.

Sensor Channel #x Row Number This setting is only visible if you select **Row number** above. Provide the number of the row that will be used to determine the channel value in column 0. Please enter an integer value.

Sensor Channel #x Key This setting is only visible if you select **Key value pair** above. Provide the key to search for in column 0 of the data table. The value in column 1 of the same row where the key value was found will be used to determine the channel value. Please enter a string.

Sensor Channel #x Mode This setting is only visible if you select **Process data table** above. Define how to display the determined value in the channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

- **Absolute (recommended):** Shows the value as the sensor retrieves it from the data table.
- **Difference:** The sensor calculates and shows the difference between the last and the current value returned from the data table. This mode is not compatible with the unit **Value Lookup**.

Sensor Channel #x Unit This setting is only visible if you select **Process data table** above. Define the unit of the channel value. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

- BytesBandwidth

DATA

- BytesMemory
- BytesDisk
- Temperature
- Percent
- TimeResponse
- TimeSeconds
- TimeHours
- Count
- CPU
- BytesFile
- SpeedDisk
- SpeedNet
- Custom
- Value Lookup

 For more information about the available units, see section [Custom Sensors](#).

 To use [lookups](#) with this channel, choose **Value Lookup** and select your lookup file below. Do not use **Custom** for using lookups with this sensor!

 Using the unit **Value Lookup** is not possible when you choose the **Difference** mode. You will not be able to create the sensor in this case.

Sensor Channel #x
Custom Unit

This setting is only visible if you select **Custom** above. Define a unit for the channel value. Please enter a string.

Sensor Channel #x
Value Lookup

This settings is only visible if you select **Value Lookup** above. Select a [lookup](#) file that you want to use with this channel.

Use Data Table Value in
Sensor Message

This setting is only visible if you select **Process data table** above. Define if the sensor message will show a value from the data table. Choose between:

- **Disable**: Do not use a custom sensor message.
- **Enable**: Define a custom sensor message with a defined value of the data table. Define the value selection below.

The method to determine a value for the sensor message is defined in setting **Select Channel Value by** above.

DATA

Sensor Message Column Number	<p>This setting is only visible if you select Column number and Use Data Table Value in Sensor Message above. Enter the number of a column. The sensor message will show the value in row 0 of this column. Please enter an integer value.</p> <p> Columns and rows start with index 0.</p>
Sensor Message Column Name	<p>This setting is only visible if you select Column name and Use Data Table Value in Sensor Message above. Enter the name of a column. The sensor message will show the value in row 0 of this column. Please enter a string.</p> <p> Columns and rows start with index 0.</p>
Sensor Message Row Number	<p>This setting is only visible if you select Row number and Use Data Table Value in Sensor Message above. Enter the number of a row. The sensor message will show value in column 0 of this row. Please enter an integer value.</p> <p> Columns and rows start with index 0.</p>
Sensor Message Key	<p>This setting is only visible if you select Key value pair and Use Data Table Value in Sensor Message above. Enter a key to search for in column 0 of the data table. The sensor message will show the value in column 1 of the row where the key has been found. Please enter a string.</p> <p> Columns and rows start with index 0.</p>
Sensor Message	<p>This setting is only visible if you select Use Data Table Value in Sensor Message above. Define the sensor message. Please enter a string. Use the placeholder {0} at the position where the value will be added.</p> <p>Example: The message is {0}</p>
If Sensor Message Changes	<p>Define what this sensor will do when the sensor value changes. You can choose between:</p> <ul style="list-style-type: none">▪ Ignore changes (default): The sensor takes no action on change.▪ Trigger 'change' notification: The sensor sends an internal message indicating that its value has changed. In combination with a Change Trigger, you can use this mechanism to trigger a notification <small>3170</small> whenever the sensor value changes.
Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p>

DATA

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).
- Stack Unit** This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.78 NetApp Aggregate Sensor

The NetApp Aggregate sensor monitors the status of a NetApp cDOT or ONTAP storage aggregate accessing the Application Programming Interface (API) via Simple Object Access Protocol (SOAP). It can show the following:

- Number of files on the aggregate
- Number of disks on the aggregate
- Status of the aggregate (online, restrict, offline, other error)
- Read and written blocks per second
- User reads and writes per seconds
- Free bytes in total and percent

NetApp Aggregate Sensor

1300

8/14/2018

Sensor in Other Languages

Dutch: **NetApp Aggregate**, French: **Agrégat NetApp**, German: **NetApp Aggregat**, Japanese: **NetApp? ? ?**, Portuguese: **NetApp Aggregate**, Russian: **Статистическое выражение NetApp**, Simplified Chinese: **NetApp? ?**, Spanish: **Agregado de NetApp**

Remarks

- This sensor type supports the NetApp cDOT 8.3 and NetApp ONTAP 9.0 or later.
- The ONTAPI user account that you use with this sensor needs [access](#)¹³⁰² to **ONTAPI (DATA ONTAP API)** so that the sensor can request data from it. The access is enabled by default.
- The NetApp System Health sensor requires **admin** permissions for the ONTAPI user account that you use to access ONTAPI. For other NetApp sensors, read-only user rights are sufficient. Modify or add this user with a suitable role in the console under **Cluster | ClusterX | Configuration | Security | Users**
- As alternative to admin permissions for the NetApp System Health sensor, you can add a specific **Role Attribute** and use read-only rights. For details, see [PRTG Manual: Net App System Health Sensor—Permissions: Alternative to Admin Rights](#)¹³⁸¹
- You can define NetApp API credentials (**User** and **Password**) in the [parent device settings](#)⁴⁰⁷ in section **Credentials for Windows Systems**. This way, you will not have to individually enter credentials for each NetApp sensor that you add to the same device.
- Requires .NET 4.5 on the probe system.
- This sensor type supersedes the deprecated NetApp cDOT Aggregate (SOAP) sensor.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.
- Currently, this sensor type is in beta status. The methods of operating can change at any **BETA** time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: .NET Framework

✘ This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the **local system** (on every node, if on a cluster probe), or on the system running the [remote probe](#)³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

🧠 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Requirement: Enabled ONTAPI Access

NetApp sensors require access to ONTAPI for the utilized user account, which is enabled by default. If access is disabled, use the following command locally on the cluster console to enable ONTAPI access for the user:

```
services web> modify -vserver clusterd -name ontapi -enabled true
```

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page.

Select the aggregates that you want to monitor. PRTG will create one sensor for each aggregate you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

NETAPP SPECIFIC

NetApp Aggregates	Select all aggregates that you want to add a sensor to. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
-------------------	--

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP CONNECTION

NetApp Credentials	<p>Specify which credentials you want to use to connect to the NetApp API. Choose between:</p> <ul style="list-style-type: none"> ▪ Use explicit credentials: Choose this option if you want to use individual NetApp API credentials with this sensor. ▪ Use Windows credentials from parent device: If you choose this option, the sensor will use the credentials (User and Password) that you enter in the parent device settings in section Credentials for Windows Systems. Defining credentials in the parent device is useful if you add several NetApp sensors to this device because you will not have to individually enter credentials for each NetApp sensor.
--------------------	--

NETAPP CONNECTION

Username	This field is only available if you select explicit credentials above. Enter a username for access to the NetApp API. Read-only rights for this ONTAP user account are sufficient. Please enter a string.
Password	This field is only available if you select explicit credentials above. Enter the password of the user that you entered above for access to the NetApp API. Please enter a string.
Port	Enter a port number on which you can access the NetApp API. Please enter an integer value. The default port is 443 .
Transport Type	Define if the connection to the NetApp API is TLS/SSL secured. Choose between: <ul style="list-style-type: none">▪ HTTP: Use an unsecured HTTP connection.▪ HTTPS: Use a TLS/SSL secured connection to the defined port to send the query.
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

NETAPP SPECIFIC

NetApp Aggregates	Shows the aggregate that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
-------------------	---

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: <ul style="list-style-type: none">▪ Discard sensor result: Do not store the sensor result.
---------------	---

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

- <https://kb.paessler.com/en/topic/60543>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

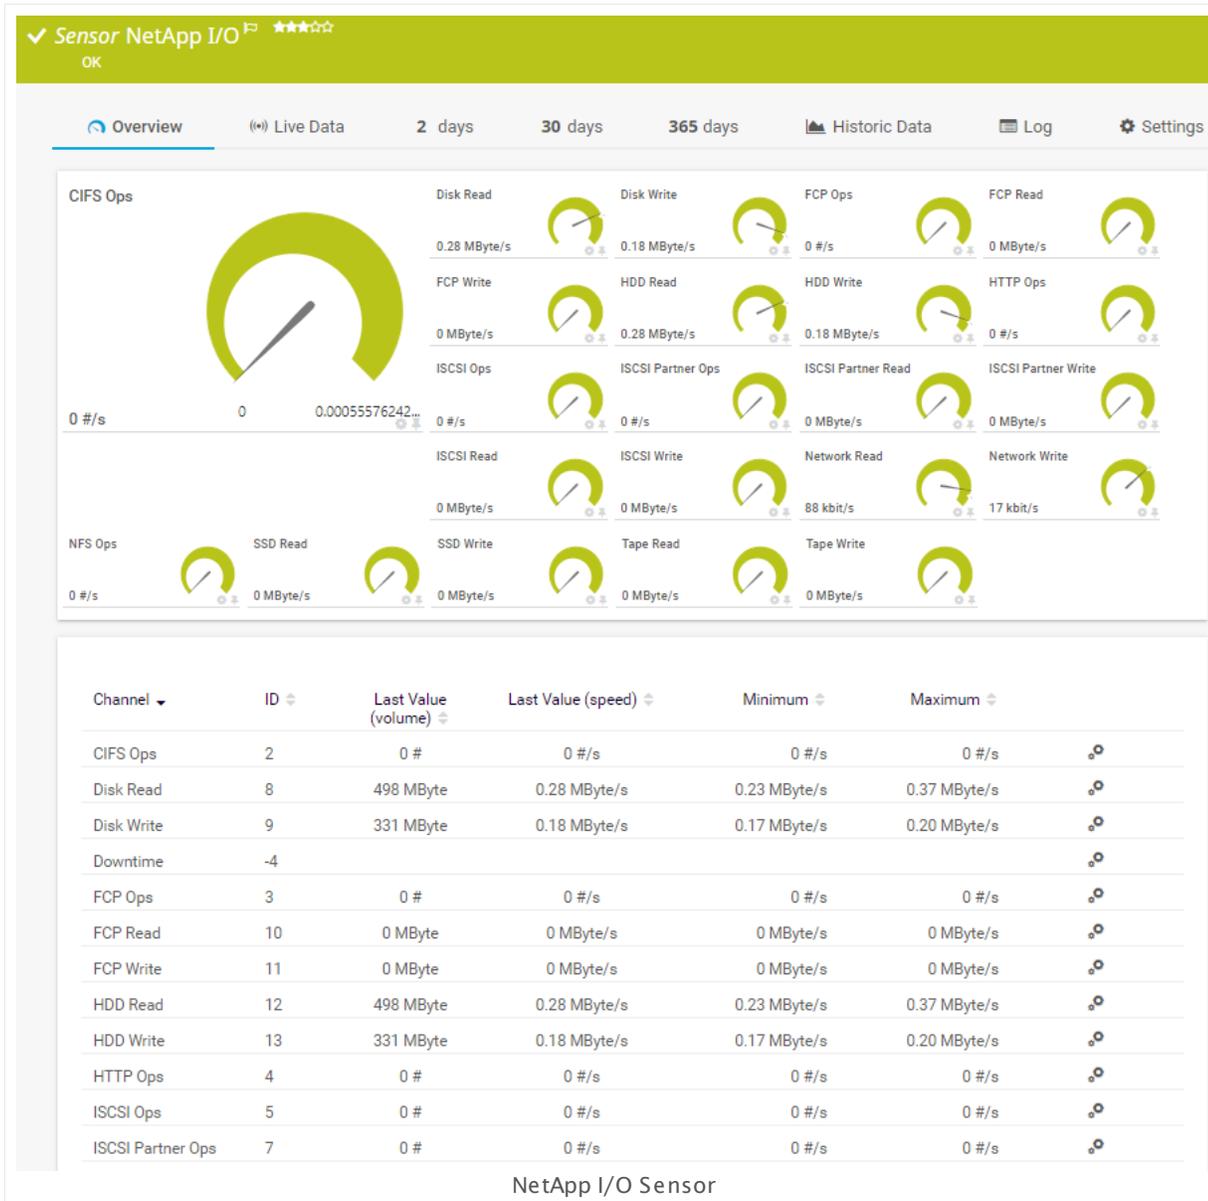

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.79 NetApp I/O Sensor

The NetApp I/O sensor monitors input and output operations of a NetApp cDOT or ONTAP storage system accessing the Application Programming Interface (API) via Simple Object Access Protocol (SOAP). It can show the following:

- Number of Common Internet File System (CIFS) operations per second
- Disk read and write speed
- Number of FCP operations per second
- FCP read and write speed
- HDD read and write speed
- HTTP operations per second
- Number of internet Small Computer System Interface (iSCSI) operations per second
- iSCSI read and write speed
- Number of iSCSI partner operations per second
- iSCSI partner read and write speed
- Network read and write speed
- Number of Network File System (NFS) operations per second
- SSD read and write speed
- Tape read and write speed

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
79 NetApp I/O Sensor

Sensor in Other Languages

Dutch: **NetApp I/O**, French: **E/S NetApp**, German: **Net App I/O**, Japanese: **NetApp I/O**, Portuguese: **NetApp E/S**, Russian: **Ввод-вывод NetApp**, Simplified Chinese: **NetApp I/O**, Spanish: **E/S de NetApp**

Remarks

- This sensor type supports the NetApp cDOT 8.3 and NetApp ONTAP 9.0 or later.
- The ONTAPI user account that you use with this sensor needs [access](#) to ONTAPI (DATA ONTAP API) so that the sensor can request data from it. The access is enabled by default.

- The NetApp System Health sensor requires **admin** permissions for the ONTAPI user account that you use to access ONTAPI. For other NetApp sensors, read-only user rights are sufficient. Modify or add this user with a suitable role in the console under **Cluster | ClusterX | Configuration | Security | Users**
- As alternative to admin permissions for the NetApp System Health sensor, you can add a specific **Role Attribute** and use read-only rights. For details, see [PRTG Manual: Net App System Health Sensor—Permissions: Alternative to Admin Rights](#)¹³⁸¹
- You can define NetApp API credentials (**User** and **Password**) in the [parent device settings](#)⁴⁰⁷ in section **Credentials for Windows Systems**. This way, you will not have to individually enter credentials for each NetApp sensor that you add to the same device.
- Requires .NET 4.5 on the probe system.
- This sensor type supersedes the deprecated NetApp cDOT I/O (SOAP) sensor.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Requirement: Enabled ONTAPI Access

NetApp sensors require access to ONTAPI for the utilized user account, which is enabled by default. If access is disabled, use the following command locally on the cluster console to enable ONTAPI access for the user:

```
services web> modify -vserver clusterd -name ontapi -enabled true
```

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page.

Select the system nodes that you want to monitor. PRTG will create one sensor for each node you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

NETAPP SPECIFIC

NetApp System Nodes Select all nodes that you want to add a sensor to. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP CONNECTION

NetApp Credentials Specify which credentials you want to use to connect to the NetApp API. Choose between:

- **Use explicit credentials:** Choose this option if you want to use individual NetApp API credentials with this sensor.
- **Use Windows credentials from parent device:** If you choose this option, the sensor will use the credentials (**User and Password**) that you enter in the [parent device settings](#)^[407] in section **Credentials for Windows Systems**. Defining credentials in the parent device is useful if you add several NetApp sensors to this device because you will not have to individually enter credentials for each NetApp sensor.

Username This field is only available if you select explicit credentials above. Enter a username for access to the NetApp API. Read-only rights for this ONTAP user account are sufficient. Please enter a string.

Password This field is only available if you select explicit credentials above. Enter the password of the user that you entered above for access to the NetApp API. Please enter a string.

Port Enter a port number on which you can access the NetApp API. Please enter an integer value. The default port is **443**.

Transport Type Define if the connection to the NetApp API is TLS/SSL secured. Choose between:

- **HTTP:** Use an unsecured HTTP connection.
- **HTTPS:** Use a TLS/SSL secured connection to the defined port to send the query.

Timeout (Sec.) Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is **900** seconds (15 minutes).

NETAPP SPECIFIC

NetApp System Nodes Shows the ID of the system node that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 📁 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 - ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#).

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Knowledge Base: Which .NET version does PRTG require?

- <https://kb.paessler.com/en/topic/60543>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

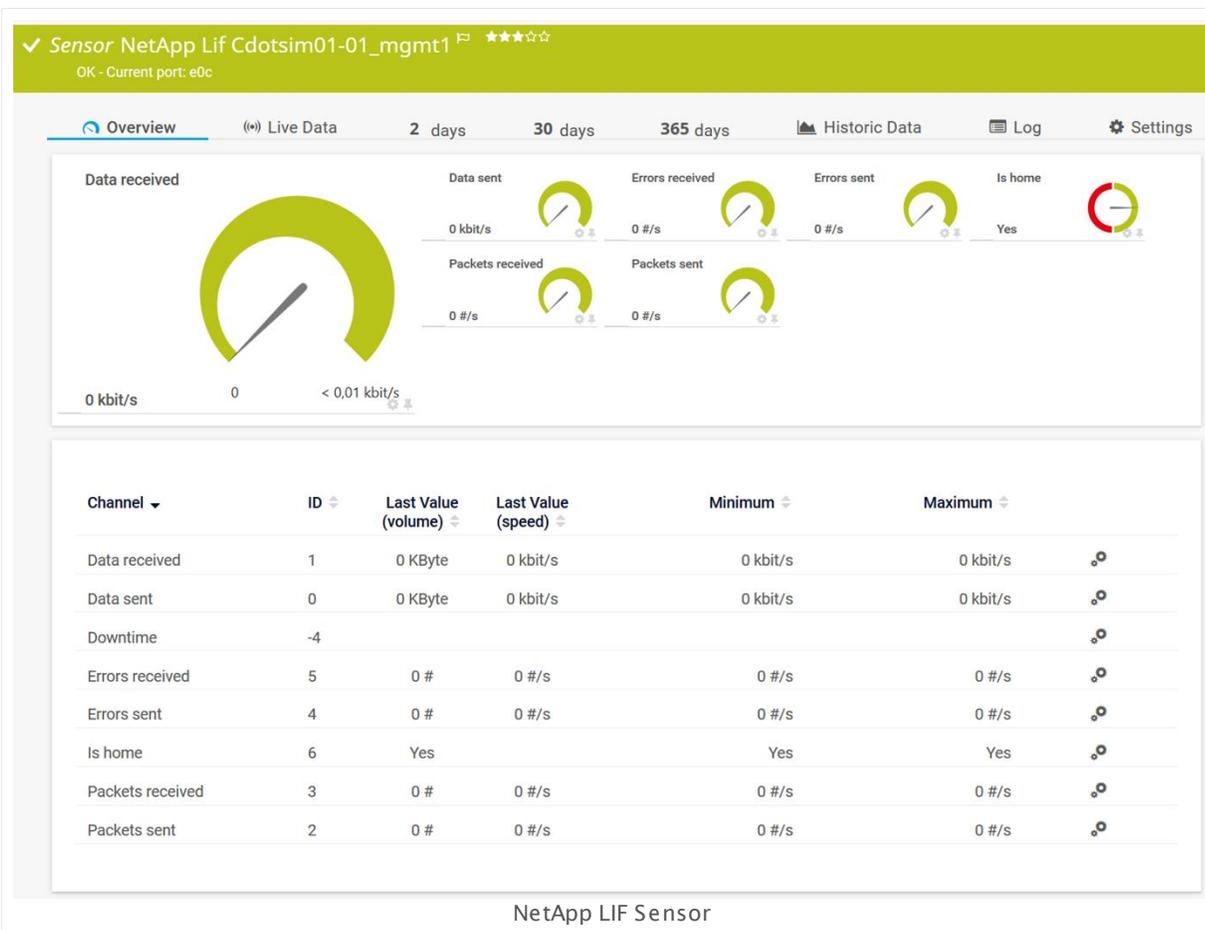

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.80 NetApp LIF Sensor

The NetApp LIF sensor monitors logical interfaces of a NetApp cDOT or ONTAP cluster accessing the Application Programming Interface (API) via Simple Object Access Protocol (SOAP).

It shows the following:

- Number of sent and received packets per second
- Amount of sent and received data per second
- Number of sent and received errors per second
- Is home: **up status** when LIF is on the home port, **down** status when it is not on the home port

Sensor in Other Languages

Dutch: **NetApp LIF**, French: **LIF NetApp**, German: **NetApp LIF**, Japanese: **NetApp LIF**, Portuguese: **NetApp LIF**, Russian: **LIF NetApp**, Simplified Chinese: **NetApp LIF**, Spanish: **LIF de NetApp**

Remarks

- This sensor type supports the NetApp cDOT 8.3 and NetApp ONTAP 9.0 or later.
- The ONTAPI user account that you use with this sensor needs [access](#)¹³⁰² to **ONTAPI** (DATA ONTAP API) so that the sensor can request data from it. The access is enabled by default.
- The NetApp System Health sensor requires **admin** permissions for the ONTAPI user account that you use to access ONTAPI. For other NetApp sensors, read-only user rights are sufficient. Modify or add this user with a suitable role in the console under **Cluster | ClusterX | Configuration | Security | Users**
- As alternative to admin permissions for the NetApp System Health sensor, you can add a specific **Role Attribute** and use read-only rights. For details, see [PRTG Manual: Net App System Health Sensor—Permissions: Alternative to Admin Rights](#)¹³⁸¹
- You can define NetApp API credentials (**User** and **Password**) in the [parent device settings](#)⁴⁰⁷ in section **Credentials for Windows Systems**. This way, you will not have to individually enter credentials for each NetApp sensor that you add to the same device.
- Requires .NET 4.5 on the probe system.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.
- Currently, this sensor type is in beta status. The methods of operating can change at any **BETA** time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Requirement: Enabled ONTAPI Access

NetApp sensors require access to ONTAPI for the utilized user account, which is enabled by default. If access is disabled, use the following command locally on the cluster console to enable ONTAPI access for the user:

```
services web> modify -vserver clusterd -name ontapi -enabled true
```

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page.

Select the logical interfaces that you want to monitor. PRTG will create one sensor for each LIF you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

NETAPP SPECIFIC

NetApp LIFs

Select the logical interfaces you want to add a sensor to. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name

Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)^[181], as well as in [alarms](#)^[219], [logs](#)^[228], [notifications](#)^[3216], [reports](#)^[3252], [maps](#)^[3278], [libraries](#)^[3235], and [tickets](#)^[230].

BASIC SENSOR SETTINGS

Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP CONNECTION

NetApp Credentials	<p>Specify which credentials you want to use to connect to the NetApp API. Choose between:</p> <ul style="list-style-type: none"> ▪ Use explicit credentials: Choose this option if you want to use individual NetApp API credentials with this sensor. ▪ Use Windows credentials from parent device: If you choose this option, the sensor will use the credentials (User and Password) that you enter in the parent device settings in section Credentials for Windows Systems. Defining credentials in the parent device is useful if you add several NetApp sensors to this device because you will not have to individually enter credentials for each NetApp sensor.
Username	This field is only available if you select explicit credentials above. Enter a username for access to the NetApp API. Read-only rights for this ONTAP user account are sufficient. Please enter a string.
Password	This field is only available if you select explicit credentials above. Enter the password of the user that you entered above for access to the NetApp API. Please enter a string.

NETAPP CONNECTION

Port	Enter a port number on which you can access the NetApp API. Please enter an integer value. The default port is 443 .
Transport Type	Define if the connection to the NetApp API is TLS/SSL secured. Choose between: <ul style="list-style-type: none">▪ HTTP: Use an unsecured HTTP connection.▪ HTTPS: Use a TLS/SSL secured connection to the defined port to send the query.
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

NETAPP SPECIFIC

NetApp LIFs	Shows the ID of the logical interface that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
-------------	---

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: <ul style="list-style-type: none">▪ Discard sensor result: Do not store the sensor result.▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.<ul style="list-style-type: none">📖 For more information on how to find the folder used for storage, see section Data Storage ³⁷³⁴. <p>☁ This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>
---------------	--

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵⁵ on PRTG on premises installations.</p>
-------------------	---

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Knowledge Base: Which .NET version does PRTG require?

- <https://kb.paessler.com/en/topic/60543>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

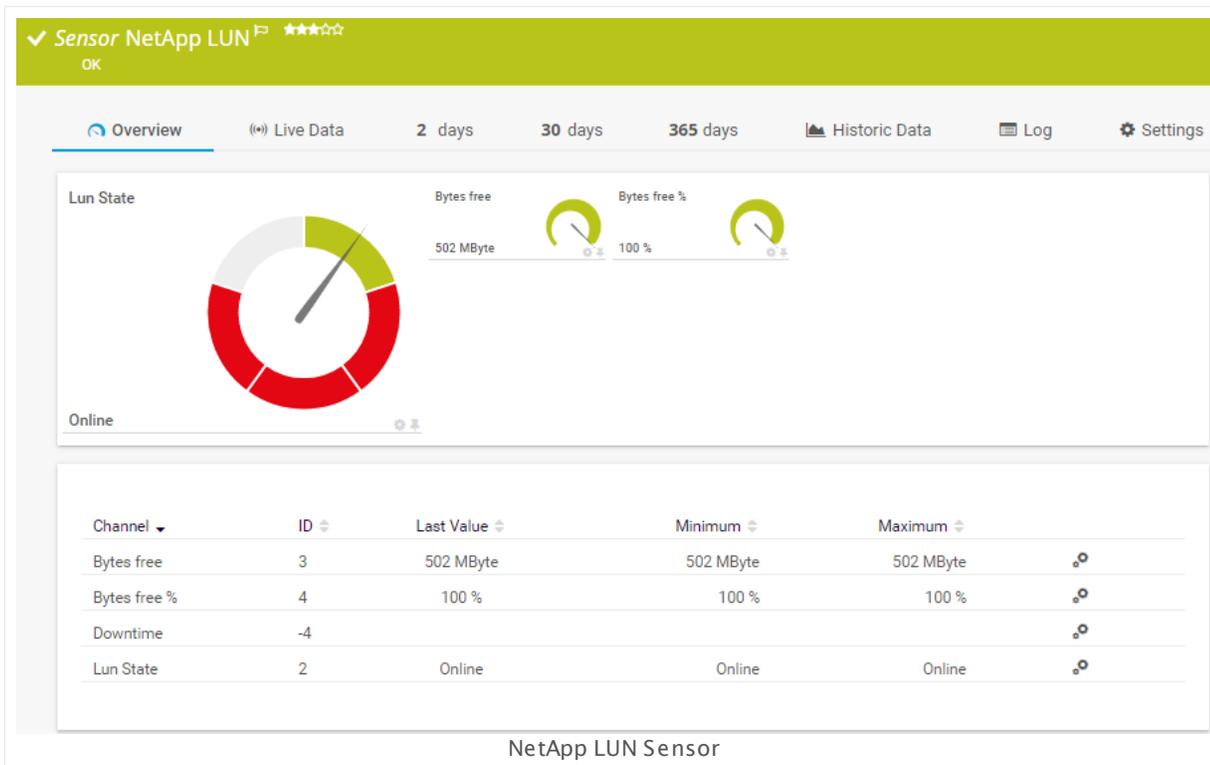

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.81 NetApp LUN Sensor

The NetApp LUN sensor monitors the logical unit number (LUN) of a NetApp cDOT or ONTAP storage system accessing the Application Programming Interface (API) via Simple Object Access Protocol (SOAP). It can show the following:

- Status of the LUN:
 - Online
 - Offline due to a media error on the associated foreign LUN
 - Offline due to an NVRAM failure
 - Offline due to insufficient space
 - Administratively offline or unknown reason
- Free bytes in percent and total
- Read and write operations per second
- Read and write blocks per second
- Other operations per second
- Number of SCSI errors per second
- Mapping status of the LUN (mapped: yes or no)

Sensor in Other Languages

Dutch: **NetApp LUN**, French: **LUN NetApp**, German: **NetApp LUN**, Japanese: **NetApp LUN**, Portuguese: **NetApp LUN**, Russian: **LUN NetApp**, Simplified Chinese: **NetApp LUN**, Spanish: **LUN de NetApp**

Remarks

- This sensor type supports the NetApp cDOT 8.3 and NetApp ONTAP 9.0 or later.
- The ONTAPI user account that you use with this sensor needs [access](#)¹³⁰² to **ONTAPI** (DATA ONTAP API) so that the sensor can request data from it. The access is enabled by default.
- The NetApp System Health sensor requires **admin** permissions for the ONTAPI user account that you use to access ONTAPI. For other NetApp sensors, read-only user rights are sufficient. Modify or add this user with a suitable role in the console under **Cluster** | **ClusterX** | **Configuration** | **Security** | **Users**
- As alternative to admin permissions for the NetApp System Health sensor, you can add a specific **Role Attribute** and use read-only rights. For details, see [PRTG Manual: NetApp System Health Sensor—Permissions: Alternative to Admin Rights](#)¹³⁸¹
- You can define NetApp API credentials (**User** and **Password**) in the [parent device settings](#)⁴⁰⁷ in section **Credentials for Windows Systems**. This way, you will not have to individually enter credentials for each NetApp sensor that you add to the same device.
- Requires .NET 4.5 on the probe system.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.
- **BETA** Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Requirement: Enabled ONTAPI Access

NetApp sensors require access to ONTAPI for the utilized user account, which is enabled by default. If access is disabled, use the following command locally on the cluster console to enable ONTAPI access for the user:

```
services web> modify -vserver clusterd -name ontapi -enabled true
```

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page.

Select the LUNs that you want to monitor. PRTG will create one sensor for each LUN you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

NETAPP SPECIFIC

NetApp LUNs

Select the LUNs you want to add a sensor to. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP CONNECTION

NetApp Credentials	<p>Specify which credentials you want to use to connect to the NetApp API. Choose between:</p> <ul style="list-style-type: none"> ▪ Use explicit credentials: Choose this option if you want to use individual NetApp API credentials with this sensor. ▪ Use Windows credentials from parent device: If you choose this option, the sensor will use the credentials (User and Password) that you enter in the parent device settings^[407] in section Credentials for Windows Systems. Defining credentials in the parent device is useful if you add several NetApp sensors to this device because you will not have to individually enter credentials for each NetApp sensor.
--------------------	--

NETAPP CONNECTION

Username	This field is only available if you select explicit credentials above. Enter a username for access to the NetApp API. Read-only rights for this ONTAP user account are sufficient. Please enter a string.
Password	This field is only available if you select explicit credentials above. Enter the password of the user that you entered above for access to the NetApp API. Please enter a string.
Port	Enter a port number on which you can access the NetApp API. Please enter an integer value. The default port is 443 .
Transport Type	Define if the connection to the NetApp API is TLS/SSL secured. Choose between: <ul style="list-style-type: none">▪ HTTP: Use an unsecured HTTP connection.▪ HTTPS: Use a TLS/SSL secured connection to the defined port to send the query.
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

NETAPP SPECIFIC

NetApp LUNs	Shows the ID of the LUN that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
-------------	---

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: <ul style="list-style-type: none">▪ Discard sensor result: Do not store the sensor result.
---------------	---

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

Knowledge Base: Which .NET version does PRTG require?

- <https://kb.paessler.com/en/topic/60543>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.82 NetApp NIC Sensor

The NetApp NIC sensor monitors the network interface controller (NIC) of a NetApp cDOT or ONTAP cluster accessing the Application Programming Interface (API) via Simple Object Access Protocol (SOAP). It can show the following:

- Sent and received bytes per second
- Number of sent and received errors per second
- Number of up to down links per seconds

Sensor in Other Languages

Dutch: **NetApp NIC**, French: **NIC NetApp**, German: **NetApp NIC**, Japanese: **NetApp NIC**, Portuguese: **NetApp NIC**, Russian: **NIC NetApp**, Simplified Chinese: **NetApp NIC**, Spanish: **NIC de NetApp**

Remarks

- This sensor type supports the NetApp cDOT 8.3 and NetApp ONTAP 9.0 or later.
- The ONTAPI user account that you use with this sensor needs [access](#) ¹³⁰² to ONTAPI (DATA ONTAP API) so that the sensor can request data from it. The access is enabled by default.

- The NetApp System Health sensor requires **admin** permissions for the ONTAPI user account that you use to access ONTAPI. For other NetApp sensors, read-only user rights are sufficient. Modify or add this user with a suitable role in the console under **Cluster | ClusterX | Configuration | Security | Users**
- As alternative to admin permissions for the NetApp System Health sensor, you can add a specific **Role Attribute** and use read-only rights. For details, see [PRTG Manual: Net App System Health Sensor—Permissions: Alternative to Admin Rights](#)¹³⁸¹
- You can define NetApp API credentials (**User** and **Password**) in the [parent device settings](#)⁴⁰⁷ in section **Credentials for Windows Systems**. This way, you will not have to individually enter credentials for each NetApp sensor that you add to the same device.
- Requires .NET 4.5 on the probe system.
- Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

BETA

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Requirement: Enabled ONTAPI Access

NetApp sensors require access to ONTAPI for the utilized user account, which is enabled by default. If access is disabled, use the following command locally on the cluster console to enable ONTAPI access for the user:

```
services web> modify -vserver clusterd -name ontapi -enabled true
```

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page.

Select the network interface controllers that you want to monitor. PRTG will create one sensor for each NIC you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

NETAPP SPECIFIC

NetApp NICs Select the NICs you want to add a sensor to. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) [402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#) [181], as well as in [alarms](#) [219], [logs](#) [228], [notifications](#) [3216], [reports](#) [3252], [maps](#) [3276], [libraries](#) [3235], and [tickets](#) [230].

Parent Tags Shows [Tags](#) [139] that this sensor [inherits](#) [140] from its [parent device, group, and probe](#) [133]. This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#) [139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) [140] from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP CONNECTION

NetApp Credentials	Specify which credentials you want to use to connect to the NetApp API. Choose between: <ul style="list-style-type: none"> ▪ Use explicit credentials: Choose this option if you want to use individual NetApp API credentials with this sensor. ▪ Use Windows credentials from parent device: If you choose this option, the sensor will use the credentials (User and Password) that you enter in the parent device settings^[407] in section Credentials for Windows Systems. Defining credentials in the parent device is useful if you add several NetApp sensors to this device because you will not have to individually enter credentials for each NetApp sensor.
Username	This field is only available if you select explicit credentials above. Enter a username for access to the NetApp API. Read-only rights for this ONTAP user account are sufficient. Please enter a string.
Password	This field is only available if you select explicit credentials above. Enter the password of the user that you entered above for access to the NetApp API. Please enter a string.
Port	Enter a port number on which you can access the NetApp API. Please enter an integer value. The default port is 443 .
Transport Type	Define if the connection to the NetApp API is TLS/SSL secured. Choose between: <ul style="list-style-type: none"> ▪ HTTP: Use an unsecured HTTP connection. ▪ HTTPS: Use a TLS/SSL secured connection to the defined port to send the query.

NETAPP CONNECTION

Timeout (Sec.) Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is **900** seconds (15 minutes).

NETAPP SPECIFIC

NetApp NICs Shows the ID of the NIC that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

SENSOR DISPLAY

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

-  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁶⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

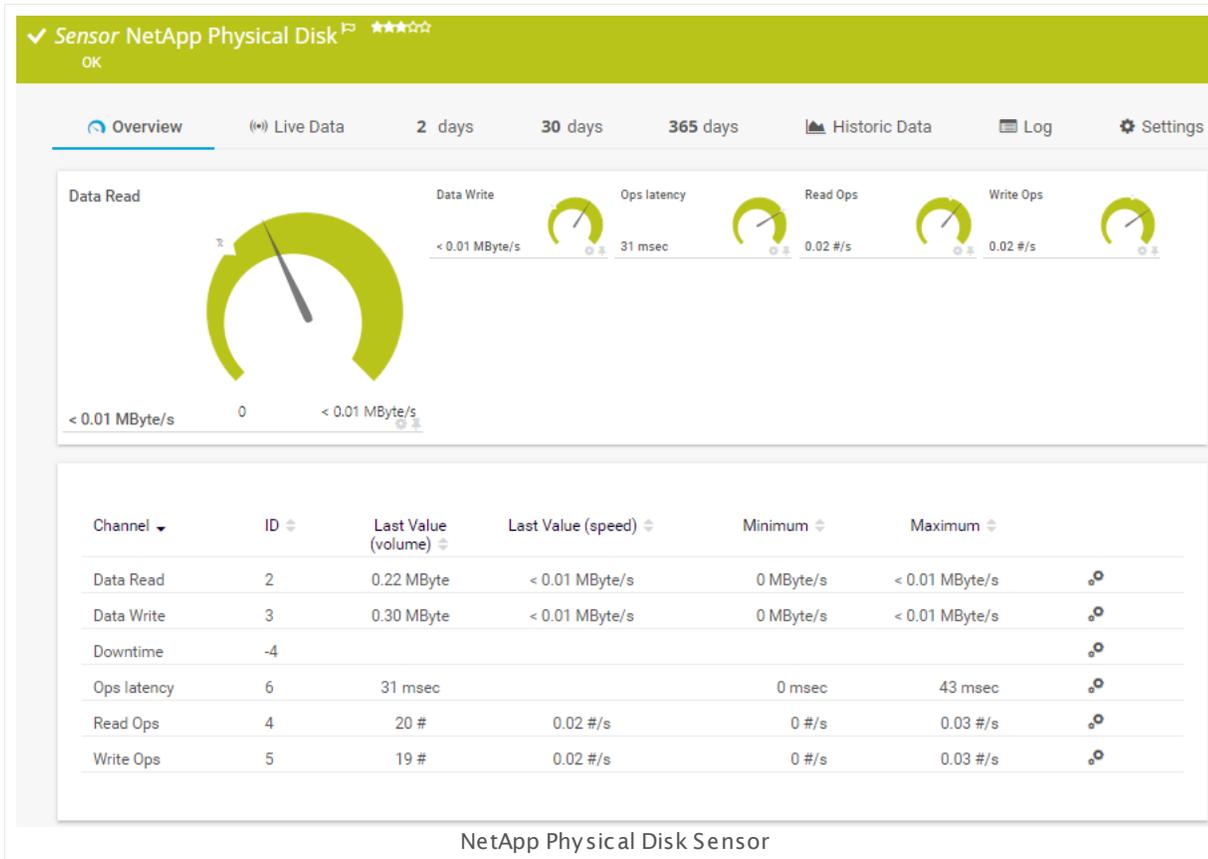

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.83 NetApp Physical Disk Sensor

The NetApp Physical Disk sensor monitors disks of a NetApp cDOT or ONTAP storage system accessing the Application Programming Interface (API) via Simple Object Access Protocol (SOAP). It can show the following:

- Latency of operations
- Read and write speed of operations
- Data read and write speed

Sensor in Other Languages

Dutch: **NetApp cDOT Fysieke Schijf**, French: **Disque physique NetApp**, German: **NetApp Physikal. Laufwerk**, Japanese: **NetApp? ? ? ? ?**, Portuguese: **NetApp Disco físico**, Russian: **Физический диск NetApp**, Simplified Chinese: **NetApp? ? ? ?**, Spanish: **Disco físico de NetApp**

Remarks

- This sensor type supports the NetApp cDOT 8.3 and NetApp ONTAP 9.0 or later.
- The ONTAPI user account that you use with this sensor needs [access](#) to ONTAPI (DATA ONTAP API) so that the sensor can request data from it. The access is enabled by default.

- The NetApp System Health sensor requires **admin** permissions for the ONTAPI user account that you use to access ONTAPI. For other NetApp sensors, read-only user rights are sufficient. Modify or add this user with a suitable role in the console under **Cluster | ClusterX | Configuration | Security | Users**
- As alternative to admin permissions for the NetApp System Health sensor, you can add a specific **Role Attribute** and use read-only rights. For details, see [PRTG Manual: Net App System Health Sensor—Permissions: Alternative to Admin Rights](#)¹³⁸¹
- You can define NetApp API credentials (**User** and **Password**) in the [parent device settings](#)⁴⁰⁷ in section **Credentials for Windows Systems**. This way, you will not have to individually enter credentials for each NetApp sensor that you add to the same device.
- Requires .NET 4.5 on the probe system.
- This sensor type supersedes the deprecated NetApp cDOT Physical Disk (SOAP) sensor.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Requirement: Enabled ONTAPI Access

NetApp sensors require access to ONTAPI for the utilized user account, which is enabled by default. If access is disabled, use the following command locally on the cluster console to enable ONTAPI access for the user:

```
services web> modify -vserver clusterd -name ontapi -enabled true
```

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page.

Select the disks you want to monitor. PRTG will create one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

NETAPP SPECIFIC

NetApp Disk Select all disks that you want to add a sensor to. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP CONNECTION

NetApp Credentials	<p>Specify which credentials you want to use to connect to the NetApp API. Choose between:</p> <ul style="list-style-type: none">▪ Use explicit credentials: Choose this option if you want to use individual NetApp API credentials with this sensor.▪ Use Windows credentials from parent device: If you choose this option, the sensor will use the credentials (User and Password) that you enter in the parent device settings^[407] in section Credentials for Windows Systems. Defining credentials in the parent device is useful if you add several NetApp sensors to this device because you will not have to individually enter credentials for each NetApp sensor.
Username	<p>This field is only available if you select explicit credentials above. Enter a username for access to the NetApp API. Read-only rights for this ONTAP user account are sufficient. Please enter a string.</p>
Password	<p>This field is only available if you select explicit credentials above. Enter the password of the user that you entered above for access to the NetApp API. Please enter a string.</p>
Port	<p>Enter a port number on which you can access the NetApp API. Please enter an integer value. The default port is 443.</p>
Transport Type	<p>Define if the connection to the NetApp API is TLS/SSL secured. Choose between:</p> <ul style="list-style-type: none">▪ HTTP: Use an unsecured HTTP connection.▪ HTTPS: Use a TLS/SSL secured connection to the defined port to send the query.
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).</p>

NETAPP SPECIFIC

NetApp Disk Shows the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 📁 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

- <https://kb.paessler.com/en/topic/60543>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
83 NetApp Physical Disk Sensor

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

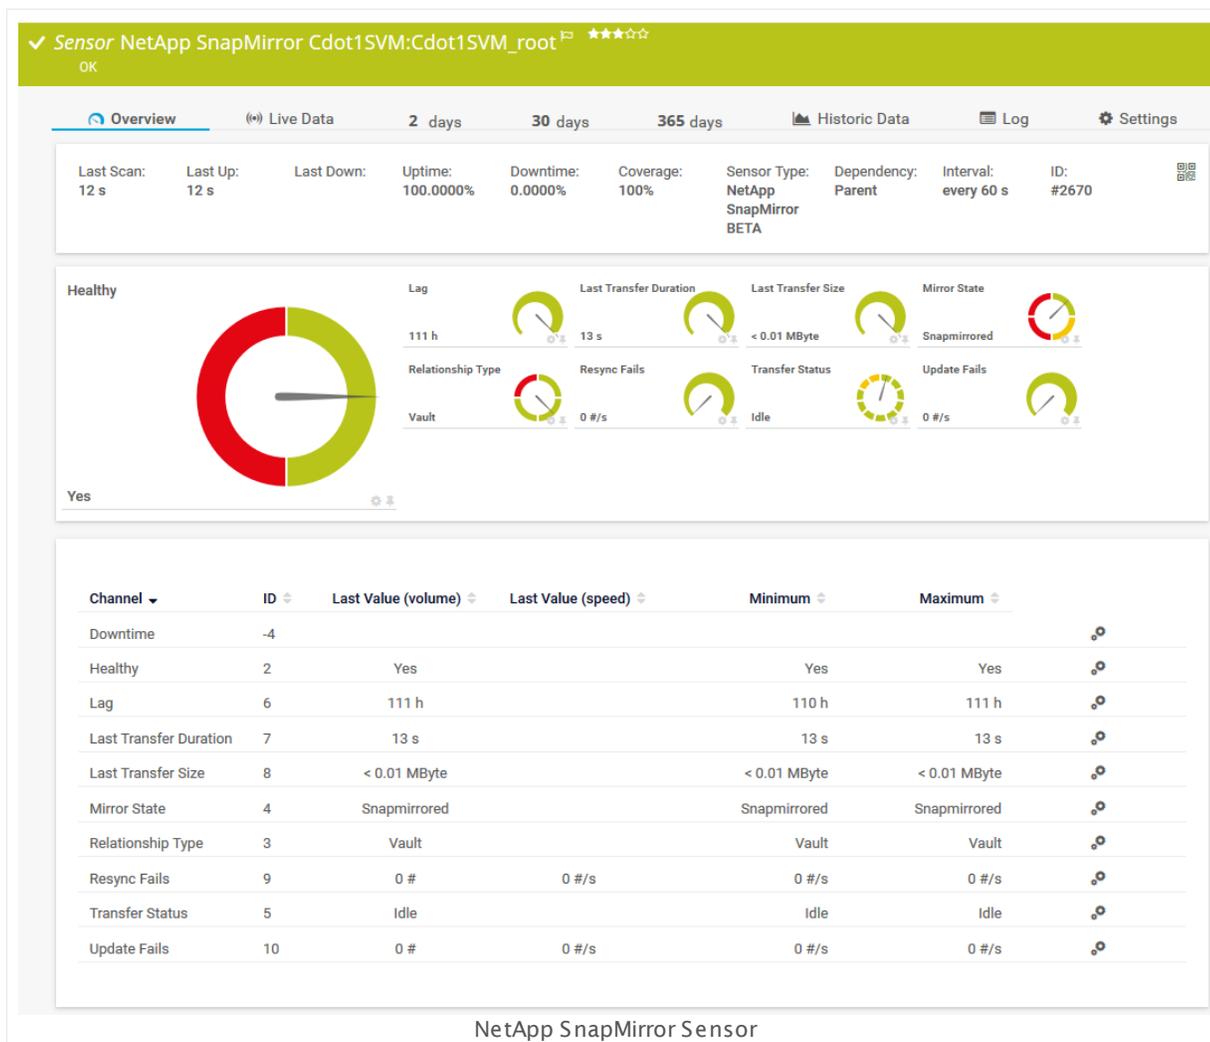

7.8.84 NetApp SnapMirror Sensor

The NetApp SnapMirror sensor monitors SnapMirror relationships of a NetApp cDOT or ONTAP storage system accessing the Application Programming Interface (API) via Simple Object Access Protocol (SOAP). It can show the following:

- Health status (healthy **yes** or **no**)
- Transfer status (relationship status returned from the API)
 - **Ok**: idle, transferring, checking, quiescing, quiesced, queued, preparing, finalizing, aborting
 - **Warning**: unknown, breaking
- Lag transfer duration
- Relationship type
 - **Ok**: mirror, vault, mirror and vault
 - **Error**: unknown
- Size of last transfer
- Duration of last transfer
- Timestamp of last transfer
- Number of resync fails per second
- Number of update fails per second
- Mirror state
 - **Ok**: snapmirrored
 - **Warning**: uninitialized
 - **Error**: broken-off, unknown

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

84 NetApp SnapMirror Sensor

Remarks

- This sensor type supports the NetApp cDOT 8.3 and NetApp ONTAP 9.0 or later.
- The ONTAPI user account that you use with this sensor needs [access](#)^[1302] to ONTAPI (DATA ONTAP API) so that the sensor can request data from it. The access is enabled by default.
- The NetApp System Health sensor requires **admin** permissions for the ONTAPI user account that you use to access ONTAPI. For other NetApp sensors, read-only user rights are sufficient. Modify or add this user with a suitable role in the console under **Cluster | ClusterX | Configuration | Security | Users**
- As alternative to admin permissions for the NetApp System Health sensor, you can add a specific **Role Attribute** and use read-only rights. For details, see [PRTG Manual: NetApp System Health Sensor—Permissions: Alternative to Admin Rights](#)^[1381]
- You can define NetApp API credentials (**User** and **Password**) in the [parent device settings](#)^[407] in section **Credentials for Windows Systems**. This way, you will not have to individually enter credentials for each NetApp sensor that you add to the same device.
- Requires .NET 4.5 on the probe system.

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.
- Currently, this sensor type is in beta status. The methods of operating can change at any **BETA** time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Requirement: Enabled ONTAPI Access

NetApp sensors require access to ONTAPI for the utilized user account, which is enabled by default. If access is disabled, use the following command locally on the cluster console to enable ONTAPI access for the user:

```
services web> modify -vserver clustered -name ontapi -enabled true
```

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page.

Select the SnapMirrors you want to monitor. PRTG will create one sensor for each SnapMirror you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

NETAPP SPECIFIC

NetApp SnapMirrors Select all SnapMirrors that you want to add a sensor to. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP CONNECTION

NetApp Credentials	<p>Specify which credentials you want to use to connect to the NetApp API. Choose between:</p> <ul style="list-style-type: none">▪ Use explicit credentials: Choose this option if you want to use individual NetApp API credentials with this sensor.▪ Use Windows credentials from parent device: If you choose this option, the sensor will use the credentials (User and Password) that you enter in the parent device settings^[407] in section Credentials for Windows Systems. Defining credentials in the parent device is useful if you add several NetApp sensors to this device because you will not have to individually enter credentials for each NetApp sensor.
Username	<p>This field is only available if you select explicit credentials above. Enter a username for access to the NetApp API. Read-only rights for this ONTAP user account are sufficient. Please enter a string.</p>
Password	<p>This field is only available if you select explicit credentials above. Enter the password of the user that you entered above for access to the NetApp API. Please enter a string.</p>
Port	<p>Enter a port number on which you can access the NetApp API. Please enter an integer value. The default port is 443.</p>
Transport Type	<p>Define if the connection to the NetApp API is TLS/SSL secured. Choose between:</p> <ul style="list-style-type: none">▪ HTTP: Use an unsecured HTTP connection.▪ HTTPS: Use a TLS/SSL secured connection to the defined port to send the query.
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).</p>

NETAPP SPECIFIC

NetApp SnapMirrors Shows the SnapMirror that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 📁 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

Knowledge Base: Which .NET version does PRTG require?

- <https://kb.paessler.com/en/topic/60543>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

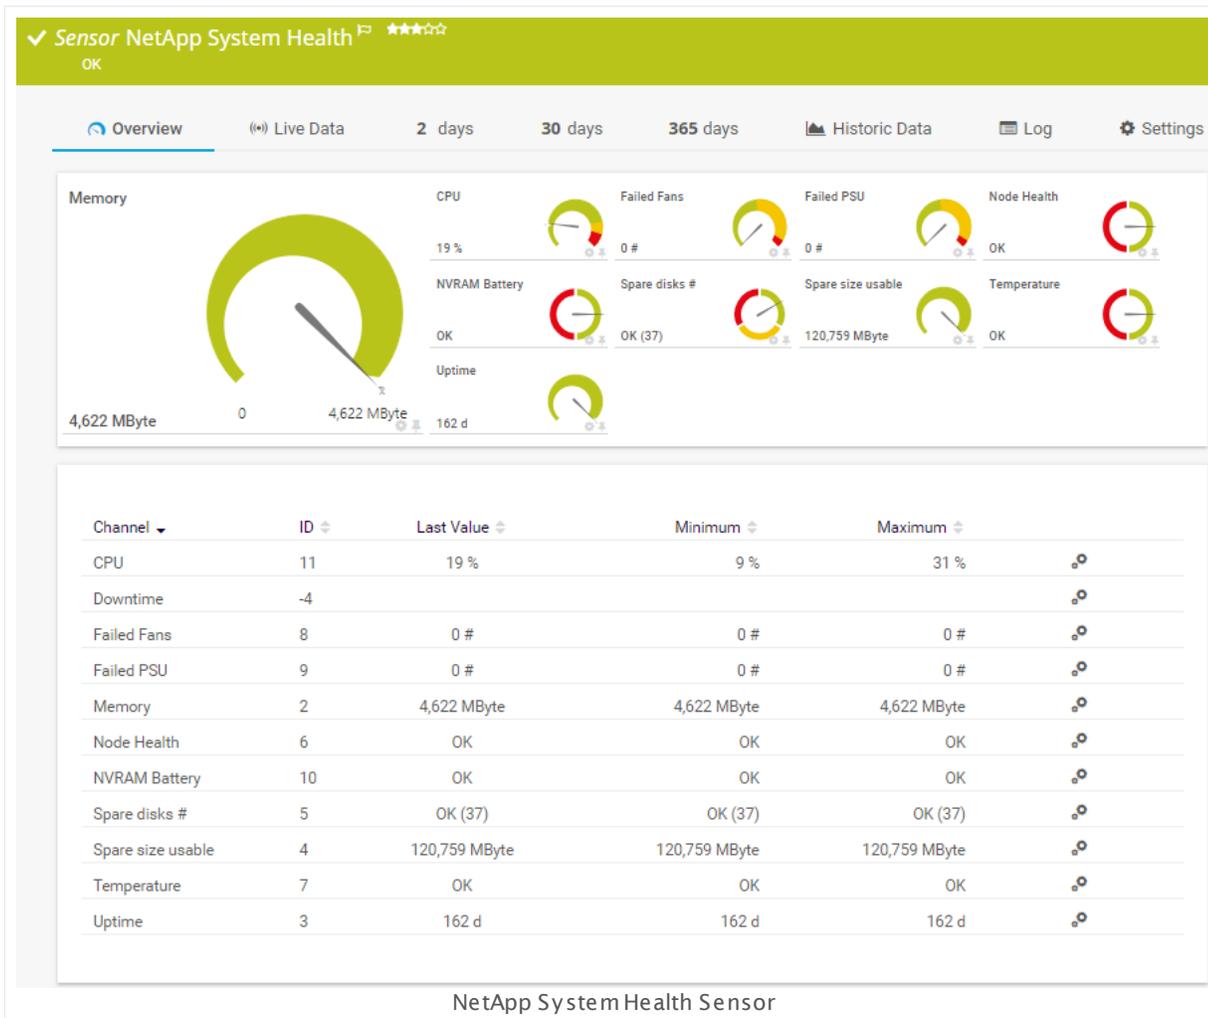

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.85 NetApp System Health Sensor

The NetApp System Health sensor monitors the health of a NetApp cDOT or ONTAP storage system accessing the Application Programming Interface (API) via Simple Object Access Protocol (SOAP). It can show the following:

- Memory usage
 - CPU load
 - Uptime
 - Number of failed fans
 - Number of failed PSU
 - Node health (error or OK)
 - NVRAM battery status (error or OK)
 - Number of spare disks
 - Low spare disks as reported by the NetApp (yes or no)
 - Usable spare size
 - Temperature status (error or OK)
 - Storage configuration path, which describes the connection of a node
 - **Up** [status](#)¹⁹⁵: multi_path, multi_path_ha, N/A
 - **Warning** status: single_path, single_path_ha, mixed_path, mixed_path_ha
 - **Down** status: unknown
- i** If there is no storage configuration path returned, the sensor will show an up status (N/A) because the availability of the configuration path depends on the NetApp version.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
 85 NetApp System Health Sensor

NetApp System Health Sensor

Sensor in Other Languages

Dutch: **NetApp Systeem Gesteldheid**, French: **État du système NetApp**, German: **NetApp Systemzustand**, Japanese: **NetApp ? ? ? ? ? ?** , Portuguese: **NetApp Funcionamento do sistema**, Russian: **Работоспособность системы NetApp**, Simplified Chinese: **NetApp ? ? ? ? ? ?** , Spanish: **Estado del sistema de NetApp**

Remarks

- This sensor type supports the NetApp cDOT 8.3 and NetApp ONTAP 9.0 or later.
- The ONTAPI user account that you use with this sensor needs [access](#) ¹³⁰² to ONTAPI (DATA ONTAP API) so that the sensor can request data from it. The access is enabled by default.
- The NetApp System Health sensor requires **admin** permissions for the ONTAPI user account that you use to access ONTAPI. For other NetApp sensors, read-only user rights are sufficient. Modify or add this user with a suitable role in the console under **Cluster | ClusterX | Configuration | Security | Users**

- As alternative to admin permissions for the NetApp System Health sensor, you can add a specific **Role Attribute** and use read-only rights. For details, see [PRTG Manual: NetApp System Health Sensor—Permissions: Alternative to Admin Rights](#)¹³⁸¹
- You can define NetApp API credentials (**User** and **Password**) in the [parent device settings](#)⁴⁰⁷ in section **Credentials for Windows Systems**. This way, you will not have to individually enter credentials for each NetApp sensor that you add to the same device.
- Requires .NET 4.5 on the probe system.
- This sensor type supersedes the deprecated NetApp cDOT System Health (SOAP) sensor.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the **local** system (on every node, if on a cluster probe), or on the system running the [remote probe](#)³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Requirement: Enabled ONTAPI Access

NetApp sensors require access to ONTAPI for the utilized user account, which is enabled by default. If access is disabled, use the following command locally on the cluster console to enable ONTAPI access for the user:

```
services web> modify -vserver clusterd -name ontapi -enabled true
```

Permissions: Alternative to Admin Rights

If you do not want to provide admin rights for the ONTAPI user account that you use with the NetApp System Health sensor, you can add a new command to the selected role of the user that makes read-only rights sufficient.

- Edit the **Role** of this user in the console under **Cluster | ClusterX | Configuration | Security | Users**.
- **Add** the command **storage aggregate check_spare_low** with ACL **all** to the **Role Attributes**.
- ✓ With this role attribute, read-only rights are sufficient for the NetApp System Health sensor.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) ³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page.

Select the system nodes that you want to monitor. PRTG will create one sensor for each node you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

NETAPP SPECIFIC

NetApp System Nodes Select the nodes you want to add a sensor to. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) ⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#) ¹⁸¹, as well as in [alarms](#) ²¹⁹, [logs](#) ²²⁸, [notifications](#) ³²¹⁶, [reports](#) ³²⁵², [maps](#) ³²⁷⁸, [libraries](#) ³²³⁵, and [tickets](#) ²³⁰.

BASIC SENSOR SETTINGS

Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP CONNECTION

NetApp Credentials	<p>Specify which credentials you want to use to connect to the NetApp API. Choose between:</p> <ul style="list-style-type: none"> ▪ Use explicit credentials: Choose this option if you want to use individual NetApp API credentials with this sensor. ▪ Use Windows credentials from parent device: If you choose this option, the sensor will use the credentials (User and Password) that you enter in the parent device settings in section Credentials for Windows Systems. Defining credentials in the parent device is useful if you add several NetApp sensors to this device because you will not have to individually enter credentials for each NetApp sensor.
Username	This field is only available if you select explicit credentials above. Enter a username for access to the NetApp API. Read-only rights for this ONTAP user account are sufficient. Please enter a string.
Password	This field is only available if you select explicit credentials above. Enter the password of the user that you entered above for access to the NetApp API. Please enter a string.

NETAPP CONNECTION

Port	Enter a port number on which you can access the NetApp API. Please enter an integer value. The default port is 443 .
Transport Type	Define if the connection to the NetApp API is TLS/SSL secured. Choose between: <ul style="list-style-type: none"> ▪ HTTP: Use an unsecured HTTP connection. ▪ HTTPS: Use a TLS/SSL secured connection to the defined port to send the query.
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

NETAPP SPECIFIC

NetApp System Nodes	Shows the ID of the system node that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
---------------------	---

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none"> ▪  For more information on how to find the folder used for storage, see section Data Storage ³⁷³⁴. ▪  This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.
---------------	---

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none">  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵⁵ on PRTG on premises installations.</p>
-------------------	---

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

Knowledge Base: Which .NET version does PRTG require?

- <https://kb.paessler.com/en/topic/60543>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

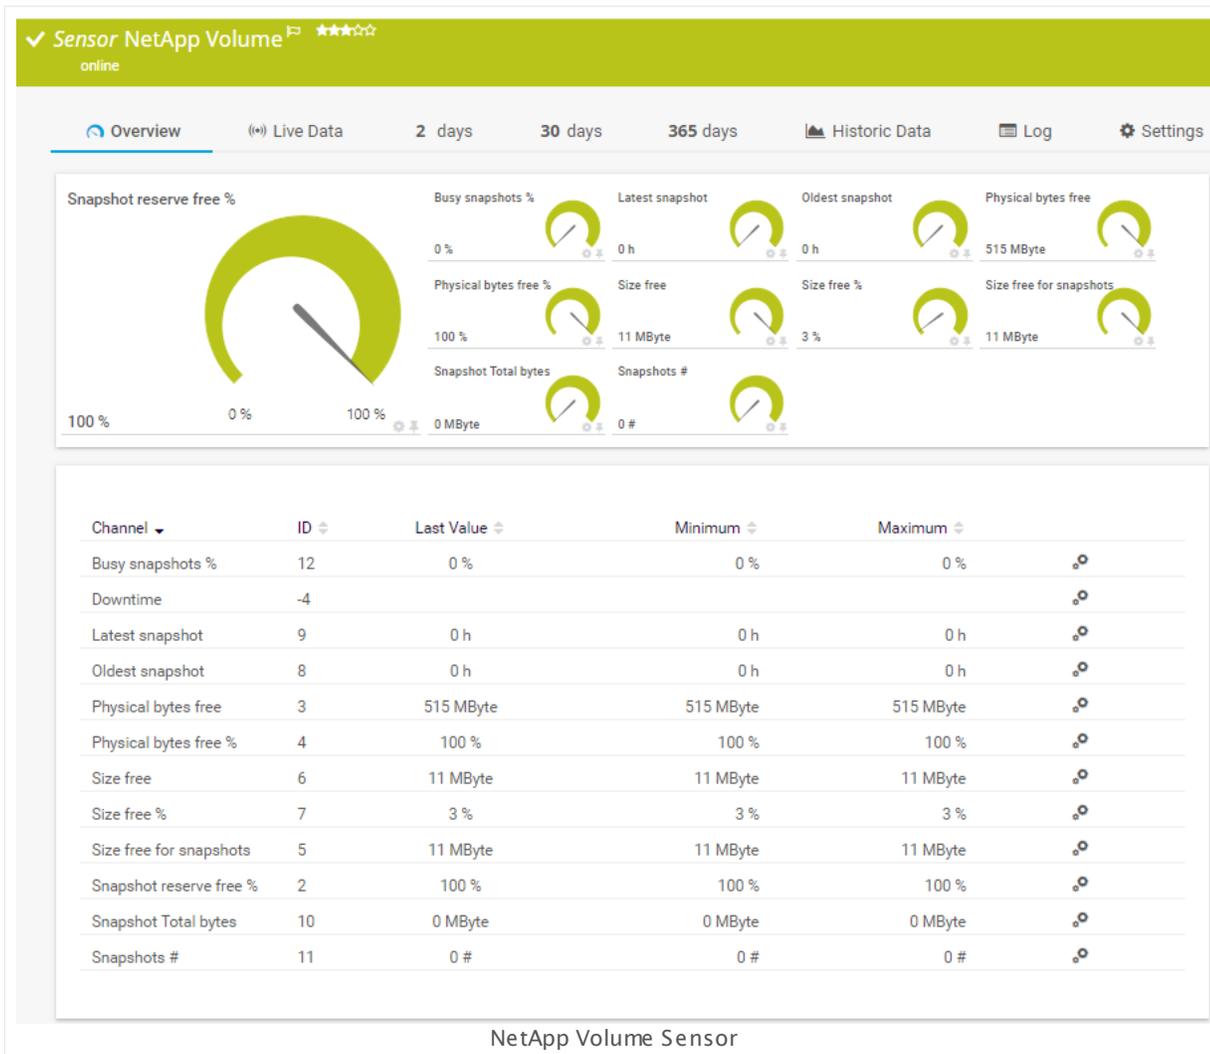

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.86 NetApp Volume Sensor

The NetApp Volume sensor monitors volumes on a NetApp cDOT or ONTAP storage system accessing the Application Programming Interface (API) via Simple Object Access Protocol (SOAP). It can show the following:

- Free space for snapshots in percent and total
- Busy snapshots in percent
- Age of latest snapshot
- Age of oldest snapshot
- Total bytes of snapshots
- Number of snapshots
- Free physical bytes in percent and total
- Free size in percent and total
- Free files in percent and total
- Compression savings in percent and total
- Deduplication savings in percent and total
- Total savings in percent and total

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
86 NetApp Volume Sensor

NetApp Volume Sensor

Sensor in Other Languages

Dutch: **NetApp Volume**, French: **Volume NetApp**, German: **NetApp Volume**, Japanese: **NetApp? ? ? ? ?**, Portuguese: **NetApp Volume**, Russian: **Tom NetApp**, Simplified Chinese: **NetApp ?**, Spanish: **Volumen de NetApp**

Remarks

- This sensor type supports the NetApp cDOT 8.3 and NetApp ONTAP 9.0 or later.
- The ONTAPI user account that you use with this sensor needs [access](#) to ONTAPI (DATA ONTAP API) so that the sensor can request data from it. The access is enabled by default.
- The NetApp System Health sensor requires **admin** permissions for the ONTAPI user account that you use to access ONTAPI. For other NetApp sensors, read-only user rights are sufficient. Modify or add this user with a suitable role in the console under **Cluster | ClusterX | Configuration | Security | Users**

- As alternative to admin permissions for the NetApp System Health sensor, you can add a specific **Role Attribute** and use read-only rights. For details, see [PRTG Manual: NetApp System Health Sensor—Permissions: Alternative to Admin Rights](#)^[1381]
- You can define NetApp API credentials (**User** and **Password**) in the [parent device settings](#)^[407] in section **Credentials for Windows Systems**. This way, you will not have to individually enter credentials for each NetApp sensor that you add to the same device.
- Requires .NET 4.5 on the probe system.
- Currently, this sensor type is in beta status. The methods of operating can change at any **BETA** time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: .NET Framework

✘ This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

💡 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Requirement: Enabled ONTAPI Access

NetApp sensors require access to ONTAPI for the utilized user account, which is enabled by default. If access is disabled, use the following command locally on the cluster console to enable ONTAPI access for the user:

```
services web> modify -vserver clusterd -name ontapi -enabled true
```

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page.

Select the volumes that you want to monitor. PRTG will create one sensor for each volume you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

NETAPP SPECIFIC

NetApp Volumes Select the volumes you want to add a sensor to. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

 Volumes that are offline will not appear in this list.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. These are visible above as **Parent Tags**.

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP CONNECTION

NetApp Credentials Specify which credentials you want to use to connect to the NetApp API. Choose between:

- **Use explicit credentials:** Choose this option if you want to use individual NetApp API credentials with this sensor.
- **Use Windows credentials from parent device:** If you choose this option, the sensor will use the credentials (**User and Password**) that you enter in the [parent device settings](#)^[407] in section **Credentials for Windows Systems**. Defining credentials in the parent device is useful if you add several NetApp sensors to this device because you will not have to individually enter credentials for each NetApp sensor.

Username This field is only available if you select explicit credentials above. Enter a username for access to the NetApp API. Read-only rights for this ONTAP user account are sufficient. Please enter a string.

Password This field is only available if you select explicit credentials above. Enter the password of the user that you entered above for access to the NetApp API. Please enter a string.

Port Enter a port number on which you can access the NetApp API. Please enter an integer value. The default port is **443**.

Transport Type Define if the connection to the NetApp API is TLS/SSL secured. Choose between:

- **HTTP:** Use an unsecured HTTP connection.
- **HTTPS:** Use a TLS/SSL secured connection to the defined port to send the query.

Timeout (Sec.) Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is **900** seconds (15 minutes).

NETAPP SPECIFIC

NetApp Volumes Shows the volume that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 📁 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 - ☁️ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

- <https://kb.paessler.com/en/topic/60543>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
86 NetApp Volume Sensor

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.87 NetFlow V5 Sensor

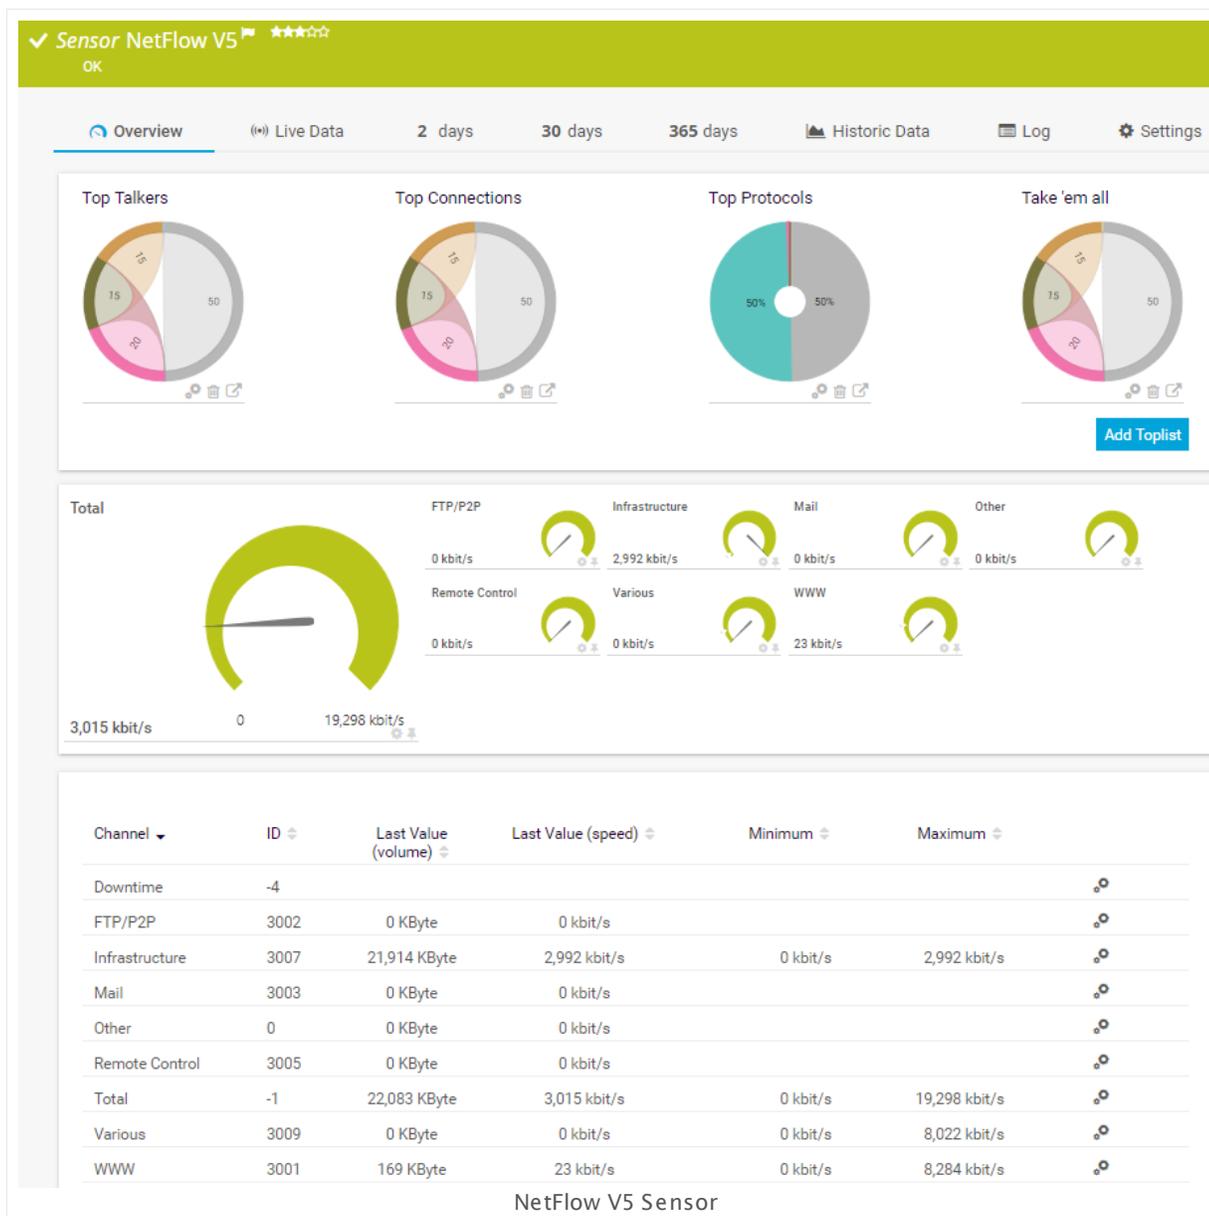

The NetFlow V5 sensor receives traffic data from a NetFlow V5 compatible device and shows the traffic by type. Ensure the sensor matches the NetFlow version your device is exporting! There are several filter options available to divide traffic into different channels.

This sensor can show the following traffic types in kbit per second:

- Chat (IRC, AIM)
- Citrix
- FTP/P2P (file transfer)
- Infrastructure (network services: DHCP, DNS, Ident, ICMP, SNMP)
- Mail (mail traffic: IMAP, POP3, SMTP)
- NetBIOS
- Remote control (RDP, SSH, Telnet, VNC)
- WWW (web traffic: HTTP, HTTPS)
- Total traffic
- Other protocols (other UDP and TCP traffic)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
87 NetFlow V5 Sensor

Remarks

- You must enable NetFlow export of the respective version on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
- This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
- Knowledge Base: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)
- Knowledge Base: [What is the Active Flow Timeout in Flow sensors?](#)

- For a general introduction to the technology behind flow monitoring, please see manual section [Monitoring Bandwidth via Flows](#).

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. These are visible above as **Parent Tags**.

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETFLOW SPECIFIC SETTINGS

Receive NetFlow Packets on UDP Port Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the NetFlow export options of your hardware router device. Please enter an integer value.

 When configuring export, make sure you select the appropriate NetFlow version for this sensor.

Sender IP Enter the IP address of the sending device you want to receive the NetFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.

Receive NetFlow Packets on IP Select the IP address(es) on which PRTG listens to NetFlow packets. The list of IP addresses you see here is specific to your setup. To select an IP address, add a check mark in front of the respective line. You can also select and deselect all items by using the check box in the table head. The IP address selected here must match the one you have configured in the NetFlow export options of your hardware router device.

 When configuring export, make sure you select the appropriate NetFlow version for this sensor.

Active Flow Timeout (Minutes) Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data was received during this time, the sensor switches to an **Unknown status**¹⁹⁵. Please enter an integer value.

We recommend that you set the timeout one minute longer than the respective timeout configured in your hardware router device. The maximum timeout is 60 minutes.

 If you set this value too low, flow information might be lost!

 For more details, see this Knowledge Base article: [What is the Active Flow Timeout in Flow sensors?](#)

NETFLOW SPECIFIC SETTINGS

 If the target device sends incorrect time information that results in wrong monitoring data, please try to use **0** as active flow timeout. This will ignore the start and stop information of a flow as provided by the device and account all data to the current point in time. It might result in spikes but all data will be captured.

Sampling Mode

Define if you want to use the sampling mode. This setting must match the setting in the flow exporter. Choose between:

- **Off:** The standard flow will be used.
- **On:** Switch into sampling mode and specify the sampling rate below.

Sampling Rate

This field is only visible when sampling mode is **On** above. Enter a number that matches the sampling rate in your exporter device. If the number is different, monitoring results will be incorrect. Please enter an integer value.

Log Stream Data to Disk (for Debugging)

Define if you want the probe to write a logfile of the stream and packet data to the data folder (see [Data Storage](#)³⁷³⁴). Choose between:

- **None (recommended):** Do not write additional logfiles. Recommended for normal use cases.
- **Only for the 'Other' channel:** Only write logfiles of data that is not filtered otherwise and therefore accounted to the default **Other** channel.
- **All stream data:** Write logfiles for all data received.

 Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

CHANNEL CONFIGURATION

Channel Selection

Define the categories the sensor accounts the traffic to. There are different groups of traffic available. Choose between:

- **Web:** Internet web traffic.
- **File Transfer:** Traffic caused by FTP.
- **Mail:** Internet mail traffic.
- **Chat:** Traffic caused by chat and instant messaging.

CHANNEL CONFIGURATION

- **Remote Control:** Traffic caused by remote control applications, such as RDP, SSH, Telnet, and VNC.
- **Infrastructure:** Traffic caused by network services, such as DHCP, DNS, Ident, ICMP, and SNMP.
- **NetBIOS:** Traffic caused by NetBIOS communication.
- **Citrix:** Traffic caused by Citrix applications.
- **Other Protocols:** Traffic caused by various other protocols via UDP and TCP.

For each traffic group, you can select how many channels will be used for each group, that is, how detailed the sensor divides the traffic. For each group, choose between:

- **No (X icon):** Do not account traffic of this group in its own channel. All traffic of this group is accounted to the default channel named **Other**.
- **Yes (check mark icon):** Count all traffic of this group and summarize it into one channel.
- **Detail (magnifier icon):** Count all traffic of this group and further divide it into different channels. The traffic appears in several channels as shown in the **Content** column.
 - ⚠ Extensive use of this option can cause load problems on your probe system. We recommend setting specific, well-chosen filters for the data you really want to analyze.

💡 You can change the default configuration for groups and channels. For details, see this Knowledge Base article: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)

FILTERING

Include Filter Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax.

🔍 For detailed information, see section [Filter Rules](#)¹⁴¹⁴ below.

Exclude Filter First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax.

🔍 For detailed information, see section [Filter Rules](#)¹⁴¹⁴ below.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
-  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#) settings).
- Stack Unit** This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

PRIMARY TOPLIST

- Primary Toplist** Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:
- **Top Talkers**
 - **Top Connections**
 - **Top Protocols**
 - **[Any custom toplists you have added]**

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail.

 For more information, see section [Toplists](#)³¹⁸⁶.

Filter Rules

The following filter rules apply to all xFlow, IPFIX, and Packet Sniffer sensors.

FIELD	POSSIBLE FILTER VALUES
IP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
Port	Any number
SourceIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
SourcePort	Any number
DestinationIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
DestinationPort	Any number

FIELD	POSSIBLE FILTER VALUES
Protocol	TCP, UDP, ICMP, OSPFIGP, any number
TOS	Type Of Service: any number
DSCP	Differentiated Services Code Point: any number

The following filter rules apply to NetFlow V5 sensors only.

FIELD	POSSIBLE FILTER VALUES
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see Valid Data Formats)
SourceASI	Any number
DestinationASI	Any number

7.8.88 NetFlow V5 (Custom) Sensor

The NetFlow V5 (Custom) sensor receives traffic data from a NetFlow V5 compatible device and shows the traffic by type. Please make sure the sensor matches the NetFlow version your device is exporting! In this custom sensor, you can define your own channel definitions to divide traffic into different channels.

- This sensor can show traffic by type individually according to your needs.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

NetFlow V5 Sensor

Sensor in Other Languages

Dutch: **NetFlow V5 (Klant specifiek)**, French: **NetFlow V5 (personnalisé)**, German: **NetFlow V5 (Benutzerdef.)**, Japanese: **NetFlow V5 (? ? ? ?)**, Portuguese: **NetFlow V5 (customizado)**, Russian: **NetFlow V5 (настраиваемый)**, Simplified Chinese: **NetFlow V5 (? ? ?)**, Spanish: **NetFlow V5 (Personalizado)**

Remarks

- You must enable NetFlow export of the respective version on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
 - This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
 - Knowledge Base: [What is the Active Flow Timeout in Flow sensors?](#)
 - This sensor [does not support more than 50 channels](#)¹⁴¹⁸ officially.
 - For a general introduction to the technology behind flow monitoring, please see manual section [Monitoring Bandwidth via Flows](#)³⁵¹⁴.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Limited to 50 Sensor Channels

 PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETFLOW SPECIFIC SETTINGS

Receive NetFlow Packets on UDP Port	<p>Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the NetFlow export options of your hardware router device. Please enter an integer value.</p> <p>i When configuring export, make sure you select the appropriate NetFlow version for this sensor.</p>
Sender IP	Enter the IP address of the sending device you want to receive the NetFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.

NETFLOW SPECIFIC SETTINGS

Receive NetFlow Packets on IP

Select the IP address(es) on which PRTG listens to NetFlow packets. The list of IP addresses you see here is specific to your setup. To select an IP address, add a check mark in front of the respective line. You can also select and deselect all items by using the check box in the table head. The IP address you select here must match the one you have configured in the NetFlow export options of your hardware router device.

 When configuring export, please make sure you select the appropriate NetFlow version for this sensor.

Active Flow Timeout (Minutes)

Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data was received during this time, the sensor switches to an **Unknown status**^[195]. Please enter an integer value.

We recommend that you set the timeout one minute longer than the respective timeout configured in your hardware router device. The maximum timeout is 60 minutes.

 If you set this value too low, flow information might be lost!

 For more details, see this Knowledge Base article: [What is the Active Flow Timeout in Flow sensors?](#)

 If the target device sends incorrect time information that results in wrong monitoring data, please try to use **0** as active flow timeout. This will ignore the start and stop information of a flow as provided by the device and account all data to the current point in time. It might result in spikes but all data will be captured.

Sampling Mode

Define if you want to use the sampling mode. This setting must match the setting in the flow exporter. Choose between:

- **Off:** The standard flow will be used.
- **On:** Switch into sampling mode and specify the sampling rate below.

Sampling Rate

This field is only visible when sampling mode is **On** above. Enter a number that matches the sampling rate in your device that exports the flows. If the number is different, monitoring results will be incorrect. Please enter an integer value.

Channel Definition

Enter a channel definition to divide the traffic into different channels. Write each definition in one line. All traffic for which no channel is defined will be accounted to the default channel named **Other**.

NETFLOW SPECIFIC SETTINGS

 For detailed information, see section [Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors](#)³⁶⁹⁰.

 Extensive use of many filters can cause load problems on your probe system. We recommend defining specific, well-chosen filters for the data you really want to analyze.

Log Stream Data to Disk (for Debugging)

Define if you want the probe to write a logfile of the stream and packet data to the data folder (see [Data Storage](#)³⁷³⁴). Choose between:

- **None (recommended):** Do not write additional logfiles. Recommended for normal use cases.
- **Only for the 'Other' channel:** Only write logfiles of data that is not filtered otherwise and therefore accounted to the default **Other** channel.
- **All stream data:** Write logfiles for all data received.

 Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

FILTERING

Include Filter

Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax.

 For detailed information, see section [Filter Rules](#)¹⁴²⁷ below.

Exclude Filter

First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax.

 For detailed information, see section [Filter Rules](#)¹⁴²⁷ below.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none">▪ Show channels independently (default): Show an own graph for each channel.▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

PRIMARY TOPLIST

Primary Toplist	<p>Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:</p> <ul style="list-style-type: none">▪ Top Talkers▪ Top Connections▪ Top Protocols▪ [Any custom toplists you have added]
-----------------	--

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail.

 For more information, see section [Toplists](#)³¹⁸⁶.

Filter Rules

The following filter rules apply to all xFlow, IPFIX, and Packet Sniffer sensors.

FIELD	POSSIBLE FILTER VALUES
IP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
Port	Any number
SourceIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
SourcePort	Any number
DestinationIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
DestinationPort	Any number

FIELD	POSSIBLE FILTER VALUES
Protocol	TCP, UDP, ICMP, OSPFIGP, any number
TOS	Type Of Service: any number
DSCP	Differentiated Services Code Point: any number

The following filter rules apply to NetFlow V5 sensors only.

FIELD	POSSIBLE FILTER VALUES
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see Valid Data Formats)
SourceASI	Any number
DestinationASI	Any number

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.89 NetFlow V9 Sensor

The NetFlow V9 sensor receives traffic data from a NetFlow V9 compatible device and shows the traffic by type. Please make sure the sensor matches the NetFlow version your device is exporting! There are several filter options available to divide traffic into different channels.

This sensor can show the following traffic types in kbit per second:

- Chat (IRC, AIM)
- Citrix
- FTP/P2P (file transfer)
- Infrastructure (network services: DHCP, DNS, Ident, ICMP, SNMP)
- Mail (mail traffic: IMAP, POP3, SMTP)
- NetBIOS
- Remote control (RDP, SSH, Telnet, VNC)
- WWW (web traffic: HTTP, HTTPS)
- Total traffic
- Other protocols (other UDP and TCP traffic)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Remarks

- You must enable NetFlow export of the respective version on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
- This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
- Knowledge Base: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)
- Knowledge Base: [What is the Active Flow Timeout in Flow sensors?](#)
- For a general introduction to the technology behind flow monitoring, please see manual section [Monitoring Bandwidth via Flows](#) [3514].

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETFLOW SPECIFIC SETTINGS

Receive NetFlow Packets on UDP Port

Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the NetFlow export options of your hardware router device. Please enter an integer value.

 When configuring export, make sure you select the appropriate NetFlow version for this sensor.

Sender IP

Enter the IP address of the sending device you want to receive the NetFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.

Receive NetFlow Packets on IP

Select the IP address(es) on which PRTG listens to NetFlow packets. The list of IP addresses you see here is specific to your setup. To select an IP address, add a check mark in front of the respective line. You can also select and deselect all items by using the check box in the table head. The IP address selected here must match the one you have configured in the NetFlow export options of your hardware router device.

 When configuring export, make sure you select the appropriate NetFlow version for this sensor.

Active Flow Timeout (Minutes)

Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data was received during this time, the sensor switches to an **Unknown status**¹⁹⁵. Please enter an integer value.

We recommend that you set the timeout one minute longer than the respective timeout configured in your hardware router device. The maximum timeout is 60 minutes.

 If you set this value too low, flow information might be lost!

 For more details, see this Knowledge Base article: [What is the Active Flow Timeout in Flow sensors?](#)

 If the target device sends incorrect time information that results in wrong monitoring data, please try to use 0 as active flow timeout. This will ignore the start and stop information of a flow as provided by the device and account all data to the current point in time. It might result in spikes but all data will be captured.

Sampling Mode

Define if you want to use the sampling mode. This setting must match the setting in the flow exporter. Choose between:

NETFLOW SPECIFIC SETTINGS

- **Off:** The standard flow will be used.
- **On:** Switch into sampling mode and specify the sampling rate below.

Sampling Rate

This field is only visible when sampling mode is **On** above. Enter a number that matches the sampling rate in your exporter device. If the number is different, monitoring results will be incorrect. Please enter an integer value.

Log Stream Data to Disk (for Debugging)

Define if you want the probe to write a logfile of the stream and packet data to the data folder (see [Data Storage](#)³⁷³⁴). Choose between:

- **None (recommended):** Do not write additional logfiles. Recommended for normal use cases.
- **Only for the 'Other' channel:** Only write logfiles of data that is not filtered otherwise and therefore accounted to the default **Other** channel.
- **All stream data:** Write logfiles for all data received.

 Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

CHANNEL CONFIGURATION

Channel Selection

Define the categories the sensor accounts the traffic to. There are different groups of traffic available. Choose between:

- **Web:** Internet web traffic.
- **File Transfer:** Traffic caused by FTP.
- **Mail:** Internet mail traffic.
- **Chat:** Traffic caused by chat and instant messaging.
- **Remote Control:** Traffic caused by remote control applications, such as RDP, SSH, Telnet, and VNC.
- **Infrastructure:** Traffic caused by network services, such as DHCP, DNS, Ident, ICMP, and SNMP.
- **NetBIOS:** Traffic caused by NetBIOS communication.
- **Citrix:** Traffic caused by Citrix applications.

CHANNEL CONFIGURATION

- **Other Protocols:** Traffic caused by various other protocols via UDP and TCP.

For each traffic group, you can select how many channels will be used for each group, that is, how detailed the sensor divides the traffic. For each group, choose between:

- **No (X icon):** Do not account traffic of this group in its own channel. All traffic of this group is accounted to the default channel named **Other**.
- **Yes (check mark icon):** Count all traffic of this group and summarize it into one channel.
- **Detail (magnifier icon):** Count all traffic of this group and further divide it into different channels. The traffic appears in several channels as shown in the **Content** column.
 - ⚠ Extensive use of this option can cause load problems on your probe system. We recommend setting specific, well-chosen filters for the data you really want to analyze.

 You can change the default configuration for groups and channels. For details, see this Knowledge Base article: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)

FILTERING

Include Filter

Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax.

 For detailed information, see section [Filter Rules](#)¹⁴⁴¹ below.

Exclude Filter

First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax.

 For detailed information, see section [Filter Rules](#)¹⁴⁴¹ below.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none">▪ Show channels independently (default): Show an own graph for each channel.▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

PRIMARY TOPLIST

Primary Toplist	<p>Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:</p> <ul style="list-style-type: none">▪ Top Talkers▪ Top Connections▪ Top Protocols▪ [Any custom toplists you have added]
-----------------	--

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)  for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail.

 For more information, see section [Toplists](#) .

Filter Rules

The following filter rules apply to all xFlow, IPFIX, and Packet Sniffer sensors.

FIELD	POSSIBLE FILTER VALUES
IP	IP address or DNS name (see Valid Data Formats )
Port	Any number
SourceIP	IP address or DNS name (see Valid Data Formats )
SourcePort	Any number
DestinationIP	IP address or DNS name (see Valid Data Formats )
DestinationPort	Any number

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
89 NetFlow V9 Sensor

FIELD	POSSIBLE FILTER VALUES
Protocol	TCP, UDP, ICMP, OSPFIGP, any number
TOS	Type Of Service: any number
DSCP	Differentiated Services Code Point: any number

The following filter rules apply to NetFlow V9 sensors only.

FIELD	POSSIBLE FILTER VALUES
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see Valid Data Formats)
SourceASI	Any number
DestinationASI	Any number
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address
Mask	Mask values represent subnet masks in with a single number (number of contiguous bits).
DestinationMask	Mask values represent subnet masks in with a single number (number of contiguous bits).

FIELD	POSSIBLE FILTER VALUES
NextHop	IP address or DNS name (see Valid Data Formats ³⁶⁸⁸)
VLAN	VLAN values represent a VLAN identifier (any number)
SourceVLAN	VLAN values represent a VLAN identifier (any number)
DestinationVLAN	VLAN values represent a VLAN identifier (any number)

7.8.90 NetFlow V9 (Custom) Sensor

The NetFlow V9 (Custom) sensor receives traffic data from a NetFlow V9 compatible device and shows the traffic by type. Please make sure the sensor matches the NetFlow version your device is exporting! In this custom sensor, you can define your own channel definitions to divide traffic into different channels.

- This sensor can show traffic by type individually according to your needs.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Channel	ID	Last Value (volume)	Last Value (speed)	Minimum	Maximum
Downtime	-4				
FTP/P2P	3002	0 KByte	0 kbit/s		
HTTP	1001	0 KByte	0 kbit/s		
Infrastructure	3007	0 KByte	0 kbit/s		
Mail	3003	0 KByte	0 kbit/s		
Other	0	0 KByte	0 kbit/s		

Sensor in Other Languages

Dutch: **NetFlow V9 (custom)**, French: **Net Flow V9 (personnalisé)**, German: **Net Flow V9 (Benutzerdef.)**, Japanese: **NetFlow V9 (? ? ? ?)**, Portuguese: **NetFlow V9 (customizado)**, Russian: **NetFlow V9 (настраиваемый)**, Simplified Chinese: **NetFlow V9 (? ? ?)**,

Spanish: **NetFlow V9 (Personalizado)**

Remarks

- You must enable NetFlow export of the respective version on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
 - This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
 - Knowledge Base: [What is the Active Flow Timeout in Flow sensors?](#)
 - This sensor [does not support more than 50 channels](#)¹⁴⁴⁵ officially.
 - For a general introduction to the technology behind flow monitoring, please see manual section [Monitoring Bandwidth via Flows](#)³⁵¹⁴.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Limited to 50 Sensor Channels

 PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETFLOW SPECIFIC SETTINGS

Receive NetFlow Packets on UDP Port	<p>Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the NetFlow export options of your hardware router device. Please enter an integer value.</p> <p>i When configuring export, make sure you select the appropriate NetFlow version for this sensor.</p>
Sender IP	Enter the IP address of the sending device you want to receive the NetFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.

NETFLOW SPECIFIC SETTINGS

Receive NetFlow Packets on IP

Select the IP address(es) on which PRTG listens to NetFlow packets. The list of IP addresses you see here is specific to your setup. To select an IP address, add a check mark in front of the respective line. You can also select and deselect all items by using the check box in the table head. The IP address you select here must match the one you have configured in the NetFlow export options of your hardware router device.

 When configuring export, please make sure you select the appropriate NetFlow version for this sensor.

Active Flow Timeout (Minutes)

Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data was received during this time, the sensor switches to an **Unknown status**^[195]. Please enter an integer value.

We recommend that you set the timeout one minute longer than the respective timeout configured in your hardware router device. The maximum timeout is 60 minutes.

 If you set this value too low, flow information might be lost!

 For more details, see this Knowledge Base article: [What is the Active Flow Timeout in Flow sensors?](#)

 If the target device sends incorrect time information that results in wrong monitoring data, please try to use **0** as active flow timeout. This will ignore the start and stop information of a flow as provided by the device and account all data to the current point in time. It might result in spikes but all data will be captured.

Sampling Mode

Define if you want to use the sampling mode. This setting must match the setting in the flow exporter. Choose between:

- **Off:** The standard flow will be used.
- **On:** Switch into sampling mode and specify the sampling rate below.

Sampling Rate

This field is only visible when sampling mode is **On** above. Enter a number that matches the sampling rate in your device that exports the flows. If the number is different, monitoring results will be incorrect. Please enter an integer value.

Channel Definition

Enter a channel definition to divide the traffic into different channels. Write each definition in one line. All traffic for which no channel is defined will be accounted to the default channel named **Other**.

NETFLOW SPECIFIC SETTINGS

 For detailed information, see section [Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors](#)³⁶⁹⁰.

 Extensive use of many filters can cause load problems on your probe system. We recommend defining specific, well-chosen filters for the data you really want to analyze.

Log Stream Data to Disk (for Debugging)

Define if you want the probe to write a logfile of the stream and packet data to the data folder (see [Data Storage](#)³⁷³⁴). Choose between:

- **None (recommended):** Do not write additional logfiles. Recommended for normal use cases.
- **Only for the 'Other' channel:** Only write logfiles of data that is not filtered otherwise and therefore accounted to the default **Other** channel.
- **All stream data:** Write logfiles for all data received.

 Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

FILTERING

Include Filter

Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax.

 For detailed information, see section [Filter Rules](#)¹⁴⁵⁴ below.

Exclude Filter

First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax.

 For detailed information, see section [Filter Rules](#)¹⁴⁵⁴ below.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none">▪ Show channels independently (default): Show an own graph for each channel.▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

PRIMARY TOPLIST

Primary Toplist	<p>Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:</p> <ul style="list-style-type: none">▪ Top Talkers▪ Top Connections▪ Top Protocols▪ [Any custom toplists you have added]
-----------------	--

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings.</p> <ul style="list-style-type: none"> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> <p>▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.</p> <p>▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.</p> <ul style="list-style-type: none"> <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail.

 For more information, see section [Toplists](#)³¹⁸⁶.

Filter Rules

The following filter rules apply to all xFlow, IPFIX, and Packet Sniffer sensors.

FIELD	POSSIBLE FILTER VALUES
IP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
Port	Any number
SourceIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
SourcePort	Any number
DestinationIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
DestinationPort	Any number

FIELD	POSSIBLE FILTER VALUES
Protocol	TCP, UDP, ICMP, OSPFIGP, any number
TOS	Type Of Service: any number
DSCP	Differentiated Services Code Point: any number

The following filter rules apply to NetFlow V9 sensors only.

FIELD	POSSIBLE FILTER VALUES
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see Valid Data Formats)
SourceASI	Any number
DestinationASI	Any number
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address
Mask	Mask values represent subnet masks in with a single number (number of contiguous bits).
DestinationMask	Mask values represent subnet masks in with a single number (number of contiguous bits).

FIELD	POSSIBLE FILTER VALUES
NextHop	IP address or DNS name (see Valid Data Formats ³⁶⁸⁸)
VLAN	VLAN values represent a VLAN identifier (any number)
SourceVLAN	VLAN values represent a VLAN identifier (any number)
DestinationVLAN	VLAN values represent a VLAN identifier (any number)

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.91 Oracle SQL v2 Sensor

The Oracle SQL v2 sensor monitors a database on an Oracle server and executes a defined query.

It can show the following:

- Execution time of the whole request (including connection buildup, query execution, transaction handling, disconnection)
- Execution time of a given query
- Number of rows that were addressed by the query (including **select** statements if you process data tables)
- It can also process the data table and show defined values in individual channels.

Remarks

- [Requires](#) .NET 4.5 or later on the probe system.
- Define credentials, custom port (if required), and timeout in settings section [Credentials for Database Management Systems](#) of the parent device, or in the settings of a group or probe above.
- Your SQL query must be stored in a file on the system of the probe the sensor is created on. If you use it on a remote probe, store the file on the system running the remote probe. In a cluster setup, copy the file to every cluster node.

- PRTG Manual: [Monitoring Databases](#)^[3534] (includes an [example](#)^[3535] for channel value selection)
 - Knowledge Base: [How to setup the SQL v2 sensors in PRTG? Is there a guide?](#)
 - Knowledge Base: [How can I monitor strings from an SQL database and show a sensor status depending on it?](#)
 - Knowledge Base: [How can I monitor error tables in SQL databases?](#)
 - Knowledge Base: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)
 - Save the SQL script with the query into the `\Custom Sensors\sql\oracle` subfolder of your PRTG installation. See manual section [Data Storage](#)^[3731] for more information about how to find this path.
 - This sensor type supports Oracle database servers version 10.2 or higher
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DATABASE SPECIFIC

Identifier	<p>Enter the Oracle System ID (SID) or the SERVICE_NAME of the database the sensor will connect to. Specify below which type of identifier you use. By default, the sensor uses the SID as connection string.</p> <p>The identifier is defined in the CONNECT_DATA part of the TNSNames.ora file on the Oracle instance. For example, a system ID can look like this: orcl</p>
Identification Method	<p>Define which type of identifier you use to connect to the database. This type depends on the configuration of your Oracle server. Choose between:</p> <ul style="list-style-type: none"> ▪ Use SID as identifier (default): Connect to the database instance using a system ID as connection string. Enter the SID above.

DATABASE SPECIFIC

- **Use SERVICE_NAME as identifier:** Connect to the database instance using a SERVICE_NAME as connection string. Enter the SERVICE_NAME above.

DATA

SQL Query File

Select an SQL script file that includes a valid SQL statement to execute on the server. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

The script will be executed with every scanning interval. The list contains SQL scripts from the database management system specific `\Custom Sensors\sql` subfolder of your PRTG installation. Store your script there. If used on a remote probe, the file must be stored on the system running the remote probe. If used on a cluster probe, you must store the file on all servers running a cluster node!

 For more information on how to find this path, see section [Data Storage](#). By default, there is the demo script **Demo Serveruptime.sql** available that you can use to monitor the uptime of the target server.

For example, a correct expression in the file could be: **SELECT AVG (UnitPrice) FROM Products**. If you want to use transactions, separate the individual steps with semicolons ";".

 Please be aware that with each request, the full result set will be transferred, so use filters and limits in your query.

 See also this Knowledge Base article: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)

SQL Variables

You can use the following variables in your query file to have them replaced by an input parameter. This is useful if you have various SQL sensors with queries that differ in only one parameter.

- Microsoft SQL, MySQL, PostgreSQL: **@prt g**
- Oracle SQL: **:prt g**
- ADO SQL: **?** (question mark)

DATA

@prtg, **:prtg**, and **?** behave like common SQL variables, so consider the general rules for SQL variables. For example, you cannot use a variable for a table in the FROM statement of a query.

Example for variables usage: **SELECT * FROM Table WHERE @prtg**

Use Input Parameter

Define if you want to pass a parameter to your SQL query file. This will replace the variables **@prtg** (Microsoft SQL, MySQL, PostgreSQL), or **:prtg** (Oracle SQL), or **?** (ADO SQL) in the SQL query, considering the general rules for SQL variables. Choose between:

- **Don't use input parameter (default):** Execute the SQL query file without using variables.
- **Use input parameter:** Execute an SQL query file that contains a variable. Provide the parameter you want to use in the query below.

Input Parameter

This field is only visible if you choose **Use input parameter** above. Enter the parameter you want to pass to the SQL query file. This parameter will replace the variable **@prtg** or **:prtg** or **?** in the SQL query, considering the general rules for SQL variables.

You can also use PRTG placeholders for custom sensors (command line parameters) as input parameter, for example, **%sensorid** or **%deviceid**. For details, see section [Custom Sensors](#)³⁶⁵⁴.

 Provide strings as they are and do not surround them with quotation marks. PRTG will correctly insert string parameters into the query automatically.

Use Transaction

Define if you want to use transactions and if they will affect the database content. Choose between:

- **Don't use transaction (default):** No transactions will be executed.
- **Use transaction and always rollback:** Choose this option to ensure that no data in the database will be changed by the query. In the SQL query file, separate the single steps of the transaction with semicolons.
- **Use transaction and commit on success:** Choose this option to perform changes on the database with the query. The changes will only apply if all execution steps succeed without any errors. In the SQL query file, separate the single steps of the transaction with semicolons.

Data Processing

Define if you want to process data from the database. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

DATA

- **Just execute the query:** If you select this option, the sensor will only show information about the number of affected rows and the execution time of the query. Affected rows are rows that were changed somehow with the query (for example, created, deleted, edited).
- **Count table rows:** Choose this option if you perform a **SELECT** statement and want to monitor how many rows of the data table this statement returns.
- **Process data table:** Select this option to read and analyze the queried data table. If you select this option, the sensor will count rows with **SELECT** statements as well.

Handle DBNull in Channel Values as

This setting is only visible if you select **Process data table** above. Define the sensor behavior if **DBNull** is returned by the query. Choose between:

- **Error:** The sensor will show a **Down** status if **DBNull** is reported.
- **Number 0:** The sensor will recognize the result **DBNull** as a valid value and interpret it as the number **0**.

Select Channel Value by

This setting is only visible if you select **Process data table** above. Define how the desired cell in the database table will be selected. This is necessary to configure the cells that will be used in the sensor channels. Choose between:

- **Column number:** The channel value will be determined by using the value in row 0 of the column whose number you specify below.
- **Column name:** The channel value will be determined by using the value in row 0 of the column whose name you specify below.
- **Row number:** The channel value will be determined by using the value in column 0 of the row whose number you specify below.
- **Key value pair:** The channel value will be determined by searching in column 0 for the key you specify below and returning the value in column 1 of the same row where the key value was found.

The option you choose here also defines the method to optionally determine a value for the sensor message. For details, see setting **Use Data Table Value in Sensor Message** below.

 See manual section [Monitoring Databases](#) ³⁵³⁴ for an [example](#) ³⁵³⁵ for channel value selection.

DATA

Sensor Channel #x This setting is only visible if you select **Process data table** above. You can define up to 10 different channels for the data processing of this sensor. You have to define at least one data channel if you process the data table, so you will see all available settings for **Channel #1** without enabling it manually. For all other possible channels, choose between:

- **Disable:** This channel will not be added to the sensor.
- **Enable:** This channel will be added to the sensor. Define the settings as described above.

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Channel #x Name This setting is only visible if you select **Process data table** above. Enter a unique name for the channel. Please enter a string. Channels will be generated dynamically with this name as identifier. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Channel #x Column Number This setting is only visible if you select **Column number** above. Provide the number of the column that will be used to determine the channel value in row 0. Please enter an integer value.

Sensor Channel #x Column Name This setting is only visible if you select **Column number** above. Provide the name of the column that will be used to determine the channel value in row 0. Please enter a string.

Sensor Channel #x Row Number This setting is only visible if you select **Row number** above. Provide the number of the row that will be used to determine the channel value in column 0. Please enter an integer value.

Sensor Channel #x Key This setting is only visible if you select **Key value pair** above. Provide the key to search for in column 0 of the data table. The value in column 1 of the same row where the key value was found will be used to determine the channel value. Please enter a string.

Sensor Channel #x Mode This setting is only visible if you select **Process data table** above. Define how to display the determined value in the channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

- **Absolute (recommended):** Shows the value as the sensor retrieves it from the data table.

DATA

- **Difference:** The sensor calculates and shows the difference between the last and the current value returned from the data table. This mode is not compatible with the unit **Value Lookup**.

Sensor Channel #x
Unit

This setting is only visible if you select **Process data table** above. Define the unit of the channel value. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

- BytesBandwidth
- BytesMemory
- BytesDisk
- Temperature
- Percent
- TimeResponse
- TimeSeconds
- TimeHours
- Count
- CPU
- BytesFile
- SpeedDisk
- SpeedNet
- Custom
- Value Lookup

 For more information about the available units, see section [Custom Sensors](#).

 To use [lookups](#) with this channel, choose **Value Lookup** and select your lookup file below. Do not use **Custom** for using lookups with this sensor!

 Using the unit **Value Lookup** is not possible when you choose the **Difference** mode. You will not be able to create the sensor in this case.

Sensor Channel #x
Custom Unit

This setting is only visible if you select **Custom** above. Define a unit for the channel value. Please enter a string.

DATA

Sensor Channel #x Value Lookup	This settings is only visible if you select Value Lookup above. Select a lookup <small>3693</small> file that you want to use with this channel.
Use Data Table Value in Sensor Message	<p>This setting is only visible if you select Process data table above. Define if the sensor message will show a value from the data table. Choose between:</p> <ul style="list-style-type: none"> ▪ Disable: Do not use a custom sensor message. ▪ Enable: Define a custom sensor message with a defined value of the data table. Define the value selection below. <p>The method to determine a value for the sensor message is defined in setting Select Channel Value by above.</p>
Sensor Message Column Number	<p>This setting is only visible if you select Column number and Use Data Table Value in Sensor Message above. Enter the number of a column. The sensor message will show the value in row 0 of this column. Please enter an integer value.</p> <p> Columns and rows start with index 0.</p>
Sensor Message Column Name	<p>This setting is only visible if you select Column name and Use Data Table Value in Sensor Message above. Enter the name of a column. The sensor message will show the value in row 0 of this column. Please enter a string.</p> <p> Columns and rows start with index 0.</p>
Sensor Message Row Number	<p>This setting is only visible if you select Row number and Use Data Table Value in Sensor Message above. Enter the number of a row. The sensor message will show value in column 0 of this row. Please enter an integer value.</p> <p> Columns and rows start with index 0.</p>
Sensor Message Key	<p>This setting is only visible if you select Key value pair and Use Data Table Value in Sensor Message above. Enter a key to search for in column 0 of the data table. The sensor message will show the value in column 1 of the row where the key has been found. Please enter a string.</p> <p> Columns and rows start with index 0.</p>
Sensor Message	<p>This setting is only visible if you select Use Data Table Value in Sensor Message above. Define the sensor message. Please enter a string. Use the placeholder {0} at the position where the value will be added.</p>

DATA

Example: **The message is {0}**

If Sensor Message Changes

Define what this sensor will do when the sensor value changes. You can choose between:

- **Ignore changes (default):** The sensor takes no action on change.
- **Trigger 'change' notification:** The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to [trigger a notification](#)³⁷⁷⁰ whenever the sensor value changes.

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.92 Oracle Tablespace Sensor

The Oracle Tablespace sensor monitors a tablespace on an Oracle server. It can show the following:

- Online status (online, system, recover, sysoff, offline, unknown)
- Status (available, invalid, unknown)
- Free disk space in bytes and percent
- Number of free blocks and in percent
- Current database size
- Database size on disk (managed tablespace)

Channel	ID	Last Value	Minimum	Maximum
Database Size	9	2.56 MByte	2.56 MByte	2.56 MByte
Database Size on Disk	10	100 MByte	100 MByte	100 MByte
Downtime	-4			
Free Blocks	7	1,441,464 #	1,441,464 #	1,441,464 #
Free Blocks %	8	>99 %	>99 %	>99 %
Free Space	5	11,261 MByte	11,261 MByte	11,261 MByte
Free Space %	6	>99 %	>99 %	>99 %
Online Status	3	ONLINE	ONLINE	ONLINE
Status	4	AVAILABLE	AVAILABLE	AVAILABLE

Oracle Tablespace Sensor

Sensor in Other Languages

Dutch: **Oracle Tablespace**, French: **Tablespace Oracle**, German: **Oracle Tablespace**, Japanese: **Oracle ? ? ? ? ? ? ? ?**, Portuguese: **Tablespace Oracle**, Russian: **Табличное пространство Oracle**, Simplified Chinese: **Oracle ? ? ?**, Spanish: **Espacio de tablas de Oracle**

Remarks

- This sensor type supports Oracle database servers version 10.2 or higher.
 - [Requires](#)¹⁴⁷⁵ .NET 4.5 or later on the probe system.
 - [Requires](#)¹⁴⁷⁵ sufficient privileges for the account that you use for the connection. We recommend that you use the **SYSTEM** account.
 - This sensor type does not support overprovisioning.
 - Knowledge Base: [Why is my Oracle Tablespace sensor showing negative values?](#)
 - Define credentials, custom port (if required), and timeout in settings section [Credentials for Database Management Systems](#)⁴¹³ of the parent device, or in the settings of a group or probe above.
 - PRTG Manual: [Monitoring Databases](#)³⁵⁴
 - This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶³.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)³⁷⁰. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Requirement: Sufficient Account Privileges

Please use an account for the connection that has the privileges to see all (or specific) views. We recommend that you use the **SYSTEM** account if possible, otherwise grant your DBA the **SELECT_CATALOG_ROLE** to the account that you use. Without sufficient privileges you may see the error message **ORA-00942: table or view does not exist**.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

In the appearing dialog box in the **Add Sensor** dialog, [enter an identifier](#)^[1477] to access the tablespace selection and click **OK**. Select the tablespaces in the Oracle database you want to monitor. PRTG creates one sensor for each tablespace you choose. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

TABLESPACE SPECIFIC

Tablespace	Select the tablespaces you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
------------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3262] , maps ^[3270] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags ^[139] , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

ORACLE SPECIFIC

Identifier Enter the **Oracle System ID (SID)** or the **SERVICE_NAME** of the database the sensor will connect to. Specify below which type of identifier you use. By default, the sensor uses the SID as connection string.

The identifier is defined in the **CONNECT_DATA** part of the **TNSNames.ora** file on the Oracle instance. For example, a system ID can look like this: **orcl**

Identification Method Define which type of identifier that you use to connect to the database. This type depends on the configuration of your Oracle server. Choose between:

- **Use SID as identifier (default):** Connect to the database instance using a system ID as connection string. Enter the SID above.
- **Use SERVICE_NAME as identifier:** Connect to the database instance using a SERVICE_NAME as connection string. Enter the SERVICE_NAME above.

Sensor Name Prefix Define if you want to use the **SERVICE_NAME** as prefix for the sensor name. If you have multiple databases on your Oracle server, this will help you to distinguish the monitored tablespaces. Choose between:

- **Do not use a prefix for the sensor name:** The sensor name will only show the name of the monitored tablespace.
- **Use SERVICE_NAME as prefix for the sensor name:** PRTG will add the **SERVICE_NAME** to the beginning of the sensor name.

ORACLE SPECIFIC

TABLESPACE SPECIFIC

Tablespace Shows the tablespace that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#) settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Knowledge Base: Why is my Oracle Tablespace sensor showing negative values?

- <https://kb.paessler.com/en/topic/79066>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

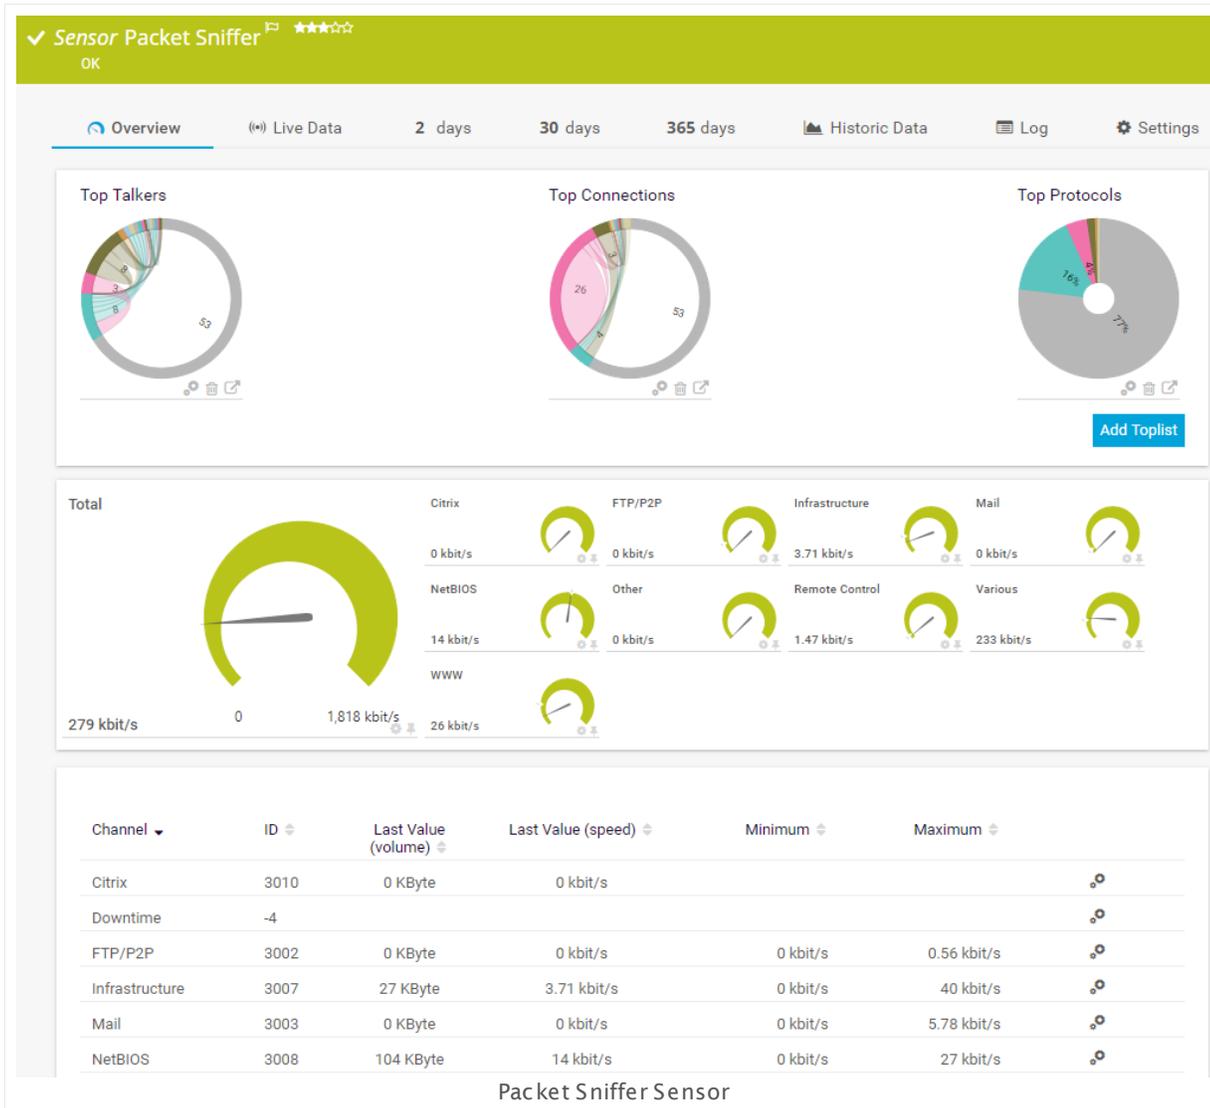

7.8.93 Packet Sniffer Sensor

The Packet Sniffer sensor monitors the headers of data packets that pass a local network card using a built-in packet sniffer. You can choose from predefined channels. The sensor analyzes only header traffic.

This sensor can show the following traffic types in kbit per second:

- Chat (IRC, AIM)
- Citrix
- FTP/P2P (file transfer)
- Infrastructure (network services: DHCP, DNS, Ident, ICMP, SNMP)
- Mail (mail traffic: IMAP, POP3, SMTP)
- NetBIOS
- Remote control (RDP, SSH, Telnet, VNC)
- WWW (web traffic: HTTP, HTTPS)
- Total traffic
- Other protocols (other UDP and TCP traffic)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **Packet Sniffer**, French: **Packet sniffing**, German: **Packet Sniffer**, Japanese: ? ? ? ? ? ? ? ? , Portuguese: **Sniffer de pacotes**, Russian: **Анализатор пакетов**, Simplified Chinese: ? ? ? ? ? ? , Spanish: **Esniifer de paquetes**

Remarks

- By default, this sensor works only on a probe device.
- Knowledge Base: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)
- For a general introduction to the technology behind packet sniffing, see manual section [Monitoring Bandwidth via Packet Sniffing](#) ³⁶¹².

- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

i By default, you can only monitor traffic passing the PRTG probe system where the **Probe Device** with the sensor is set up (either a local or remote probe). To monitor other traffic in your network, you can configure a monitoring port (if available) that the switch sends a copy of all traffic to. You can then physically connect this port to a network card of the computer the PRTG probe (either local or remote probe) is running on. This way, PRTG can analyze the complete traffic that passes through the switch. This feature of your hardware may be called Switched Port Analyzer (SPAN), port mirroring, or port monitoring.

☁ You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3276] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags ^[139] , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)¹⁴⁰¹ from objects further up in the device tree. These are visible above as **Parent Tags**.

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SNIFFER SPECIFIC

Include Filter Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special syntax.

 For detailed information, see section [Filter Rules](#)¹⁴⁹⁴ below.

Exclude Filter First, the filters you define in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax.

 For detailed information, see section [Filter Rules](#)¹⁴⁹⁴ below.

Network Adapters Define the network adapters that this sensor monitors. You see a list of names with all adapters available on the probe system. To select an adapter, set a check mark symbol in front of the respective name. You can also select and deselect all items by using the check box in the table head.

Log Stream Data to Disk (for Debugging) Define if the probe will write a logfile of the stream and packet data to the data folder (see [Data Storage](#)³⁷³⁴). Choose between:

- **None (recommended):** Do not write additional logfiles. We recommend this for normal use cases.
- **Only for the 'Other' channel:** Only write logfiles of data that is not filtered otherwise and therefore accounted to the default **Other** channel.
- **All stream data:** Write logfiles for all data received.

SNIFFER SPECIFIC

 Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

CHANNEL CONFIGURATION

Channel Selection Define the categories the sensor accounts the traffic to. There are different groups of traffic available. Choose between:

- **Web:** Internet web traffic.
- **File Transfer:** Traffic caused by FTP.
- **Mail:** Internet mail traffic.
- **Chat:** Traffic caused by chat and instant messaging.
- **Remote Control:** Traffic caused by remote control applications, such as RDP, SSH, Telnet, and VNC.
- **Infrastructure:** Traffic caused by network services, such as DHCP, DNS, Ident, ICMP, and SNMP.
- **NetBIOS:** Traffic caused by NetBIOS communication.
- **Citrix:** Traffic caused by Citrix applications.
- **Other Protocols:** Traffic caused by various other protocols via UDP and TCP.

For each traffic group, you can select how many channels will be used for each group, that is, how detailed the sensor divides the traffic. For each group, choose between:

- **No (X icon):** Do not account traffic of this group in its own channel. All traffic of this group is accounted to the default channel named **Other**.
- **Yes (check mark icon):** Count all traffic of this group and summarize it into one channel.
- **Detail (magnifier icon):** Count all traffic of this group and further divide it into different channels. The traffic appears in several channels as shown in the **Content** column.
 -  Extensive use of this option can cause load problems on your probe system. We recommend setting specific, well-chosen filters for the data you really want to analyze.

CHANNEL CONFIGURATION

 You can change the default configuration for groups and channels. For details, see this Knowledge Base article: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#) settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

PRIMARY TOPLIST

Primary Toplist Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:

- **Top Talkers**
- **Top Connections**

PRIMARY TOPLIST

- **Top Protocols**
- **[Any custom toplists you have added]**

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ^[336] on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none"> ▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request. ▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests. ▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests. |

SCANNING INTERVAL

- **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)  for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail.

 For more information, see section [Toplists](#) .

Filter Rules

The following filter rules apply to all xFlow, IPFIX, and Packet Sniffer sensors.

FIELD	POSSIBLE FILTER VALUES
IP	IP address or DNS name (see Valid Data Formats )
Port	Any number
SourceIP	IP address or DNS name (see Valid Data Formats )
SourcePort	Any number
DestinationIP	IP address or DNS name (see Valid Data Formats )

FIELD	POSSIBLE FILTER VALUES
DestinationPort	Any number
Protocol	TCP, UDP, ICMP, OSPFIGP, any number
TOS	Type Of Service: any number
DSCP	Differentiated Services Code Point: any number

The following filter rules apply to Packet Sniffer sensors only.

FIELD	POSSIBLE FILTER VALUES
MAC	Physical address (see Examples )
SourceMAC	Physical address
DestinationMAC	Physical address
EtherType	IPV4, ARP, RARP, APPLE, AARP, IPV6, IPXold, IPX, any number
VlanPCP	IEEE 802.1Q VLAN Priority Code Point
VlanID	IEEE 802.1Q VLAN Identifier
TrafficClass	IPv6 Traffic Class: corresponds to TOS used with IPv4
FlowLabel	IPv6 Flow Label

(????)**, Portuguese: **Sniffer de pacotes (Customizado)**, Russian: **Анализатор пакетов (нестандартный)**, Simplified Chinese: **?????? (????)**, Spanish: **Esnifer de paquetes (personalizado)**

Remarks

- By default, this sensor works only on a probe device.
- This sensor [does not support more than 50 channels](#)^[1498] officially.
- For a general introduction to the technology behind packet sniffing, see manual section [Monitoring Bandwidth via Packet Sniffing](#)^[3512].
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

i By default, you can only monitor traffic passing the PRTG probe system where the **Probe Device** with the sensor is set up (either a local or remote probe). To monitor other traffic in your network, you can configure a monitoring port (if available) that the switch sends a copy of all traffic to. You can then physically connect this port to a network card of the computer the PRTG probe (either local or remote probe) is running on. This way, PRTG can analyze the complete traffic that passes through the switch. This feature of your hardware may be called Switched Port Analyzer (SPAN), port mirroring, or port monitoring.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Limited to 50 Sensor Channels

! PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SNIFFER SPECIFIC

Include Filter	<p>Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special syntax.</p> <p> For detailed information, see section Filter Rules below.</p>
Exclude Filter	<p>First, the filters you define in the Include Filter field are considered. From this subset, you can explicitly exclude traffic, using the same syntax.</p> <p> For detailed information, see section Filter Rules below.</p>

SNIFFER SPECIFIC

Channel Definition	<p>Enter a channel definition to divide the traffic into different channels. Write each definition in one line. All traffic for which no channel is defined is accounted to the default channel named Other.</p> <p> For detailed information, see section Channel Defintions for xFlow and Packet Sniffer Sensors³⁶⁹⁰.</p> <p> Extensive use of many filters can cause load problems on your probe system. We recommend defining specific, well-chosen filters for the data you really want to analyze. We recommend that you do not use more than 20 channels in graphs and tables, and not more than 100 channels in total. For performance reasons, it is better to add several sensors with less channels each.</p>
Network Adapters	<p>Define the network adapters that this sensor monitors. You see a list of names with all adapters available on the probe system. To select an adapter, set a check mark symbol in front of the respective name. You can also select and deselect all items by using the check box in the table head.</p>
Log Stream Data to Disk (for Debugging)	<p>Define if the probe will write a logfile of the stream and packet data to the data folder (see Data Storage³⁷³⁴). Choose between:</p> <ul style="list-style-type: none"> ▪ None (recommended): Do not write additional logfiles. Recommended for normal use cases. ▪ Only for the 'Other' channel: Only write logfiles of data that is not filtered otherwise and therefore accounted to the default Other channel. ▪ All stream data: Write logfiles for all data received. <p> Use with caution! Enabling this option might create huge data files. Please use for a short time and for debugging purposes only.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
-----------------	---

SENSOR DISPLAY

Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> ⓘ This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

PRIMARY TOPLIST

Primary Toplist	<p>Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:</p> <ul style="list-style-type: none"> ▪ Top Talkers ▪ Top Connections ▪ Top Protocols ▪ [Any custom toplists you have added]
-----------------	---

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ³³⁵ on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none"> ▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request. ▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests. ▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests. ▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests. ▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> <p> If a channel uses lookup³⁶⁹³ values, it will always show a Down status immediately, so no "wait" options will apply.</p> |

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>[3311]</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail.

 For more information, see section [Toplists](#)³¹⁸⁶.

Filter Rules

The following filter rules apply to all xFlow, IPFIX, and Packet Sniffer sensors.

FIELD	POSSIBLE FILTER VALUES
IP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
Port	Any number
SourceIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
SourcePort	Any number
DestinationIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
DestinationPort	Any number

FIELD	POSSIBLE FILTER VALUES
Protocol	TCP, UDP, ICMP, OSPFIGP, any number
TOS	Type Of Service: any number
DSCP	Differentiated Services Code Point: any number

The following filter rules apply to Packet Sniffer sensors only.

FIELD	POSSIBLE FILTER VALUES
MAC	Physical address (see Examples )
SourceMAC	Physical address
DestinationMAC	Physical address
EtherType	IPV4, ARP, RARP, APPLE, AARP, IPV6, IPXold, IPX, any number
VlanPCP	IEEE 802.1Q VLAN Priority Code Point
VlanID	IEEE 802.1Q VLAN Identifier
TrafficClass	IPv6 Traffic Class: corresponds to TOS used with IPv4
FlowLabel	IPv6 Flow Label

- <https://kb.paessler.com/en/topic/61272>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)  section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.95 PerfCounter Custom Sensor

The PerfCounter Custom sensor monitors a configured set of Windows Performance Counters. You can define your own channels. There are no predefined channels available for this sensor type.

- This sensor can show Windows Performance Counters individually to your needs.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

 To find available performance counters and their names on the target system, see this Knowledge Base article: [How can I find out the names of available Performance Counters?](#)

Sensor in Other Languages

Dutch: **Prestatie Meters Klant specifiek**, French: **PerfCounter personnalisé**, German: **Leistungsindikator (benutzerdef.)**, Japanese: ??????????????????, Portuguese: **PerfCounter (Customizado)**, Russian: **Специальные настройки PerfCounter**, Simplified Chinese: ??????????, Spanish: **PerfCounter Personalizado**

Remarks

- [Requires](#)  Windows credentials in the parent device settings.

- [Requires](#)^[1510] the Windows Remote Registry service to be running on the target computer.
 - [Requires](#)^[1510] Windows Server 2008 R2 or later on the probe system.
 - Knowledge Base: [How can I find out the names of available Performance Counters?](#)
 - Knowledge Base: [My Performance Counter sensor does not work. What can I do?](#)
 - You cannot add different performance counters with the same name to one sensor.
 - If a performance counter contains angle brackets (< or >), please do not edit the channel settings because this might cause an error.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

-  Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the [parent device's](#)^[407] **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.
-  If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible.
-  The user account has to be a member of the **Performance Monitor Users** user group on the target system.

Requirement: Remote Registry Service

-  In order for this sensor to work with Windows Performance Counters, please make sure the **RemoteRegistry** "Remote Registry" Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Requirement: Windows Version

-  In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 R2 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)^[3705].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

PERFORMANCE COUNTER SETTINGS

List of Counters

Enter a list of performance counters that will be queried. Define one counter per row. PRTG will create one channel for each counter. Use the following syntax: the name of the counter, followed by two colons (::) and the unit.

Example: `\Processor(_Total)\% Processor Time::%`

 It is not possible to monitor different performance counters with the same name in one sensor. The sensor uses the counter as channel name, so this would create duplicate channels, which PRTG does not support. If you want to monitor different performance counters with the same name, please add one sensor for each counter. You can also create a [custom sensor](#)³¹⁵⁵. For example, you can write a PowerShell query that connects to the target device, retrieves the desired counters with the `Get-Counter` cmdlet, and reports them back to PRTG as individual channels.

 If your custom performance counter includes an angle bracket (< or >), please do not edit the [Sensor Channels Settings](#)³¹⁶⁰ (for example, limits) after creating the sensor! This might lead to a malfunctioning sensor.

Mode

Define the mode for the return value of the performance counter. This setting determines if the returning value will be displayed as absolute value or if the difference between the last and the current value will be used. Choose between:

- **Absolute (recommended):** The returning value will be displayed as absolute value.
 - **Difference:** The difference between last and current value will be displayed.
-  Make sure that all counters that you monitor are capable of this mode if you select it.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

PERFORMANCE COUNTER SETTINGS

List of Counters	Shows the performance counters that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Mode	Shows the mode in which the sensor displays the returning values. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.96 PerfCounter IIS Application Pool Sensor

The PerfCounter IIS Application Pool sensor monitors a Microsoft Internet Information Services (IIS) application pool using Windows Performance Counters.

It can show the following:

- Overall status of the application pool:
 - Running ([sensor status](#) ¹⁹⁵ **Up**)
 - Initialized or Shutdown Pending (**Warning**)
 - Unavailable, Uninitialized, Stopping, Stopped, or Delete Pending (**Down**)
- Number of worker processes
- Number of failures in worker processes per second
- Number of ping failures per second
- Number of shutdown failures per second
- Number of startup failures per second

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Channel	ID	Last Value (volume)	Last Value (speed)	Minimum	Maximum
Application Pool St...	0	Running		Running	Running
Downtime	-4				
Worker Process Fai...	2	0 #	0 #/s	0 #/s	0 #/s
Worker Process Pin...	3	0 #	0 #/s	0 #/s	0 #/s
Worker Process Sh...	4	0 #	0 #/s	0 #/s	0 #/s
Worker Process Sta...	5	0 #	0 #/s	0 #/s	0 #/s
Worker Processes	1	0 #		0 #	0 #

PerfCounter IIS Application Pool Sensor

Sensor in Other Languages

Dutch: **PerfCounter IIS Application Pool**, French: **Pool d'application IIS PerfCounter**, German: **Leistungsindikator IIS-Anwendungspool**, Japanese: **?? ? ? ? ? ? ? ? ? IIS ? ? ? ? ? ? ? ? ? ?**, Portuguese: **Pool de aplicativos IIS via PerfCounter**, Russian: **Пл приложений IIS (PerfCounter)**, Simplified Chinese: **?? ? ? ? IIS ? ? ? ? ?**, Spanish: **Grupo de aplicaciones PerfCounter IIS**

Remarks

- [Requires](#)¹⁵²⁰ Microsoft IIS version 7.5 or later on the target system.
- [Requires](#)¹⁵²⁰ Windows credentials in the parent device settings.
- [Requires](#)¹⁵²⁰ the Windows Remote Registry service to be running on the target computer.
- [Requires](#)¹⁵²¹ Windows Server 2008 R2 or later on the probe system.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Microsoft IIS Version 7.5

 To monitor Microsoft Internet Information Services (IIS) application pools, this sensor needs IIS version 7.5 or later to be installed on the target system.

Requirement: Windows Credentials

 Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the [parent device's](#)⁴⁰⁷ **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

 If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible.

 The user account has to be a member of the **Performance Monitor Users** user group on the target system.

Requirement: Remote Registry Service

 In order for this sensor to work with Windows Performance Counters, please make sure the **RemoteRegistry** "Remote Registry" Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Requirement: Windows Version

 In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 R2 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)^[370].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Microsoft Internet Information Services (IIS) application pools that you want to monitor. PRTG creates one sensor for each pool you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

IIS APPLICATION POOL SPECIFIC

Application Pool	Select the application pools you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
------------------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IIS APPLICATION POOL SPECIFIC

Application Pool	Shows the name of the application pool that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
------------------	--

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-----------------	--

SENSOR DISPLAY

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

-  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁶⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

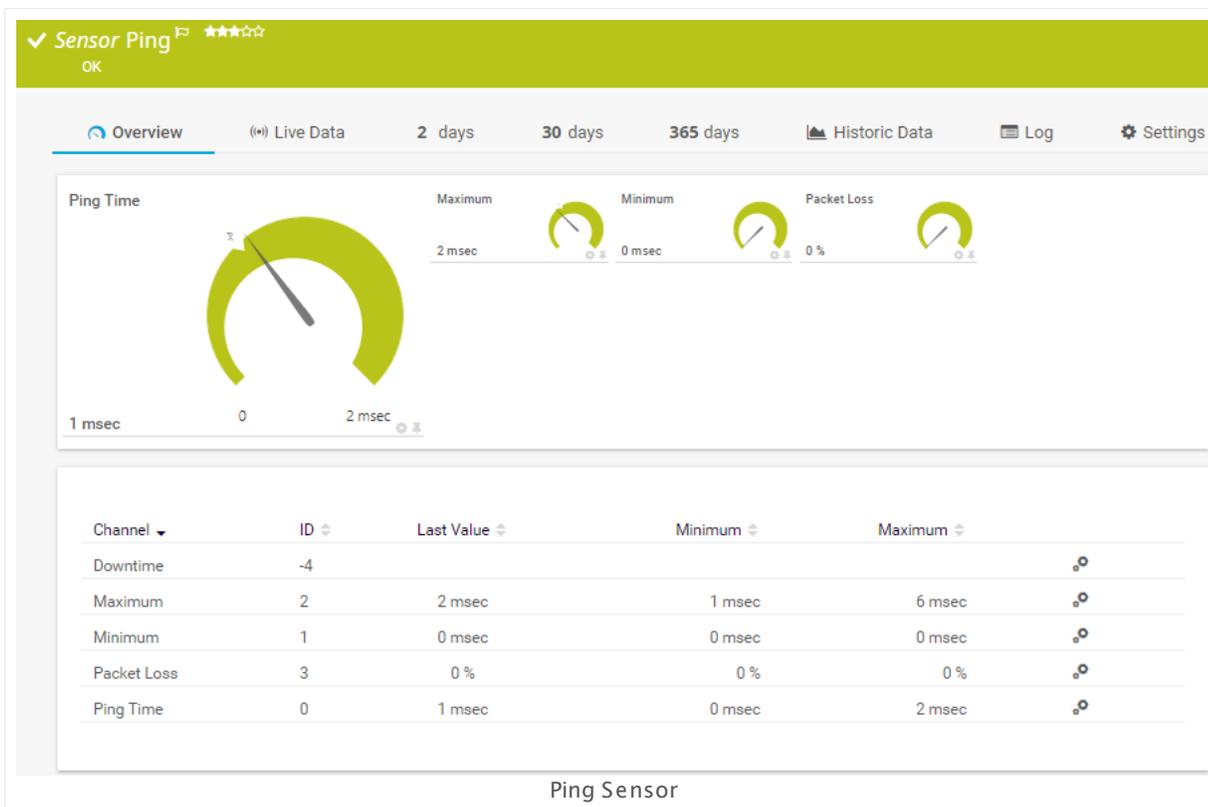

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.97 Ping Sensor

The Ping sensor sends an Internet Control Message Protocol (ICMP) echo request ("Ping") from the computer running the probe to the device it is created on to monitor the availability of a device. Default is 5 Pings per scanning interval.

It can show the following:

- Ping time
- Minimum Ping time when using more than one Ping per interval
- Maximum Ping time when using more than one Ping per interval
- Packet loss in percent when using more than one Ping per interval

Remarks

- Knowledge Base: [How to create/customize statistical PING sensor?](#)
- Knowledge Base: [Can I create an inverse Ping sensor?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

PING SETTINGS

Timeout (Sec.)	Enter a timeout in seconds for the Ping. If the reply takes longer than this value defines, the sensor will cancel the request and show an error message. The maximum timeout value is 300 seconds (5 minutes).
Packet Size (Bytes)	Enter the packet size in bytes for the Ping. You can choose any value between 1 and 10000 . We recommend that you use the default value.
Ping Method	Define the kind of Ping check that the sensor performs. Choose between: <ul style="list-style-type: none">▪ Send one single Ping: With each scanning interval, send a single Ping only. A sensor in this setting will show the Ping time only. This setting is good for simple availability monitoring.▪ Send multiple Ping request: With each scanning interval, send multiple Pings in a row. A sensor in this setting will also show minimum and maximum Ping time as well as packet loss (in percent). This setting is good if you want to create reports about average Ping times out of a series of ping requests. This is the default setting.<ul style="list-style-type: none">❗ When using multiple requests, all of them have to be lost to show a Down status^[195]. For example, if there is only one Ping request answered in a series of five, the sensor will still show a green Up status.
Ping Count	This field is only visible if you enable Send multiple Ping request above. Enter the number of Pings that the sensor sends in a row for one interval. Please enter an integer value. The default value is 5 .
Ping Delay (in ms)	This field is only visible if you enable Send multiple Ping request above. Enter the time in milliseconds the sensor waits between two Ping requests. Please enter an integer value. The default value is 5 . <ul style="list-style-type: none">❗ Increase the value if the target device drops Ping packets due to denial-of-service (DOS) suspicion.
Auto Acknowledge	You can define that a Down status of this sensor will be acknowledged ^[220] automatically. <ul style="list-style-type: none">▪ Show "Down" status on error (default): Do not automatically acknowledge an alarm if this sensor changes to a Down status.▪ Show "Down (Acknowledged)" status on error: Automatically acknowledge an alarm. If this sensor changes to a Down status, it will automatically show Down (Acknowledged) instead.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵⁵ on PRTG on premises installations.</p>
-------------------	---

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

- <https://kb.paessler.com/en/topic/10203>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.98 Ping Jitter Sensor

The Ping Jitter sensor sends a series of Internet Control Message Protocol (ICMP) echo requests ("Pings") to the given URI to determine the statistical jitter.

This sensor shows the following:

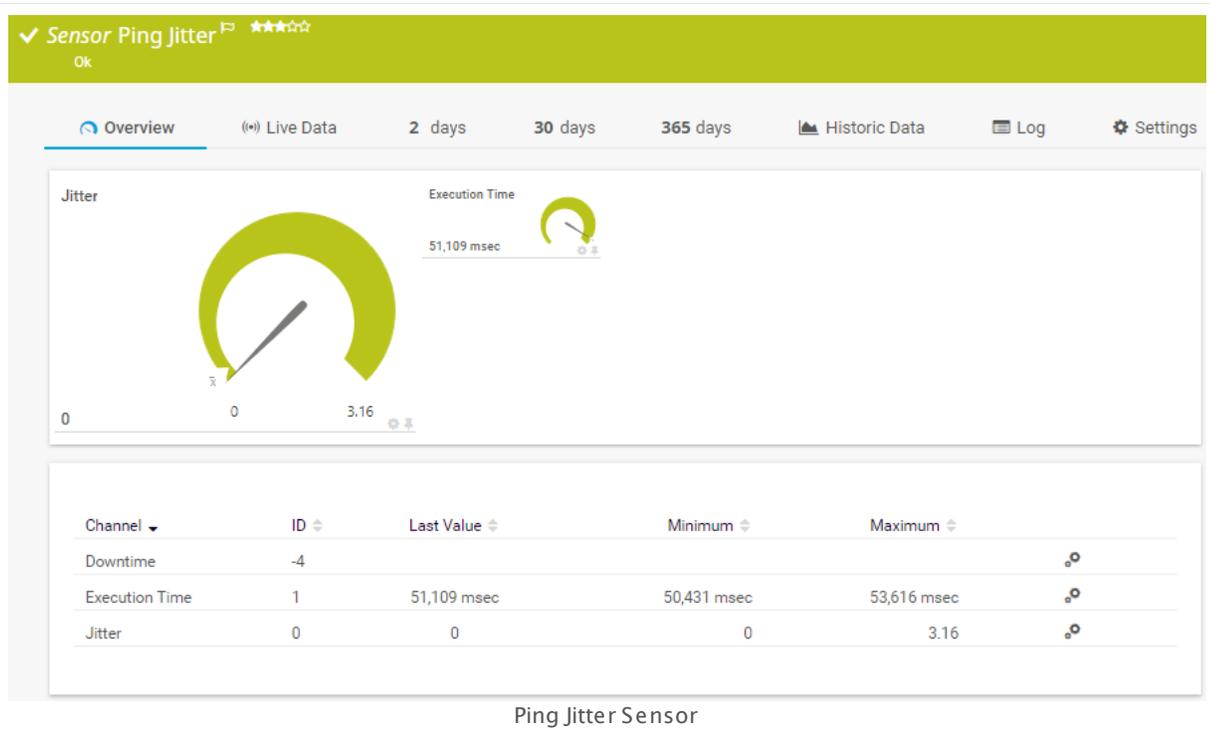

- Statistical jitter value
- Execution time

The Real Time Jitter value is updated every time a packet is received using the formula described in RFC 1889:

```
Jitter = Jitter + ( abs( ElapsedTime - OldElapsedTime ) - Jitter ) / 16
```

The Statistical Jitter value is calculated on the first x packets received using the statistical variance formula:

```
Jitter Statistical = SquareRootOf( SumOf( ( ElapsedTime[i] - Average ) ^ 2 ) / ( ReceivedPacketCount - 1 )
```

Sensor in Other Languages

Dutch: **Ping Jitter**, French: **Gigue du ping**, German: **Ping Jitter**, Japanese: **PI ng JI tter ? ?**, Portuguese: **Ping Jitter**, Russian: **Флуктуация Ping**, Simplified Chinese: **Ping ? ?**, Spanish: **Jitter de Ping**

Remarks

- [Requires](#) ¹⁶³⁹ .NET 4.5 or later on the probe system. If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#) ³⁷⁰⁹. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) ³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) ⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ¹⁸¹ , as well as in alarms ²¹⁹ , logs ²²⁸ , notifications ³²¹⁶ , reports ³²⁵² , maps ³²⁷⁶ , libraries ³²³⁵ , and tickets ²³⁰ .
Parent Tags	Shows Tags ¹³⁹ that this sensor inherits ¹⁴⁰ from its parent device, group, and probe ¹³³ . This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

- Tags** Enter one or more [Tags](#)¹³⁹, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.
- You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)¹⁴⁰ from objects further up in the device tree. These are visible above as **Parent Tags**.
-  It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).
- Priority** Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

- Ping Count** Define the number of Internet Control Message Protocol (ICMP) pings that this sensor sends. Please enter an integer value.

DEBUG OPTIONS

- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result:** Do not store the sensor result.
 - **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

DEBUG OPTIONS

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ³³⁵ on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none"> ▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request. ▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests. ▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests. ▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests. ▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> <p> If a channel uses lookup³⁶⁹³ values, it will always show a Down status immediately, so no "wait" options will apply.</p> |

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>3311</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

Knowledge Base: Which .NET version does PRTG require?

- <https://kb.paessler.com/en/topic/60543>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
98 Ping Jitter Sensor

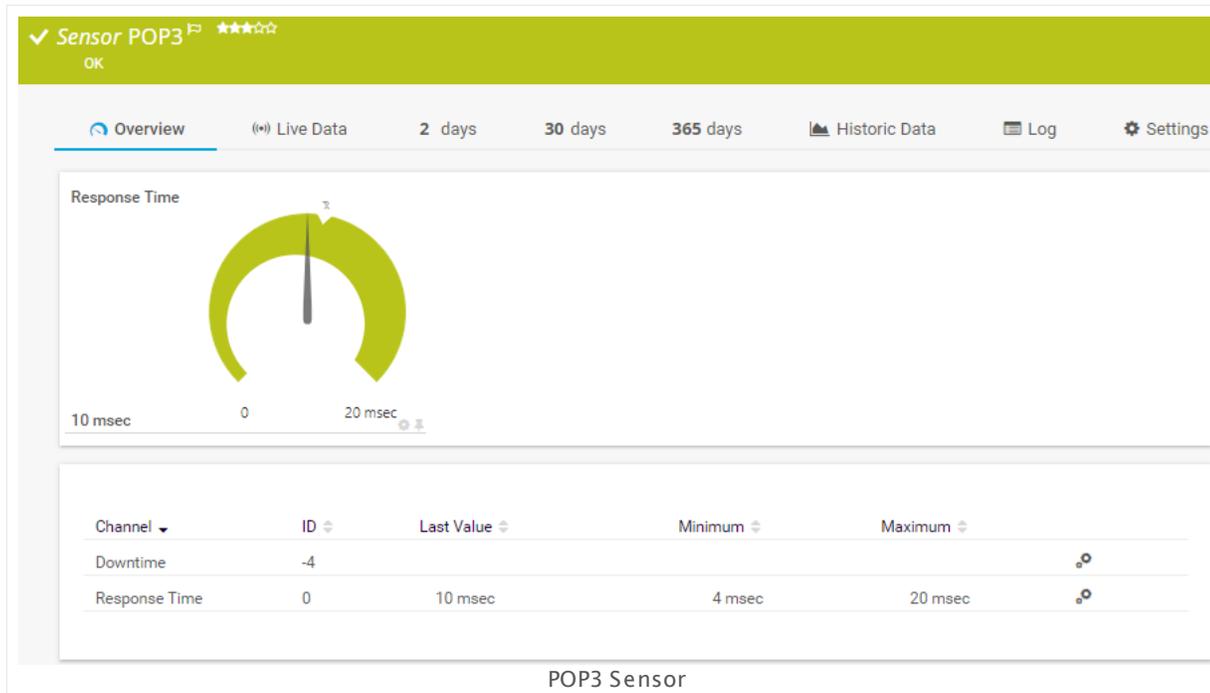

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.99 POP3 Sensor

The POP3 sensor monitors an email server using Post Office Protocol version 3 (POP3).

- It shows the response time of the server.

Remarks

- This sensor type does not support Secure Remote Password (SRP) ciphers.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

POP3 SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port	<p>Specify the port that the sensor uses for the POP3 connection. This is usually port 110 for non-secure connections and usually port 995 for SSL connections. The actual setting depends on the server you are connecting to. Please enter an integer value. We recommend that you use the default value.</p> <p> If you do not get a connection, please try another port number.</p>

TRANSPORT-LEVEL SECURITY

Sensor Specific

Define the security level for the sensor connection. Choose between:

- **Use Transport-Level Security if available using StartTLS (default):** Choose this option to try to connect to the server using TLS and StartTLS. If the server does not support this, the sensor will try to connect without encryption.
 - **Use Transport-Level Security if available:** Choose this option to try to connect to the server using TLS. If the server does not support this, the sensor will try to connect without encryption.
 - **Enforce Transport-Level Security using StartTLS:** Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will show a **Down status**^[195].
 - **Enforce Transport-Level Security:** Choose this option to try to connect to the server using TLS. If the server does not support this, the sensor will show a **Down status**^[195].
- i** If the sensor connects to a server via **StartTLS**, the connection is established unencrypted first. After the connection is established, the sensor sends a certain command (StartTLS) over the unencrypted connection to negotiate a secure connection via the SSL/TLS protocol.
- i** If the sensor uses **TLS without StartTLS**, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If there is no secure connection possible, no communication will take place.

POP3 AUTHENTICATION

Type	<p>Select the kind of authentication for the POP3 connection. Choose between:</p> <ul style="list-style-type: none"> ▪ Without login: Monitor the connection to the POP3 server only. ▪ Username and password: Log in to the POP3 server with username and password (simple login, non-secure). ▪ 128-bit MD5 hash value (APOP): Send the password in an encrypted form using APOP. This option must be supported by the POP3 server you connect to.
Username	<p>This field is only visible if you select an option with login above. Enter a username for POP3 authentication. Please enter a string.</p>
Password	<p>This field is only visible if you select an option with login above. Enter a password for POP3 authentication. Please enter a string.</p>
Sensor Result	<p>Define what PRTG will do with the sensor results. Choose between:</p> <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none"> For more information on how to find the folder used for storage, see section Data Storage. <p> This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
-----------------	---

SENSOR DISPLAY

Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> ⓘ This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings^[3160] settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration^[336] on PRTG on premises installations.</p>
If a Sensor Query Fails	<p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p>

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

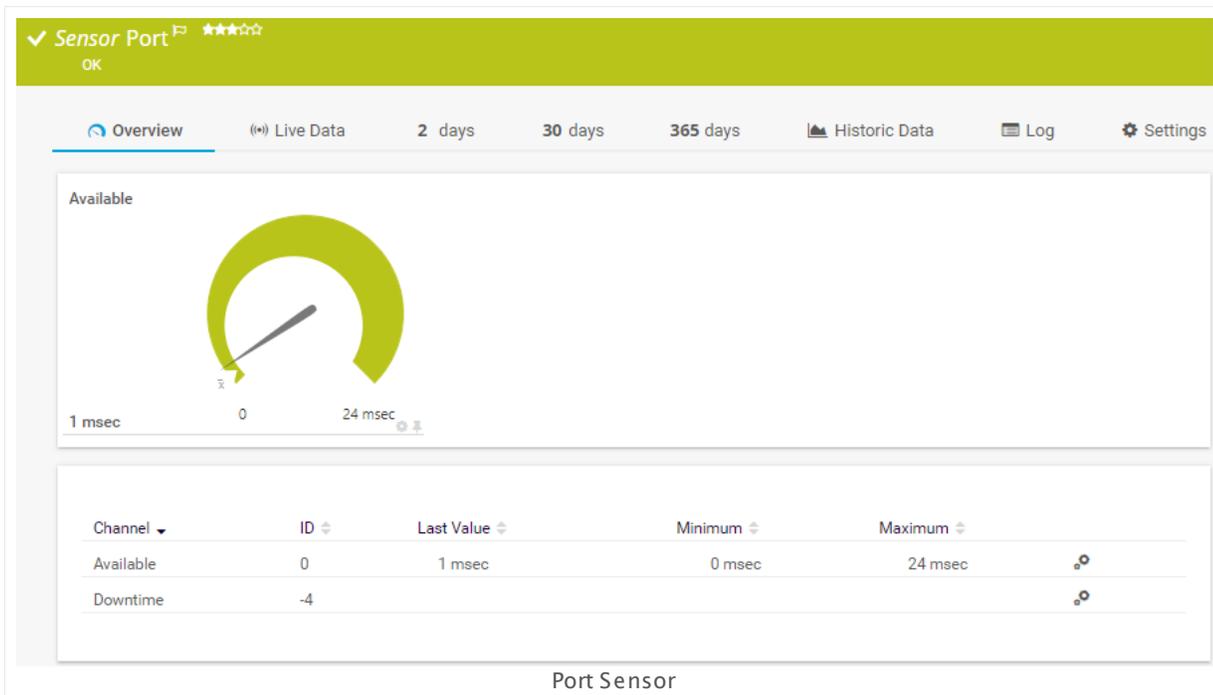

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.100 Port Sensor

The Port sensor monitors a network service by connecting to its port. It tries to connect to the specified TCP/IP port number of a device and waits for the request to be accepted. Depending on your settings, it can alert you either when the monitored port is open, or when it is closed.

- The sensor shows the time until a request to a port is accepted.

Sensor in Other Languages

Dutch: **Poort**, French: **Port**, German: **Port**, Japanese: ? ? ? , Portuguese: **Porta**, Russian: **Порт**, Simplified Chinese: ? ? , Spanish: **Puerto**

Remarks

- This sensor type does not support Secure Remote Password (SRP) ciphers.
- ☁ You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

PORT SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port	Enter the number of the port to which this sensor connects. Please enter an integer value.

TRANSPORT-LEVEL SECURITY

- Security** Define the security level for the sensor connection. Choose between:
- **Use Transport-Level Security (default):** Establish the connection with the strongest TLS method that the target device provides.
 - **Do not use Transport-Level Security:** Establish the connection without encryption.

ADVANCED SENSOR SETTINGS

- Goal** Define how the sensor will report on the port defined above. Choose between:
- **Open:** The sensor shows a green **Up status** ¹⁹⁵ if the port is open, and a red **Down** status if the port is closed.
 - **Closed:** The sensor shows a green **Up status** ¹⁹⁵ if the port is closed, and a red **Down** status if the port is open.
- Command** Define whether the sensor will send a command after opening the port. Choose between:
- **Don't send command:** Only check if a connection to the port is possible.
 - **Send command:** Open a Telnet session to the respective port and send the command.
 - ❗ You cannot use this option if the target machine is a web server.
- Command** This field is only visible if you enable **Send command** above. Enter a command that the sensor sends in a Telnet session to the respective port. You cannot use line breaks, only a simple Telnet command in a single line. Please enter a string.
- Response** Define if the sensor will process the received response further. Choose between:
- **Ignore response:** Do not check the response.
 - **Check response code (integer):** Check if the response matches a defined response code. Define below.

ADVANCED SENSOR SETTINGS

- **Check response text:** Check if the response matches a defined response text. Define below.

Allowed Code

This field is only visible if you enable **Check response code (integer)** above. Enter a code that the target device must return. If it does not match, the sensor will show a **Down status**^[195]. Please enter an integer value.

Check For Existing
Keywords (positive)

This setting is only visible if you activated **Check response text** above. Check if a certain keyword is part of the received value. If there is no match, the sensor will show a **Down status**^[195].

- **Disable:** Do not check for positive keywords.
- **Enable keyword check (positive):** Check if a certain keyword exists in the received value. Define below.

Response Must Include

This setting is only visible if you activate keyword check above. Enter a search string that the returned value must contain.

For Keyword Search
Use

Define the method that you want to use for the search string. Choose between:

- **Plain Text:** Search for a simple string.
- **Regular Expression:** Search using a regular expression. For more details, see [Regular Expressions](#)^[3704] section.

 PRTG supports **PCRE** regex. You cannot use regex options or flags. For more details, see manual section [Regular Expressions](#)^[3704].

Check For Existing
Keywords (negative)

This setting is only visible if you activated text processing above. Check if a certain keyword is **not** part of the received value. If there **is** a match, the sensor will show a **Down status**^[195].

- **Disable:** Do not check for negative keywords.
- **Enable keyword check (negative):** Check if a certain keyword does not exist in the received value. Define below.

Text Must Not Include

This setting is only visible if you activate keyword check above. Enter a search string that the returned value must **not** contain.

For Keyword Search
Use

Define the method you want to use for the search string. Choose between:

- **Plain Text:** Search for a simple string.

- **Regular Expression:** Search using a regular expression. For more details, see [Regular Expressions](#)³⁷⁰⁴ section.

 PRTG supports **PCRE** regex. You cannot use regex options or flags. For more details, see manual section [Regular Expressions](#)³⁷⁰⁴.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

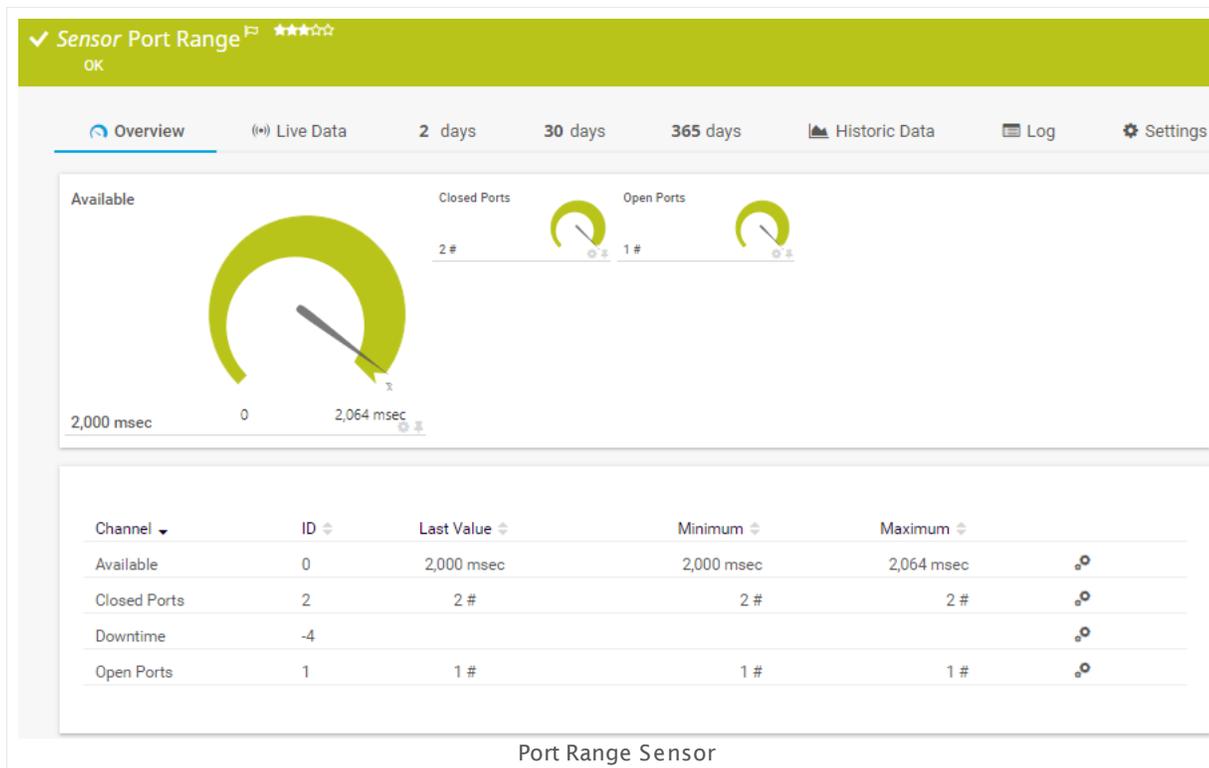

7.8.101 Port Range Sensor

The Port Range sensor monitors a network service by connecting to various TCP/IP ports. It tries to connect to the specified TCP/IP port numbers of a device in succession and waits for each request to be accepted.

It shows the following:

- Number of closed ports
- Number of open ports
- Time until requests are accepted

Optionally, you can set limits in the [sensor channel settings](#). This way you can get alerts about open and closed ports.

Sensor in Other Languages

Dutch: **Poort bereik**, French: **Plage de port**, German: **Port bereich**, Japanese: ? ? ? ? ? ,
 Portuguese: **Intervalo de portas**, Russian: **диапазон портов**, Simplified Chinese: ? ? ? ? ,
 Spanish: **Rango de puerto**

Remarks

- This sensor type does not support Secure Remote Password (SRP) ciphers.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

PORT RANGE SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port-by-Port-Delay (ms)	Specify in milliseconds how long the sensor will wait to go to the next port while running through all given ports.
Port Range Selection Method	Define whether you want to monitor all ports within a range or if you want to monitor several individual ports. Choose between: <ul style="list-style-type: none"> ▪ Port range with start/end: Monitor ports within a range. ▪ List of ports: Monitor several individual ports.
Range Start	This field is only visible if you enable Port range with start/end above. Enter the port number where the scan starts. Please enter an integer value.
Range End	This field is only visible if you enable Port range with start/end above. Enter the port number where the scan ends. Please enter an integer value.
Port List	This field is only visible if you enable List of ports above. Enter the numbers of the ports the sensor will try to connect to. Enter one or more individual integer values, each port in one line.
If Value Changes	Define what the sensor will do if the number of closed ports or open ports changes. Choose between: <ul style="list-style-type: none"> ▪ Ignore changes: No action is taken on change. ▪ Trigger 'change' notification: The sensor sends an internal message indicating that its value has changed. In combination with a Change Trigger, you can use this mechanism to trigger a notification <small>3170</small> whenever the sensor value changes.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend
-----------------	--

SENSOR DISPLAY

on what channels are available for this sensor.

- ❗ You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ❗ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁶⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

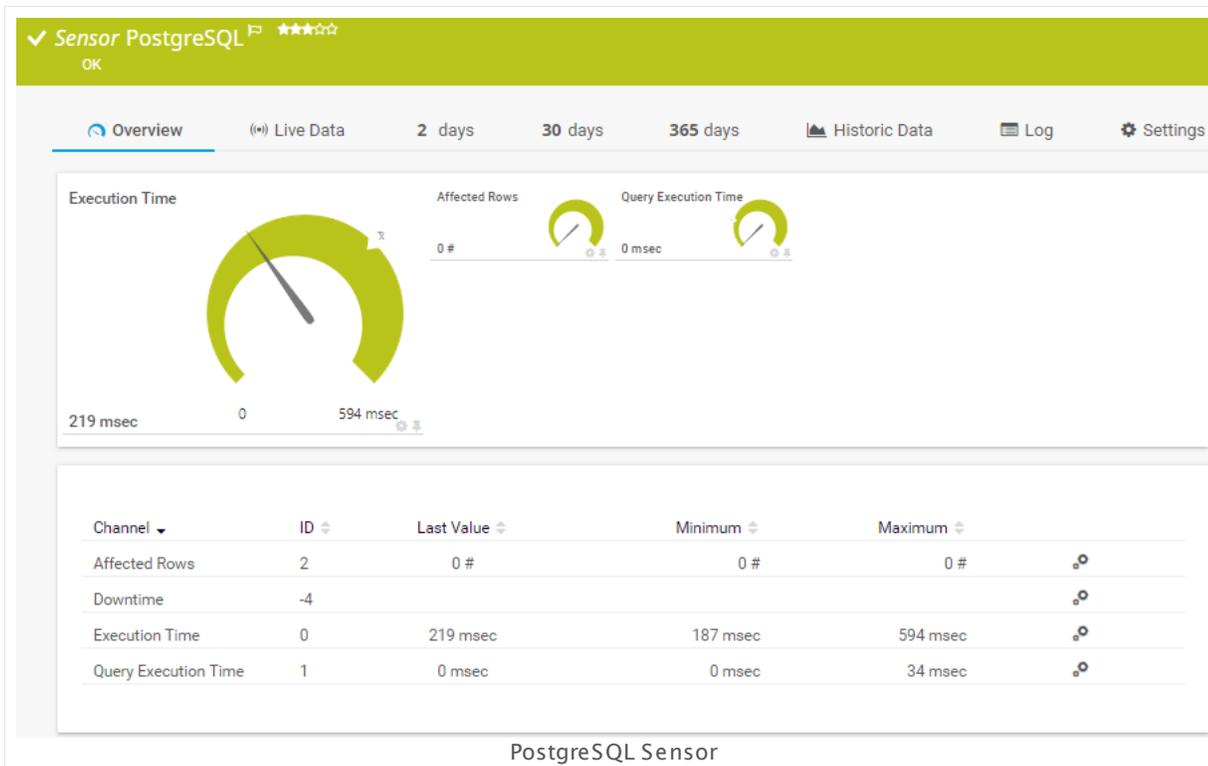

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.102 PostgreSQL Sensor

The PostgreSQL sensor monitors a database on a PostgreSQL server and executes a defined query.

It can show the following:

- Execution time of the whole request (including connection buildup, query execution, transaction handling, disconnection)
- Execution time of a given query
- Number of rows that were addressed by the query (including `select` statements if you process data tables)
- It can also process the data table and show defined values in individual channels.

Remarks

- [Requires](#) ¹⁵⁷⁵ .NET 4.5 or later on the probe system.
- Define credentials, custom port (if required), and timeout in settings section [Credentials for Database Management Systems](#) ⁴¹³ of the parent device, or in the settings of a group or probe above.
- Your SQL query must be stored in a file on the system of the probe the sensor is created on. If you use it on a remote probe, store the file on the system running the remote probe. In a cluster setup, copy the file to every cluster node.

- Save the SQL script with the query into the `\Custom Sensors\sql\postgresql` subfolder of your PRTG installation. See manual section [Data Storage](#)^[3734] for more information about how to find this path
- This sensor type supports PostgreSQL 7.x or later.
- PRTG Manual: [Monitoring Databases](#)^[3534] (includes an [example](#)^[3535] for channel value selection)
- Knowledge Base: [How can I monitor strings from an SQL database and show a sensor status depending on it?](#)

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DATABASE SPECIFIC

Database	Enter the name of the PostgreSQL database to which the sensor connects (for example, MyDatabase). This is a logical entity on the database server where database objects like tables or stored procedures exist.
SSL Mode	<p>Select the PostgreSQL SSL mode for the sensor connection. PostgreSQL SSL connections require OpenSSL to be installed on both the target server and on the PRTG probe system with this sensor.</p> <p>The SSL mode options you can choose here are the same as the values of the PostgreSQL sslmode parameter. PRTG sends it with the sensor requests.</p> <p>Choose between these SSL modes:</p>

DATABASE SPECIFIC

- **Disable**
- **Allow**
- **Prefer**
- **Require**

 For details about the PostgreSQL SSL modes, refer to the PostgreSQL documentation.

DATA

SQL Query File

Select an SQL script file that includes a valid SQL statement to execute on the server. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

The script will be executed with every scanning interval. The list contains SQL scripts from the database management system specific **\Custom Sensors\sql** subfolder of your PRTG installation. Store your script there. If used on a remote probe, the file must be stored on the system running the remote probe. If used on a cluster probe, you must store the file on all servers running a cluster node!

 For more information on how to find this path, see section [Data Storage](#)³⁷³⁴. By default, there is the demo script **Demo Serveruptime.sql** available that you can use to monitor the uptime of the target server.

For example, a correct expression in the file could be: **SELECT AVG (UnitPrice) FROM Products**. If you want to use transactions, separate the individual steps with semicolons ";".

 Please be aware that with each request, the full result set will be transferred, so use filters and limits in your query.

 See also this Knowledge Base article: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)

SQL Variables

You can use the following variables in your query file to have them replaced by an input parameter. This is useful if you have various SQL sensors with queries that differ in only one parameter.

DATA

- Microsoft SQL, MySQL, PostgreSQL: **@prtg**
- Oracle SQL: **:prtg**
- ADO SQL: **?** (question mark)

@prtg, **:prtg**, and **?** behave like common SQL variables, so consider the general rules for SQL variables. For example, you cannot use a variable for a table in the FROM statement of a query.

Example for variables usage: **SELECT * FROM Table WHERE @prtg**

Use Input Parameter

Define if you want to pass a parameter to your SQL query file. This will replace the variables **@prtg** (Microsoft SQL, MySQL, PostgreSQL), or **:prtg** (Oracle SQL), or **?** (ADO SQL) in the SQL query, considering the general rules for SQL variables. Choose between:

- **Don't use input parameter (default):** Execute the SQL query file without using variables.
- **Use input parameter:** Execute an SQL query file that contains a variable. Provide the parameter you want to use in the query below.

Input Parameter

This field is only visible if you choose **Use input parameter** above. Enter the parameter you want to pass to the SQL query file. This parameter will replace the variable **@prtg** or **:prtg** or **?** in the SQL query, considering the general rules for SQL variables.

You can also use PRTG placeholders for custom sensors (command line parameters) as input parameter, for example, **%sensorid** or **%deviceid**. For details, see section [Custom Sensors](#)^[365].

 Provide strings as they are and do not surround them with quotation marks. PRTG will correctly insert string parameters into the query automatically.

Use Transaction

Define if you want to use transactions and if they will affect the database content. Choose between:

- **Don't use transaction (default):** No transactions will be executed.
- **Use transaction and always rollback:** Choose this option to ensure that no data in the database will be changed by the query. In the SQL query file, separate the single steps of the transaction with semicolons.
- **Use transaction and commit on success:** Choose this option to perform changes on the database with the query. The changes will only apply if all execution steps succeed without any errors. In the SQL query file, separate the single steps of the transaction with semicolons.

DATA

Data Processing

Define if you want to process data from the database. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

- **Just execute the query:** If you select this option, the sensor will only show information about the number of affected rows and the execution time of the query. Affected rows are rows that were changed somehow with the query (for example, created, deleted, edited).
- **Count table rows:** Choose this option if you perform a **SELECT** statement and want to monitor how many rows of the data table this statement returns.
- **Process data table:** Select this option to read and analyze the queried data table. If you select this option, the sensor will count rows with **SELECT** statements as well.

Handle DBNull in Channel Values as

This setting is only visible if you select **Process data table** above. Define the sensor behavior if **DBNull** is returned by the query. Choose between:

- **Error:** The sensor will show a **Down** status if **DBNull** is reported.
- **Number 0:** The sensor will recognize the result **DBNull** as a valid value and interpret it as the number **0**.

Select Channel Value by

This setting is only visible if you select **Process data table** above. Define how the desired cell in the database table will be selected. This is necessary to configure the cells that will be used in the sensor channels. Choose between:

- **Column number:** The channel value will be determined by using the value in row 0 of the column whose number you specify below.
- **Column name:** The channel value will be determined by using the value in row 0 of the column whose name you specify below.
- **Row number:** The channel value will be determined by using the value in column 0 of the row whose number you specify below.
- **Key value pair:** The channel value will be determined by searching in column 0 for the key you specify below and returning the value in column 1 of the same row where the key value was found.

The option you choose here also defines the method to optionally determine a value for the sensor message. For details, see setting **Use Data Table Value in Sensor Message** below.

DATA

 See manual section [Monitoring Databases](#)  for an [example](#)  for channel value selection.

Sensor Channel #x This setting is only visible if you select **Process data table** above. You can define up to 10 different channels for the data processing of this sensor. You have to define at least one data channel if you process the data table, so you will see all available settings for **Channel #1** without enabling it manually. For all other possible channels, choose between:

- **Disable:** This channel will not be added to the sensor.
- **Enable:** This channel will be added to the sensor. Define the settings as described above.

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Channel #x Name This setting is only visible if you select **Process data table** above. Enter a unique name for the channel. Please enter a string. Channels will be generated dynamically with this name as identifier. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Channel #x Column Number This setting is only visible if you select **Column number** above. Provide the number of the column that will be used to determine the channel value in row 0. Please enter an integer value.

Sensor Channel #x Column Name This setting is only visible if you select **Column number** above. Provide the name of the column that will be used to determine the channel value in row 0. Please enter a string.

Sensor Channel #x Row Number This setting is only visible if you select **Row number** above. Provide the number of the row that will be used to determine the channel value in column 0. Please enter an integer value.

Sensor Channel #x Key This setting is only visible if you select **Key value pair** above. Provide the key to search for in column 0 of the data table. The value in column 1 of the same row where the key value was found will be used to determine the channel value. Please enter a string.

Sensor Channel #x Mode This setting is only visible if you select **Process data table** above. Define how to display the determined value in the channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

DATA

- **Absolute (recommended):** Shows the value as the sensor retrieves it from the data table.
- **Difference:** The sensor calculates and shows the difference between the last and the current value returned from the data table. This mode is not compatible with the unit **Value Lookup**.

Sensor Channel #x
Unit

This setting is only visible if you select **Process data table** above. Define the unit of the channel value. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

- BytesBandwidth
- BytesMemory
- BytesDisk
- Temperature
- Percent
- TimeResponse
- TimeSeconds
- TimeHours
- Count
- CPU
- BytesFile
- SpeedDisk
- SpeedNet
- Custom
- Value Lookup

 For more information about the available units, see section [Custom Sensors](#).

 To use [lookups](#) with this channel, choose **Value Lookup** and select your lookup file below. Do not use **Custom** for using lookups with this sensor!

 Using the unit **Value Lookup** is not possible when you choose the **Difference** mode. You will not be able to create the sensor in this case.

Sensor Channel #x
Custom Unit

This setting is only visible if you select **Custom** above. Define a unit for the channel value. Please enter a string.

DATA

Sensor Channel #x Value Lookup	This settings is only visible if you select Value Lookup above. Select a lookup <small>3693</small> file that you want to use with this channel.
Use Data Table Value in Sensor Message	<p>This setting is only visible if you select Process data table above. Define if the sensor message will show a value from the data table. Choose between:</p> <ul style="list-style-type: none"> ▪ Disable: Do not use a custom sensor message. ▪ Enable: Define a custom sensor message with a defined value of the data table. Define the value selection below. <p>The method to determine a value for the sensor message is defined in setting Select Channel Value by above.</p>
Sensor Message Column Number	<p>This setting is only visible if you select Column number and Use Data Table Value in Sensor Message above. Enter the number of a column. The sensor message will show the value in row 0 of this column. Please enter an integer value.</p> <p> Columns and rows start with index 0.</p>
Sensor Message Column Name	<p>This setting is only visible if you select Column name and Use Data Table Value in Sensor Message above. Enter the name of a column. The sensor message will show the value in row 0 of this column. Please enter a string.</p> <p> Columns and rows start with index 0.</p>
Sensor Message Row Number	<p>This setting is only visible if you select Row number and Use Data Table Value in Sensor Message above. Enter the number of a row. The sensor message will show value in column 0 of this row. Please enter an integer value.</p> <p> Columns and rows start with index 0.</p>
Sensor Message Key	<p>This setting is only visible if you select Key value pair and Use Data Table Value in Sensor Message above. Enter a key to search for in column 0 of the data table. The sensor message will show the value in column 1 of the row where the key has been found. Please enter a string.</p> <p> Columns and rows start with index 0.</p>
Sensor Message	<p>This setting is only visible if you select Use Data Table Value in Sensor Message above. Define the sensor message. Please enter a string. Use the placeholder {0} at the position where the value will be added.</p>

DATA

Example: **The message is {0}**

If Sensor Message Changes

Define what this sensor will do when the sensor value changes. You can choose between:

- **Ignore changes (default):** The sensor takes no action on change.
- **Trigger 'change' notification:** The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to [trigger a notification](#)³⁷⁷⁰ whenever the sensor value changes.

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.103 Probe Health Sensor

The Probe Health sensor monitors internal PRTG parameters. It shows the status of the PRTG probe (either for the local probe, the hosted probe, a [remote probe](#), or a [cluster](#) probe).

It checks various parameters of your PRTG system that can affect the quality of the monitoring results:

- **Health:** This index value sums up the probe state into a value between 100% (healthy) and 0% (failing). Frequent or repeated health values below 100% should be investigated.
- **Probe Process CPU Load:** This channel shows the current percentage CPU load that the probe process causes. Extensive CPU load can lead to false, incomplete, and incorrect monitoring results. This value usually should stay below 50%.
- **Data Storage Free:** This channel shows the free disk space on the probe system. PRTG dynamically sets limits for this channel. You can manually override these limits in the [sensor channel settings](#).
- **Handles:** This is a counter for the data structures of the operating system. It is responsible for internal resource management. Repeated obviously increasing values should be investigated.
- **Interval Delay non-WMI&SNMP:** This channel shows the percentage interval delay for all sensor types that are not of the type SNMP or WMI. If this value is over 0%, try to increase the [scanning intervals](#) or distribute your sensors over [multiple probes](#).
- **Interval Delay SNMP:** This channel shows the percentage interval delay for SNMP sensors. If this value is above 0%, there are probably too many very slow SNMP V3 sensors. In this case, try to increase the [monitoring intervals](#) or distribute the sensors over [several probes](#).
- **Interval Delay WMI:** This channel shows the percentage interval delay for WMI sensors. If this value is above 0%, WMI sensors could not check the target device according to their interval. 100% means that WMI sensors on the average are checked with twice their interval. For values above 0% try to increase the [monitoring intervals](#) or distribute the sensors over [several probes](#) to keep the number of WMI sensors per probe below 120 (with 60 seconds interval) or 600 (with 300 seconds interval).
- **Lost Flow Packets:** This channel shows the percentage of lost [flow](#) packets. The higher this value, the less flow packages PRTG can handle. Usually, this value should be 0%. Investigate increasing values.
- **Memory Usage:** This channel shows the amount of memory being used by the PRTG probe service as reported by the memory manager. Repeated obviously increasing values should be investigated. If the value is constantly above 2 GB this indicates that PRTG runs at its limits. In this case you should distribute some sensors to [Remote Probe](#).
- **Message Queue:** This channel shows the number of monitoring results from the probe that have not been processed yet by the core. This value usually should stay below 1/10 of the sensor count.
- **Open Requests:** This channel shows the number of currently active monitoring requests. This value should stay below the maximum of 500 open requests.
- **Syslog Buffer:** This channel shows the number of buffered syslog packages. Usually, this value should be 0 (or very low). Investigate increasing values.

- **Threads:** This channel shows the number of program parts that are running simultaneously currently. This value can increase with heavy load. The number should not exceed 100 in normal operation.
- **Toplist Memory:** This channel shows the amount of RAM that the [Toplists](#) on this probe are using. Stay below 1 GB memory usage (depending on available memory on the probe system). If necessary, reduce the number of toplist or distribute them on [multiple probes](#).
- **Trap Buffer:** This channel shows the number of buffered SNMP traps. Usually, this value should be 0 (or very low). Investigate increasing values.

Sensor in Other Languages

Dutch: **Probe Status**, French: **État de la probe**, German: **Zustand der Probe**, Japanese: ? ? ? ? ? , Portuguese: **Funcionamento da sonda**, Russian: **Работоспособность зонда**, Simplified Chinese: ? ? ? ? ? ? , Spanish: **Salud de sonda**

Remarks

- PRTG creates this sensor automatically and you cannot delete it.

- You can create this sensor only on a probe device (either local probe, a [remote probe](#), or a [cluster](#) probe).
- Knowledge Base: [My probe system is running out of disk space. What can I do?](#)

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: My probe system is running out of disk space. What can I do?

- <https://kb.paessler.com/en/topic/64628>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

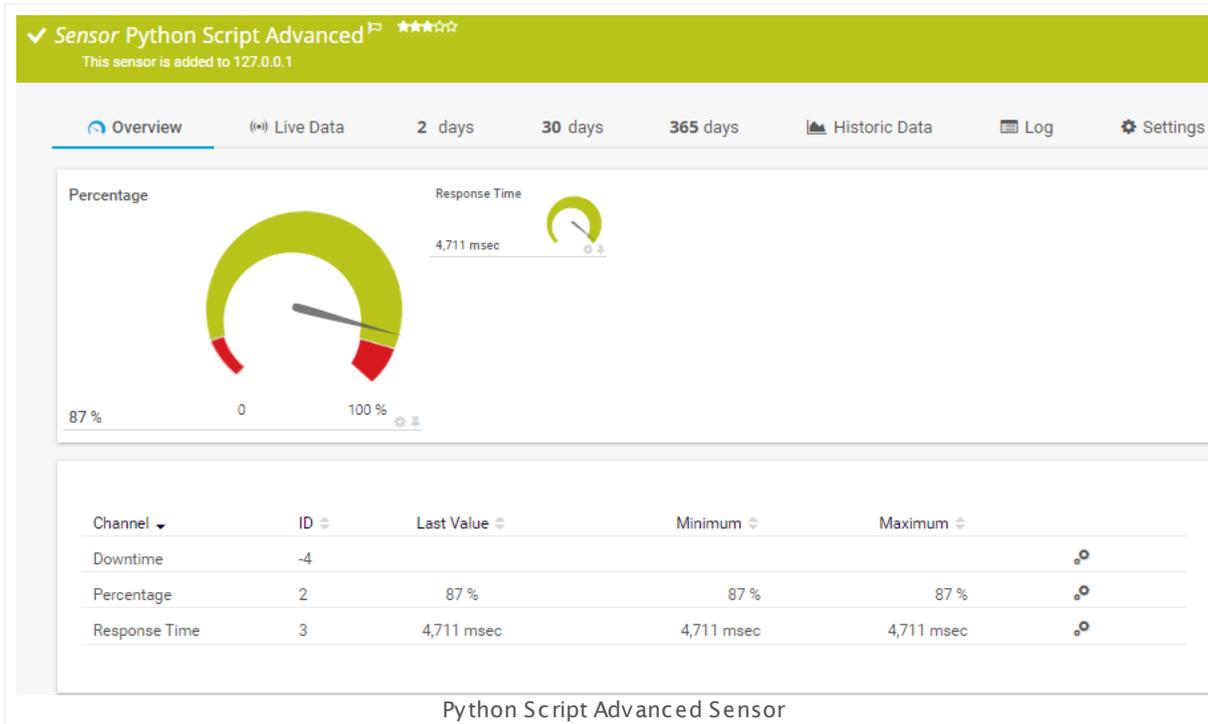

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.104 Python Script Advanced Sensor

The Python Script Advanced sensor executes a Python script on the computer running the local or remote probe. This option is provided as part of the PRTG Application Programming Interface (API). The return value of this sensor must be valid JSON or XML.

- The sensor can show values returned by the Python script in multiple channels.

Sensor in Other Languages

Dutch: **Python Script Geavanceerd**, French: **Paramètres du capteur avancé**, German: **Python-Skript (Erweitert)**, Japanese: **Python ? ? ? ? ? (? ?)**, Portuguese: **Script Python Avançado**, Russian: **Настройки расширенного сенсора**, Simplified Chinese: **Python ? ? ? ?**, Spanish: **Secuencia de comandos Python avanzada**

Remarks

- You must store the script file on the system of the probe where you create the sensor: If used on a remote probe, you must store the file on the system running the remote probe. In a cluster setup, copy the file to every cluster node.
- For best sensor usage, we recommend that the return value is JSON encoded.
- The timeout of the sensor is its [scanning interval](#) minus 1 second. Ensure your Python script does not run longer than this.
- Print commands in the Python script are not supported and lead to an invalid JSON result.
- Exceptions in the script are not supported.
- Sensor channel values greater than 2^{62} are not supported.

- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
 - This sensor [does not support more than 50 channels](#) ¹⁵⁹⁸ officially.
 - Knowledge Base: [What is the Mutex Name in PRTG's EXE/Script Sensor's settings?](#)
 - Knowledge Base: [Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?](#)
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Limited to 50 Sensor Channels

 PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) ³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Python Script

Select a Python script from the list. The sensor will execute it with every [scanning interval](#) ¹⁶⁰².

This list shows all Python script files available in the **\Custom Sensors\python** subdirectory of the probe system's PRTG program directory (see [Data Storage](#) ³⁷³⁴). For the files to appear in this list, please store the files into this folder ending in **.py**. To show the expected values and sensor status, your files must return the expected XML or JSON format to standard output. Values and message must be embedded in the XML or JSON. We recommend JSON encoded return values.

For detailed information on how to build custom sensors and for the expected return format, see section [Custom Sensors](#) ³⁶⁴⁷.

 When using custom sensors on the **Cluster Probe**, please copy your files to every cluster node installation.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Python Script	Shows the Python script file that the sensor executes with each scan as defined at sensor creation. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Security Context	Define the Windows user account that the sensor uses to run the Python interpreter. Choose between: <ul style="list-style-type: none">▪ Use security context of probe service: Run the selected file under the same Windows user account the probe is running on. By default, this is the Windows system user account (if not manually changed).▪ Use Windows credentials of parent device: Use the Windows user account defined in the settings of the parent device on which you create this sensor. Please navigate to the parent device settings^[402] of this sensor to change these Windows credentials.
Device Credentials	Define if you want to transmit device credentials to the Python script. PRTG adds the device credentials to the JSON object that is passed to the script as command line parameter. Please navigate to parent device settings ^[402] of this sensor to change these credentials. Choose between: <ul style="list-style-type: none">▪ Do not transmit device credentials: No device credentials are given to the script.▪ Transmit Windows credentials: Windows credentials^[407] are given to the script.▪ Transmit Linux credentials: Linux credentials^[408] are given to the script.▪ Transmit SNMP credentials: SNMP credentials^[411] are given to the script.▪ Transmit all device credentials: Windows, Linux, and SNMP credentials are all given to the script. <p> All parameters are transmitted in plain text.</p>
Additional Parameters	Define additional parameters to add to the JSON object that is passed to the script as command line parameter. Please enter a string or leave the field empty. <p> All parameters are transmitted in plain text.</p>

SENSOR SETTINGS

Mutex Name Define any desired mutex name for the process. All script sensors having the same mutex name will be executed serially (not simultaneously). This is useful if you use a lot of sensors and want to avoid high resource usage caused by processes running simultaneously. Please enter a string or leave the field empty.

 For more details, please see this Knowledge Base article: [What is the Mutex Name in PRTG's EXE/Script Sensor's settings?](#)

DEBUG OPTIONS

Sensor Result Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.

 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

 You can use **Write sensor result to disk** to inspect the passed JSON object that contains all parameters (PRTG on premises only). This way you can find out which key you can access when you script.

 Transmitted passwords are masked in the logfile.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

SENSOR DISPLAY

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁶⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

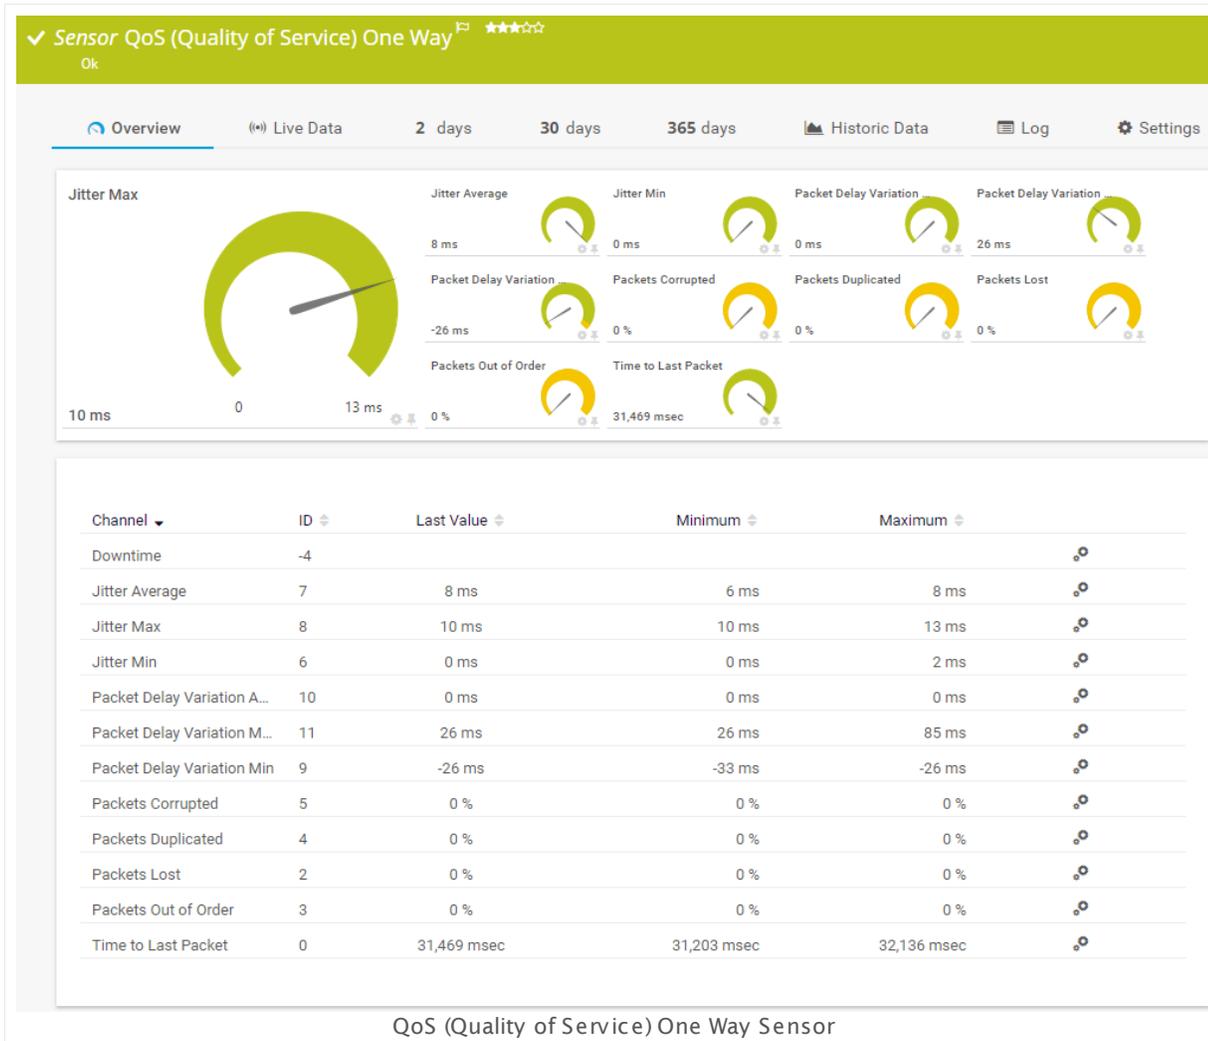

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.105 QoS (Quality of Service) One Way Sensor

The QoS (Quality of Service) One Way sensor monitors parameters regarding the quality of a network connection between two probes. This is important, for example, when using Voice over IP (VoIP) over this connection.

The sensor sends a series of UDP packets from the parent probe to another probe and measures these parameters:

- Jitter in milliseconds (maximum, minimum, average)
- Packet delay variation in milliseconds (maximum, minimum, average)
- Corrupted packets in percent
- Duplicated packets in percent
- Lost packets in percent
- Packets out of order in percent
- Time to last packet in milliseconds

Sensor in Other Languages

Dutch: **QoS (Quality of Service) Eén Richting**, French: **QoS (Quality of Service) à sens unique**, German: **QoS (Quality of Service) Unidirektional**, Japanese: **QoS (Quality of Service) Unidirectional**, Portuguese: **QoS (Qualidade de serviço) Unidirecional**, Russian: **Одностороннее качество обслуживания**, Simplified Chinese: **QoS (Quality of Service) 单向**, Spanish: **QoS (Quality of Service) unidireccional**

Remarks

- You have to configure at least one [remote probe](#) in your PRTG on premises setup for this sensor to work, and at least two remote probes in PRTG hosted by Paessler.
- You can create this sensor on the Probe Device of either a local or remote probe.
- For a general introduction to the technology behind Quality of Service monitoring, please see manual section [Monitoring Quality of Service](#).

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

QUALITY OF SERVICE MEASUREMENT

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Target Probe	<p>Define the target probe that will receive the UDP packets. The dropdown menu shows all local and remote probes in your setup.</p> <p>When running the sensor on the PRTG on premises local probe, select a remote probe as Target Probe. If no remote probe is available, please install and connect a remote probe^[3707] first. When running the sensor on a remote probe, select either another remote probe or the local probe in PRTG on premises as target. The sensor will measure values for the network track between the probe the sensor is created on and the target probe.</p> <p> You must ensure that firewalls, NAT rules, etc. allow UDP packets to reach the target probe. The Windows firewall on the target system will be opened automatically by the probe.</p> <p> In PRTG hosted by Paessler you can only select another remote probe as target probe. QoS measurements for connections to the hosted probe are not possible.</p>
Target Host/IP	Define the IP address of the target probe to which the probe the sensor is created on connects. If you do not use NAT rules, this is usually the address shown above next to the target probe's name.
Port	<p>Define the source and target port for the UDP packets. This port is used on both the source and target probe. Use a different port for each QoS sensor to make sure packets can be assigned correctly. Enter an integer value between 1024 and 65536.</p> <p> This port must be available on both the source and target system.</p>
Number of Packets	Define how many packets the sensor sends with each scanning interval. Please enter an integer value. Default value is 1000 . We recommend that you use the default value.
Size of Packets (Bytes)	Define the size in bytes of the packets that the sensor sends. Please enter an integer value. Default value is 172 . We recommend that you use the default value.
Time between Packets (ms)	Define the time in milliseconds that the sensor waits between two packets. Please enter an integer value. Default value is 20 . We recommend that you use the default value.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵⁵ on PRTG on premises installations.</p>
-------------------	---

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.106 QoS (Quality of Service) Round Trip Sensor

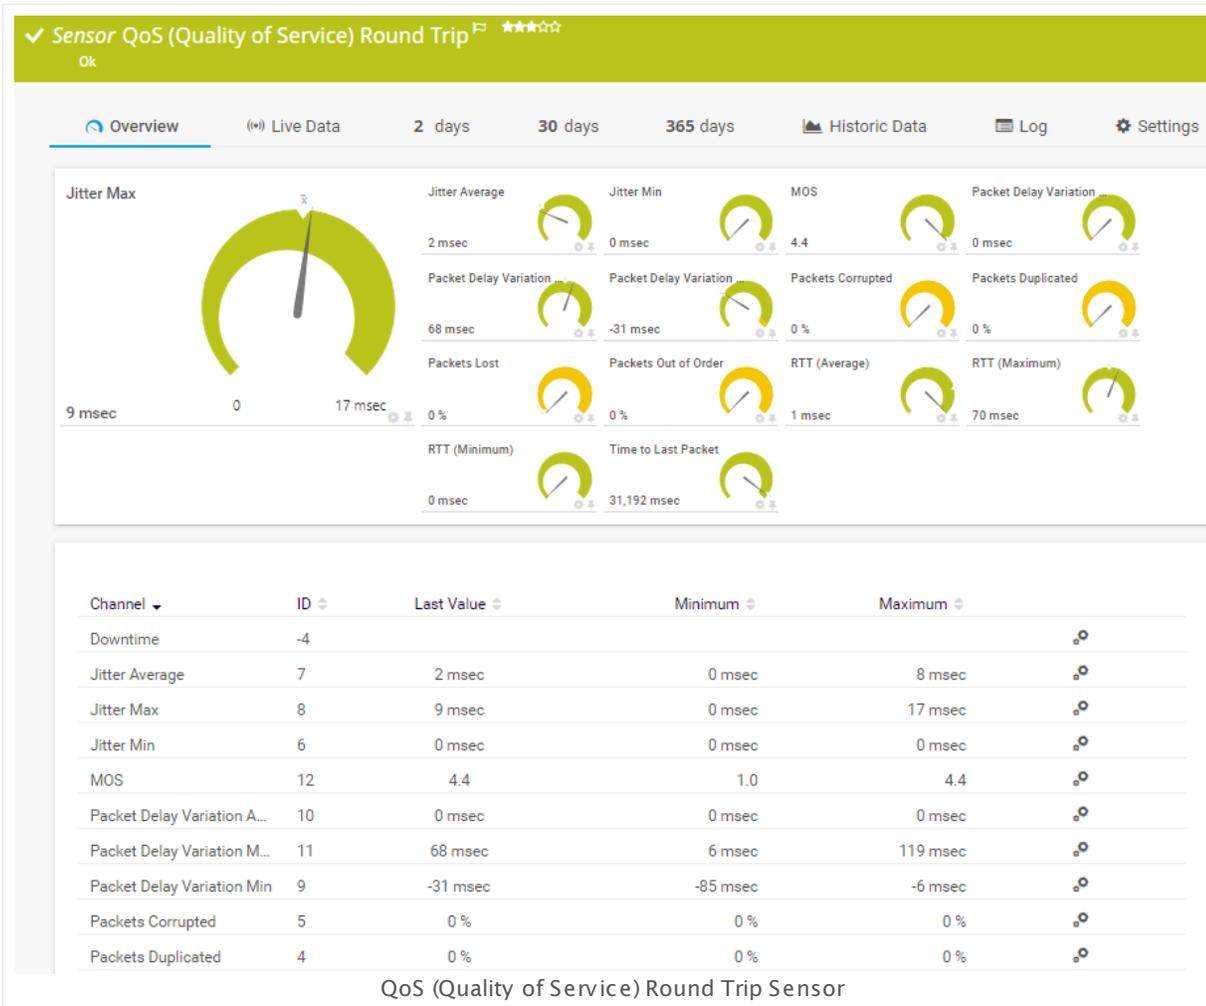

The QoS (Quality of Service) Round Trip sensor monitors parameters regarding the quality of a network connection between two probes. This is important, for example, when using Voice over IP (VoIP) over this connection.

The sensor sends a series of UDP packets from the source probe to a target at the 'end' of the connection line. Then, the packets are sent back to the original probe ("round trip").

The sensor measures the following parameters:

- Jitter in milliseconds (maximum, minimum, average)
- Packet delay variation in milliseconds (maximum, minimum, average)
- MOS (Mean Opinion Score)
- Corrupted packets in percent
- Duplicated packets in percent
- Lost packets in percent
- Packets out of order in percent
- Round trip time (RTT) in milliseconds (maximum, minimum, average)
- Time to last packet in milliseconds

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
 106 QoS (Quality of Service) Round Trip Sensor

QoS (Quality of Service) Round Trip Sensor

Sensor in Other Languages

Dutch: **QoS (Quality of Service) Heen en weer**, French: **Aller-retour du QoS (Quality of Service)**, German: **QoS (Quality of Service) Round Trip**, Japanese: **QoS (Quality of Service)**, Portuguese: **QoS (Qualidade de serviço) Ida e volta**, Russian: **Цикл тестирования качества обслуживания**, Simplified Chinese: **QoS (Quality of Service) Round Trip**, Spanish: **QoS (Calidad de servicio) Round Trip**

Remarks

- You have to configure at least one [remote probe](#) in your PRTG on premises setup and at least two remote probes in PRTG hosted by Paessler, or you need to set up the **PRTG QoS Reflector** tool on the target machine at the endpoint of the monitored connection.
- Knowledge Base: [How can I monitor QoS roundtrips without using remote probes?](#)
- Knowledge Base: [How does PRTG calculate the MOS score for QoS sensors?](#)
- Knowledge Base: [What connection settings are necessary for the QoS \(Quality of Service\) Round Trip Sensor?](#)

- For a general introduction to the technology behind Quality of Service monitoring, please see manual section [Monitoring Quality of Service](#).
- ☁ You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. These are visible above as **Parent Tags**.

It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

QUALITY OF SERVICE MEASUREMENT

Timeout (Sec.) Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is **900** seconds (15 minutes).

QoS Target Define the type of target that will receive the UDP packets. Choose between:

- **PRTG Probe (recommended):** The connection endpoint is a PRTG probe.
- **Custom Target:** Choose this option if you want to use the **PRTG QoS Reflector** as connection endpoint.

 For more information about the QoS Reflector, see this Knowledge Base: [How can I monitor QoS roundtrips without using remote probes?](#)

Target Probe This setting is only available if you select PRTG probe as QoS target. In the dropdown menu, you see all local and remote probes of your setup.

When running the sensor on the PRTG on premises local probe, select a remote probe as **Target Probe**. If no remote probe is available, [install and connect a remote probe](#) first or use the **PRTG QoS Reflector**.

When running the sensor on a remote probe, select either another remote probe or the local probe in PRTG on premises as target. The sensor will measure values for the network track between the probe the sensor is created on and the target probe.

 You must ensure that firewalls, NAT rules, etc. will allow the UDP packets to reach the target probe. The Windows firewall on the target system will be automatically opened by the probe. For details, see this Knowledge Base article: [What connection settings are necessary for the QoS \(Quality of Service\) Round Trip Sensor?](#)

 In PRTG hosted by Paessler you can only select another remote probe as target probe. QoS measurements for connections to the hosted probe are not possible.

QUALITY OF SERVICE MEASUREMENT

Target Host/IP	<p>Define the IP address of the QoS target. If you use the QoS Reflector, enter the address of the machine on which the reflector script runs. If you use a probe, enter the address of the probe to which the probe the sensor is created on connects.</p> <p> If you do not use NAT rules, this is usually the address shown above next to the target probe's name.</p>
Port	<p>Define the source and target port for the UDP packets. This port will be used on both the source and target probe. Use a different port for each QoS sensor to make sure packets can be assigned correctly. Enter an integer value between 1024 and 65536.</p> <p> This port must be available on both the source and target system.</p>
Number of Packets	<p>Define how many packets the sensor sends for each scanning interval. Please enter an integer value. Default value is 1000. We recommend that you use the default value.</p>
Size of Packets (Bytes)	<p>Define the size in bytes of the packets that the sensor sends. Please enter an integer value. Default value is 172. We recommend that you use the default value.</p>
Time between Packets (ms)	<p>Define the time in milliseconds that the sensor waits between two packets. Please enter an integer value. Default value is 20. We recommend that you use the default value.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none">▪ Show channels independently (default): Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

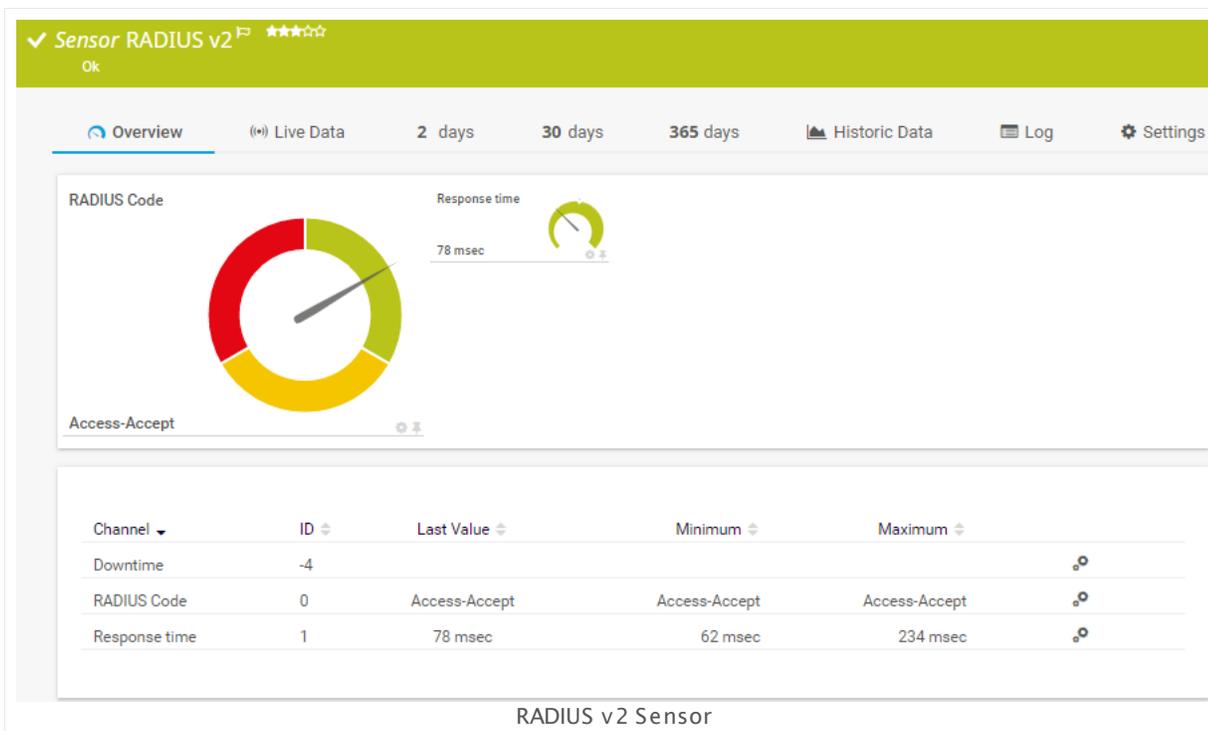

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.107 RADIUS v2 Sensor

The RADIUS v2 sensor monitors a Remote Authentication Dial-In User Service (RADIUS) server according to [RFC 2865](#). The sensor tries to authenticate at the server and shows the following:

- Response time
- RADIUS code:
 - Access-Accept ([sensor status](#)¹⁹⁵ Up)
 - Access-Challenge (Warning)
 - Access-Reject (Down)
- If authentication fails, the sensor will show a **Down status**¹⁹⁵.

Remarks

- [Requires](#)¹⁶²⁹ .NET 4.5 on the probe system.
- This sensor only supports plain text authentication (Password Authentication Protocol (PAP)).
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3276] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags ^[139] , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)¹⁴⁰¹ from objects further up in the device tree. These are visible above as **Parent Tags**.

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority

Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

RADIUS SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value, the request is aborted and an error message is triggered. The maximum value is 900 seconds (15 minutes). Please enter an integer value.
User	Enter the username that is used for authentication at the RADIUS server. Please enter a string.
Password	Enter the password that is used for authentication between the client (this is the PRTG probe on which the sensor runs) and the RADIUS server. Please enter a string.
Secret	Enter the shared secret that is used for authentication between the authenticator (this is the PRTG probe) and the RADIUS server. Please enter a string.
Port	Enter the port number that is used for the connection to the RADIUS server. The default value is 1812 . Please enter an integer value.
Network Access Server	Define how to identify the Network Access Server (NAS) . Choose between: <ul style="list-style-type: none"> ▪ Use NAS IP address: Enter the IP address for identification below. ▪ Use NAS identifier: Enter the identifier below.
NAS IP Address	This field is only visible if you select Use NAS IP address as an identification method above. Enter a valid IP address for the Network Access Server (NAS) that originates the access request.
NAS Identifier	This field is only visible if you select Use NAS identifier above. Enter an identifier for the NAS that originates the access request.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none"> ▪  For more information on how to find the folder used for storage, see section Data Storage ³⁷³⁴. <p> This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵⁵ on PRTG on premises installations.</p>
-------------------	---

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

7.8.108 RDP (Remote Desktop) Sensor

The RDP (Remote Desktop) sensor monitors remote desktop services (RDP, Terminal Services Client).

- It shows the response time of the service.

Sensor in Other Languages

Dutch: **RDP (Remote Desktop)**, French: **RDP (Bureau à distance)**, German: **RDP (Remote Desktop)**, Japanese: **RDP (? ? ? ? ? ? ? ? ?)**, Portuguese: **RDP (desktop remoto)**, Russian: **RDP (удаленный рабочий стол)**, Simplified Chinese: **RDP (? ? ? ?)**, Spanish: **RDP (Escritorio remoto)**

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port	Enter the number of the port to which this sensor connects. Please enter an integer value. Default value is 3389 . We recommend that you use the default value.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.109 REST Custom Sensor

The REST Custom sensor queries a REST Application Programming Interface (API) endpoint and maps the JSON or XML result to sensor values. The mapping rule has to be available as a REST configuration file in JSON template (*.template) format according to the PRTG API definition for custom sensors.

- The sensor can show values returned by a REST API in multiple channels.

For details about the return value format, see section [Custom Sensors](#) ³⁶⁴¹.

REST Custom Sensor

Sensor in Other Languages

Dutch: **REST Aangepast**, French: **REST personnalisé**, German: **REST (Benutzerdef.)**,
 Japanese: **REST ? ? ?**, Portuguese: **REST (Customizado)**, Russian: **Специальные настройки REST**,
 Simplified Chinese: **REST ? ? ?**, Spanish: **REST personalizado**

Remarks

- The REST configuration file that contains the mapping rules must be stored on the system of the probe the sensor is created on: If used on a remote probe, the file must be stored on the system running the remote probe. In a cluster setup, please copy the file to every cluster node.
- This sensor [does not support more than 50 channels](#)¹⁶⁴⁷. If you have more than 50 channel mappings in your REST configuration file, the sensor will show an error.
- In a cluster, status changes triggered by limits only work on the master node.
- Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

BETA

Limited to 50 Sensor Channels

 PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

REST SPECIFIC

REST Configuration	<p>Select a REST configuration from the list. The sensor will use it to map the JSON or XML result from the REST query into sensor values.</p> <p>Default is channelDiscovery. If you choose this REST configuration, the sensor will parse the returned JSON or XML and automatically create channels based on available values: one channel for each number and boolean, for strings if they are convertible into numbers.</p> <p>This list shows all available files in the <code>\Custom Sensors\rest</code> sub-directory of the probe system's PRTG program directory (see Data Storage³⁷²⁴). To appear in this list, store the files as JSON template (*.template) into this folder.</p>
--------------------	---

REST SPECIFIC

 Using custom scripts is not possible on hosted probes. To use custom REST configurations, add this sensor to a remote probe instead and save the file on this system.

To show the expected values and sensor status, your files must return the expected JSON format. Channels, values, and messages must be embedded in valid JSON using JSONPath. For details, see section [Define Sensor Channels and Select Channel Values](#) ^[1658].

 For detailed information on how to build custom sensors and for the expected return format, see section [Custom Sensors](#) ^[3641] for more information.

 There are several REST configuration files available by default. They are ready to use. You can also analyze them to see how to write your own REST configuration.

 When using custom sensors on the **Cluster Probe**, please copy your files to every cluster node installation.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) ^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#) ^[181], as well as in [alarms](#) ^[219], [logs](#) ^[228], [notifications](#) ^[3216], [reports](#) ^[3252], [maps](#) ^[3276], [libraries](#) ^[3235], and [tickets](#) ^[230].

Parent Tags Shows [Tags](#) ^[139] that this sensor [inherits](#) ^[140] from its [parent device, group, and probe](#) ^[133]. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags¹³⁹, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited¹⁴⁰ from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

REST SPECIFIC

Timeout (Sec.)	<p>Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).</p>
Request Method	<p>Choose an HTTP request method to determine how the sensor will request the REST API.</p> <ul style="list-style-type: none">▪ GET (default): Use the GET method to request the REST API.▪ POST: Use the POST method to request the REST API.
Postdata	<p>This field is only visible when you select the POST Request Method setting above. Enter the data part for the POST request here.</p>
Request Protocol	<p>Define the security of the HTTP request. Choose between:</p> <ul style="list-style-type: none">▪ HTTP (default): Send the REST query via insecure HTTP.▪ HTTPS: Send the REST query via secure HTTPS.
Authentication Method	<p>Select the authentication method for access to the REST API. Choose between:</p>

REST SPECIFIC

- **No authentication (default):** Do not use any authentication for the request.
- **Basic authentication:** Use simple username and password authentication.
- **Basic authentication with Windows credentials from parent device:** Use the Windows credentials from the parent device. See section [Inheritance of Settings](#)^[137] for more information.
- **Token:** Use a **JSON Web Token (JWT)** or **OAuth2 Bearer Token** for authentication.

User	This field is only visible if you enable basic authentication above. Enter a username for the REST API. Please enter a string.
Password	This field is only visible if you enable basic authentication above. Enter a password for the REST API. Please enter a string.
Token	This field is only visible if you enable token authentication above. Enter a JWT or OAuth2 Bearer Token that is required by the REST API for authentication.
HTTP Headers	Define if you want to send custom HTTP headers to the target URL. Choose between: <ul style="list-style-type: none"> ▪ Do not use custom HTTP headers ▪ Use custom HTTP headers
Custom HTTP Headers	<p>This field is only available if you select using custom headers above. Enter a list of custom HTTP headers with their respective values that you want to transmit to the URL you define above, each pair in one line. The syntax of a header-value pair is header1:value1</p> <p> The sensor does not support the header field names user-agent, content-length, host.</p> <p> Ensure the HTTP header statement is valid! Otherwise, the sensor request will not be successful.</p>
REST Query	<p>This field shows the REST query that this sensor executes. To change it, enter a valid query for the target REST API. The syntax is: [:port]/path[?var1=val1&...]</p> <p> The first part of the address is always inherited from the parent device's address. Only enter the path to the REST endpoint of the parent device. You can override the port if necessary.</p>

REST SPECIFIC

For example, if you add the sensor to a probe device, a query to the REST API of your PRTG installation that returns the number of sensors on the probe would look like this:

```
/api/table.json?id=1&passhash=<passhash>&username=<username>&c
```

REST Configuration

Shows the REST configuration file that the sensor uses to map returned JSON or XML into sensor values. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

SENSOR DISPLAY

Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> ⓘ This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings^[3160] settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

HTTP Proxy Settings	<p>The proxy settings determine how a sensor connects to a given URL. You can enter data for an HTTP proxy server that sensors will use when connecting via HTTP or HTTPS.</p> <ul style="list-style-type: none"> ⓘ This setting affects monitoring only and determines the behavior of HTTP sensors. To change proxy settings for the core server, see System Administration—Core & Probes^[3368]. ⓘ The SSL Certificate Sensor^[2635] and the SSL Security Check Sensor^[2646] do not support HTTP proxies, but you can configure connections via SOCKS proxies in their sensor settings.
Name	<p>Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.</p>

PROXY SETTINGS FOR HTTP SENSORS

Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	<p>If the proxy requires authentication, enter the username for the proxy login.</p> <p> Only basic authentication is available! Please enter a string or leave the field empty.</p>
Password	<p>If the proxy requires authentication, enter the password for the proxy login.</p> <p> Only basic authentication is available! Please enter a string or leave the field empty.</p>

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ^[336] on PRTG on premises installations.
If a Sensor Query Fails	<p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none"> ▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request. ▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

i Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#) 3209 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Define Sensor Channels and Select Channel Values

In your REST configuration file, you have to define which values of the returned JSON or XML will be mapped to which sensor channels.

- A sensor channel is defined by the channel key in your REST configuration. See the **JSON Return Format: Minimum Example** in section [Custom Sensors](#)³⁶⁴¹.
- A channel value is defined by an expression that retrieves and processes the value from the JSON source. The expression can contain [JSONPath](#)¹⁶⁶⁰, [gval operators](#)¹⁶⁶¹, and [functions](#)¹⁶⁶⁶.

Example

For this example, we take PRTG as REST endpoint and query the sensor status statistics for the local probe. The REST query that we enter in the sensor settings looks like this:

```
/api/table.json?id=1&passhash=<passhash>&username=<username>&content=sensorxref&
noraw=1&filter_basetype=probe&columns=totalsens=extraw,upsens=extraw
downsens=extraw,partialdownsens=extraw,warnsens=extraw,pausedsens=extraw,
unusualsens=extraw,undefinedsens=extraw,downacksens=extraw
```

This REST query will return some JSON, for example:

```
{
  "prtg-version": "17.3.33.2517",
  "treesize": 1,
  "state": "ok",
  "sensorxref": [
    {
      "totalsens": 28,
      "upsens": 18,
      "downsens": 0,
      "partialdownsens": 0,
      "warnsens": 0,
      "pausedsens": 9,
      "unusualsens": 1,
      "undefinedsens": 0,
      "downacksens": 0
    }
  ]
}
```

Your REST configuration has to translate this JSON for the sensor. It has to be available as JSON template (*template) in the `\Custom Sensors\rest` sub-directory of your PRTG probe system. See section [Custom Sensors](#) ³⁶⁴¹ for details about the JSON return format.

The following example returns two channels from the JSON resource that will be added to the sensor in PRTG, **Total** (total sensor count) and **Alarms** (sensors in error status), each selected by their keys in the returned JSON.

```
{
  "prtg": {
    "result": [
      {
        "channel": "Total" ,
        "value": $.sensorxref[0].totalsens
      },
      {
        "channel": "Alarms" ,
        "value": $.sensorxref[0].downsens
      }
    ]
  }
}
```

 There are several REST configuration files available in the `\Custom Sensors\rest` folder by default. They are ready to use. You can also analyze them to see how to write your own REST configuration.

JSONPath

The REST Custom sensor uses **JSONPath** to assign values from the returned JSON to sensor channels. With JSONPath you provide the path to the value in the JSON source that you want to monitor in a sensor channel.

 The JSONPath implementation that PRTG uses for the REST Custom sensor might differ from other JSONPath implementations. You can [test and debug your definitions](#)¹⁶⁶⁸ using the command line. To test simple JSONPath expressions and calculations, you can also use [JSONPath Online Evaluator](#)¹⁶⁷⁰, for example. Please note that this tool might not work properly with complex JSONPath expressions that PRTG supports.

Example

To demonstrate the practical usage of JSONPath, we use this JSON example that a REST query might have returned as reference in this section.

```
{
  "devices": [
    {
      "firmware": {
        "id": "0.7",
        "date": "2017-05-18T17:11:43.7049944Z",
        "channel": "beta"
      },
      "networks": {
        "a": {
          "rx_bytes": 35985021,
          "tx_bytes": 7229493,
          "rx_errors": 0,
          "rx_dropped": 476,
          "tx_bytes": 7229493,
          "tx_packets": 35518,
          "tx_errors": 0,
          "tx_dropped": 1
        },
        "b": {
          "rx_bytes": 40085321,
          "tx_bytes": 55294975
        }
      }
    },
    {
      "networks": {
        "a": {
          "rx_bytes": 63685865,
          "tx_bytes": 7229472
        }
      }
    }
  ]
}
```

REST CUSTOM SENSOR: JSONPATH

Root The dollar sign (\$) matches the root element of the JSON data.

Child You can match a child with `.<key>` or `[<key>]`

- `.<key>` must only contain letters, numbers, and underscore (_). Hyphens (-) are not supported.
- `[<key>]` must only contain a number or a quoted string.

Example

This expression matches **35985021** in the example above:

```
$.devices.0.networks.a.rx_bytes
```

You get the same result with this expression:

```
["$devices"][0]["networks"]["a"]["rx_bytes"]
```

If an element contains a hyphen (-), the `.<key>` notation does not work. Use the `[<key>]` notation in this case:

```
["$data"][0]["system-stats"]["temps"]["Board (CPU)"]
```

Wildcard To match multiple values, you can use the asterisk symbol (*).

- `.*`
- `[*]`

Example

This expression matches **35985021** and **40085321** in the example above:

```
$.devices[0].networks.*.rx_bytes
```

Recursive Descent You can match all sub-items of a node with two dots (..).

Example

This expression matches **7229493** and **55294975** and **7229472** in the example above:

```
$...tx_bytes
```

Union You can match multiple children with `[<key 1>,<key 2>,<...>]`.

Example

This expression matches **35985021** and **7229493** in the example above:

```
$.devices.0.networks.a["rx_bytes","tx_bytes"]
```

REST CUSTOM SENSOR: JSONPATH

- Slice** You can match multiple children of an array with [**<begin>:<end>**] or [**<begin>:<end>:<step>**].
- By default, **begin**, **end**, and **step** are either integers or empty.
 - The default approach is to go step by step from the first array element to the last element.
 - **Step** can also be a negative integer to go through the array in reversed order.

Example

This expression matches **63685865** in the example above:

```
$.devices[-1:].networks.a.rx_bytes
```

- Current** The @ symbol matches the current element.

Example

This expression matches to **40.085321** and **55.294975** in the example above and can be used to receive a percentage value:

```
$.devices[1].networks.a.["rx_bytes","tx_bytes"](@/100000000*100)
```

- Filter** You can filter matches with [**?<expression>**].

Example

This expression matches **35985021** in the example above because the first device is the only one with a beta channel:

```
$.devices[?@.firmware.channel=="beta"].networks.a.rx_bytes
```

- Script** You can modify matches with (**<expression>**) and keys with [**<expression>**].

Example

This expression matches **true** and **false** in the example above because only the first device has a beta channel:

```
$.devices[*](@.firmware.channel=="beta")
```

- Placeholder** Placeholders give access to values of wildcards in a match. A placeholder **#n** (where **n** is a natural number) represents the value of the **n**th wildcard. You can use this in the keys of JSON arrays.

Example

REST CUSTOM SENSOR: JSONPATH

This expression creates a JSON map from **ids** to the corresponding firmware channel and matches **{"0.7":"beta"}** in the example above:

```
{$.devices[#0].id:$.devices[*].channel}
```

 This is an extension of the official JSONPath.

- Constant
 - Numeric constants as 64-bit floating point: **12345.678**
 - String constants with double quotes: **"switch"**
 - Boolean constants: **true** and **false**

- Operator
 - Parentheses control the order of evaluation: **(<expression>)**
 - Arrays with square brackets: **[<expression>, <expression>, ...]**
 - Objects: **{<expression>:<expression>, <expression>:<expression>, ...}**
 - Conditionals: **<condition> ? <expression> : <expression>**

Calculating Channel Values and Functions

You can perform calculations with the values of the source JSON or XML. The sensor uses the Paessler **gval** package for the calculations. Please refer to the [gval documentation](#)¹⁶⁷⁰ for details.

The following operators and functions are available to calculate channel values.

REST CUSTOM SENSOR: OPERATORS

	Oper ator	Description	Operand Type	Out put Type
Infix Modifiers	+	plus	number	number
	-	minus	number	number
	*	times	number	number
	**	power of	number	number
	%	modulo	number	number

REST CUSTOM SENSOR: OPERATORS

	/	divide	number	number
	&	bitwise and	number	number
		bitwise or	number	number
	^	bitwise xor	number	number
	<<	shift left	number	number
	>>	shift right	number	number
Logical Infix Operators	>	greater than	number/string	bool
	>=	equal or greater than	number/string	bool
	<	less than	number/string	bool
	<=	equal or less than	number/string	bool
	==	equal	any	bool
	!=	not equal	any	bool
	=~	match regular expression	string	bool
	!~	mismatch regular expression	string	bool
	in	contains element	any, array	bool
	&&	and	and	bool
	or	or	bool	
??	coalescence	any	any	

REST CUSTOM SENSOR: OPERATORS

Prefix Operators	-	negative	number	number
	~	bitwise not	number	number
	!	not	bool	bool

REST CUSTOM SENSOR: FUNCTIONS

duration
(start,end)

- Calculates the nanoseconds between start and end.
- Both parameters must be RFC3339 date time strings.

Example

```
duration($.devices[0].firmware.date, "017-05-18T17:11:43.7049944Z")
```

now()

- Returns the current date time in RFC3339.

Example

```
duration($.devices[0].firmware.date, now())
```

number(string,
[base])

- Converts a string to a floating point number.
- If the base is not set, it will be detected via the prefix of the string.
 - "0": base = 8
 - "0X": base = 16
 - otherwise: base = 10
- Decimals are only supported at base 10.

Examples

```
number("10.5")
number("a", 16)
```

len(object/
array/string)

- Returns the length of an array or string and counts the number of properties in a JSON object.

Example

```
len($..(number(@)))
```

REST CUSTOM SENSOR: FUNCTIONS

This expression counts every number or string that can be converted into a number. It returns **13** in the example above.

sum(array-/
object-of-
numbers)

- Returns the sum over an array of numbers.

Example

```
sum([1,2,3])
```

This expression returns **6**.

mean(array-/
object-of-
numbers)

- Returns the average value of an array of numbers.

Example

```
mean([1,2,3])
```

This expression returns **2**.

lookup(string,
string, string, ...)

- Returns the index of the given string in a string list, or **-1** if the string is not found.

Example

```
lookup($.device[0].firmware.channel, "stable", "beta", "alpha")
```

This expression returns **1** because **\$.device[0].firmware.channel** resolves to **beta**.

implode(array-/
object-of-string,
string)

- Returns the concatenation of each string in the array, separated by the given string.

Example

```
implode($.tx_bytes, ",")
```

This expression returns **7229493,7229472**.

Generic Channels

You can create a template in your REST configuration that defines generic channels. Generic channels are created based on the data that the REST endpoint returns. When the returned value is an array or object, the sensor will create a channel for each element and concatenate the corresponding key to the channel name.

Example

Imagine you want to have a total byte channel for each network card that is defined in the JSON example above. You can do this by creating a dynamic channel like in the following example.

```
{
  "prtg": {
    "result": [
      {
        "value": {
          "Total bytes on device" + #0 + " in network " + #1: $.devices.*.networks[*](@.rx_bytes + @.tx_by
        },
        "CustomUnit": "Bytes"
      }
    ]
  }
}
```

 Every channel must have unique name. Channels cannot be removed once they are added and will keep their last received value. New channels can be added.

XML Sources

If the REST source returns XML instead of JSON, the sensor will transform the XML result to JSON before replacing the value paths with source values. Because of this, you will not know the structure of the source JSON to correctly provide the paths.

In this case, manually execute the sensor executable **rest.exe** from the **\Sensor System** subfolder of the PRTG probe system. Execute **rest.exe** with the address of the XML endpoint and the parameter **passthrough**. The rest executable will return the converted XML to JSON result that you can use to define the desired paths..

```
rest.exe <xml-endpoint-url> passthrough
```

Usage and Debugging

To create a suitable REST configuration for the sensor, you might want to check the returned JSON or XML and see what happens when your mapping rules apply.

The REST Custom sensor is an EXE sensor, so you can test and debug your configuration by executing **rest.exe** with several parameters. The **rest.exe** is located in the **\Sensor System** subfolder of the PRTG program directory.

Command syntax:

```
rest.exe url template|passthrough|channelDiscovery [flags]
```

REST.EXE: PARAMETERS

url	<ul style="list-style-type: none">▪ Address of the REST API endpoint that returns JSON or XML
template	<ul style="list-style-type: none">▪ Fully qualified path and file name of your REST configuration file used to map the JSON result to the sensor
passthrough	<ul style="list-style-type: none">▪ No mapping, only returning the queried JSON or XML▪ Useful to analyze XML that has been converted to JSON
channelDiscovery	<ul style="list-style-type: none">▪ Creates a channel for every number or boolean in the returned JSON or XML▪ If possible, it converts string values to number or boolean values.

REST.EXE: FLAGS

-authtoken <string>	<ul style="list-style-type: none">▪ JWT or OAuth2 Bearer Token to send with the request in authorization header as Bearer
-authusername <string>	<ul style="list-style-type: none">▪ User name for basic authentication
-authuserpwd <string>	<ul style="list-style-type: none">▪ User password for basic authentication
-post <string>	<ul style="list-style-type: none">▪ {1 0}▪ Default: 0▪ 0 results in a GET request.▪ 1 results in a POST request.
-proxy <string>	<ul style="list-style-type: none">▪ Proxy server connection
-proxyusername <string>	<ul style="list-style-type: none">▪ Proxy user name with basic authentication
-proxyuserpwd <string>	<ul style="list-style-type: none">▪ Proxy user password with basic authentication
-tlsignore <string>	<ul style="list-style-type: none">▪ {1 0}▪ Default: 0

REST.EXE: FLAGS

- 1 will accept self-signed certificates on HTTPS connections
- customheaders <string> ▪ key1:val1|key2:val2|...
- template ▪ Returns the discovered template is you use **channelDiscovery**.
- timeout <integer> ▪ Sensor timeout in seconds
▪ Default: 10

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.110 REST Dell EMC Capacity Sensor

The REST Dell EMC Capacity sensor monitors the disk usage on a Dell EMC storage system via the REST Application Programming Interface (API). Dell EMC systems that provide a REST API are EMC Unity Family, EMC Unity All Flash, EMC Unity Hybrid, and EMC UnityVSA.

The sensor shows the following:

- Response time
- Total size
- Free size
- Free space in percent
- Used size in percent
- Subscribed size
- Compression in percent

✓ Sensor REST Dell EMC Capacity ★★★★☆

REST Dell EMC Capacity Sensor

Sensor in Other Languages

Dutch: **REST Dell EMC Capacity**, French: **Capacité de l'EMC REST Dell**, German: **REST Dell EMC Capacity**, Japanese: **REST Dell EMC ? ?**, Portuguese: **REST Dell EMC Capacidade**, Russian: **Емкость REST Dell EMC**, Simplified Chinese: **REST Dell EMC ? ?**, Spanish: **Capacidad de Dell EMC con REST**

Remarks

- Currently, this sensor type is in beta status. The methods of operating can change at any **BETA** time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

REST SPECIFIC SETTINGS

Authentication Method Select the authentication method for access to the REST API. Choose between:

- **Basic authentication:** Use simple username and password authentication.
- **Basic authentication with Windows credentials from parent device (default):** Use the Windows credentials from the parent device. See section [Inheritance of Settings](#)^[137] for more information.

User This field is only visible if you enable basic authentication above. Enter a username for the REST API. Please enter a string.

Password This field is only visible if you enable basic authentication above. Enter a password for the REST API. Please enter a string.

Certificate Acceptance Select the kind of certificates that you want the sensor to accept for the connection. Choose between:

- **Accept trusted certificates only (default):** Accept only trusted certificates issued by a Certificate Authority (CA).
- **Accept all certificates:** Accept all certificates, including self-signed certificates.

Timeout (Sec.) Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is **900** seconds (15 minutes).

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

HTTP Proxy Settings The proxy settings determine how a sensor connects to a given URL. You can enter data for an HTTP proxy server that sensors will use when connecting via HTTP or HTTPS.

-  This setting affects monitoring only and determines the behavior of HTTP sensors. To change proxy settings for the core server, see [System Administration—Core & Probes](#)³³⁸.
-  The [SSL Certificate Sensor](#)²⁶³⁵ and the [SSL Security Check Sensor](#)²⁶⁴⁶ do not support HTTP proxies, but you can configure connections via SOCKS proxies in their sensor settings.

Name Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.

Port Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.

User If the proxy requires authentication, enter the username for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

Password If the proxy requires authentication, enter the password for the proxy login.

PROXY SETTINGS FOR HTTP SENSORS

-  Only basic authentication is available! Please enter a string or leave the field empty.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

-  Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
-  To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies^[323] in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	<p>This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector^[240] to choose an object on which the current sensor will depend.</p>
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

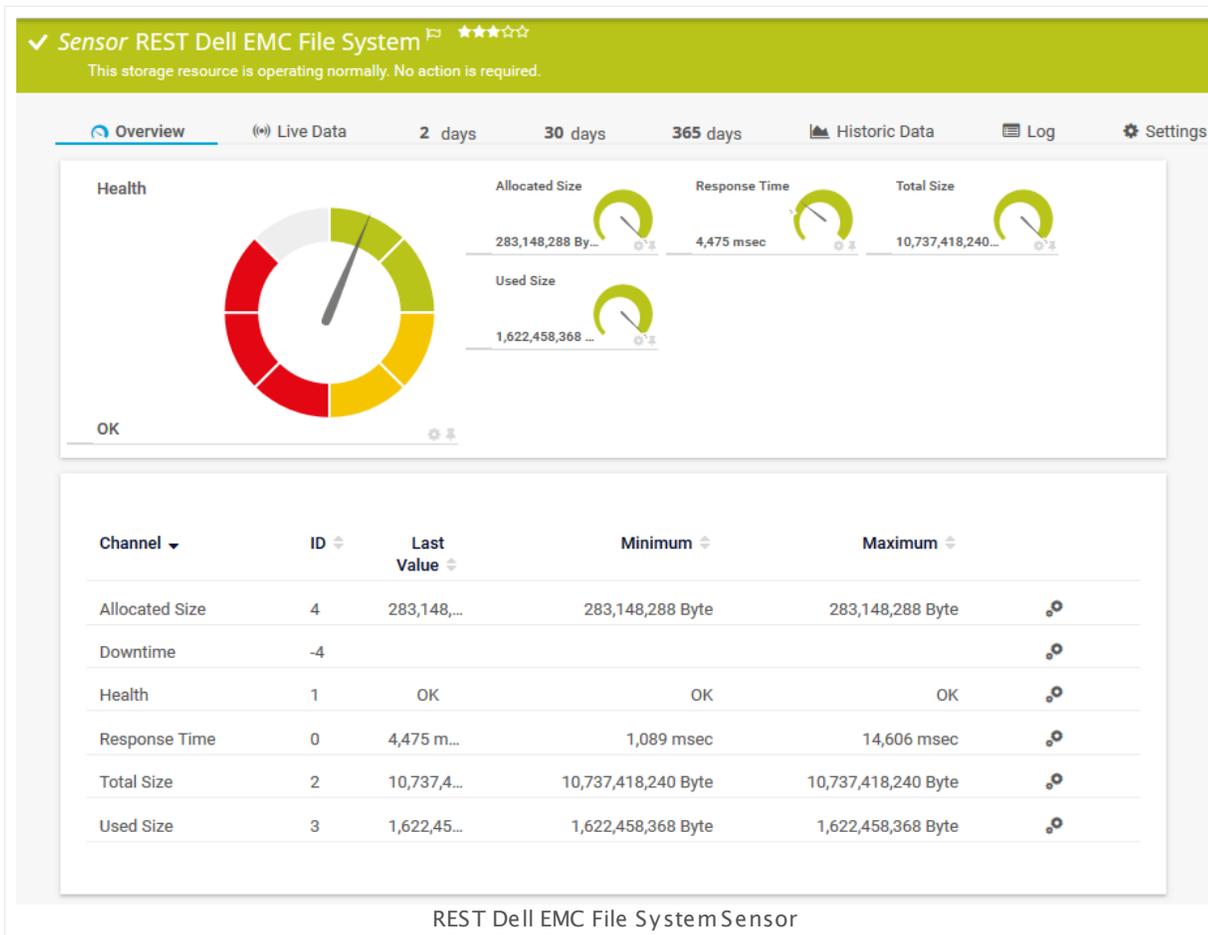

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.111 REST Dell EMC File System Sensor

The REST Dell EMC File System sensor monitors the health of a file system on a Dell EMC storage system via the REST Application Programming Interface (API). Dell EMC systems that provide a REST API are EMC Unity Family, EMC Unity All Flash, EMC Unity Hybrid, and EMC UnityVSA.

The sensor shows the following:

- Response time
- Health status
 - Up [status](#)¹⁹⁵: OK, OK But Minor Warning
 - **Warning** status: Degraded, Minor Issue
 - **Down** status: Major Issue, Critical Issue, Non Recoverable
- Total size
- Used size
- Allocated size

Sensor in Other Languages

Dutch: **REST Dell EMC bestandssysteem**, French: **Système de fichiers EMC REST Dell**, German: **REST Dell EMC Dateisystem**, Japanese: **REST Dell EMC ? ? ? ? ? ? ?**, Portuguese: **REST Dell EMC Sistema de arquivos**, Russian: **Файловая система REST Dell EMC**, Simplified Chinese: **REST Dell EMC ? ? ? ?**, Spanish: **Sistema de archivos de Dell EMC con REST**

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.
- Currently, this sensor type is in beta status. The methods of operating can change at any **BETA** time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page.

Select the file systems you want to monitor. PRTG will create one sensor for each file system you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

EMC SPECIFIC

EMC File System	Select the file system(s) you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
-----------------	--

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

EMC SPECIFIC

EMC File System	Shows the name of the file system that the sensor monitors. This value is shown for reference purposes only. We strongly recommend that you only change it if Paessler support explicitly asks you to do so. Wrong usage can result in incorrect monitoring data!
-----------------	---

REST SPECIFIC SETTINGS

Authentication Method	Select the authentication method for access to the REST API. Choose between: <ul style="list-style-type: none">▪ Basic authentication: Use simple username and password authentication.▪ Basic authentication with Windows credentials from parent device (default): Use the Windows credentials from the parent device. See section Inheritance of Settings^[137] for more information.
User	This field is only visible if you enable basic authentication above. Enter a username for the REST API. Please enter a string.
Password	This field is only visible if you enable basic authentication above. Enter a password for the REST API. Please enter a string.
Certificate Acceptance	Select the kind of certificates that you want the sensor to accept for the connection. Choose between: <ul style="list-style-type: none">▪ Accept trusted certificates only (default): Accept only trusted certificates issued by a Certificate Authority (CA).▪ Accept all certificates: Accept all certificates, including self-signed certificates.
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: <ul style="list-style-type: none">▪ Discard sensor result: Do not store the sensor result.
---------------	---

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 - 🔗 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
- ☁ This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

- 📘 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - 📘 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

HTTP Proxy Settings The proxy settings determine how a sensor connects to a given URL. You can enter data for an HTTP proxy server that sensors will use when connecting via HTTP or HTTPS.

-  This setting affects monitoring only and determines the behavior of HTTP sensors. To change proxy settings for the core server, see [System Administration—Core & Probes](#)³³⁸.
-  The [SSL Certificate Sensor](#)²⁶³⁵ and the [SSL Security Check Sensor](#)²⁶⁴⁶ do not support HTTP proxies, but you can configure connections via SOCKS proxies in their sensor settings.

Name Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.

Port Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.

User If the proxy requires authentication, enter the username for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

Password If the proxy requires authentication, enter the password for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.112 REST Dell EMC LUN Sensor

The REST Dell EMC LUN sensor monitors a logical unit number (LUN) on a Dell EMC storage system via the REST Application Programming Interface (API). Dell EMC systems that provide a REST API are EMC Unity Family, EMC Unity All Flash, EMC Unity Hybrid, and EMC UnityVSA.

The sensor shows the following:

- Health status
 - **Up** [status](#)¹⁹⁵: OK, OK But Minor Warning
 - **Warning** status: Degraded, Minor Issue
 - **Down** status: Major Issue, Critical Issue, Non Recoverable
- Total size
- Compression in percent
- Allocated size
- Metadata size
- Allocated metadata size
- Snapshot size
- Allocated snapshot size

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).
- Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page.

Select the LUNs you want to monitor. PRTG will create one sensor for each LUN that you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

EMC SPECIFIC

EMC LUN Select the file LUN(s) you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

EMC SPECIFIC

EMC LUN Shows the name of the LUN that the sensor monitors. This value is shown for reference purposes only. We strongly recommend that you only change it if Paessler support explicitly asks you to do so. Wrong usage can result in incorrect monitoring data!

REST SPECIFIC SETTINGS

Authentication Method Select the authentication method for access to the REST API. Choose between:

- **Basic authentication:** Use simple username and password authentication.
- **Basic authentication with Windows credentials from parent device (default):** Use the Windows credentials from the parent device. See section [Inheritance of Settings](#)^[137] for more information.

User This field is only visible if you enable basic authentication above. Enter a username for the REST API. Please enter a string.

Password This field is only visible if you enable basic authentication above. Enter a password for the REST API. Please enter a string.

REST SPECIFIC SETTINGS

- Certificate Acceptance** Select the kind of certificates that you want the sensor to accept for the connection. Choose between:
- **Accept trusted certificates only (default):** Accept only trusted certificates issued by a Certificate Authority (CA).
 - **Accept all certificates:** Accept all certificates, including self-signed certificates.
- Timeout (Sec.)** Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is **900** seconds (15 minutes).

DEBUG OPTIONS

- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result:** Do not store the sensor result.
 - **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

SENSOR DISPLAY

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

-  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

HTTP Proxy Settings

The proxy settings determine how a sensor connects to a given URL. You can enter data for an HTTP proxy server that sensors will use when connecting via HTTP or HTTPS.

-  This setting affects monitoring only and determines the behavior of HTTP sensors. To change proxy settings for the core server, see [System Administration—Core & Probes](#)³³⁶⁸.
-  The [SSL Certificate Sensor](#)²⁶³⁵ and the [SSL Security Check Sensor](#)²⁶⁴⁶ do not support HTTP proxies, but you can configure connections via SOCKS proxies in their sensor settings.

PROXY SETTINGS FOR HTTP SENSORS

Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login.  Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login.  Only basic authentication is available! Please enter a string or leave the field empty.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings ³³¹¹ .  Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷ section.

Others

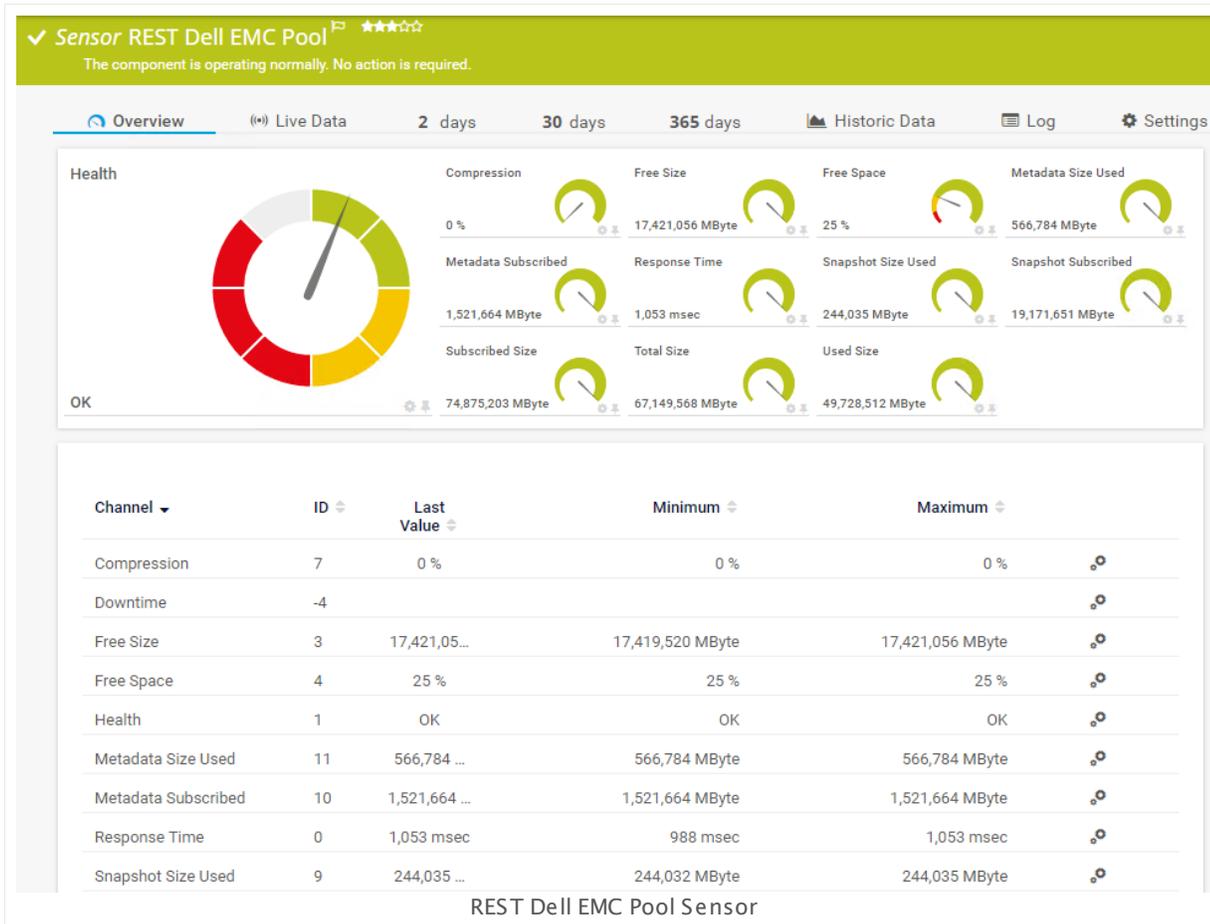

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.113 REST Dell EMC Pool Sensor

The REST Dell EMC Pool sensor monitors a storage pool on a Dell EMC storage system via the REST Application Programming Interface (API). Dell EMC systems that provide a REST API are EMC Unity Family, EMC Unity All Flash, EMC Unity Hybrid, and EMC UnityVSA.

The sensor shows the following:

- Response time
- Health status
 - **Up** [status](#)¹⁹⁵: OK, OK But Minor Warning
 - **Warning** status: Degraded, Minor Issue
 - **Down** status: Major Issue, Critical Issue, Non Recoverable
- Total, free, used, and subscribed size
- Free space in percent
- Compression in percent
- Snapshot subscribed and snapshot size used
- Metadata subscribed and metadata size used

Sensor in Other Languages

Dutch: REST Dell EMC Pool, French: Pool EMC REST Dell, German: REST Dell EMC Pool, Japanese: REST Dell EMC ? ? ? , Portuguese: REST Dell EMC Pool, Russian: Пул REST Dell EMC, Simplified Chinese: REST Dell EMC ? , Spanish: Grupo de Dell EMC con REST

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).
- **BETA** Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page.

Select the storage pools you want to monitor. PRTG will create one sensor for each pool that you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

EMC SPECIFIC

EMC Pool

Select the file pool(s) you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name

Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags

Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

- Tags** Enter one or more [Tags](#)^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.
- You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.
-  It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).
- Priority** Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

EMC SPECIFIC

- EMC Pool** Shows the name of the pool that the sensor monitors. This value is shown for reference purposes only. We strongly recommend that you only change it if Paessler support explicitly asks you to do so. Wrong usage can result in incorrect monitoring data!

REST SPECIFIC SETTINGS

- Authentication Method** Select the authentication method for access to the REST API. Choose between:
- **Basic authentication:** Use simple username and password authentication.
 - **Basic authentication with Windows credentials from parent device (default):** Use the Windows credentials from the parent device. See section [Inheritance of Settings](#)^[137] for more information.

REST SPECIFIC SETTINGS

User	This field is only visible if you enable basic authentication above. Enter a username for the REST API. Please enter a string.
Password	This field is only visible if you enable basic authentication above. Enter a password for the REST API. Please enter a string.
Certificate Acceptance	Select the kind of certificates that you want the sensor to accept for the connection. Choose between: <ul style="list-style-type: none"> ▪ Accept trusted certificates only (default): Accept only trusted certificates issued by a Certificate Authority (CA). ▪ Accept all certificates: Accept all certificates, including self-signed certificates.
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result. ▪ Write sensor result to disk (Filename: "Result of Sensor [ID].txt"): Store the last result received from the sensor to the Logs (Sensor) directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. <ul style="list-style-type: none"> ▪  For more information on how to find the folder used for storage, see section Data Storage³⁷³⁴. <p> This option is not available when the sensor runs on the Hosted Probe of a PRTG hosted by Paessler instance.</p>
---------------	--

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

HTTP Proxy Settings	<p>The proxy settings determine how a sensor connects to a given URL. You can enter data for an HTTP proxy server that sensors will use when connecting via HTTP or HTTPS.</p>
---------------------	--

PROXY SETTINGS FOR HTTP SENSORS

-  This setting affects monitoring only and determines the behavior of HTTP sensors. To change proxy settings for the core server, see [System Administration—Core & Probes](#)³³⁶⁸.
-  The [SSL Certificate Sensor](#)²⁶³⁵ and the [SSL Security Check Sensor](#)²⁶⁴⁶ do not support HTTP proxies, but you can configure connections via SOCKS proxies in their sensor settings.

Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login.
	 Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login.
	 Only basic authentication is available! Please enter a string or leave the field empty.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

-  Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings ³³¹¹ .
	 Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none">▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p> To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none">▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below.▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

i This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

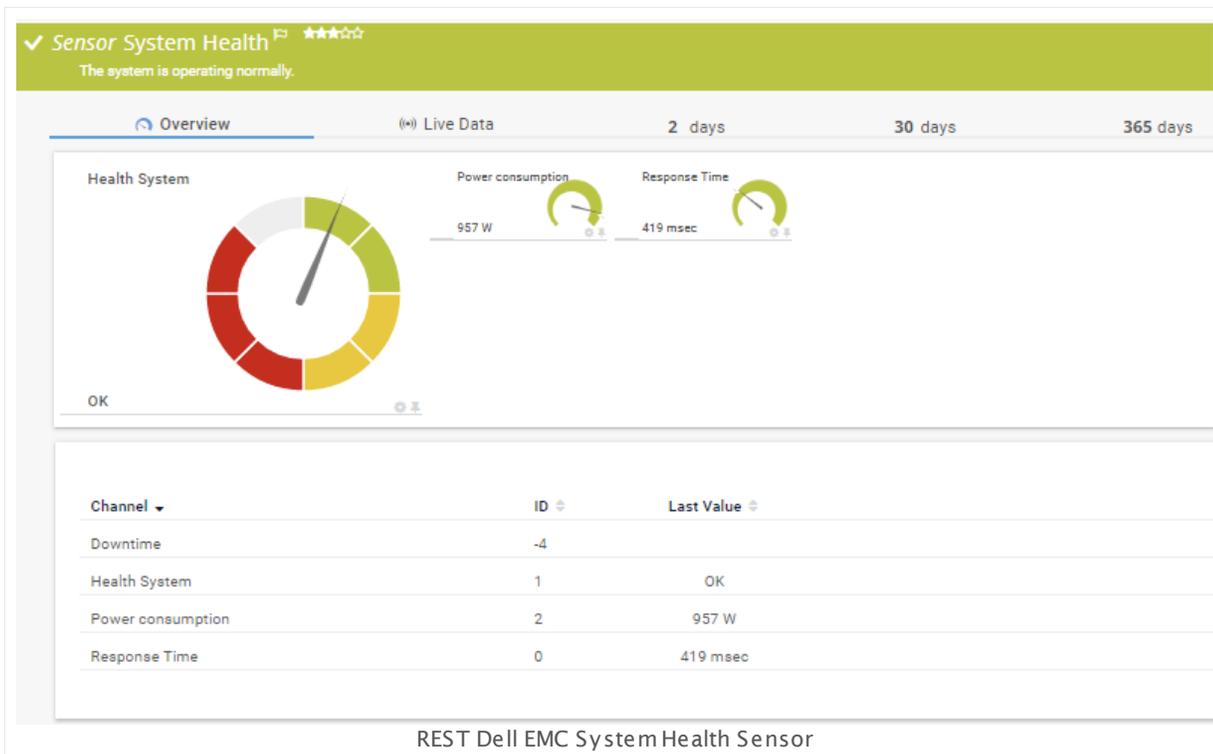

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.114 REST Dell EMC System Health Sensor

The REST Dell EMC System Health sensor monitors the health status of a Dell EMC storage system via the REST Application Programming Interface (API). Dell EMC systems that provide a REST API are EMC Unity Family, EMC Unity All Flash, EMC Unity Hybrid, and EMC UnityVSA.

The sensor shows the following:

- Health status
 - **Up status** ¹⁹⁵¹: OK, OK But Minor Warning
 - **Warning status**: Degraded, Minor Issue
 - **Down status**: Major Issue, Critical Issue, Non Recoverable
- Power consumption

Sensor in Other Languages

Dutch: **REST Dell EMC systeem gezondheid**, French: **État du système EMC REST Dell**, German: **REST Dell EMC Systemzustand**, Japanese: **REST Dell EMC ? ? ? ? ? ? ?**, Portuguese: **REST Dell EMC Funcionamento do sistema**, Russian: **Работоспособность системы REST Dell EMC**, Simplified Chinese: **REST Dell EMC ? ? ? ? ? ? ?**, Spanish: **Estado del sistema de Dell EMC con REST**

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).
- Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

BETA

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags .

BASIC SENSOR SETTINGS

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

REST SPECIFIC SETTINGS

Authentication Method Select the authentication method for access to the REST API. Choose between:

- **Basic authentication:** Use simple username and password authentication.
- **Basic authentication with Windows credentials from parent device (default):** Use the Windows credentials from the parent device. See section [Inheritance of Settings](#)^[137] for more information.

User This field is only visible if you enable basic authentication above. Enter a username for the REST API. Please enter a string.

Password This field is only visible if you enable basic authentication above. Enter a password for the REST API. Please enter a string.

Certificate Acceptance Select the kind of certificates that you want the sensor to accept for the connection. Choose between:

- **Accept trusted certificates only (default):** Accept only trusted certificates issued by a Certificate Authority (CA).
- **Accept all certificates:** Accept all certificates, including self-signed certificates.

Timeout (Sec.) Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is **900** seconds (15 minutes).

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.

 For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.

 This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

HTTP Proxy Settings The proxy settings determine how a sensor connects to a given URL. You can enter data for an HTTP proxy server that sensors will use when connecting via HTTP or HTTPS.

-  This setting affects monitoring only and determines the behavior of HTTP sensors. To change proxy settings for the core server, see [System Administration—Core & Probes](#).
-  The [SSL Certificate Sensor](#) and the [SSL Security Check Sensor](#) do not support HTTP proxies, but you can configure connections via SOCKS proxies in their sensor settings.

Name Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.

Port Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.

User If the proxy requires authentication, enter the username for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

Password If the proxy requires authentication, enter the password for the proxy login.

-  Only basic authentication is available! Please enter a string or leave the field empty.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.115 Sensor Factory Sensor

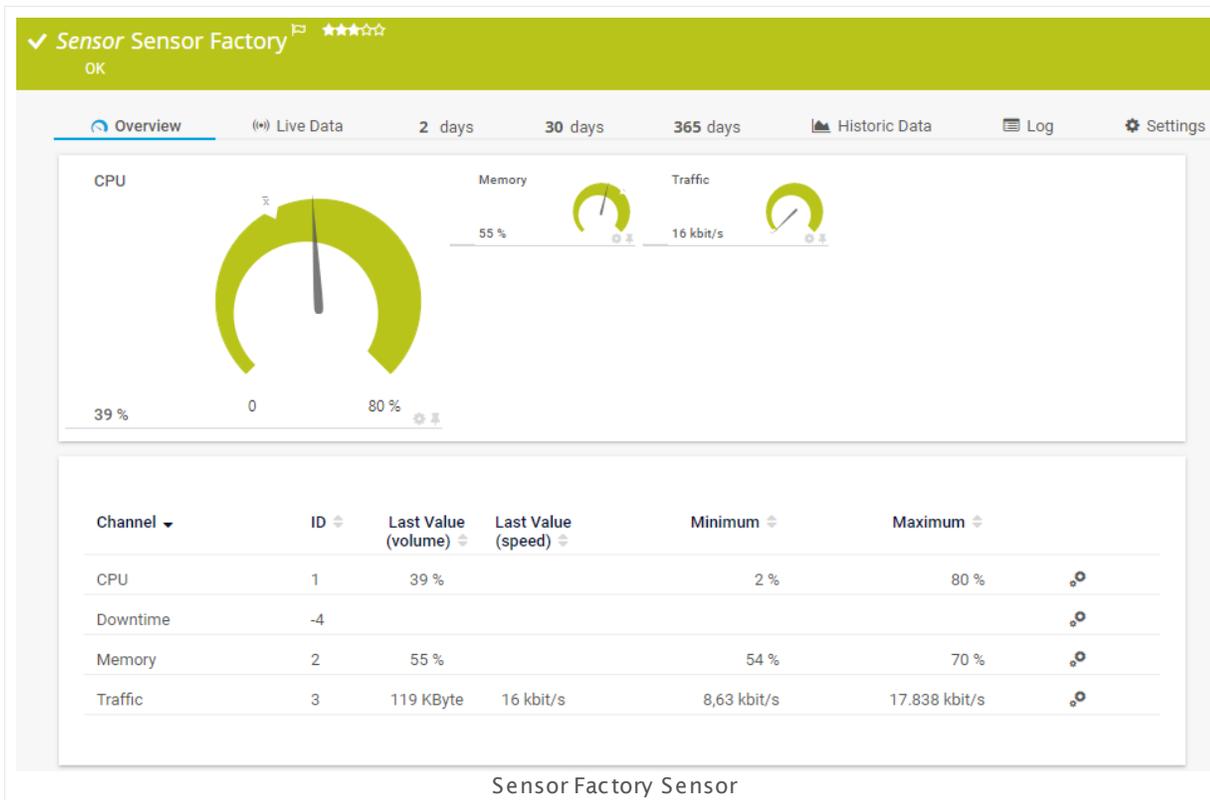

The Sensor Factory sensor is a powerful tool that allows you to monitor entire business processes that involve several components.

You can define one or more channels that combine monitoring results from other sensors or devices. You can create your own individual sensor with channels based on data from other sensors or devices.

Samples for usage are:

- Show single channels of one or more sensors in one graph.
 - Use the data from single channels of one or more sensors to calculate new values (for example, you can subtract, multiply, and divide).
 - Create graphs with data from other sensor channels and add horizontal lines at specific vertical positions.
- ❗ The Sensor Factory sensor does not show values in the **Downtime** channel because they cannot be calculated for this sensor type.
- ❗ If you want to create only a cumulated sensor status based on specific source sensors, we recommend that you use the [Business Process Sensor](#) instead.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **Sensor Fabriek**, French: **Capteur combiné**, German: **Formelsensor**, Japanese: ? ? ? ? ? ? ? ? , Portuguese: **Sensor de fórmula**, Russian: **Фабрика сенсоров**, Simplified Chinese: ? ? ? ? ? ? , Spanish: **Sensor Factory**

Remarks

- This sensor [does not support more than 50 channels](#)^[1721] officially.
- Ensure the [scanning interval](#)^[1725] of this sensor is equal to or greater than the scanning interval of the source sensor(s) to avoid incorrect sensor behavior. For example, "no data" messages or erratic changes of the sensor status can be a result of an invalid scanning interval.
- Knowledge Base: [How can I monitor the overall status of the business process "Email"?](#)
- The Sensor Factory sensor might not work with [flow sensors](#)^[3514]. Sensor types using **active flow timeout**, this is, [NetFlow and jFlow sensors](#)^[430], are not supported by the Sensor Factory sensor.
- [Reports](#)^[204] cannot show uptime or downtime data for this sensor type.
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type per PRTG installation.

Limited to 50 Sensor Channels

 PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR FACTORY SPECIFIC SETTINGS

Channel Definition	<p>Enter a channel definition for the sensor. Using a specific syntax, you can refer to data from channels of other sensors here. You can also calculate values. Enter one channel definition for each new channel you want to add to this sensor.</p> <p> For more information, see section Define Sensor Channels^[1729] below.</p>
--------------------	--

SENSOR FACTORY SPECIFIC SETTINGS

Error Handling

Define the behavior of the sensor if one of the sensors defined above is in an error status. In this case, you can set the sensor factory sensor either to down or to warning status. Choose between:

- **Factory sensor shows error status when one or more source sensors are in error status:** If at least one sensor that you use in a channel definition is in a **Down** status, the Factory sensor shows a **Down** status as well until all referred sensors leave this status. While the Sensor Factory sensor is **Down**, it will still show data of all available sensor channels.
 - ❗ If a [lookup definition](#)³⁶⁹³ or an [error limit](#)³¹⁶² triggers the error status of the source sensor, the Sensor Factory will not show a **Down** status. This is because the Sensor Factory should only show this status if it cannot calculate values.
- **Factory sensor shows warning status when one or more source sensors are in error status:** If at least one sensor that you use in a channel definition is in a **Down** status, the factory sensor shows a **Warning** status until all referred sensors leave the **Down** status.
 - ❗ If a [lookup definition](#)³⁶⁹³ or an [error limit](#)³¹⁶² triggers the error status of the source sensor, the Sensor Factory will not show a **Warning** status. This is because the Sensor Factory should only show this status if it cannot calculate values.
- **Use custom formula:** Define the status of the Factory sensor by adding a status definition in the field below.

SENSOR FACTORY SPECIFIC SETTINGS

Status Definition

This field is only visible if you choose **Use custom formula** above. Define when the sensor will switch to a **Down** status. You can use the `status()` function in combination with Boolean operations. For advanced users it is also possible to calculate a status value.

 For more information, see section [Define Sensor Status](#)¹⁷³⁶ below.

If a Sensor Has No Data

Choose how this Sensor Factory sensor reacts if a sensor referred to in the channel definition does not provide any data (for example, because it is paused or does not exist). Choose between:

- **Do not calculate factory channels that use the sensor:** For defined channels that use one or more sensor(s) that deliver no data, no data is shown.
- **Calculate the factory channels and use zero as source value:** If a sensor that you use in a channel definition does not deliver any data, zero values will be filled in instead. The sensor factory calculates the channel value and shows it using these zero values.

 If a sensor in the channel of a factory sensor has no data, the factory sensor will always show a **Warning** `status`¹⁹⁵, no matter which of the above options you select.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

SENSOR DISPLAY

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

-  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁶⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Define Sensor Channels

The channels of a Sensor Factory sensor are controlled by the **Channel Definition** text field. Using a special syntax you can refer to other sensor channels, calculate values, and add horizontal lines. You can define factory sensor channels using data from any other sensor's channels on your PRTG server.

Example

You see a definition of two factory sensor channels. Both use the `channel()` function, which simply collects data from the channels of other sensors in your monitoring and displays them:

```
#1:Local Probe Health
channel(1001,0)
#2:Local Traffic Out[kbit]
channel(1004,1)
```

The first channel of the factory sensor (**#1**) collects data from the **Health** channel (**ID 0**) of the **Probe Health** sensor (**ID 1001**) running on the Local Probe device. The second channel (**#2**) collects data from the **Traffic out** channel (**ID 1**) of a traffic sensor (**ID 1004**) measuring the system's local network card. Both channels will be shown together in the factory sensor's data tables and graphs.

The basic syntax for a sensor factory channel definition looks like this:

```
#<id>:<name>[<unit>]
<formula>
```

For each channel one section is used. A section begins with the **#** sign. Function names in formulas are not case sensitive.

The parameters are:

- **<id>** is the ID of the factory sensor's channel and must be a unique number that is greater than 0.
- **<name>** is the name of the factory sensor's channel (displayed in graphs and tables).
- **[<unit>]** is an optional unit description for the factory sensor's channel (for example, bytes). If you do not provide a unit, the sensor factory selects a suitable unit string automatically (recommended).
- **<formula>** contains the formula to calculate the factory sensor's channel. For the formula, you can use the following functions: [channel\(\)](#)¹⁷³¹, [min\(\)](#)¹⁷³², [max\(\)](#)¹⁷³², [avg\(\)](#)¹⁷³², or [percent\(\)](#)¹⁷³³.

Define Sensor Channels—Formula Calculations

Within a formula, the following elements are allowed to perform calculations with the values that are returned by one or more functions.

- Basic operations: + (add), - (subtract), * (multiply), / (divide)
Example: $3 + 5 * 2$
- Brackets: ()
Example: $3 * (2 + 6)$

- Compare: = (equal), <> (not equal), > (greater), < (less), >= (greater or equal), <= (less or equal)
If the comparison resolves to true, the value is **10,000**; if false, the value is **0**. For delta sensors the speed is compared.

Example

You see a Sensor Factory channel definition with calculation.

```
#1:Traffic Total x Minus Traffic Out y
( channel(2001,-1) - channel(1004,1) ) * 2
```

This full channel definition results in a factory sensor that shows a calculation with values from two channels (channel IDs **-1** and **1**) of two traffic sensors (sensor IDs **2001** and **1004**). The returned values are subtracted and then multiplied by two.

Channels can be gauge values (for example, ping ms) or delta values (for example, traffic kbit/s). Not all combinations are allowed in a formula.

- ⓘ When performing percentage calculation, please use the [percent\(\) Function](#)¹⁷³⁰ to make sure you obtain the expected values!

There are calculations you **cannot** do:

- You cannot add/subtract a delta from a gauge channel (and vice-versa).
- You cannot multiply two delta channels.
- You cannot compare a delta with a gauge channel.
- You cannot use a channel of (another) Sensor Factory sensor channel in the formula.

Define Sensor Channels—channel() Function

The **channel()** function allows to read the data from a channel of a different sensor. The syntax is:

```
channel(<sensorId>,<channelId>)
```

The parameters are:

- **<sensorId>** is the ID of the sensor. It is displayed on the sensor details page in the [page header bar](#)¹⁸⁵.
- **<channelId>** is the ID of the sensor channel. It is displayed in the respective field of the [channel settings](#)³¹⁶².

Example

```
channel(2001,2)
```

This function reads the data from channel ID **2** of the sensor with the ID **2001**.

```
#1:Sample  
channel(2001,2)
```

This full channel definition reads the data from channel ID **2** of the sensor with the ID **2001** and displays it in the first factory sensor channel (**#1**), without any additional calculations.

Define Sensor Channels—min() and max() Functions

The **min()** and **max()** functions return the minimum or maximum of two values. The syntax is:

```
min(<a>,<b>)  
max(<a>,<b>)
```

Values for **<a>** and **** are either numbers or [channel\(\)](#) functions.

Examples

```
min(10,5)
```

This function in the first line returns **5**, because this is the smaller value out of 10 and 5.

```
min( channel(2001,1),channel(2002,1) )
```

This function returns the minimum of the values of channel **1** of the sensor with ID **2001** and channel **1** of the sensor with ID **2002**.

Define Sensor Channels—avg() Function

The **avg()** function returns the average of the two values. This equals: $(a+b) / 2$. The syntax is:

```
avg(<a>,<b>)
```

Values for **<a>** and **** are either numbers or [channel\(\)](#) functions.

Examples

```
avg(20,10)
```

This function returns **15**: $(20+10) / 2 = 15$.

```
avg( channel(2001,1),channel(2002,1) )
```

This function returns the average of channel **1** of the sensor with ID **2001** and channel **1** of the sensor with ID **2002**.

Define Sensor Channels—percent() Function

The **percent()** function calculates the percent value of two given values, for example, a channel and a fixed value. The syntax is:

```
percent(<source>,<maximum>[,<unit>])
```

The parameters are:

- **<source>** is the value the percent is calculated for. This is usually a [channel\(\)](#)¹⁷³¹ function.
- **<maximum>** is the limit value used for the percent calculation.
- **[<unit>]** is an optional unit the maximum is provided in. You can use constants with this function (see [Constants](#)¹⁷³⁵ section below for a list). This can be used for absolute values (for example, [Ping sensors](#)¹⁵²⁹) or calculated delta values (for example, traffic sensors). If no unit is provided, **1** will be used.
 - ❗ The sensor adds the unit string **%** automatically.

PRTG will calculate: $\text{<source>} / \text{<maximum>} * \text{<unit>} * 100$

Examples

```
#1:Usage Traffic In
percent(channel(2001,0),100,kilobit)
#2:Usage Traffic Out
percent(channel(2001,1),100,kilobit)
```

This full channel definition results in a factory sensor that shows two channels of a traffic sensor (sensor ID **2001**): Traffic in (channel ID **0**) and traffic out (channel ID **1**). The sensor displays the values % of maximum bandwidth (100 kilobit/second).

```
#1:Ping %
percent(channel(2002,0),200)
```

This full channel definition results in a factory sensor that shows the **Ping Time** channel (channel ID **0**) of a Ping sensor (sensor ID **2002**). The sensor displays the values as a percentage of 200 ms.

Define Sensor Channels—Horizontal Lines

You can add lines to the graph using a formula without **channel()** function. Use a fixed value instead. The syntax is:

```
#<id>:<name>[<unit>]
<value>
```

The parameters are:

- **<id>** is the ID of the factory sensor's channel and must be a unique number greater than 1. Although the sensor does not show a horizontal line as a channel, the ID has to be unique.
- **<name>** is the name of the factory sensor's channel. PRTG does not display this name in graphs and tables, but you can use it as a comment to describe the nature of the line.
- **[<unit>]** is an optional unit description (for example, kbit/s). If you do not provide a unit, PRTG applies the line automatically to the scale of the first factory sensor channel. If your factory sensor uses different units, provide a unit to make sure the line is added for the right scale. Enter the unit exactly as shown in your graph's legend. If you enter a unit that does not yet exist in your graph, a new scale will be added automatically.
- **<value>** contains a number defining where the line will be shown in the graph.

Examples

```
#5:Line at 100ms [ms]
100
```

This channel definition results in a graph that shows a horizontal line at the value of **100** on the **ms** scale.

```
#6:Line at 2 Mbit/s [kbit/s]
2000
```

This channel definition results in a graph that shows a horizontal line at the value of **2000** on the **kbit/s** scale.

```
#1:Ping Time
channel(2002,0)
#2:Line at 120ms [ms]
120
```

This full channel definition results in a factory sensor that shows the **Ping Time** channel (channel ID **0**) of a Ping sensor (sensor ID **2002**). Additionally, the sensor graphs will show a horizontal line at **120 ms**.

Define Sensor Channels—Constants

The following constants are defined and can be used in calculations:

- **one** = 1
- **kilo** = 1000
- **mega** = 1000 * kilo
- **giga** = 1000 * mega
- **tera** = 1000 * giga
- **byte** = 1
- **kilobyte** = 1024
- **megabyte** = 1024 * kilobyte
- **gigabyte** = 1024 * megabyte
- **terabyte** = 1024 * gigabyte
- **bit** = 1/8
- **kilobit** = kilo / 8
- **megabit** = mega / 8

- **gigabit** = giga / 8
- **terabit** = tera / 8

Define Sensor Status—status() Function

You can control the status of a Sensor Factory sensor via the **Status Definition** text field if you enable the custom formula option in the [Sensor Settings](#)¹⁷²¹. Using a special syntax, you can define when the factory sensor changes to a **Down** status. In all other cases, the sensor will be in an **Up** status. The syntax is:

```
status(sensorID) <boolean> status(sensorID)
```

The parameters are:

- **<sensorid>** is the ID of the sensor you want to check the status of. It is displayed on the sensor details page in the [page header bar](#)¹⁸⁵.
- **<boolean>** is one of the Boolean operators **AND**, **OR**, or **NOT**. If the resulting expression is **true**, the factory sensor will change to a **Down** status.

Examples

```
status(2031) AND status(2044)
```

This changes the factory sensor to a **Down** status if both sensors, with IDs **2031** and **2044**, are **Down**. Otherwise the factory sensor shows an **Up** status.

```
status(2031) OR status(2044)
```

This changes the factory sensor to a **Down** status if at least one of the sensors with ID **2031** or ID **2044** is **Down**. Otherwise the factory sensor shows an **Up** status.

```
status(2031) AND NOT status(2044)
```

This changes the factory sensor to a **Down** status if the sensor with ID **2031** is **Down**, but the sensor with ID **2044** is **not** in a **Down** status. Otherwise the factory sensor shows an **Up** status.

! A `status()` function with **NOT** has to be connected with **AND** or **OR** if it is combined with other `status()` functions:

```
status(sensorID) AND NOT status(sensorID)
status(sensorID) OR NOT status(sensorID)
```

```
( status(2031) AND status(2044) ) OR status(2051)
```

This changes the factory sensor to a **Down** status if both the sensor with ID **2031** and the sensor with ID **2044** is **Down**, or if the sensor with ID **2051** is **Down**. Otherwise the factory sensor shows an **Up** status.

Additionally, the following elements are allowed to perform calculations and comparisons with the values that are returned by the status functions:

- Basic operations: + (add), - (subtract), * (multiply), / (divide)
Example: $3 + 5 * 2$
- Brackets: ()
Example: $3 * (2 + 6)$
- Compare: = (equal), <> (not equal), > (greater), < (less), >= (greater or equal), <= (less or equal)
If the comparison resolves to true, the value is **10,000**; if false, the value is **0**. For delta sensors the speed is compared.

Internally, the `status()` function returns the downtime channel of the sensor in hundreds of percent (10,000 = 100%).

- **true** corresponds to a value of 10,000, which is a **Down** status.

- **false** corresponds to a value of 0, which is an **Up** status.

If you understand this, you are able to use more complex formulas.

Example

```
( status(1031) + status(1032) + status(1033) + status(1034) ) >= 20000
```

This changes the factory sensor to a **Down** status if at least any two of the sensors with IDs **1031**, **1032**, **1033**, or **1034** are **Down**. Otherwise the factory sensor shows an **Up** status.

i You can also use the `status()` function in [channel definitions](#)¹⁷²⁹. Using this functionality, it is possible, for example, to display the numeric status value of sensors in a factory sensor channel.

Using Factory Sensors in a Cluster Setup

If you run PRTG in [Clustering](#)¹³⁰ mode, please note these additional facts:

- If you add a Sensor Factory sensor underneath the **Cluster Probe**, and in the Sensor Factory formula you refer to a channel of a sensor running on the **Cluster Probe** as well, the Sensor Factory sensor will show the data of all cluster nodes for this sensor channel.
- If you add a Sensor Factory sensor underneath the **Local Probe**, and in the Sensor Factory formula you refer to a channel of a sensor running on the **Cluster Probe**, the Sensor Factory sensor will only show data of the primary master node for this sensor channel.

Edit Sensor Channels

To change display settings and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel.

 For detailed information, see the [Sensor Channels Settings](#)^[3160].

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

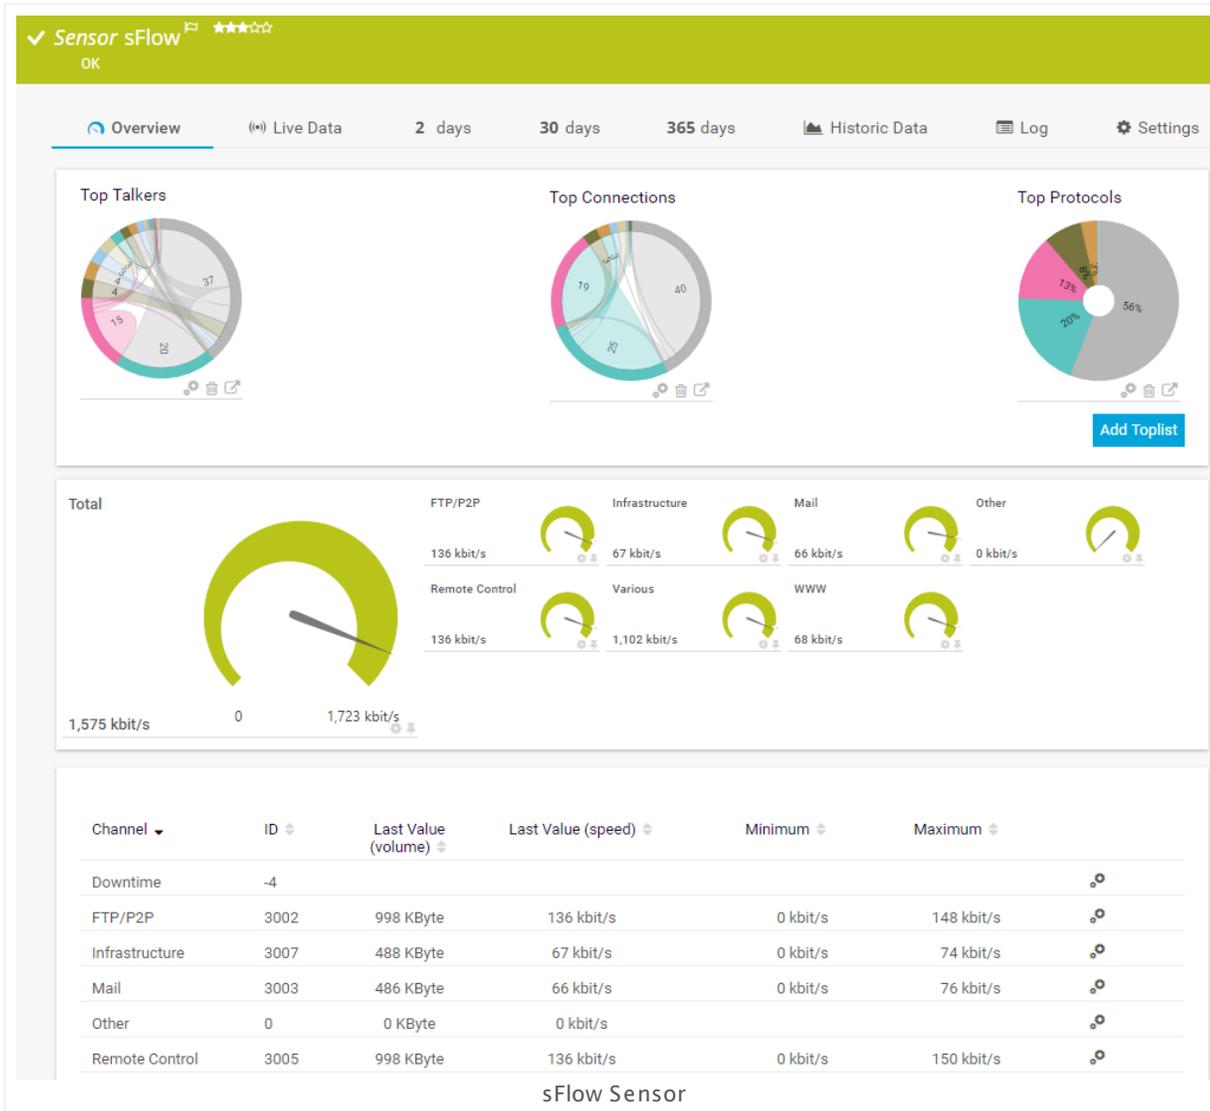

7.8.116 sFlow Sensor

The sFlow sensor receives traffic data from an sFlow V5 compatible device and shows the traffic by type. Only header traffic will be analyzed. Ensure the device matches the sFlow version V5! There are several filter options available to divide traffic into different channels.

This sensor can show the following traffic types in kbit per second:

- Chat (IRC, AIM)
- Citrix
- FTP/P2P (file transfer)
- Infrastructure (network services: DHCP, DNS, Ident, ICMP, SNMP)
- Mail (mail traffic: IMAP, POP3, SMTP)
- NetBIOS
- Remote control (RDP, SSH, Telnet, VNC)
- WWW (web traffic: HTTP, HTTPS)
- Total traffic
- Other protocols (other UDP and TCP traffic)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Remarks

- You must enable sFlow V5 export on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
- The sensor accepts RAW data only. The stream must be sent via IPv4.
- This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
- There are several [limitations](#) for this sensor type.
- Paessler Website: [Paessler sFlow Tester](#)
- Knowledge Base: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)
- Knowledge Base: [Where is the volume line in graphs?](#)

- For a general introduction to the technology behind flow monitoring, please see manual section [Monitoring Bandwidth via Flows](#)³⁵¹⁴.

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Limitations of This Sensor Type

There are some limitations that you want to consider before using this sensor type:

- Only sFlow version 5 datagrams are supported
- Only IPv4 flows are supported
- Only the "raw packet header" format is supported
- Only the "Flow sample" and "Extended flow" formats are supported. "Counter" formats cannot be processed
- PRTG processes only samples where the source ID matches the ifIndex of the input interface (avoiding double counted traffic) and ascending sequence numbers.
- Sample packets have to be of ethernet type "IP" (with optional VLAN tag)
- Sampled packets of type TCP and UDP are supported

 We recommend that you use the sFlow tester for debugging. Please download it here: [Paessler sFlow Tester](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SFLOW SPECIFIC SETTINGS

Receive sFlow Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the sFlow export options of your hardware router device. Default value is 6343 . Please enter an integer value.  When configuring export, ensure you select the appropriate sFlow version 5.
Sender IP	Enter the IP address of the sending device you want to receive the sFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.

SFLOW SPECIFIC SETTINGS

Receive sFlow Packets on IP Select the IP address(es) on which PRTG listens to sFlow packets. The list of IP addresses shown here is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address selected here must match the one configured in the sFlow export options of your hardware router device.

 When configuring export, ensure you select the appropriate sFlow version 5.

Log Stream Data to Disk (for Debugging) Define if you want the probe to write a logfile of the stream and packet data to the data folder (see [Data Storage](#)³⁷³⁴). Choose between:

- **None (recommended):** Do not write additional logfiles. Recommended for normal use cases.
- **Only for the 'Other' channel:** Only write logfiles of data that is not filtered otherwise and therefore accounted to the default **Other** channel.
- **All stream data:** Write logfiles for all data received.

 Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

CHANNEL CONFIGURATION

Channel Selection Define the categories the sensor accounts the traffic to. There are different groups of traffic available. Choose between:

- **Web:** Internet web traffic.
- **File Transfer:** Traffic caused by FTP.
- **Mail:** Internet mail traffic.
- **Chat:** Traffic caused by chat and instant messaging.
- **Remote Control:** Traffic caused by remote control applications, such as RDP, SSH, Telnet, and VNC.
- **Infrastructure:** Traffic caused by network services, such as DHCP, DNS, Ident, ICMP, and SNMP.
- **NetBIOS:** Traffic caused by NetBIOS communication.
- **Citrix:** Traffic caused by Citrix applications.

CHANNEL CONFIGURATION

- **Other Protocols:** Traffic caused by various other protocols via UDP and TCP.

For each traffic group, you can select how many channels will be used for each group, that is, how detailed the sensor divides the traffic. For each group, choose between:

- **No (X icon):** Do not account traffic of this group in its own channel. All traffic of this group is accounted to the default channel named **Other**.
- **Yes (check mark icon):** Count all traffic of this group and summarize it into one channel.
- **Detail (magnifier icon):** Count all traffic of this group and further divide it into different channels. The traffic appears in several channels as shown in the **Content** column.
 - ⚠ Extensive use of this option can cause load problems on your probe system. We recommend setting specific, well-chosen filters for the data you really want to analyze.

 You can change the default configuration for groups and channels. For details, see this Knowledge Base article: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)

FILTERING

Include Filter Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax.

 For detailed information, see section [Filter Rules](#)¹⁷⁵¹ below.

Exclude Filter First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax.

 For detailed information, see section [Filter Rules](#)¹⁷⁵¹ below.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none">▪ Show channels independently (default): Show an own graph for each channel.▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

PRIMARY TOPLIST

Primary Toplist	<p>Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:</p> <ul style="list-style-type: none">▪ Top Talkers▪ Top Connections▪ Top Protocols▪ [Any custom toplists you have added]
-----------------	--

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings.</p> <ul style="list-style-type: none"> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> <p>▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.</p> <p>▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.</p> <ul style="list-style-type: none"> <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)  for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail.

 For more information, see section [Toplists](#) .

Filter Rules

The following filter rules apply to all xFlow, IPFIX, and Packet Sniffer sensors.

FIELD	POSSIBLE FILTER VALUES
IP	IP address or DNS name (see Valid Data Formats )
Port	Any number
SourceIP	IP address or DNS name (see Valid Data Formats )
SourcePort	Any number
DestinationIP	IP address or DNS name (see Valid Data Formats )
DestinationPort	Any number

FIELD	POSSIBLE FILTER VALUES
Protocol	TCP, UDP, ICMP, OSPFIGP, any number
TOS	Type Of Service: any number
DSCP	Differentiated Services Code Point: any number

The following filter rules apply to sFlow sensors only.

FIELD	POSSIBLE FILTER VALUES
Interface	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see Valid Data Formats)
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address

7.8.117 sFlow (Custom) Sensor

The sFlow (Custom) sensor receives traffic data from an sFlow V5 compatible device and shows the traffic by type. Please make sure the device matches the sFlow version V5! There are several filter options available to divide traffic into different channels.

- This sensor can show traffic by type individually according to your needs.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: sFlow (Custom), French: sFlow (personnalisé), German: sFlow (Benutzerdef.), Japanese: sFlow(? ? ? ?), Portuguese: sFlow (customizado), Russian: sFlow (нестандартный), Simplified Chinese: sFlow(? ? ?), Spanish: sFlow (Personalizado)

Remarks

- You must enable sFlow V5 export on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
 - The sensor accepts RAW data.
 - This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
 - There are several [limitations](#)¹⁷⁵⁵ for this sensor type.
 - Paessler Website: [Paessler sFlow Tester](#)
 - Knowledge Base: [Where is the volume line in graphs?](#)
 - For a general introduction to the technology behind flow monitoring, please see manual section [Monitoring Bandwidth via Flows](#)³⁵¹⁴.
-  You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Limitations of This Sensor Type

There are some limitations that you want to consider before using this sensor type:

- Only sFlow version 5 datagrams are supported
- Only IPv4 flows are supported
- Only the "raw packet header" format is supported
- Only the "Flow sample" and "Extended flow" formats are supported. "Counter" formats cannot be processed
- PRTG processes only samples where the source ID matches the ifIndex of the input interface (avoiding double counted traffic) and ascending sequence numbers.
- Sample packets have to be of ethernet type "IP" (with optional VLAN tag)
- Sampled packets of type TCP and UDP are supported

 We recommend that you use the sFlow tester for debugging. Please download it here: [Paessler sFlow Tester](#)

Limited to 50 Sensor Channels

 PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SFLOW SPECIFIC SETTINGS

Receive sFlow Packets on UDP Port	<p>Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the sFlow export options of your hardware router device. Default value is 6343. Please enter an integer value.</p> <p> When configuring export, ensure you select the appropriate sFlow version 5.</p>
Sender IP	<p>Enter the IP address of the sending device you want to receive the sFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.</p>
Receive sFlow Packets on IP	<p>Select the IP address(es) on which PRTG listens to sFlow packets. The list of IP addresses shown here is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address selected here must match the one configured in the sFlow export options of your hardware router device.</p> <p> When configuring export, ensure you select the appropriate sFlow version 5.</p>

Channel Definition	<p>Enter a channel definition to divide the traffic into different channels. Write each definition in one line. All traffic for which no channel is defined will be accounted to the default channel named Other.</p> <p> For detailed information, see section Channel Defintions for xFlow and Packet Sniffer Sensors³⁶⁹⁰.</p> <p> Extensive use of many filters can cause load problems on your probe system. We recommend defining specific, well-chosen filters for the data you really want to analyze.</p>
Log Stream Data to Disk (for Debugging)	<p>Define if you want the probe to write a logfile of the stream and packet data to the data folder (see Data Storage³⁷³⁴). Choose between:</p> <ul style="list-style-type: none"> ▪ None (recommended): Do not write additional logfiles. Recommended for normal use cases. ▪ Only for the 'Other' channel: Only write logfiles of data that is not filtered otherwise and therefore accounted to the default Other channel. ▪ All stream data: Write logfiles for all data received. <p> Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.</p>

FILTERING

- Include Filter** Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax.
-  For detailed information, see section [Filter Rules](#)¹⁷⁶⁴ below.
- Exclude Filter** First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax.
-  For detailed information, see section [Filter Rules](#)¹⁷⁶⁴ below.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).
- Stack Unit** This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

PRIMARY TOPLIST

Primary Toplist Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:

- **Top Talkers**
- **Top Connections**
- **Top Protocols**
- **[Any custom toplist you have added]**

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.

SCANNING INTERVAL

- **Set sensor to "warning" for 2 intervals, then set to "down":**
Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- ❶ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- ❶ If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- ❶ If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

❶ Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

❶ Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none">▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p> To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none">▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below.▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

i This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplist, you can review traffic data of small time periods in great detail.

 For more information, see section [Toplists](#)³¹⁸⁶.

Filter Rules

The following filter rules apply to all xFlow, IPFIX, and Packet Sniffer sensors.

FIELD	POSSIBLE FILTER VALUES
IP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
Port	Any number
SourceIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
SourcePort	Any number
DestinationIP	IP address or DNS name (see Valid Data Formats ³⁶⁸⁹)
DestinationPort	Any number

FIELD	POSSIBLE FILTER VALUES
Protocol	TCP, UDP, ICMP, OSPFIGP, any number
TOS	Type Of Service: any number
DSCP	Differentiated Services Code Point: any number

The following filter rules apply to sFlow sensors only.

FIELD	POSSIBLE FILTER VALUES
Interface	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see Valid Data Formats)
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address

7.8.118 SFTP Secure File Transfer Protocol Sensor

The SFTP Secure File Transfer Protocol sensor monitors FTP servers of a Linux/Unix system using SSH File Transfer Protocol (FTP over SSH).

- It tries to connect to the server and shows the response time.

Sensor in Other Languages

Dutch: **SFTP Secure File Transfer Protocol**, French: **Protocole sécurisé de transfert de fichiers SFTP (Secure File Transfer Protocol)**, German: **SFTP Secure File Transfer Protocol**, Japanese: **SFTP(Secure File Transfer Protocol)**, Portuguese: **SFTP Secure File Transfer Protocol**, Russian: **Защищенный протокол передачи файлов SFTP**, Simplified Chinese: **SFTP ? ? ? ? ? ? ? ?**, Spanish: **SFTP Secure File Transfer Protocol**

Remarks

- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.
- This sensor type cannot support all Linux/Unix and Mac OS distributions.
- For a general introduction to SSH monitoring, please see manual section [Monitoring via SSH](#).
- Knowledge Base: [SSH and SFTP Sensors in Unknown Status](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH SPECIFIC

Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time the sensor will wait to establish a connection to the host. Keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.</p> <p> The sensor types SSH SAN Enclosure, SSH SAN Logical Disk, SSH SAN Physical Disk, SSH SAN System Health have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.</p> <p> Ensure the connection timeout is a higher value than the shell timeout to avoid potential errors.</p>
Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor will wait for the shell to return a response after it has sent its specific command (for example, <code>cat /proc/loadavg</code>). The maximum value is 300 seconds (5 minutes). Please enter an integer value.</p> <p> The sensor types SSH SAN Enclosure, SSH SAN Logical Disk, SSH SAN Physical Disk, SSH SAN System Health have a fixed timeout of 300 seconds. Changing the value here will not have an effect on the timeout.</p> <p> Ensure the shell timeout is a lower value than the connection timeout to avoid potential errors.</p>
SSH Port	<p>Define which port this sensor uses for the SSH connection. Choose between:</p> <ul style="list-style-type: none">▪ Inherit port number from parent device (default): Use the port number as defined in the Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems^[408] section of the device this sensor is created on.▪ Enter custom port number: Define a custom port number below and do not use the port number from the parent device settings.
Use Port Number	<p>This field is only visible if you choose Enter custom port number above. Enter the port number (between 1 and 65535) that this sensor will use for the SSH connection. Please enter an integer value.</p>
SSH Engine	<p>Select the method you want to use to access data with this SSH sensor^[3510]. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between:</p>

SSH SPECIFIC

- **Inherit from parent device (default):** Use the SSH engine that you have defined in the parent device settings or higher in the [object hierarchy](#)¹³³. If you did not change it, this is the recommended default engine.
 - **Default:** This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option.
 - **Compatibility Mode (deprecated):** Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.
-  The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).

Result Handling

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result:** Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error:** Store the last result of the sensor only if it throws an error.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: SSH and SFTP Sensors in Unknown Status

- <https://kb.paessler.com/en/topic/79174>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

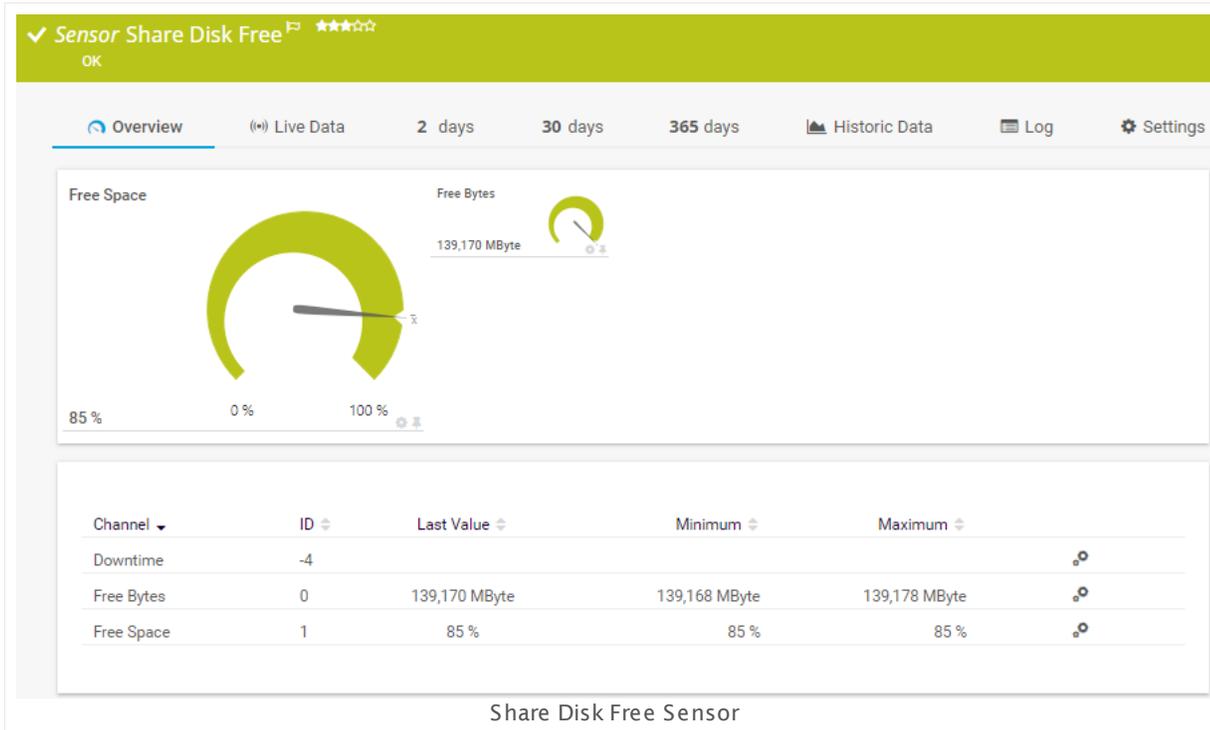

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.119 Share Disk Free Sensor

The Share Disk Free sensor monitors free disk space of a share (Windows/Samba) using Server Message Block (SMB).

- It shows the free disk space in percent and bytes.

Sensor in Other Languages

Dutch: **Share Disk Ruimte**, French: **Espace disque libre partagé**, German: **Freigaben-Speicherplatz**, Japanese: **?** **?** **?** **?** **?** **?** **?** **?** **?** **?**, Portuguese: **Disco livre para compartilhamento**, Russian: **Свободное дисковое пространство общего ресурса**, Simplified Chinese: **?** **?** **?** **?** **?** **?** **?** **?** **?** **?**, Spanish: **Disco libre share**

Remarks

- [Requires](#) ¹⁷⁷⁸ the LanmanServer Windows service to be running on the target device.
- This sensor only works if no quotas are enabled on the target share. If there are quotas enabled for the user account this sensor uses to connect to the share, the absolute value will be okay, but the percentage variable will show wrong values.
- Knowledge Base: [What can I do if PRTG doesn't succeed with monitoring a share? PE029 PE032](#)

 You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Requirement: LanmanServer Windows Service

- ✘ To monitor shares on Windows machines, please make sure the **LanmanServer** "Server" Windows service is running on the target computer.

To enable the service, please log in to the respective computer and open the services manager (for example, via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

- ℹ Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags .

BASIC SENSOR SETTINGS

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SHARE CONFIGURATION

Share Enter the name of the share this sensor will monitor. Only a share name is allowed here (for example, enter C\$). Please do not enter a complete UNC name here. The server name (\\server) is taken from the parent device of this sensor.

 To provide any shares under Windows, the LanmanServer "Server" Windows service must be running on the target computer.

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#).

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: What can I do if PRTG doesn't succeed with monitoring a share? PE029 PE032

- <https://kb.paessler.com/en/topic/513>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

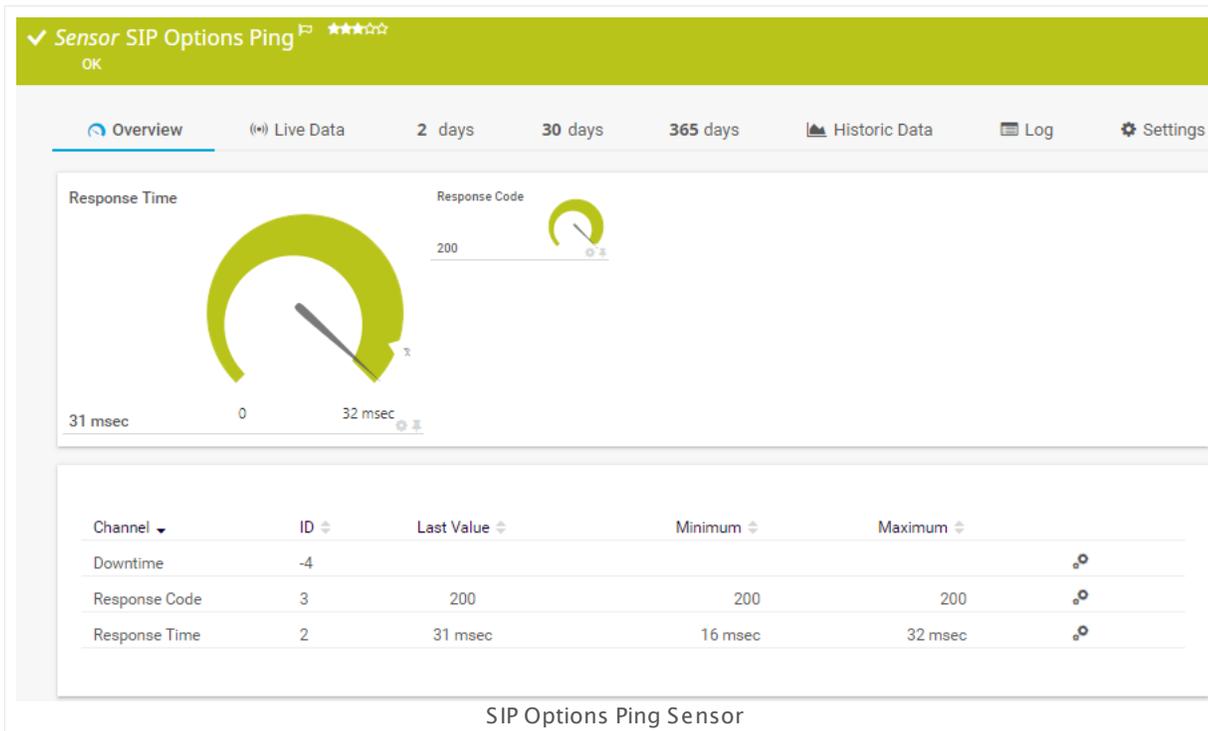

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.120 SIP Options Ping Sensor

The SIP Options Ping sensor monitors the connectivity for a Session Initiation Protocol (SIP) server using SIP options "Ping". You can use it to monitor Voice over IP (VoIP) services. The sensor sends **auth** and **options** requests to the SIP server. It can alert in case of an error.

It can show the following:

- Response time of the SIP server
- Response code: You can individually define the status for each individual response code by editing the [lookup](#) file `prtg.standardlookups.sip.statuscode`

Sensor in Other Languages

Dutch: **SIP Opties Ping**, French: **Ping SIP Options**, German: **SIP Options Ping**, Japanese: **SIP Ping**, Portuguese: **SIP Options Ping**, Russian: **Ping параметров SIP**, Simplified Chinese: **SIP Ping**, Spanish: **Opciones Ping SIP**

Remarks

- [Requires](#) .NET 4.5 or later on the probe system.
- An SIP server might return the error **480 Service temporarily unavailable** until at least one reachable SIP client is connected to the server.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).

- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

 This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)^[3709]. If the framework is missing, you cannot create this sensor.

Required **.NET** version (with latest update): .NET 4.5, .NET 4.6, or .NET 4.7.

 For more information, please see this Knowledge Base article: [Which .NET version does PRTG require?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3276] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags¹³⁹, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited¹⁴⁰ from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

SIP SPECIFIC

Port	<p>Enter the number of the port to which this sensor connects. Please enter an integer value. The default UDP port is 5060.</p>
Username	<p>Enter the username of the SIP account this sensor will log on to after a connection to the SIP server has been established. Please enter a string.</p>
Password	<p>Enter the password of the SIP account this sensor will log on to after a connection to the SIP server has been established. Please enter a string.</p>
Timeout (Sec.)	<p>Enter the timeout for the connection to the SIP server. Please enter an integer value. The maximum value is 300.</p>
Retry Count	<p>If the connection to the SIP server fails, the sensor tries to connect again. Enter the maximum number of retries. After reaching the maximum count, the sensor will show a red Down status¹⁹⁵. Please enter an integer value.</p>

DEBUG OPTIONS

- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result:** Do not store the sensor result.
 - **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).
- Stack Unit** This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: Which .NET version does PRTG require?

- <https://kb.paessler.com/en/topic/60543>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

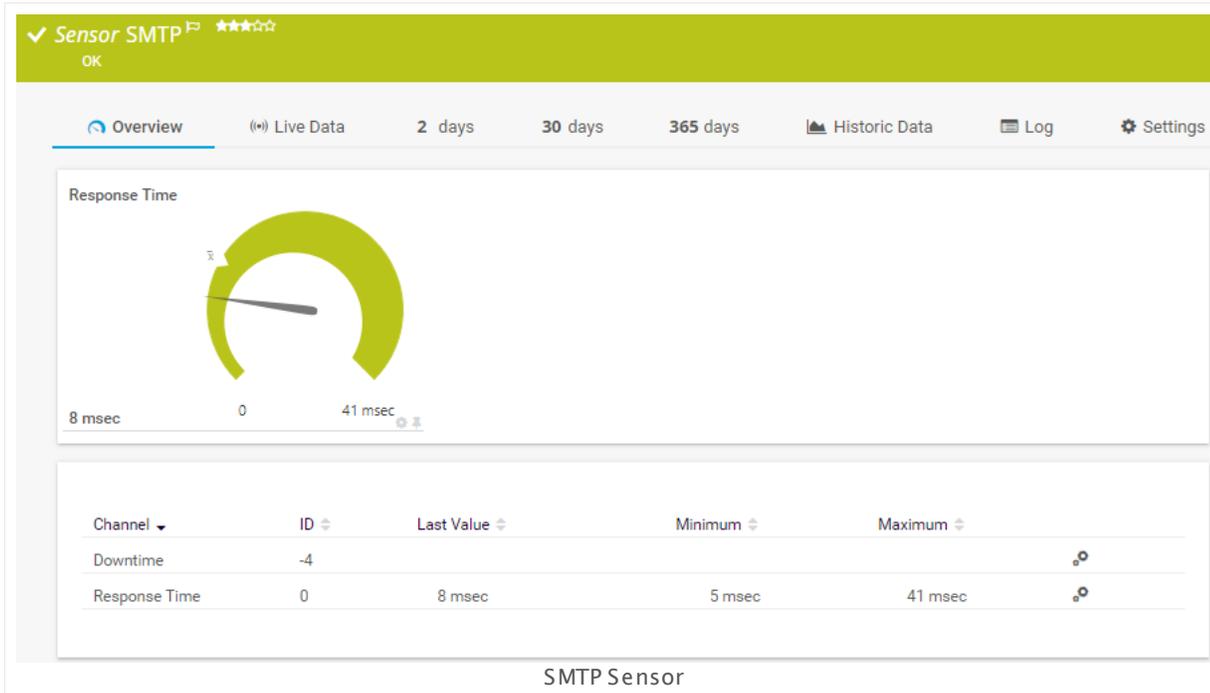

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.121 SMTP Sensor

The SMTP sensor monitors a mail server using Simple Mail Transfer Protocol (SMTP) and can optionally send a test email with every check.

- It shows the response time of the server.

Remarks

- This sensor type does not support Secure Remote Password (SRP) ciphers.
- ☁ You cannot add this sensor type to the **Hosted Probe** of a PRTG hosted by Paessler instance. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SMTP SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port	Enter the number of the port that the sensor uses to send an email via SMTP. For non-secure connections usually port 25 is used, for SSL/TLS connections port 465 or 587 . The actual setting depends on the server you connect to.

SMTP SPECIFIC

If you do not get a connection, try another port number.

Please enter an integer value. We recommend that you use the default value.

AUTHENTICATION

Type	Select whether to use an authentication method for the SMTP connection. Choose between: <ul style="list-style-type: none">▪ None: Do not use any authentication method.▪ Username and password: Authenticate at the SMTP server via username and password.
Username	This field is only visible if you enable SMTP authentication above. Enter a username for SMTP authentication. Please enter a string.
Password	This field is only visible if you enable SMTP authentication above. Enter a password for SMTP authentication. Please enter a string.
HELO Ident	Enter a server name for the HELO part of the email protocol. For some mail servers, the HELO identifier must be the valid principal host domain name for the client host. See SMTP RFC 2821 .

TRANSPORT-LEVEL SECURITY

Sensor Specific	Define the security level for the sensor connection. Choose between: <ul style="list-style-type: none">▪ Use Transport-Level Security if available using StartTLS (default): Choose this option to try to connect to the server using TLS and StartTLS. If the server does not support this, the sensor will try to connect without encryption.▪ Use Transport-Level Security if available: Choose this option to try to connect to the server using TLS. If the server does not support this, the sensor will try to connect without encryption.▪ Enforce Transport-Level Security using StartTLS: Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will show a Down status ¹⁹⁵.
-----------------	--

TRANSPORT-LEVEL SECURITY

- **Enforce Transport-Level Security:** Choose this option to try to connect to the server using TLS. If the server does not support this, the sensor will show a **Down status**^[195].
- ⓘ If the sensor connects to a server via **StartTLS**, the connection is established unencrypted first. After the connection is established, the sensor sends a certain command (StartTLS) over the unencrypted connection to negotiate a secure connection via the SSL/TLS protocol.
- ⓘ If the sensor uses **TLS without StartTLS**, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If there is no secure connection possible, no communication will take place.

MONITORING

Send Email	Define the monitoring approach when connecting to the SMTP server. Choose between: <ul style="list-style-type: none"> ▪ None: Do not send an email, just connect to the SMTP server. ▪ Send Email: Send an email through the SMTP server. If there is an error when sending the email, an error message will be triggered and the sensor will change to a Down status^[195].
From	Specify the address that the sent emails contain in the from field. Please enter a valid email address.
To	Specify the address that PRTG sends the emails to. If you define more than one recipient, separate the individual email addresses with commas. Please enter a valid email address.
Topic	Specify the subject that the sent emails contain. Please enter a string or leave the field empty.
Content	Specify the body that the sent emails contain. Please enter a string or leave the field empty.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: <ul style="list-style-type: none"> ▪ Discard sensor result: Do not store the sensor result.

MONITORING

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁰⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

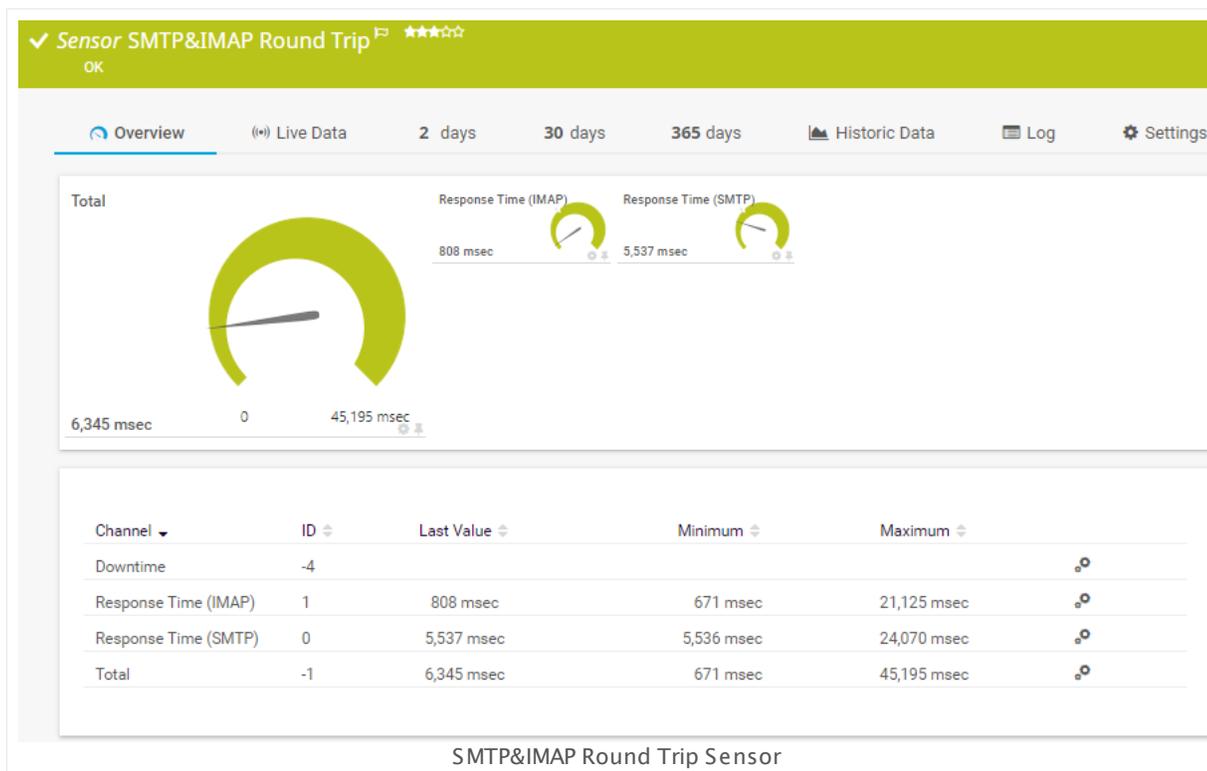

7.8.122 SMTP&IMAP Round Trip Sensor

The SMTP&IMAP Round Trip sensor monitors the time it takes for an email to reach an Internet Message Access Protocol (IMAP) mailbox after being sent using Simple Mail Transfer Protocol (SMTP). It sends an email using the parent device as SMTP server and then scans a dedicated IMAP mailbox until this email comes in.

The SMTP&IMAP Round Trip sensor will delete these emails automatically from the mailbox as soon as PRTG retrieves them. Emails will only remain in the mailbox particularly if a timeout or a restart of the PRTG server occurred during sensor runtime.

The sensor shows the following:

- Response time of SMTP server
- Response time of IMAP server
- Sum of both response times

Sensor in Other Languages

Dutch: **SMTP & IMAP Round Trip**, French: **Durée de boucle SMTP&IMAP**, German: **SMTP&IMAP-Übermittlung**, Japanese: **SMTP&IMAP ? ? ? ? ? ? ?**, Portuguese: **SMTP&IMAP Viagem de ida e volta**, Russian: **Цикл SMTP&IMAP**, Simplified Chinese: **SMTP ? IMAP ? ?**, Spanish: **SMTP&IMAP Round Trip**

Remarks

- Please use dedicated email accounts with this sensor type. If you use more sensors of this type, please make sure that each sensor uses its own email accounts.
- This sensor type does not support Secure Remote Password (SRP) ciphers.
- For a general introduction to the technology behind round trip monitoring, please see [Monitoring Email Round Trip](#) section.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

- ⓘ We recommend that you add this sensor to an SMTP server device only, because the settings of this sensor type are optimized for this scenario.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

- ⓘ Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

EMAIL SETTINGS

From Specify the address that the sent emails will contain in the from field. Please enter a valid email address.

To Specify the address that PRTG sends the emails to. Please enter a valid email address.

HELO Ident Enter a server name for the HELO part of the mail protocol. For some mail servers the HELO identifier must be the valid principal host domain name for the client host. See [SMTP RFC 2821](#).

STEP 1: SEND EMAIL WITH PARENT DEVICE AS SMTP SERVER

i In this step, you configure how PRTG sends the emails. As SMTP server, the sensor uses the **IP Address/DNS Name** of the device you add this sensor to.

Port Enter the number of the port that the sensor uses to send an email via SMTP.

For non-secure connections, usually port **25** is used, for SSL/TLS connections port **465** or **587**. The actual setting depends on the server you are connecting to.

If you do not get a connection, please try another port number.

STEP 1: SEND EMAIL WITH PARENT DEVICE AS SMTP SERVER

	Please enter an integer value. We recommend that you use the default value.
Timeout for SMTP Connection (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
SMTP Authentication Type	Define if you want to use authentication for the SMTP connection. Choose between: <ul style="list-style-type: none">▪ None: Do not use any authentication method.▪ Username/Password: Authenticate at the SMTP server via username and password.
Username	This field is only visible if you enable SMTP authentication above. Enter a username for SMTP authentication. Please enter a string.
Password	This field is only visible if you enable SMTP authentication above. Enter a password for SMTP authentication. Please enter a string.
Additional Text for Email Subject	<p>The subject part of the round trip email is created automatically by PRTG. It consists of the string PRTG Roundtrip Mail:, followed by a unique GUID to correctly identify the email in the IMAP mailbox, for example, PRTG Roundtrip Mail: {5E858D9C-AC70-466A-9B2A-55630165D276}.</p> <p>Use this field to place your custom text before the automatically created text.</p>

TRANSPORT-LEVEL SECURITY

Sensor Specific	Define the security level for the sensor connection. Choose between: <ul style="list-style-type: none">▪ Use Transport-Level Security if available using StartTLS (default): Choose this option to try to connect to the server using TLS and StartTLS. If the server does not support this, the sensor will try to connect without encryption.▪ Use Transport-Level Security if available: Choose this option to try to connect to the server using TLS. If the server does not support this, the sensor will try to connect without encryption.
-----------------	--

TRANSPORT-LEVEL SECURITY

- **Enforce Transport-Level Security using StartTLS:** Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will show a **Down status**¹⁹⁵.
 - **Enforce Transport-Level Security:** Choose this option to try to connect to the server using TLS. If the server does not support this, the sensor will show a **Down status**¹⁹⁵.
- ⓘ If the sensor connects to a server via **StartTLS**, the connection is established unencrypted first. After the connection is established, the sensor sends a certain command (StartTLS) over the unencrypted connection to negotiate a secure connection via the SSL/TLS protocol.
- ⓘ If the sensor uses **TLS without StartTLS**, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If there is no secure connection possible, no communication will take place.

STEP 2: CHECK AN IMAP MAILBOX UNTIL EMAIL ARRIVES

ⓘ In this step, you configure how to receive the sent emails.

IP Address/DNS Name	Specify the IMAP server. Enter a valid IP address or DNS name.
Mailbox	Specify the IMAP mailbox you want to check. Enter the IMAP mailbox or folder name.
Port	Specify the port that the sensor will use for the IMAP connection. For non-secure connections usually port 143 is used, for SSL/TLS connections port 993 . The actual setting depends on the server you connect to. If you do not get a connection, try another port number. Please enter an integer value. We recommend that you use the default value.
Connection Interval (Sec.)	Enter the number of seconds the sensor will wait between two connections to the IMAP server. PRTG will repeatedly check the mailbox in this interval until the email arrives. Please enter an integer value.

STEP 2: CHECK AN IMAP MAILBOX UNTIL EMAIL ARRIVES

Maximum Trip Time (Sec.)	Enter the number of seconds an email may take to arrive in the IMAP mailbox. PRTG will continuously check the mailbox in the interval that you specify above until the email arrives. If it does not arrive within the maximum trip time, the sensor will show an error message. Please enter an integer value.
Username	Enter a username for IMAP authentication. Please enter a string.
Password	Enter a password for IMAP authentication. Please enter a string.
Search Method	Define how to search for the roundtrip email in the mailbox. Choose between: <ul style="list-style-type: none"> ▪ Search email directly (default): Send a SEARCH command to find the roundtrip email directly on the IMAP server. ▪ Search through all available emails: Iterate over all available message in the mailbox on the IMAP server to find the roundtrip email.

TRANSPORT-LEVEL SECURITY

Sensor Specific	Define the security level for the sensor connection. Choose between: <ul style="list-style-type: none"> ▪ Use Transport-Level Security if available using StartTLS (default): Choose this option to try to connect to the server using TLS and StartTLS. If the server does not support this, the sensor will try to connect without encryption. ▪ Use Transport-Level Security if available: Choose this option to try to connect to the server using TLS. If the server does not support this, the sensor will try to connect without encryption. ▪ Enforce Transport-Level Security using StartTLS: Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will show a Down status¹⁹⁵. ▪ Enforce Transport-Level Security: Choose this option to try to connect to the server using TLS. If the server does not support this, the sensor will show a Down status¹⁹⁵. <p>i If the sensor connects to a server via StartTLS, the connection is established unencrypted first. After the connection is established, the sensor sends a certain command (StartTLS) over the unencrypted connection to negotiate a secure connection via the SSL/TLS protocol.</p>
-----------------	--

TRANSPORT-LEVEL SECURITY

-  If the sensor uses **TLS without StartTLS**, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If there is no secure connection possible, no communication will take place.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁸⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#).

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

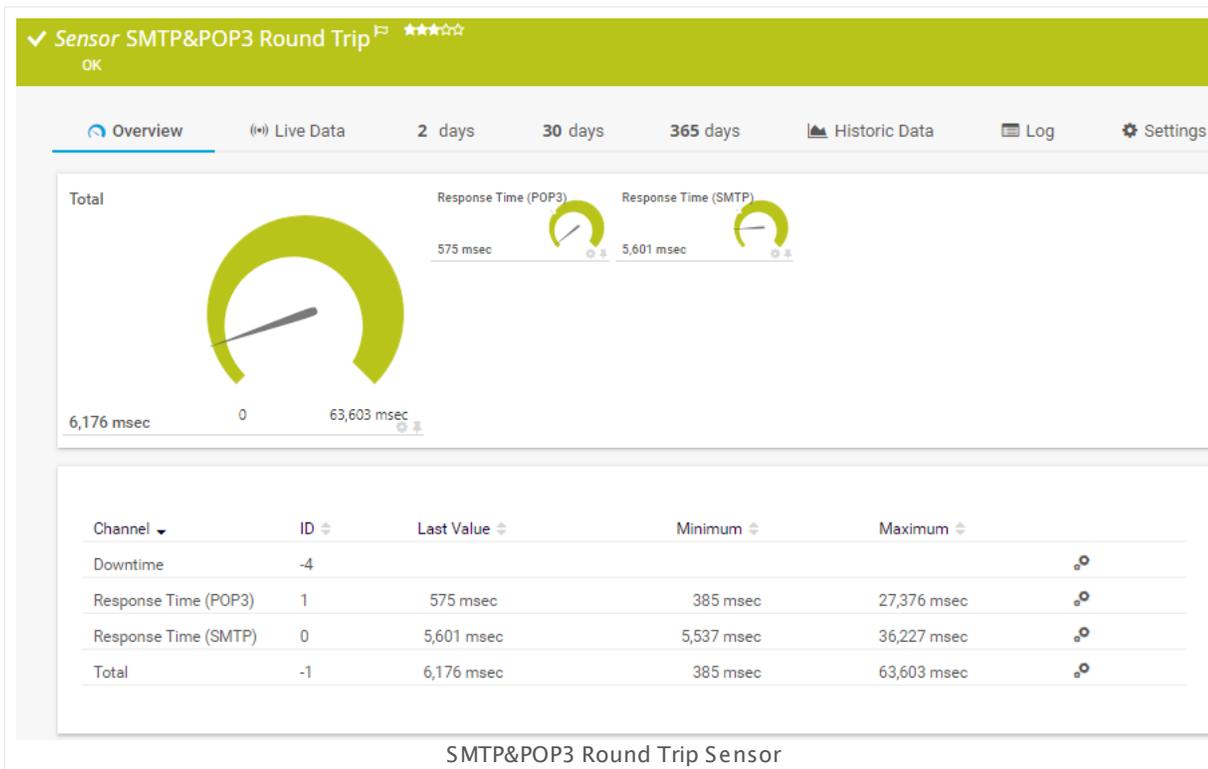

7.8.123 SMTP&POP3 Round Trip Sensor

The SMTP&POP3 Round Trip sensor monitors the time it takes for an email to reach a Post Office Protocol version 3 (POP3) mailbox after being sent using Simple Mail Transfer Protocol (SMTP). It sends an email using the parent device as SMTP server and then scans a dedicated POP3 mailbox until the email comes in.

The SMTP&POP3 Round Trip sensor will delete these emails automatically from the mailbox as soon as PRTG retrieves them. Emails will only remain in the mailbox particularly if a timeout or a restart of the PRTG server occurred during sensor runtime.

The sensor shows the following:

- Response time of SMTP server
- Response time of POP3 server
- Sum of both response times

Sensor in Other Languages

Dutch: **SMTP & POP3 Round Trip**, French: **Durée de boucle SMTP&POP3**, German: **SMTP&POP3-Übermittlung**, Japanese: **SMTP&POP3 ? ? ? ? ? ? ? ?**, Portuguese: **SMTP&POP3 Viagem de ida e volta**, Russian: **Цикл SMTP и POP3**, Simplified Chinese: **SMTP ? POP3 ? ?**, Spanish: **SMTP&POP3 Round Trip**

Remarks

- Please use dedicated email accounts with this sensor type. If you use more sensors of this type, please make sure that each sensor uses its own email accounts.
- This sensor type does not support Secure Remote Password (SRP) ciphers.
- For a general introduction to the technology behind round trip monitoring, please see [Monitoring Email Round Trip](#) section.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

- ⓘ We recommend that you add this sensor to an SMTP server device only, because the settings of this sensor type are optimized for this scenario.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

- ⓘ Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags .

BASIC SENSOR SETTINGS

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

EMAIL SETTINGS

From Specify the address that the sent emails will contain in the from field. Please enter a valid email address.

To Specify the address that PRTG sends the emails to. Please enter a valid email address.

HELO Ident Enter a server name for the HELO part of the mail protocol. For some mail servers the HELO identifier must be the valid principal host domain name for the client host. See [SMTP RFC 2821](#).

STEP 1: SEND EMAIL WITH PARENT DEVICE AS SMTP SERVER

 In this step, you configure how PRTG sends the emails. As SMTP server, the sensor uses the **IP-Address/DNS Name** of the device you add this sensor to.

Port Enter the number of the port that the sensor uses to send an email via SMTP.

For non-secure connections usually port 25 is used, for SSL/TLS connections port 465 or 587. The actual setting depends on the server you connect to.

If you do not get a connection, try another port number.

Please enter an integer value. We recommend that you use the default value.

STEP 1: SEND EMAIL WITH PARENT DEVICE AS SMTP SERVER

Timeout for SMTP Connection (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
SMTP Authentication Type	Define if you want to use an authentication for the SMTP connection. Choose between: <ul style="list-style-type: none">▪ None: Do not use any authentication method.▪ Username/Password: Authenticate at the SMTP server via username and password.
Username	This field is only visible if you enable SMTP authentication above. Enter a username for SMTP authentication. Please enter a string.
Password	This field is only visible if you enable SMTP authentication above. Enter a password for SMTP authentication. Please enter a string.
Additional Text for Email Subject	<p>The subject part of the round trip email is created automatically by PRTG. It consists of the string PRTG Roundtrip Mail:, followed by a unique GUID to correctly identify the email in the POP3 mailbox, for example, PRTG Roundtrip Mail: {5E858D9C-AC70-466A-9B2A-55630165D276}.</p> <p>Use this field to place your custom text before the automatically created text.</p>

TRANSPORT-LEVEL SECURITY

Sensor Specific	Define the security level for the sensor connection. Choose between: <ul style="list-style-type: none">▪ Use Transport-Level Security if available using Start TLS (default): Choose this option to try to connect to the server using TLS and StartTLS. If the server does not support this, the sensor will try to connect without encryption.▪ Use Transport-Level Security if available: Choose this option to try to connect to the server using TLS. If the server does not support this, the sensor will try to connect without encryption.▪ Enforce Transport-Level Security using Start TLS: Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will show a Down status¹⁹⁵.
-----------------	---

TRANSPORT-LEVEL SECURITY

- **Enforce Transport-Level Security:** Choose this option to try to connect to the server using TLS. If the server does not support this, the sensor will show a **Down status** ¹⁹⁵.
- ① If the sensor connects to a server via **StartTLS**, the connection is established unencrypted first. After the connection is established, the sensor sends a certain command (StartTLS) over the unencrypted connection to negotiate a secure connection via the SSL/TLS protocol.
- ① If the sensor uses **TLS without StartTLS**, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If there is no secure connection possible, no communication will take place.

STEP 2: CHECK A POP3 MAILBOX UNTIL EMAIL ARRIVES

- ① In this step, you configure how to receive the sent emails.

IP Address/DNS Name	Specify the POP3 server. Enter a valid IP address or DNS name.
Port	Specify the port that the sensor uses for the POP3 connection. For non-secure connections usually port 110 is used, for SSL/TLS connections port 995 . The actual setting depends on the server you are connecting to. If you do not get a connection, please try another port number. Please enter an integer value. We recommend that you use the default value.
Connection Interval (Sec.)	Enter the number of seconds the sensor will wait between two connections to the IMAP server. PRTG will continuously check the mailbox in this interval until the email arrives. Please enter an integer value.
Maximum Trip Time (Sec.)	Enter the number of seconds an email may take to arrive in the IMAP mailbox. PRTG will continuously check the mailbox in the interval that you specify above until the email arrives. If it does not arrive within the maximum trip time, the sensor will trigger an error message. Please enter an integer value.

STEP 2: CHECK A POP3 MAILBOX UNTIL EMAIL ARRIVES

POP3 Authentication Type	Select the kind of authentication for the POP3 connection. Choose between: <ul style="list-style-type: none"> ▪ Without Login: Monitor the connection to the POP3 server only. ▪ Username and Password: Log in into the POP3 server with username and password (simple login, non-secure). ▪ 128-bit MD5 hash value (APOP): Send the password in an encrypted form using APOP. This option must be supported by the POP3 server you connect to.
Username	This field is only visible if you select an option with login above. Enter a username for POP3 authentication. Please enter a string.
Password	This field is only visible if you select an option with login above. Enter a username for POP3 authentication. Please enter a string.

TRANSPORT-LEVEL SECURITY

Sensor Specific	Define the security level for the sensor connection. Choose between: <ul style="list-style-type: none"> ▪ Use Transport-Level Security if available using StartTLS (default): Choose this option to try to connect to the server using TLS and StartTLS. If the server does not support this, the sensor will try to connect without encryption. ▪ Use Transport-Level Security if available: Choose this option to try to connect to the server using TLS. If the server does not support this, the sensor will try to connect without encryption. ▪ Enforce Transport-Level Security using StartTLS: Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will show a Down status^[195]. ▪ Enforce Transport-Level Security: Choose this option to try to connect to the server using TLS. If the server does not support this, the sensor will show a Down status^[195]. <p>i If the sensor connects to a server via StartTLS, the connection is established unencrypted first. After the connection is established, the sensor sends a certain command (StartTLS) over the unencrypted connection to negotiate a secure connection via the SSL/TLS protocol.</p>
-----------------	--

TRANSPORT-LEVEL SECURITY

-  If the sensor uses **TLS without StartTLS**, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If there is no secure connection possible, no communication will take place.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
-  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁸⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)^[3383] settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)^[158].

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.124 SNMP APC Hardware Sensor

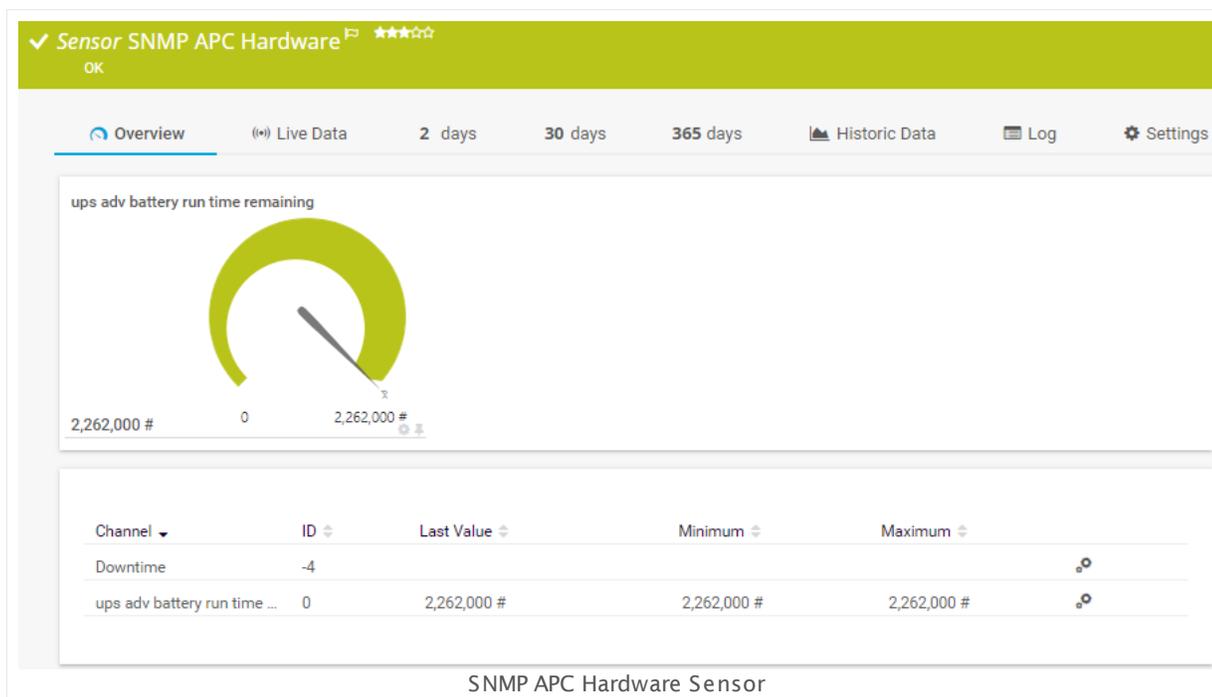

The SNMP APC Hardware sensor monitors performance counters on an APC UPS device using Simple Network Management Protocol (SNMP).

It can show the following:

- Actual voltage of battery
- Capacity of battery
- Temperature of battery
- Remaining runtime of battery
- Input and output frequency
- Input and output voltage
- Output load

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

i The SNMP APC Hardware sensor will not appear as running sensor, instead it will be created as [SNMP Custom Advanced sensor](#).

Sensor in Other Languages

Dutch: **SNMP APC Hardware**, French: **Matériels SNMP APC**, German: **SNMP APC Hardware**, Japanese: **SNMP APC** ? ? ? ? ? , Portuguese: **Hardware SNMP APC**, Russian: **Оборудование SNMP APC**, Simplified Chinese: **SNMP APC** ? ? , Spanish: **SNMP APC Hardware**

Remarks

- Knowledge Base: [How can I monitor additional counters with the SNMP APC Hardware sensor?](#)
- Knowledge Base: [How can I monitor an APC UPS that does not support SNMP?](#)
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the performance counters you want to monitor. PRTG will create one [SNMP Custom Advanced sensor](#) for each Library OID category you select in the **Add Sensor** dialog. If you select more than 10 OIDs per category, PRTG will create the corresponding amount of SNMP Custom Advanced sensors. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

APC UPS SPECIFIC

Library OIDs	Select the performance counters you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
--------------	--

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

APC UPS SPECIFIC

Selected Interface	Shows the name of the interface (performance counter) that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Unit String	Define the unit of the numerical data that the sensor monitors at the given OID. Please enter a string.
Multiplication	If you want to multiply the received data with a certain value, enter the quotient here. Please enter an integer value.
Division	If you want to divide the received data by a certain value, enter the divisor here. Please enter an integer value.

APC UPS SPECIFIC

- If Value Changes Define what this sensor will do when the sensor value changes. You can choose between:
- **Ignore changes (default):** The sensor takes no action on change.
 - **Trigger 'change' notification:** The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to [trigger a notification](#) 3170 whenever the sensor value changes.

SENSOR DISPLAY

- Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
- i** You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
- i** This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#) 3160 settings).
- Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings.</p> <ul style="list-style-type: none"> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> <p>▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active.</p> <p>▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.</p> <ul style="list-style-type: none"> <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[3160] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[3170] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.125 SNMP Buffalo TS System Health Sensor

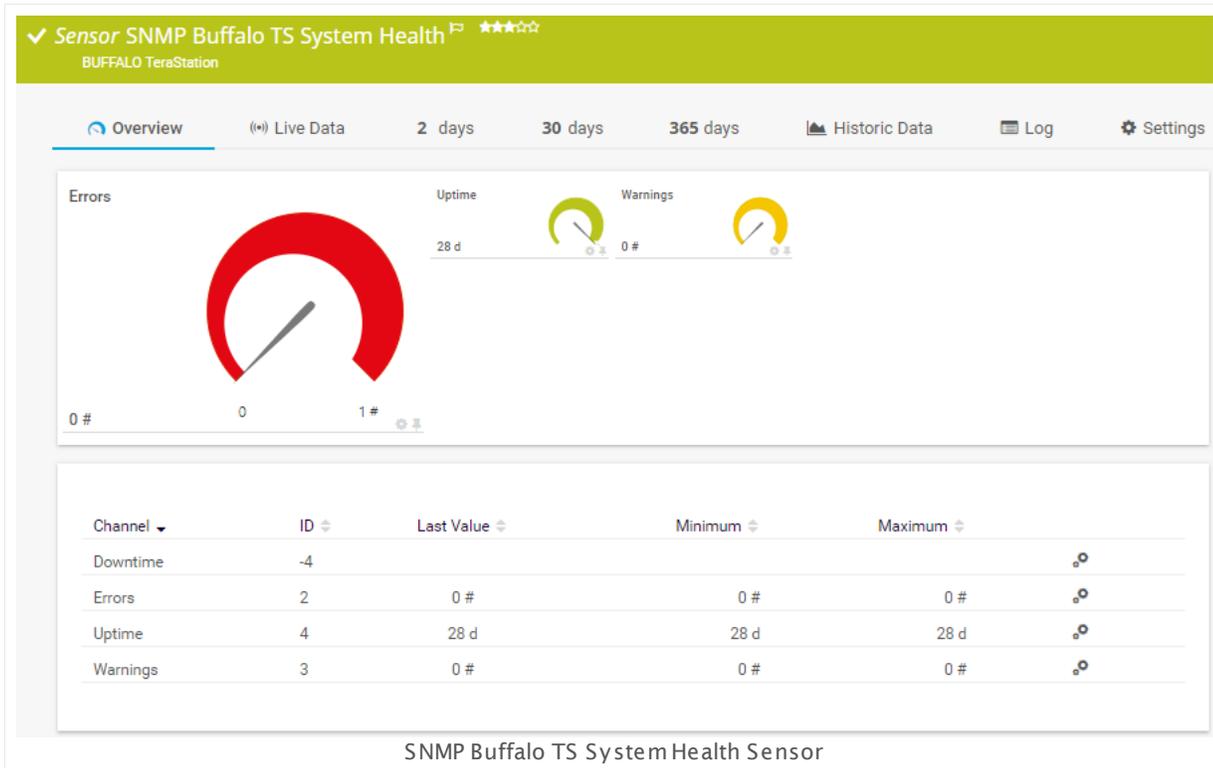

The SNMP Buffalo TS System Health sensor monitors the system health of a Buffalo TeraStation Network Attached Storage (NAS) using Simple Network Management Protocol (SNMP). Supported TeraStation systems are the 3000, 3010, 5000, 5010, and 7000 series.

It can show the following:

- Number of errors
- Number of warnings
- Available memory in total and percent
- CPU usage
- Uptime
- Failover status: idle, busy, starting main, starting backup, initializing, stopping
- Firmware update availability: yes, no, unknown
- RPSU status: fine, broken, unknown

The channels are created at run-time, depending on your Buffalo TeraStation NAS and firmware version. Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

 Run an [Auto-Discovery](#)^[282] with the device template **Buffalo TeraStation NAS** to automatically create [SNMP Custom Table sensors](#)^[1992] with additional useful information about your Buffalo TeraStation, for example, array status, disk smart status, disk status, and iSCSI status. This device template will also create [SNMP sensors](#)^[431] for traffic, memory, and load average on your TeraStation.

Sensor in Other Languages

Dutch: **SNMP Buffalo TS System Status**, French: **État du système SNMP Buffalo TS**, German: **SNMP Buffalo TS System Health**, Japanese: **SNMP Buffalo TS System? ? ?**, Portuguese: **SNMP Buffalo TS Funcionamento do sistema**, Russian: **Работоспособность системы Buffalo TS no SNMP**, Simplified Chinese: **SNMP Buffalo TS ? ? ? ? ?**, Spanish: **Salud del sistema NS de Buffalo TS SNMP**

Remarks

- This sensor supports the TeraStation 3000, 3010, 5000, 5010, and 7000 series.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, refer to the manual section [Sensor Channels Settings](#)^[3180].
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].
- **BETA** Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
125 SNMP Buffalo TS System Health Sensor

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

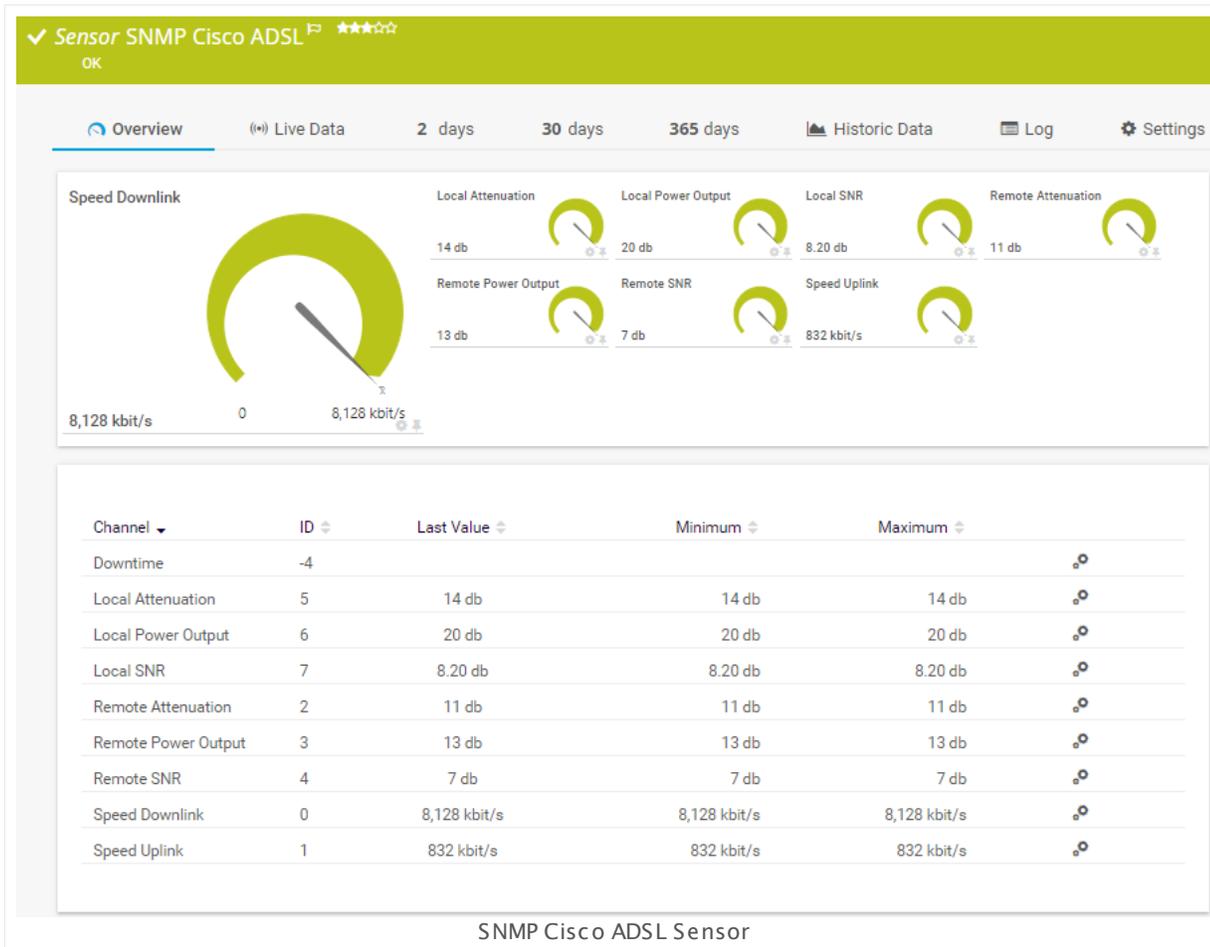

7.8.126 SNMP Cisco ADSL Sensor

The SNMP Cisco ADSL sensor monitors Asymmetric Digital Subscriber Line (ADSL) statistics of a Cisco router using Simple Network Management Protocol (SNMP).

It shows the following:

- Speed of downlink
- Speed of uplink
- Remote and local attenuation
- Remote and local SNR (signal-to-noise ratio)
- Remote and local power output

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Remarks

- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the performance counters you want to monitor. PRTG will create one sensor for each counter you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

CISCO ADSL SETTINGS

Line Index	Select the performance counters you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
------------	--

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none">▪ Show channels independently (default): Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

7.8.127 SNMP Cisco ASA VPN Connections Sensor

The SNMP Cisco ASA VPN Connections sensor monitors the Virtual Private Network (VPN) connections on a Cisco Adaptive Security Appliance using Simple Network Management Protocol (SNMP).

It can show the following:

- Active email sessions
- Active Internet Protocol Security (IPsec) sessions
- Active L2L sessions
- Active LB sessions
- Active sessions in total
- Active SVC sessions
- Active users
- Groups with active users

SNMP Cisco ASA VPN Connections Sensor

Sensor in Other Languages

Dutch: **SNMP Cisco ASA VPN Verbindingen**, French: **Connexions VPN ASA Cisco SNMP**, German: **SNMP Cisco ASA VPN-Verbindungen**, Japanese: **SNMP Cisco ASA VPN ? ? ?** , Portuguese: **Conexões VPN SNMP Cisco ASA**, Russian: **Подключения SNMP Cisco ASA VPN**, Simplified Chinese: **SNMP Cisco ASA VPN ? ?** , Spanish: **Conexiones SNMP Cisco ASA VPN**

Remarks

- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3276] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags ^[139] , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)¹⁴⁰¹ from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority

Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

i This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

CREDENTIALS FOR SNMP DEVICES

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

SNMP Version	<p>Select the SNMP version for the device connection. Choose between:</p> <ul style="list-style-type: none"> ▪ v1: Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices. <ul style="list-style-type: none">  SNMP v1 does not support 64-bit counters. This may result in invalid data when monitoring traffic via SNMP. ▪ v2c (recommended): Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters. ▪ v3: Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption. <ul style="list-style-type: none">  When using SNMP v3 you can only monitor a limited number of sensors per second due to internal limitations. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds limits you to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased Interval Delay or Open Requests with the Probe Health Sensor^[1590], distribute the load over multiple probes^[3709]. SNMP v1 and v2 do not have this limitation.
Community String	<p>This setting is only visible if you select SNMP version v1 or v2c above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.</p>
Authentication Type	<p>This setting is only visible if you select SNMP version v3 above. Choose between:</p> <ul style="list-style-type: none"> ▪ MD5: Use Message-Digest Algorithm 5 (MD5) for authentication. ▪ SHA: Use Secure Hash Algorithm (SHA) for authentication.

CREDENTIALS FOR SNMP DEVICES

The type you choose must match the authentication type of your device.

i If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field **Password** empty. In this case, **SNMP_SEC_LEVEL_NOAUTH** is used and authentication deactivated entirely.

User This setting is only visible if you select SNMP version **v3** above. Enter a username for secure authentication. This value must match the username of your device.

Password This setting is only visible if you select SNMP version **v3** above. Enter a password for secure authentication. This value must match the password of your device.

Encryption Type This setting is only visible if you select SNMP version **v3** above. Select an encryption type. Choose between:

- **DES**: Use **Data Encryption Standard** (DES) as encryption algorithm.
- **AES**: Use **Advanced Encryption Standard** (AES) as encryption algorithm.

i AES 192 and AES 256 are not supported by Net-SNMP. They lack RFC specification.

i The type that you choose must match the encryption type of your device.

Data Encryption Key This setting is only visible if you select SNMP version **v3** above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device.

i If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.

Context Name This setting is only visible if you select SNMP version **v3** above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.

SNMP Port Enter the port for the SNMP communication. We recommend that you use the default value.

CREDENTIALS FOR SNMP DEVICES

SNMP Timeout (Sec.) Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered. The maximum timeout value is **300** seconds (5 minutes).

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)^[336] on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.128 SNMP Cisco ASA VPN Traffic Sensor

The SNMP Cisco ASA VPN Traffic sensor monitors the traffic of an Internet Protocol Security (IPsec) Virtual Private Network (VPN) connection on a Cisco Adaptive Security Appliance using Simple Network Management Protocol (SNMP).

It shows the following:

- Incoming traffic
- Outgoing traffic

Sensor in Other Languages

Dutch: **SNMP Cisco ASA VPN Verkeer**, French: **Traffic VPN ASA Cisco SNMP**, German: **SNMP Cisco ASA VPN-Datenverkehr**, Japanese: **SNMP Cisco ASA VPN**, Portuguese: **Tráfego VPN SNMP Cisco ASA**, Russian: **Трафик SNMP Cisco ASA VPN**, Simplified Chinese: **SNMP Cisco ASA VPN**, Spanish: **Trafico SNMP Cisco ASA VPN**

Remarks

- This sensor type is intended to monitor permanent connections. It will show an error if a connection is interrupted.
- This sensor can monitor IPsec connections only!
- Knowledge Base: [I get the error PE123 when using the SNMP Cisco ASA VPN Traffic sensor. What can I do?](#)

- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the connections you want to monitor. PRTG will create one sensor for each connection you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

ASA VPN SPECIFIC

Connections Select the IPsec VPN connections you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

 This sensor type can only monitor VPN connections based on **IPsec**. This means, for example, that connections using **Cisco AnyConnect** are not listed here.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)^[181], as well as in [alarms](#)^[219], [logs](#)^[228], [notifications](#)^[3216], [reports](#)^[3252], [maps](#)^[3278], [libraries](#)^[3235], and [tickets](#)

BASIC SENSOR SETTINGS

Parent Tags

Shows **Tags** that this sensor inherits from its parent device, group, and probe. This setting is shown for your information only and cannot be changed here.

Tags

Enter one or more **Tags**, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority

Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

ASA VPN SPECIFIC

Remote IP

Shows the IP address of the connection this sensor monitors. This value is shown for reference purposes only. We strongly recommend that you only change it if Paessler support explicitly asks you to do so. Wrong usage can result in incorrect monitoring data!

i This sensor type can only monitor VPN connections based on **IPsec**.

Sensor Behavior

Define the **status of the sensor** if there is no active connection available. Choose between:

- **Show 'Down' status if no connection is active (recommended)**
- **Show 'Warning' status if no connection is active**
- **Stay in 'Up' status if no connection is active**

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

CREDENTIALS FOR SNMP DEVICES

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

SNMP Version	Select the SNMP version for the device connection. Choose between:
--------------	--

CREDENTIALS FOR SNMP DEVICES

- **v1:** Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices.

i SNMP v1 does not support 64-bit counters. This may result in invalid data when monitoring traffic via SNMP.

- **v2c (recommended):** Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters.

- **v3:** Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption.

i When using SNMP v3 you can only monitor a limited number of sensors per second due to internal limitations. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds limits you to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased **Interval Delay** or **Open Requests** with the **Probe Health Sensor**, distribute the load over **multiple probes**. SNMP v1 and v2 do not have this limitation.

Community String	This setting is only visible if you select SNMP version v1 or v2c above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.
Authentication Type	<p>This setting is only visible if you select SNMP version v3 above. Choose between:</p> <ul style="list-style-type: none"> ▪ MD5: Use Message-Digest Algorithm 5 (MD5) for authentication. ▪ SHA: Use Secure Hash Algorithm (SHA) for authentication. <p>The type you choose must match the authentication type of your device.</p> <p>i If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field Password empty. In this case, SNMP_SEC_LEVEL_NOAUTH is used and authentication deactivated entirely.</p>
User	This setting is only visible if you select SNMP version v3 above. Enter a username for secure authentication. This value must match the username of your device.

CREDENTIALS FOR SNMP DEVICES

Password	This setting is only visible if you select SNMP version v3 above. Enter a password for secure authentication. This value must match the password of your device.
Encryption Type	<p>This setting is only visible if you select SNMP version v3 above. Select an encryption type. Choose between:</p> <ul style="list-style-type: none">▪ DES: Use Data Encryption Standard (DES) as encryption algorithm.▪ AES: Use Advanced Encryption Standard (AES) as encryption algorithm. <p> AES 192 and AES 256 are not supported by Net-SNMP. They lack RFC specification.</p> <p> The type that you choose must match the encryption type of your device.</p>
Data Encryption Key	<p>This setting is only visible if you select SNMP version v3 above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device.</p> <p> If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.</p>
Context Name	This setting is only visible if you select SNMP version v3 above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port for the SNMP communication. We recommend that you use the default value.
SNMP Timeout (Sec.)	Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered. The maximum timeout value is 300 seconds (5 minutes).

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)  for more

SCANNING INTERVAL

information.

- Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#) on PRTG on premises installations.
- If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to **Down status**. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:
- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
128 SNMP Cisco ASA VPN Traffic Sensor

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

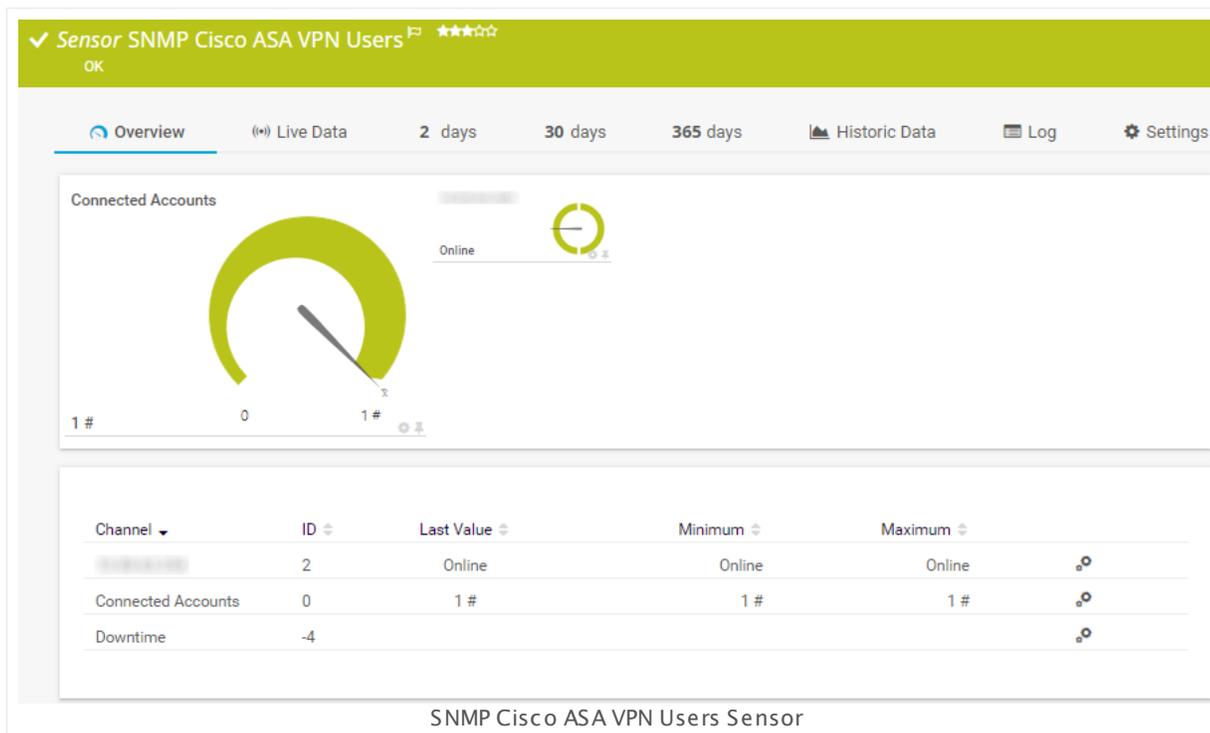

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.129 SNMP Cisco ASA VPN Users Sensor

The SNMP Cisco ASA VPN Users sensor monitors account connections to a Virtual Private Network (VPN) on a Cisco Adaptive Security Appliance via Simple Network Management Protocol (SNMP).

It can show the following:

- Number of currently connected accounts
- If a specific user account is currently offline or online

Sensor in Other Languages

Dutch: **SNMP Cisco ASA VPN Gebruikers**, French: **Utilisateurs Cisco ASA VPN SNMP**, German: **SNMP Cisco ASA VPN-Benutzer**, Japanese: **SNMP Cisco ASA VPN ? ? ? ?**, Portuguese: **Usuários VPN SNMP Cisco ASA**, Russian: **Пользователи SNMP Cisco ASA VPN**, Simplified Chinese: **SNMP Cisco ASA VPN ? ?**, Spanish: **Usuarios de SNMP Cisco ASA VPN**

Remarks

- Please do not use the sensor to monitor more than 50 VPN users, especially if they are all connected simultaneously. For more information, see this Knowledge Base article: [My Cisco ASA VPN Users sensor shows a user limit error. Why? What can I do?](#)
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

CREDENTIALS FOR SNMP DEVICES

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
129 SNMP Cisco ASA VPN Users Sensor

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

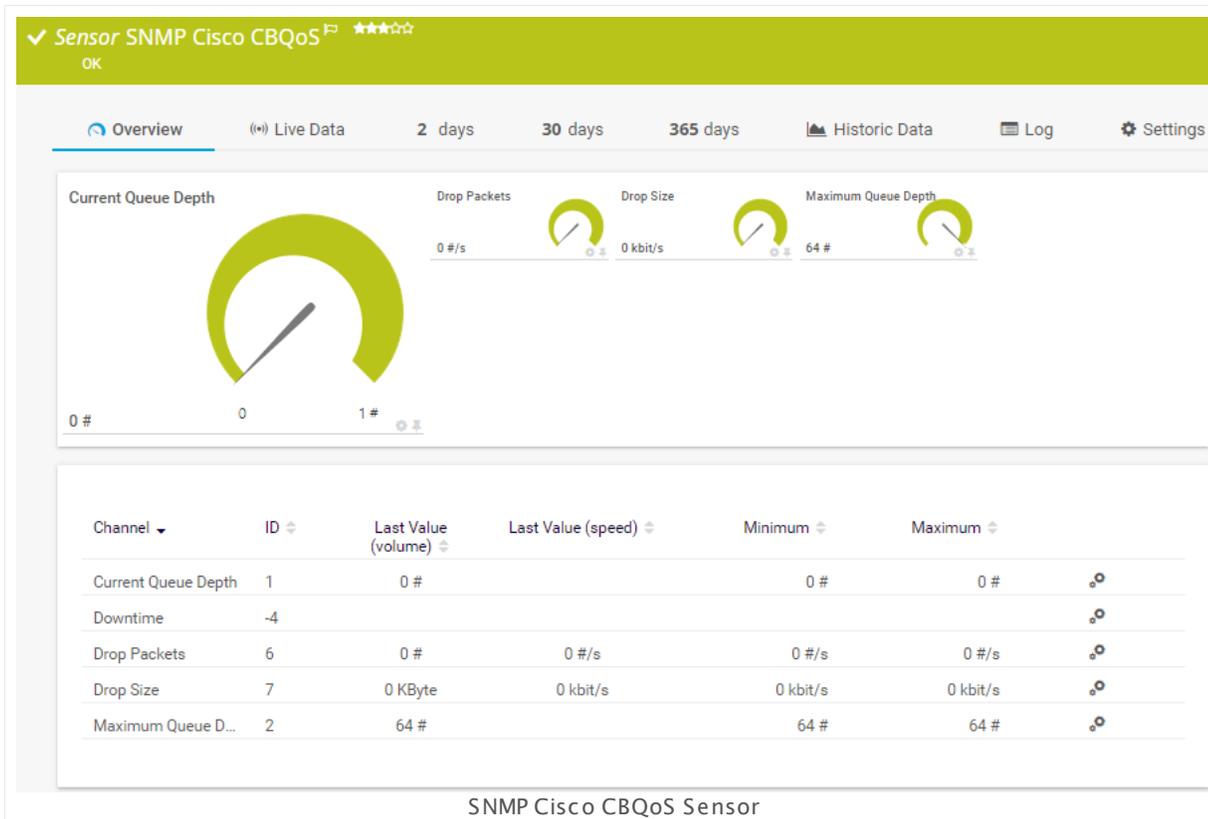

7.8.130 SNMP Cisco CBQoS Sensor

The SNMP Cisco CBQoS sensor monitors network parameters using Cisco's Class Based Quality of Service (CBQoS) via Simple Network Management Protocol (SNMP). It supports the classes Class Map, Match Statement, and Queueing.

The sensor can show the following depending on the particular class type:

- Current and maximum queue depth
- Pre policy packets
- Pre and post policy size
- Drop packets and size
- Drop packets without buffer
- Fragment packets and size.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Remarks

- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#) [3489].

- For a general introduction to the technology behind Quality of Service monitoring, please see manual section [Monitoring Quality of Service](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the CBQoS entries you want to monitor. To monitor Quality of Service (QoS) via compatible devices, PRTG will create one sensor for each CBQoS entry you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

CLASS BASED QOS SPECIFIC

CBQoS Entries	Select the measurements you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
---------------	--

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
-------------	--

BASIC SENSOR SETTINGS

Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

CLASS BASED QOS SPECIFIC

Object Type	Shows further information about the parameter that this sensor monitors. Once a sensor is created, you cannot change this value.
Interface	It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Description	
BitMask	
ObjectID	
ConfigID	

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

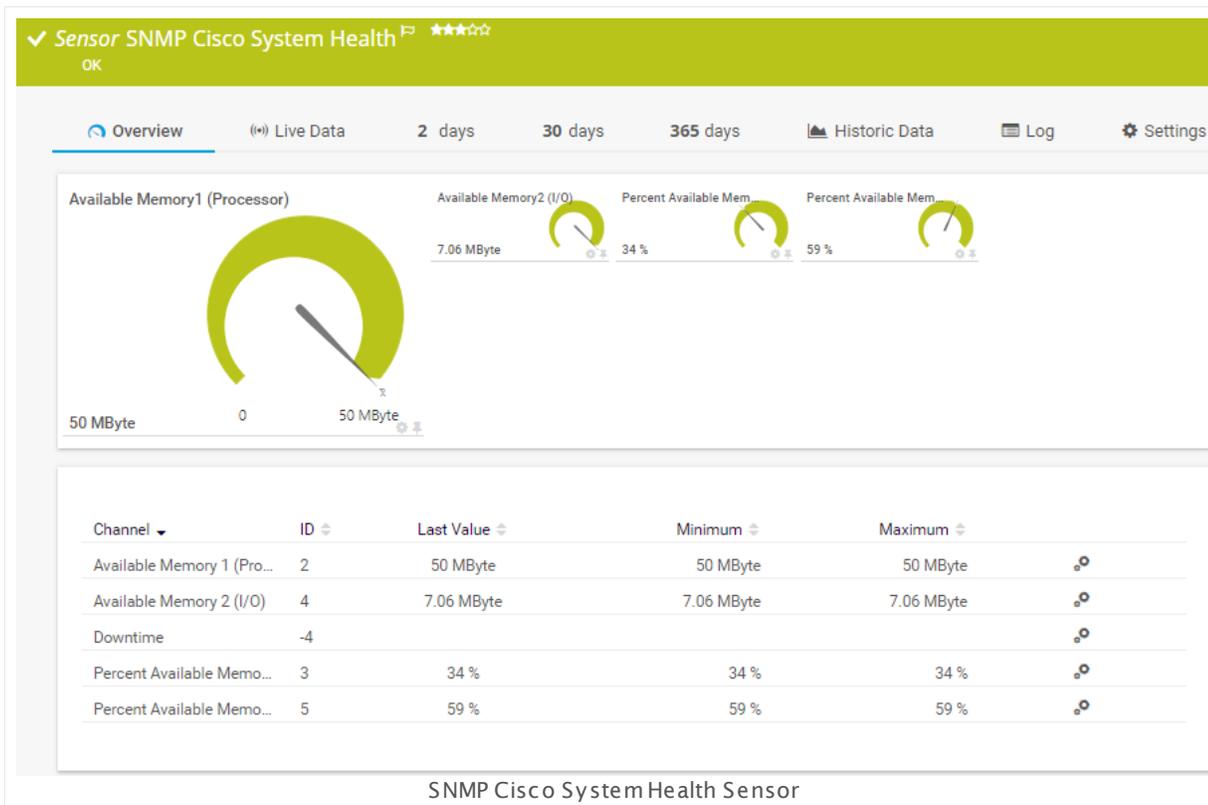

7.8.131 SNMP Cisco System Health Sensor

The SNMP Cisco System Health sensor monitors the system health of a Cisco device via Simple Network Management Protocol (SNMP).

Depending on what your device can deliver via SNMP, the sensor can show, for example, the following system health components:

- CPU load in percent
- Available memory in absolute and percentage values
- Values of the current
- Status of power supplies
- Voltage values
- Fan states
- Current temperature and temperature status
- Other information, for example, transmit and receive power

PRTG creates one sensor per component. Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **SNMP Cisco System Health**, French: **État du système Cisco SNMP**, German: **SNMP Cisco Systemzustand**, Japanese: **SNMP Cisco ? ? ? ? ? ? ?**, Portuguese: **Funcionamento do sistema SNMP Cisco**, Russian: **Работоспособность системы устройства SNMP Cisco**, Simplified Chinese: **SNMP Cisco ? ? ? ? ? ? ?**, Spanish: **SNMP Salud de sistema Cisco**

Remarks

- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, refer to the manual section [Sensor Channels Settings](#)³¹⁶⁰.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)³⁴⁸⁹.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the components you want to monitor. To monitor the system health of a Cisco device, PRTG will create one sensor for each measurement you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

CISCO SYSTEM HEALTH SPECIFIC

Measurement	Select the measurements you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
-------------	--

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

CISCO SYSTEM HEALTH SPECIFIC

Measurement	Shows the ID of the measurement that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
-------------	---

DEBUG OPTIONS

- Sensor Result** Define what PRTG will do with the sensor results. Choose between:
- **Discard sensor result:** Do not store the sensor result.
 - **Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):** Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: **Result of Sensor [ID].txt** and **Result of Sensor [ID].Data.txt**. This is for debugging purposes. PRTG overrides these files with each scanning interval.
 -  For more information on how to find the folder used for storage, see section [Data Storage](#)³⁷³⁴.
 -  This option is not available when the sensor runs on the **Hosted Probe** of a PRTG hosted by Paessler instance.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).
- Stack Unit** This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ³³⁵ on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

7.8.132 SNMP Cisco UCS Blade Sensor

The SNMP Cisco UCS Blade sensor monitors the health status of a Cisco Unified Computing System (UCS) blade server via Simple Network Management Protocol (SNMP).

It can show the following states:

- Operability
- Oper state
- Power state

Sensor in Other Languages

Dutch: **SNMP Cisco UCS Blade**, French: **Serveur lame Cisco UCS SNMP**, German: **SNMP Cisco UCS Blade**, Japanese: **SNMP Cisco UCS ? ? ? ?**, Portuguese: **Blade UCS Cisco SNMP**, Russian: **Блейд-сервер SNMP Cisco UCS**, Simplified Chinese: **SNMP Cisco UCS ? ?**, Spanish: **Blade del Cisco UCS del SNMP**

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) ^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the blade servers you want to monitor. PRTG will create one sensor for each blade you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Blade Server Select the blades you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) ^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#) ^[181], as well as in [alarms](#) ^[213], [logs](#) ^[228], [notifications](#) ^[3216], [reports](#) ^[3262], [maps](#) ^[3270], [libraries](#) ^[3235], and [tickets](#) ^[230].

Parent Tags Shows [Tags](#) ^[139] that this sensor [inherits](#) ^[140] from its [parent device, group, and probe](#) ^[133]. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

SENSOR SETTINGS

Blade Server	Shows information about the blade server that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Channel Mask	
Model	
Serial Number	

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.133 SNMP Cisco UCS Chassis Sensor

The SNMP Cisco UCS Chassis sensor monitors the health status of the chassis of a Cisco Unified Computing System (UCS) device via Simple Network Management Protocol (SNMP).

It can show the states of the following properties:

- Configuration
- License
- Oper
- Operability
- Power
- Thermal
- Serial electronic erasable programmable read-only memory (SEEPROM)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Channel	ID	Last Value	Minimum	Maximum
Config State	0	Ok	Ok	Ok
Downtime	-4			
License State	1	License Ok	License Ok	License Ok
Oper State	2	Operable	Operable	Operable
Operability	3	Operable	Operable	Operable
Power State	4	Ok	Ok	Ok
Seeprom State	6	Operable	Operable	Operable
Thermal State	5	Ok	Ok	Ok

SNMP Cisco UCS Chassis Sensor

Sensor in Other Languages

Dutch: **SNMP Cisco UCS Chassis**, French: **Châssis SNMP Cisco UCS**, German: **SNMP Cisco UCS Chassis**, Japanese: **SNMP Cisco UCS** ? ? ? ? , Portuguese: **Chassi UCS Cisco SNMP**, Russian: **Копныс SNMP Cisco UCS**, Simplified Chinese: **SNMP Cisco UCS** ? ? , Spanish: **Carcasa del Cisco UCS del SNMP**

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the chassis you want to monitor. PRTG will create one sensor for each chassis you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Chassis	Select the chassis you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
---------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Chassis	Shows the chassis that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
---------	---

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-----------------	--

SENSOR DISPLAY

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 -  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁶⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

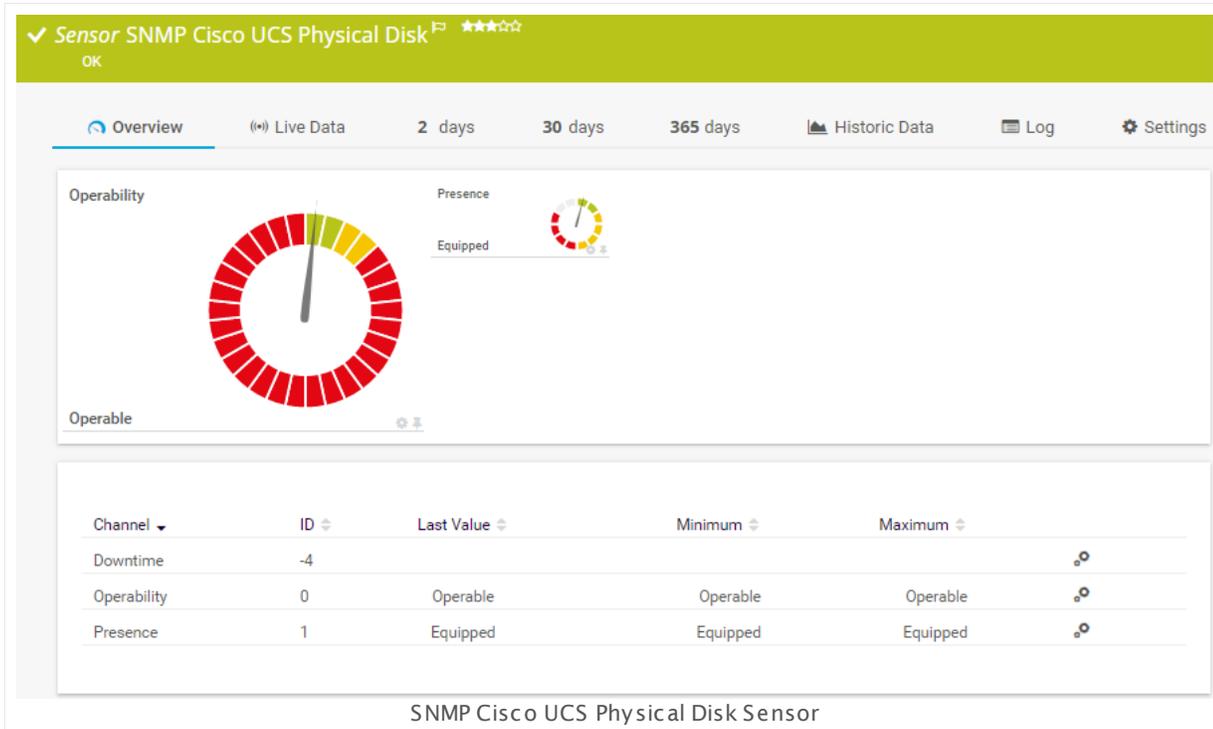

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.134 SNMP Cisco UCS Physical Disk Sensor

The SNMP Cisco UCS Physical Disk sensor monitors a physical disk of a Cisco Unified Computing System (UCS) device via Simple Network Management Protocol (SNMP).

It can show the following:

- Operability status of the disk
- Connection status of the disk

Sensor in Other Languages

Dutch: **SNMP-Cisco UCS fysieke schijf**, French: **Disque physique UCS Cisco SNMP**, German: **SNMP Cisco UCS Physikalisches Laufwerk**, Japanese: **SNMP Cisco UCS**, Portuguese: **Disco físico de UCS Cisco de SNMP**, Russian: **Физический диск SNMP Cisco UCS**, Simplified Chinese: **SNMP Cisco UCS**, Spanish: **Disco físico Cisco UCS de SNMP**

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

To monitor physical disks in a UCS device, PRTG will create one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

UCS PHYSICAL DISK

Disks

Select the disks you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

 This list only shows working disks with the current status **Up** or **Warning**.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name

Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)^[181], as well as in [alarms](#)^[213], [logs](#)^[228], [notifications](#)^[3216], [reports](#)^[3262], [maps](#)^[3270], [libraries](#)^[3235], and [tickets](#)^[230].

Parent Tags

Shows [Tags](#)^[139] that this sensor [inherits](#)^[140] from its [parent device, group, and probe](#)^[133]. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

UCS PHYSICAL DISK

Disk	<p>Shows the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p>
Display Name	<p>Shows the display name of the physical disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p>

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

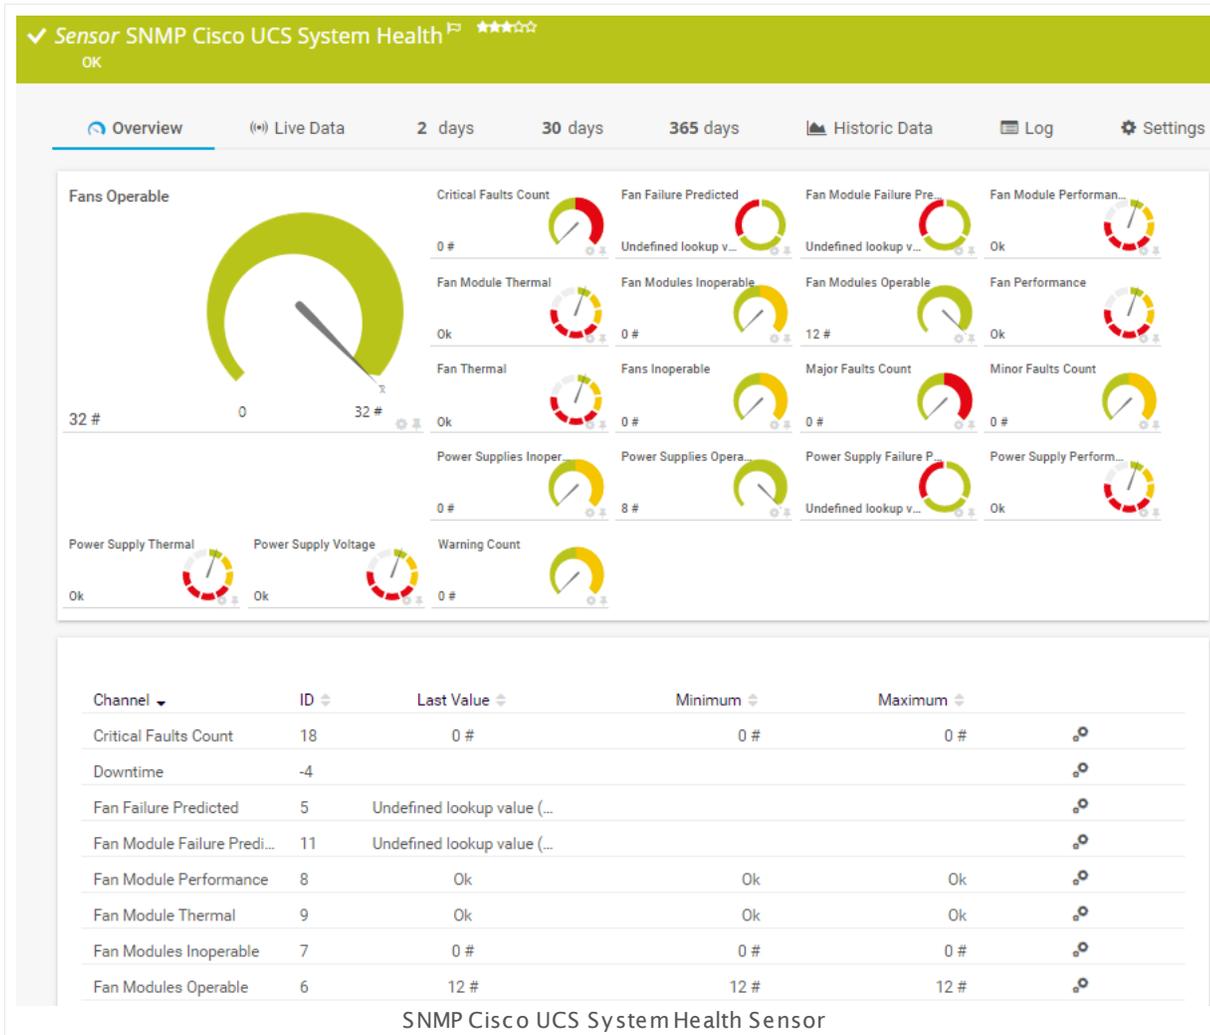

7.8.135 SNMP Cisco UCS System Health Sensor

The SNMP Cisco UCS System Health sensor monitors the system health of a Cisco Unified Computing System (UCS) device via Simple Network Management Protocol (SNMP).

It can show the following:

- Number of operable and inoperable fans
- Status of fan performance, fan thermal, and fan voltage
- Number of operable and inoperable fan modules
- Status of fan module performance, fan module thermal, and fan module voltage
- Number of operable and inoperable power supplies
- Status of power supply performance, power supply thermal, and power supply voltage
- Number of minor, major, and critical faults (that are not yet acknowledged in the UCS logs)
- Number of warnings (that are not yet acknowledged in the UCS logs)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **SNMP Cisco UCS System Health**, French: **État du système SNMP Cisco UCS**, German: **SNMP Cisco UCS Systemzustand**, Japanese: **SNMP Cisco UCS ? ? ? ? ? ? ?**, Portuguese: **Funcionamento do sistema UCS SNMP Cisco**, Russian: **Работоспособность системы SNMP Cisco UCS**, Simplified Chinese: **SNMP Cisco UCS ? ? ? ? ? ? ?**, Spanish: **Estado del sistema Cisco UCS del SNMP**

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#) [3693].
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#) [3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹³⁶. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

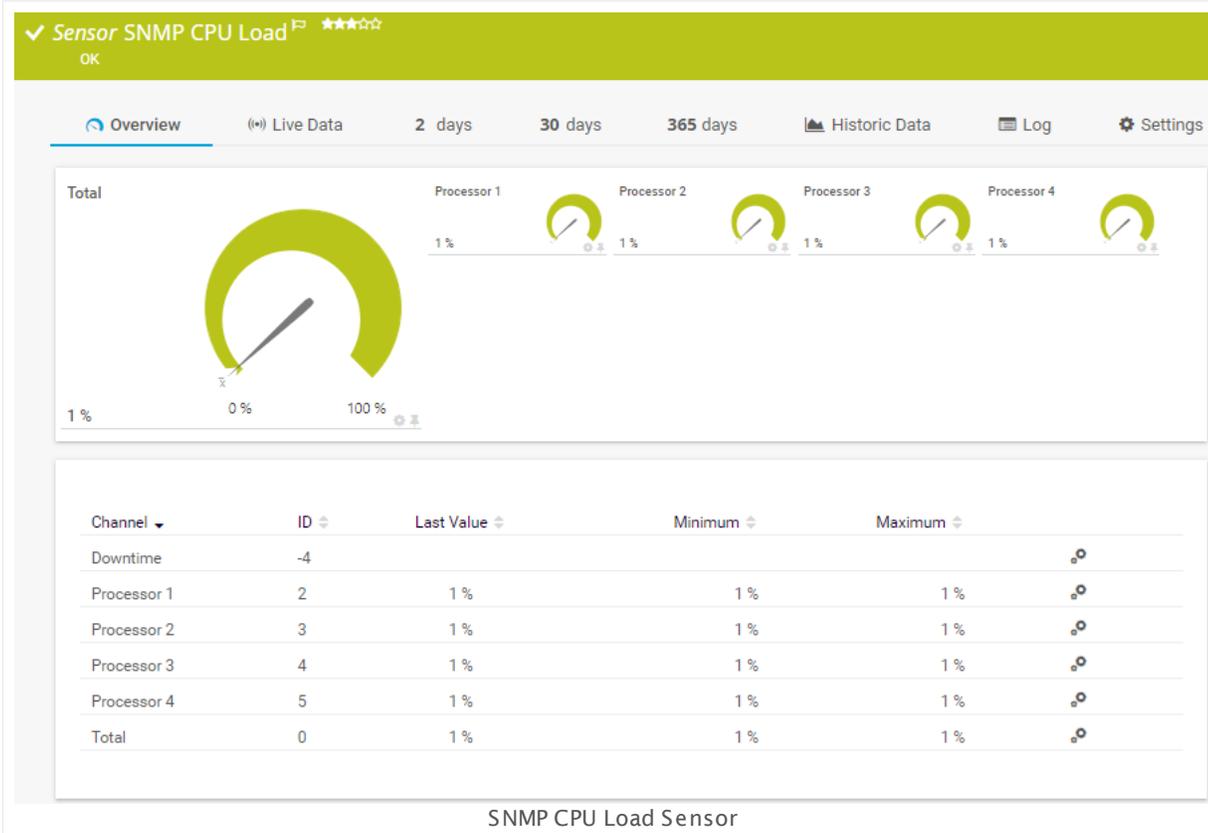

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.136 SNMP CPU Load Sensor

The SNMP CPU Load sensor monitors the system load using Simple Network Management Protocol (SNMP).

- It shows the load of several CPUs in percent.

Sensor in Other Languages

Dutch: **SNMP CPU Load**, French: **Charge CPU SNMP**, German: **SNMP Prozessorlast**, Japanese: **SNMP CPU ? ?**, Portuguese: **Carga da SNMP CPU**, Russian: **Загрузка ЦП SNMP**, Simplified Chinese: **SNMP CPU ? ?**, Spanish: **SNMP Carga de CPU**

Remarks

- It might not work to query data from a probe device via SNMP (querying **localhost**, **127.0.0.1**, or **:::1**). [Add this device to PRTG](#) with the IP address that it has in your network and create the SNMP sensor on this device instead.
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

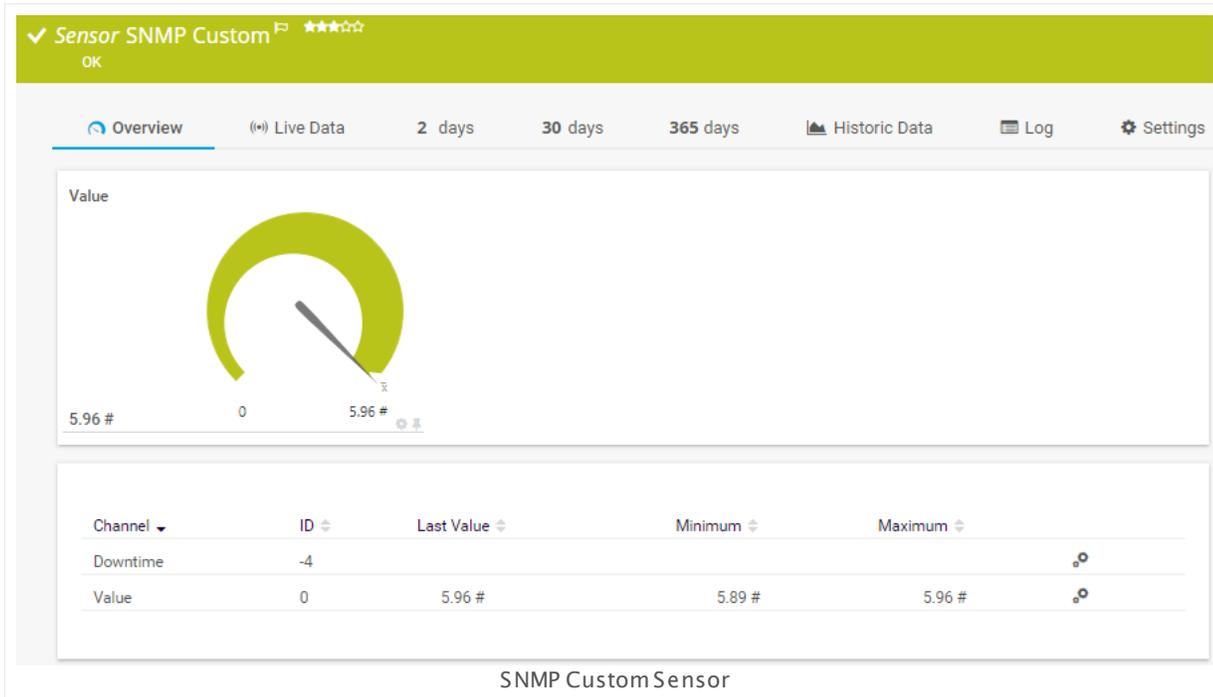

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.137 SNMP Custom Sensor

The SNMP Custom sensor monitors a single parameter that is returned by a specific Object Identifier (OID) using Simple Network Management Protocol (SNMP).

- This sensor shows a single numerical value (int64) for a given OID. Each OID always refers to a specific parameter of a certain SNMP device.

Sensor in Other Languages

Dutch: **SNMP (Klant specifiek)**, French: **SNMP (personnalisé)**, German: **SNMP (Benutzerdef.)**, Japanese: **SNMP ? ? ? ?**, Portuguese: **SNMP customizado**, Russian: **Пользовательские параметры SNMP**, Simplified Chinese: **SNMP ? ? ?**, Spanish: **SNMP personalizado**

Remarks

- It might not work to query data from a probe device via SNMP (querying `localhost`, `127.0.0.1`, or `:::1`). [Add this device to PRTG](#) with the IP address that it has in your network and create the SNMP sensor on this device instead.
- Knowledge Base: [How do I find out what OID I need to use for a custom sensor?](#)
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

OID VALUES

Channel Name Enter a name for the channel in which the sensor shows the results for the given OID. Please enter a string. You can change this value later in the corresponding [channel settings](#)³¹⁶⁰ of this sensor.

Value Type Select the expected numeric type of the results at the given OID. Choose between:

- **Absolute (unsigned Integer):** Integer values, without an operational sign, such as **10** or **120**.
- **Absolute (signed integer):** For integer values, including an operational sign, such as **-12** or **120**.
- **Absolute (float):** For float values, such as **-5.80** or **8.23**.
- **Delta (Counter):** For counter values. PRTG will calculate the difference between the last and the current value. The delta value will additionally be divided by a time period to indicate a speed value.

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Unit String Enter the unit for the values that this sensor returns. Please enter a string. This unit string is used for display purposes and will be shown in graphs, data tables, and gauges. If you want to change the **Unit** after having created the sensor, you can change it in the sensor's [channel settings](#)³¹⁶⁰.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

OID VALUES

OID Value	<p>Enter the OID of the SNMP object you want to receive numerical data from.</p> <p>i Most OIDs begin with 1.3.6.1. However, entering OIDs starting with 1.0, or 1.1, or 1.2 is also allowed. If you want to disable the validation of your entry entirely, add the string norfccheck: to the beginning of your OID, for example, norfccheck:2.0.0.0.1.</p>
-----------	--

OID VALUES

Value Type	Shows the value type of the numerical data, that this sensor receives from the given OID. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Multiplication	If you want to multiply the received data with a certain value, enter the multiplier here. Use the default value 1 to not change the received value. Please enter an integer value.
Division	If you want to divide the received data by a certain value, enter the divisor here. Use the default value 1 to not change the received value. Please enter an integer value.
If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between: <ul style="list-style-type: none"> ▪ Ignore changes (default): The sensor takes no action on change. ▪ Trigger 'change' notification: The sensor sends an internal message indicating that its value has changed. In combination with a Change Trigger, you can use this mechanism to trigger a notification <small>3170</small> whenever the sensor value changes.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings <small>3160</small> settings).</p>

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies <small>3209</small> in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.138 SNMP Custom Advanced Sensor

The SNMP Custom Advanced sensor monitors numerical values returned for Object Identifiers (OIDs) using Simple Network Management Protocol (SNMP).

- The sensor displays numerical values for given OIDs that refer to this specific SNMP device. Up to 10 OIDs and corresponding numerical values are possible.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

i The [SNMP Library sensor](#) will automatically create SNMP Custom Advanced sensors when the imported Management Information Base (MIB) file contains single values.

Channel	ID	Last Value	Minimum	Maximum
Battery Actual Voltage	4	55 V DC	55 V DC	55 V DC
Battery Temperature	3	27.4 °C	27.4 °C	27.4 °C
Downtime	-4			
Input Frequency	9	60 Hz	60 Hz	60 Hz
Input Line Voltage	5	127.4 V AC	127.4 V AC	127.4 V AC
Output Frequency	10	60 Hz	60 Hz	60 Hz
Output Load	7	7 %	7 %	7 %
Output Voltage	6	127.4 V AC	127.4 V AC	127.4 V AC
Run Time Remaining	2	708 d	708 d	708 d
System Uptime	8	28 d	28 d	28 d

SNMP Custom Advanced Sensor

Sensor in Other Languages

Dutch: **SNMP-geavanceerde douane**, French: **SNMP personnalisé avancé**, German: **SNMP (Benutzerdef. erweitert)**, Japanese: **SNMP ? ? ? ? ? ? ? ? ? ?**, Portuguese: **SNMP customizado avançado**, Russian: **Дополнительные пользовательские параметры SNMP**, Simplified Chinese: **SNMP ? ? ? ? ?**, Spanish: **SNMP personalizado avanzado**

Remarks

- It might not work to query data from a probe device via SNMP (querying `localhost`, `127.0.0.1`, or `:::1`). [Add this device to PRTG](#) with the IP address that it has in your network and create the SNMP sensor on this device instead.
- Knowledge Base: [How do I find out what OID I need to use for a custom sensor?](#)
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

OID VALUES

Value Type

Select the expected numeric type of the results at the given OID. Choose between:

- **Absolute (unsigned Integer)**: For integer values, such as `10` or `120`.
- **Absolute (signed integer)**: For integer values, such as `-12` or `120`.
- **Absolute (float)**: For float values, such as `-5.80` or `8.23`. This value type is not compatible with the unit **Value Lookup**.
- **Delta (Counter)**: For counter values. PRTG will calculate the difference between the last and the current value. The delta value will additionally be divided by a time period to indicate a speed value. This value type is not compatible with the unit **Value Lookup**.

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Channel #2 – #10

You can create up to 10 different sensor channels for this sensor. You have to define at least one data channel, so you will see all available settings for **Sensor Channel #1** without enabling it manually. Additionally you can define **Sensor Channel #2** up to **Sensor Channel #10**. To do so, choose between:

OID VALUES

- **Disable:** The sensor will not create this channel.
- **Enable:** The sensor will create this channel. Specify name, OID, value type, and unit for this channel below.

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. It is not possible to enable or disable sensor channels after creation of this sensor!

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) [402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#) [181], as well as in [alarms](#) [219], [logs](#) [228], [notifications](#) [3216], [reports](#) [3252], [maps](#) [3276], [libraries](#) [3235], and [tickets](#) [230].

Parent Tags Shows [Tags](#) [139] that this sensor [inherits](#) [140] from its [parent device, group, and probe](#) [133]. This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#) [139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) [140] from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

OID VALUES

Sensor Channel #x Name Enter a name for the channel in which the sensor shows the results at the given OID. Please enter a string.

Sensor Channel #x OID Enter the OID of the SNMP object you want to receive numerical data from.

 Most OIDs begin with **1.3.6.1**. However, entering OIDs starting with **1.0**, or **1.1**, or **1.2** is also allowed. If you want to disable the validation of your entry during your typing entirely, add the string **norfccheck:** to the beginning of your OID, for example, **norfccheck:2.0.0.0.1**.

Sensor Channel #x Value Type Shows the value type of the numerical data that this sensor receives from the given OID. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Channel #x Unit Define the unit of the numerical data that this sensor receives from the given OID. Choose between:

- BytesBandwidth
- BytesMemory
- BytesDisk
- Temperature
- Percent
- TimeResponse
- TimeSeconds
- TimeHours
- Count
- CPU
- BytesFile

OID VALUES

- SpeedDisk
- SpeedNet
- Custom
- Value Lookup

 For more information about the available units, see section [Custom Sensors](#)³⁶⁴².

 To use [lookups](#)³⁶⁹³ with this channel, choose the unit **Value Lookup** and select your lookup file below. Do not use the unit **Custom** for using lookups with this sensor and do not use the [channel settings](#)³¹⁶⁰ to define a lookup file!

 Using the unit **Value Lookup** is not possible when you choose the value type **Delta (Counter)** or **Absolute (float)**. You will not be able to create the sensor in this case.

Sensor Channel #x
Custom Unit

This setting is only available if you select the **Custom** unit option above. Define a unit for the channel value. Please enter a string.

Sensor Channel #x
Value Lookup

This setting is only available if you select the **Value Lookup** option above. Choose a [lookup](#)³⁶⁹³ file that you want to use with this channel.

Sensor Channel #y

This field shows the option you chose for this channel in the [Add Sensor](#)¹⁹⁶⁰ dialog, **Enable** or **Disable**. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

If you created this channel, you can define the settings of this channel as described above.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.139 SNMP Custom String Sensor

The SNMP Custom String sensor monitors a string returned by a specific Object Identifier (OID) using Simple Network Management Protocol (SNMP). It can check for keywords. If you want to set limits to the sensor channel value, you can also extract a numeric value contained in the string.

This sensor shows the following:

- Response time of the monitored device
- Optionally a value extracted from the string
- In the sensor message, the sensor shows the string you [search](#) for and which is the reason for a current **Warning** or **Down status**.

i The [SNMP Library sensor](#) will automatically create SNMP Custom String sensors when the imported Management Information Base (MIB) file contains string values.

Linux 4.4.0-59-generic #80-Ubuntu SMP Fri Aug 4 17:47:47 UTC 2017 x86_64

Overview Live Data 2 days 30 days 365 days Historic Data Log Settings

Response Time 3 msec 0 10 msec

Extracted Value 0

Channel	ID	Last Value	Minimum	Maximum
Downtime	-4

Response Time	3	3 msec	1 msec	10 msec

SNMP Custom String Sensor

Sensor in Other Languages

Dutch: **SNMP Aangepaste Tekenreeks**, French: **Chaîne personnalisée SNMP**, German: **SNMP-Zeichenfolge**, Japanese: **SNMP ? ? ? ? ? ?**, Portuguese: **Sequência de caracteres customizada SNMP**, Russian: **SNMP: строка ответа**, Simplified Chinese: **SNMP ? ? ? ? ? ?**, Spanish: **Cadena personalizada de SNMP**

Remarks

- It might not work to query data from a probe device via SNMP (querying `localhost`, `127.0.0.1`, or `:::1`). [Add this device to PRTG](#) with the IP address that it has in your network and create the SNMP sensor on this device instead.
- Knowledge Base: [How do I find out what OID I need to use for a custom sensor?](#)
- Example: [Number Extraction with Regular Expression](#)
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags .

BASIC SENSOR SETTINGS

 It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

OID VALUES

OID Value Enter the OID of the SNMP object you want to receive a string from.

 Most OIDs begin with **1.3.6.1**. However, entering OIDs starting with **1.0**, or **1.1**, or **1.2** is also allowed. If you want to disable the validation of your entry entirely, add the string **norfccheck:** at the beginning of your OID, for example, **norfccheck:2.0.0.0.1**.

Maximum Length of String Define the maximum allowed length of the string to be received from the SNMP object at the given OID. If the string is longer than this value, the sensor shows a **Down status**^[195]. Please enter an integer value or leave the field empty.

If Value Changes Define what this sensor will do when the sensor value changes. You can choose between:

- **Ignore changes (default):** The sensor takes no action on change.
- **Trigger 'change' notification:** The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to [trigger a notification](#)^[3170] whenever the sensor value changes.

KEYWORD SEARCH

Response Must Include (Error State) Define which string must be part of the data that is received from the SNMP object at the given OID. You can either enter plain text or a [Regular Expression](#)^[3704]. If the data does not include the search pattern, the sensor shows a **Down status**^[195]. Please enter a string or leave the field empty.

For Keyword Search Use Define in which format you have entered the search expression in the field above.

- **Plain Text:** Search for the string as plain text. The characters asterisk `*` and question mark `?` work here as placeholder, whereas `*` stands for no or any number of characters and `?` stands for exactly one character (as known from Windows search). You cannot disable this behavior, so the literal search for these characters is not possible with plain text search.
- **Regular Expression:** Use the search pattern as a [Regular Expression](#)^[3704].

 PRTG supports **PCRE** regex. You cannot use regex options or flags. For more details, see manual section [Regular Expressions](#)^[3704].

Response Must Not Include (Error State) Define which string must **not** be part of the data that is received from the SNMP object at the given OID. You can either enter plain text or a [Regular Expression](#)^[3704]. If the data does include the search pattern, the sensor shows a **Down status**^[195]. Please enter a string or leave the field empty.

For Keyword Search Use Define in which format you have entered the search expression in the field above.

- **Plain Text:** Search for the string as plain text. The characters asterisk `*` and question mark `?` work here as placeholder, whereas `*` stands for no or any number of characters and `?` stands for exactly one character (as known from Windows search). You cannot disable this behavior, so the literal search for these characters is not possible with plain text search.
- **Regular Expression:** Use the search pattern as a [Regular Expression](#)^[3704].

 PRTG supports **PCRE** regex. You cannot use regex options or flags. For more details, see manual section [Regular Expressions](#)^[3704].

KEYWORD SEARCH

Response Must Include (Warning State)	Define which string must be part of the data that is received from the SNMP object at the given OID. You can either enter plain text or a Regular Expression ^[3704] . If the data does not include the search pattern, the sensor shows a Warning status ^[195] . Please enter a string or leave the field empty.
For Keyword Search Use	<p>Define in which format you have entered the search expression in the field above.</p> <ul style="list-style-type: none"> ▪ Plain Text: Search for the string as plain text. The characters asterisk <code>*</code> and question mark <code>?</code> work here as placeholder, whereas <code>*</code> stands for no or any number of characters and <code>?</code> stands for exactly one character (as known from Windows search). You cannot disable this behavior, so the literal search for these characters is not possible with plain text search. ▪ Regular Expression: Use the search pattern as a Regular Expression^[3704]. <p> PRTG supports PCRE regex. You cannot use regex options or flags. For more details, see manual section Regular Expressions^[3704].</p>
Response Must Not Include (Warning State)	Define which string must not be part of the data that is received from the SNMP object at the given OID. You can either enter plain text or a Regular Expression ^[3704] . If the data does include the search pattern, the sensor shows a Warning status ^[195] . Please enter a string or leave the field empty.
For Keyword Search Use	<p>Define in which format you have entered the search expression in the field above.</p> <ul style="list-style-type: none"> ▪ Plain Text: Search for the string as plain text. The characters asterisk <code>*</code> and question mark <code>?</code> work here as placeholder, whereas <code>*</code> stands for no or any number of characters and <code>?</code> stands for exactly one character (as known from Windows search). You cannot disable this behavior, so the literal search for these characters is not possible with plain text search. ▪ Regular Expression: Use the search pattern as a Regular Expression^[3704]. <p> PRTG supports PCRE regex. You cannot use regex options or flags. For more details, see manual section Regular Expressions^[3704].</p>

EXTENDED PROCESSING

Interpret Result as	<p>Define the type of the received string. Choose between:</p> <ul style="list-style-type: none"> ▪ String (default): Handle the result as common string. ▪ Hexadecimal bytes (as in MAC addresses): Handle the result as hexadecimal bytes. For example, choose this option when monitoring MAC addresses. ▪ Decimal bytes (as in IP addresses): Handle the result as decimal bytes. For example, choose this option when monitoring IP addresses.
Extract Number Using Regular Expression	<p>Define if you want to filter out a numeric value from the string received from the SNMP object at the given OID. You can convert this into a float value to use it with channel limits (see Sensor Channels Settings³¹⁶⁰).</p> <ul style="list-style-type: none"> ▪ No extraction: Do not extract a float value. Use the result as a string value. ▪ Extract a numeric value using a regular expression: Use a regular expression to identify a numeric value in the string and convert it to a float value. Define below. See also the example¹⁹⁸⁰ below.
Regular Expression	<p>This setting is only visible if you enable number extraction above. Enter a Regular Expression³⁷⁰⁴ to identify the numeric value you want to extract from the string returned by the SNMP object at the given OID. You can use capturing groups here.</p> <p>Make sure the expression returns numbers only (including decimal and thousands separators). The result will be further refined by the settings below.</p> <p> PRTG supports PCRE regex. You cannot use regex options or flags. For more details, see manual section Regular Expressions³⁷⁰⁴.</p>
Index of Capturing Group	<p>This setting is only visible if you enable number extraction above. If your regular expression uses capturing groups, please specify which one will be used to capture the number. Please enter an integer value or leave the field empty.</p>
Decimal Separator	<p>This setting is only visible if you enable number extraction above. Define which character is used as decimal separator for the number extracted above. Please enter a string or leave the field empty.</p>

EXTENDED PROCESSING

Thousands Separator This setting is only visible if you enable number extraction above. Define which character is used as thousands separator for the number extracted above. Please enter a string or leave the field empty.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ³³⁵ on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none"> ▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request. ▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests. ▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests. ▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests. ▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> <p> If a channel uses lookup³⁶⁹³ values, it will always show a Down status immediately, so no "wait" options will apply.</p> |

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>3311</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- User Group Access** Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:
- **Inherited:** Use the access rights settings of the parent object.
 - **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
 - **Read:** Users in this group can see the object and review its monitoring results.
 - **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
 - **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Example: Number Extraction with Regular Expression

 If you want to extract a number in the response string using a regular expression, please note that the index for captures in this sensor is based on **1 (not on 0)**. Furthermore, capturing groups are not created automatically. The example below will illustrate this issue.

Consider the following string as returned by a request for CPU usage:

```
5 Sec (3.49%), 1 Min (3.555%), 5 Min (3.90%)
```

Assuming you would like to filter for the number **3.555**, that is the percentage in the second parentheses. Then enter the following regex in the **Regular Expression** field:

```
(\d+\.\d+).*?(\d+\.\d+).*?(\d+\.\d+)
```

As **Index of Capturing Group** enter **3**. This will extract the desired number **3.555**.

The index has to be 3 in this case because the capturing groups here are the following:

- Group 1 contains 3.49%, 1 Min (3.555), 5 Min (3.90)
- Group 2 contains 3.49
- Group 3 contains 3.555
- Group 4 contains 3.90

Please keep in mind this note about index and capturing groups when using number extraction.

 It is not possible to match an empty string with the PRTG regex sensor search.

 PRTG supports PCRE regex. You cannot use regex options or flags. For more details, see manual section [Regular Expressions](#)³⁷⁰⁴.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

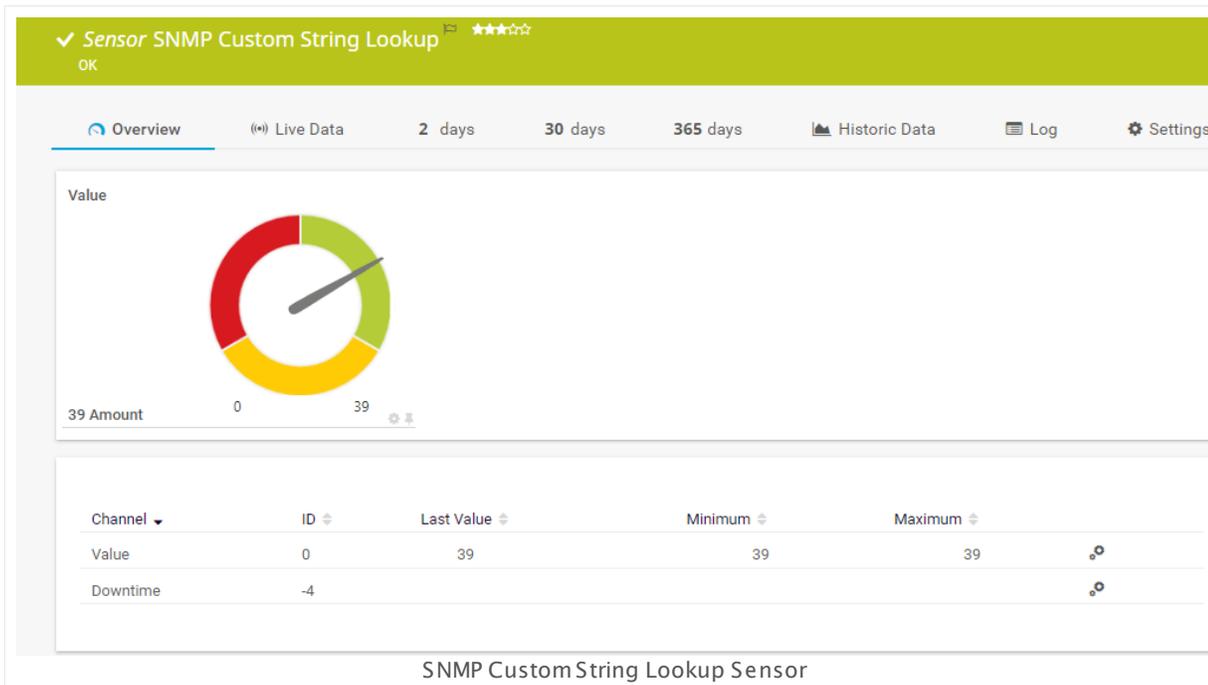

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.140 SNMP Custom String Lookup Sensor

The SNMP Custom String Lookup sensor monitors a string that a specific Object Identifier (OID) returns via Simple Network Management Protocol (SNMP). It can map the string directly to a [sensor status](#)^[195] by using a [defined lookup file](#)^[365]. Basically, this sensor type does a "reverse lookup". You have to define all potential return strings in the lookup file as text values, each in one lookup entry. Graphs and data tables show the value to which the string is mapped, usually an integer ([lookup type](#)^[370] **SingleInt**). See manual section [SNMP Custom String Lookup Sensor—Example](#)^[199].

- This sensor shows a retrieved string value and its status, as defined in the corresponding lookup file.

Sensor in Other Languages

Dutch: **SNMP Aangepaste Tekst Lookup**, French: **Requête de chaîne personnalisée SNMP**, German: **SNMP-Zeichenfolge mit Lookup**, Japanese: **SNMP ? ? ? ? ? ? ? ?**, Portuguese: **Pesquisa da sequência de caracteres customizada SNMP**, Russian: **Подстановка пользовательской строки по SNMP**, Simplified Chinese: **SNMP ? ? ? ? ? ? ? ?**, Spanish: **Búsqueda de cadena personalizada de SNMP**

Remarks

- See manual section [SNMP Custom String Lookup Sensor—Example](#)^[199] for a sample lookup definition for this sensor type.
- It might not work to query data from a probe device via SNMP (querying **localhost**, **127.0.0.1**, or **:::1**). [Add this device to PRTG](#)^[311] with the IP address that it has in your network and create the SNMP sensor on this device instead.
- Knowledge Base: [How do I find out what OID I need to use for a custom sensor?](#)

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).
- Currently, this sensor type is in beta status. The methods of operating can change at any **BETA** time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

OID VALUES

Channel Name	Enter a name for the channel in which the sensor shows the results at the given OID. Please enter a string. You can change this value later in the respective channel settings of this sensor.
Lookup	Select a lookup file that you stored in the <code>\lookups\custom</code> subfolder of your PRTG installation. This lookup file must contain all potential strings that the monitored OID can return.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

OID VALUES

OID Value	<p>Enter the OID of the SNMP object you want to receive a string from.</p> <p>i Most OIDs begin with 1.3.6.1. However, entering OIDs starting with 1.0, or 1.1, or 1.2 is also allowed. If you want to disable the validation of your entry entirely, add the string norfccheck: at the beginning of your OID, for example, norfccheck:2.0.0.0.1.</p>
Lookup	Shows the lookup file that this sensor uses. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between:

OID VALUES

- **Ignore changes (default):** The sensor takes no action on change.
- **Trigger 'change' notification:** The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to [trigger a notification](#)³¹⁷⁰ whenever the sensor value changes.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ³³⁵ on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to Down status¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none"> ▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request. ▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests. ▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests. ▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests. ▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> <p> If a channel uses lookup³⁶⁹³ values, it will always show a Down status immediately, so no "wait" options will apply.</p> |

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>[331]</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Example

 You have to provide all possible return strings for this sensor in one lookup file. For example, consider an OID that can return one of the three strings **Good**, **Deficient**, or **Bad**. Then you have to [define a lookup file](#)³⁰⁹³ for this sensor that contains all these possible string values as text, each text value in one lookup entry:

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

140 SNMP Custom String Lookup Sensor

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="mylookupfile" desiredValue="0" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:
  <Lookups>
    <SingleInt state="Ok" value="0">
      Good
    </SingleInt>
    <SingleInt state="Warning" value="1">
      Deficient
    </SingleInt>
    <SingleInt state="Error" value="2">
      Bad
    </SingleInt>
  </Lookups>
</ValueLookup>
```

If a retrieved string matches one of the text values, the sensor maps it into the defined integer value ("reverse lookup") that is shown, for example, in data graphs. Depending on the integer, the sensor shows the according status and converts the integer back to the original string to show it as channel value. If the OID returns a string that the lookup definition does not contain, the sensor will show a **Down status** with a corresponding error message.

For example, you create an SNMP Custom String Lookup sensor, apply the example lookup definition from above (store it into the `\lookups\custom` subfolder of your PRTG installation), and the given OID returns the string **Good**. Then the sensor maps **Good** into the integer value **0**, shown in the live graph of the sensor, for example. According to the status definition `state="Ok"`, the **sensor status** is **Up** in this case. The integer **0** is converted back to the string **Good**, which is shown as channel value.

 The string match is not case sensitive.

 Use the lookup type **SingleInt** for this sensor. BitFields and ranges are not supported!

 If you [imported an SNMP library](#) (this is an `oidlib` file) that contains [lookups](#) (you can see this in section **Lookup** in the MIB Importer), you can define your own sensor states for returning values. Use the **lookupname** of the imported SNMP library as **id** parameter in a custom lookup definition. This overrides the lookups that an `oidlib` might contain with your own status definitions. See section [Define Lookups—Customizing Lookups](#) for details about this mechanism.

Knowledge Base: How do I find out what OID I need to use for a custom sensor?

- <https://kb.paessler.com/en/topic/903>

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

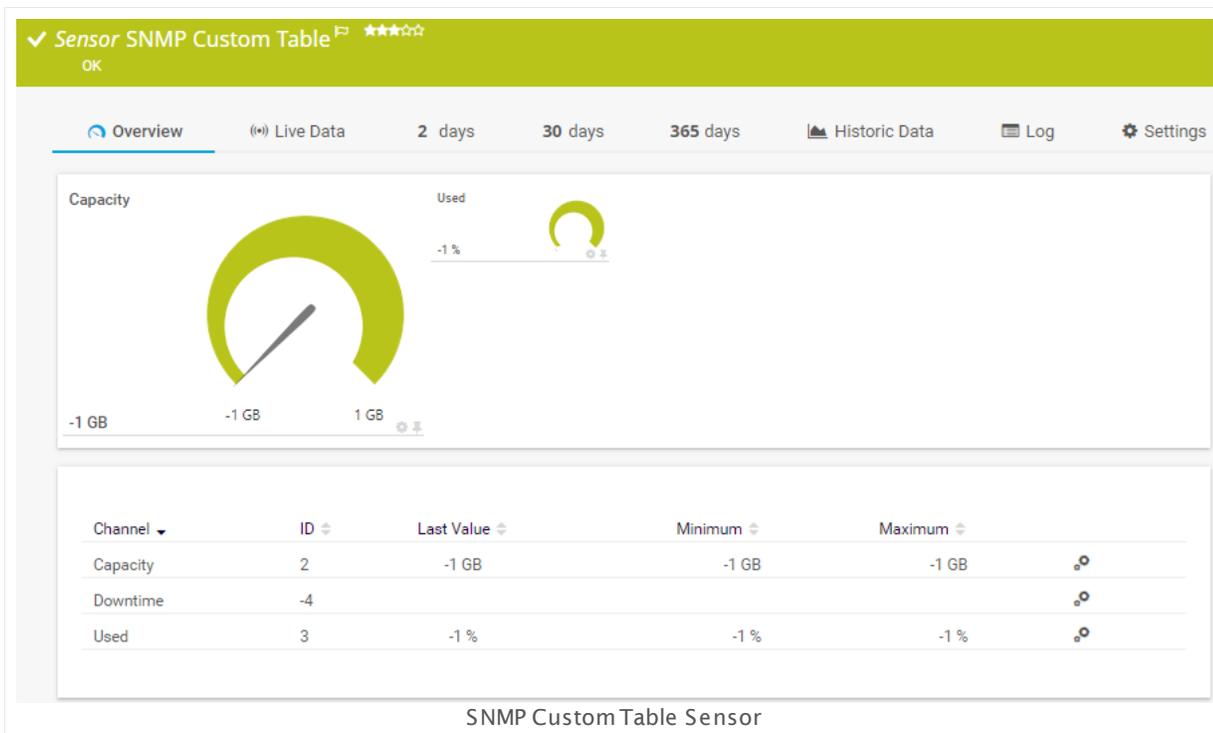

7.8.141 SNMP Custom Table Sensor

The SNMP Custom Table sensor monitors entries from a table that is provided via Simple Network Management Protocol (SNMP). You can create one new sensor per table row. For each sensor, you can define up to ten channels. Each channel shows the value of one defined table column.

- It can show numerical values in up to 10 channels per table row.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

i The [SNMP Library sensor](#)²²³⁷ will automatically create SNMP Custom Table sensors when the imported Management Information Base (MIB) file contains tables.

Sensor in Other Languages

Dutch: **SNMP Aangepaste Tabel**, French: **Table SNMP personnalisée**, German: **SNMP (Benutzerdef. Tabelle)**, Japanese: **SNMP ? ? ? ? ? ? ? ?**, Portuguese: **Tabela customizada do SNMP**, Russian: **Нестандартная таблица SNMP**, Simplified Chinese: **SNMP ? ? ? ?**, Spanish: **Tabla de SNMP personalizado**

Remarks

- It might not work to query data from a probe device via SNMP (querying `localhost`, `127.0.0.1`, or `:::1`). [Add this device to PRTG](#)³¹¹ with the IP address that it has in your network and create the SNMP sensor on this device instead.
- Knowledge Base: [How do I find out what OID I need to use for a custom sensor?](#)

- Knowledge Base: [What can I monitor with the SNMP Custom Table Sensor?](#)
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will create one SNMP Table sensor for each table row that you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SNMP TABLE

Table OID Enter the OID of the SNMP table you want to monitor. The OID needs to point directly to an object that represents an SNMP table. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

 Without entering an OID, you cannot proceed to the sensor and sensor channel creation.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. You can use the placeholders **[tablename]** and **[rowidentifier]**. They will be replaced with the name of the table and the identifying value of the chosen row respectively. You can choose the column that provides the row identifier in the **Identification Column** option below.

You can also enter a valid OID that is part of a different SNMP table, for example, **[1.3.6.1.2.1.2.1.2]**, to query information that is not contained in the current table. The same index as in the original table will be added to the OID.

TABLE SPECIFIC

Table

Choose the relevant table rows in which you find the data that you want to monitor. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

PRTG shows you the table that the OID you entered before returns. To better find what you want to monitor, especially in large tables, use the search function in the upper right corner.

Identification Column

Define the identification column for the SNMP Table sensor(s) you want to create. The sensor uses this column to uniquely identify each table row. This column should preferably be unique because it will allow the sensor to keep track of changing indexes.

The value of the column that you choose as the identification column will replace the **[row identifier]** in the sensor name. This allows you to distinguish sensors that are created for the same SNMP table.

 One new sensor is created for each table row you choose.

Sensor Channel #2 - #10

You can create up to 10 different sensor channels for this sensor. You have to define at least one data channel, so you will see all available settings for **Sensor Channel #1** without enabling it manually. Additionally you can define **Sensor Channel #2** up to **Sensor Channel #10**. To do so, choose between:

- **Disable:** The sensor will not create this channel.
- **Enable:** Create an additional channel and define all its characteristics below, its name, column, value type, and unit.

It is not possible to enable or disable sensor channels after the creation of this sensor!

 All sensor channels that you define while creating an SNMP Table sensor will be the same for all sensors for each table row.

Value Type

Select the expected type of the results in this channel. Choose between:

- **Absolute (unsigned Integer):** For integer values, such as **10** or **120**.
- **Absolute (signed integer):** For integer values, such as **-12** or **120**.

TABLE SPECIFIC

- **Absolute (float):** For float values, such as **-5.80** or **8.23**. This value type is not compatible with the unit **Value Lookup**.
- **Delta (Counter):** For counter values. PRTG will calculate the difference between the last and the current value. The delta value will additionally be divided by a time period to indicate a speed value. This value type is not compatible with the unit **Value Lookup**.

See [below](#) for the other channel settings that can be changed also after the sensor has been created.

i This sensor monitors numerical values only. Make sure that you do not select columns that return strings because they lead to a **Down status**. For example, if you monitor an **ifTable**, we recommend that you do not select an **ifDescr** column because this will result in an error.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SNMP TABLE

Table OID Shows the OID of the SNMP table that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

TABLE SPECIFIC

Identifier This is the value of the column that you selected as the **Identification Column** during the sensor creation. It is also displayed in the sensor name to distinguish it from other sensors you created for the same table with other table rows. You can change the identifier if you want to.

Identification Column Shows the table column that you chose as the identification column. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Channel #x Name Enter a name for the channel in which the sensor shows the desired result. Please enter a string.

Sensor Channel #x Column Select the table column that together with the table row points to the value that you want to monitor in this channel. You can choose between the available columns of the table that you monitor.

TABLE SPECIFIC

Sensor Channel #x Value Type	Shows the value type of the data that this sensor receives in this channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Channel #x Unit	<p>Define the unit of the data that this sensor receives in this channel. Choose between:</p> <ul style="list-style-type: none"> ▪ BytesBandwidth ▪ BytesMemory ▪ BytesDisk ▪ Temperature ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours ▪ Count ▪ CPU ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Value Lookup <p> For more information about the available units, see section Custom Sensors³⁶⁴².</p> <p> To use lookups³⁶⁹³ with this channel, choose the unit Value Lookup and select your lookup file below. Do not use the unit Custom for using lookups with this sensor and do not use the channel settings³¹⁶⁰ to define a lookup file!</p> <p> Using the unit Value Lookup is not possible when you choose the value type Delta (Counter) or Absolute (float). You will not be able to create the sensor in this case.</p>
Sensor Channel #x Custom Unit	This setting is only visible if you select the Custom unit option above. Define a unit for the channel value. Please enter a string.

TABLE SPECIFIC

Sensor Channel # x Value Lookup	This setting is only visible if you select the Value Lookup option above. Select a lookup <small>3683</small> file that you want to use with this channel.
Sensor Channel # x+1	Shows if you enabled or disabled a channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings <small>3160</small> settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) 331 group's settings, see section [Inheritance of Settings](#) 137 for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

- | | |
|-------------------------|--|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ^[336] on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> |

SCANNING INTERVAL

- ❗ If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- ❗ Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- ❗ Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- ❗ To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies^[323] in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	<p>This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector^[240] to choose an object on which the current sensor will depend.</p>
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

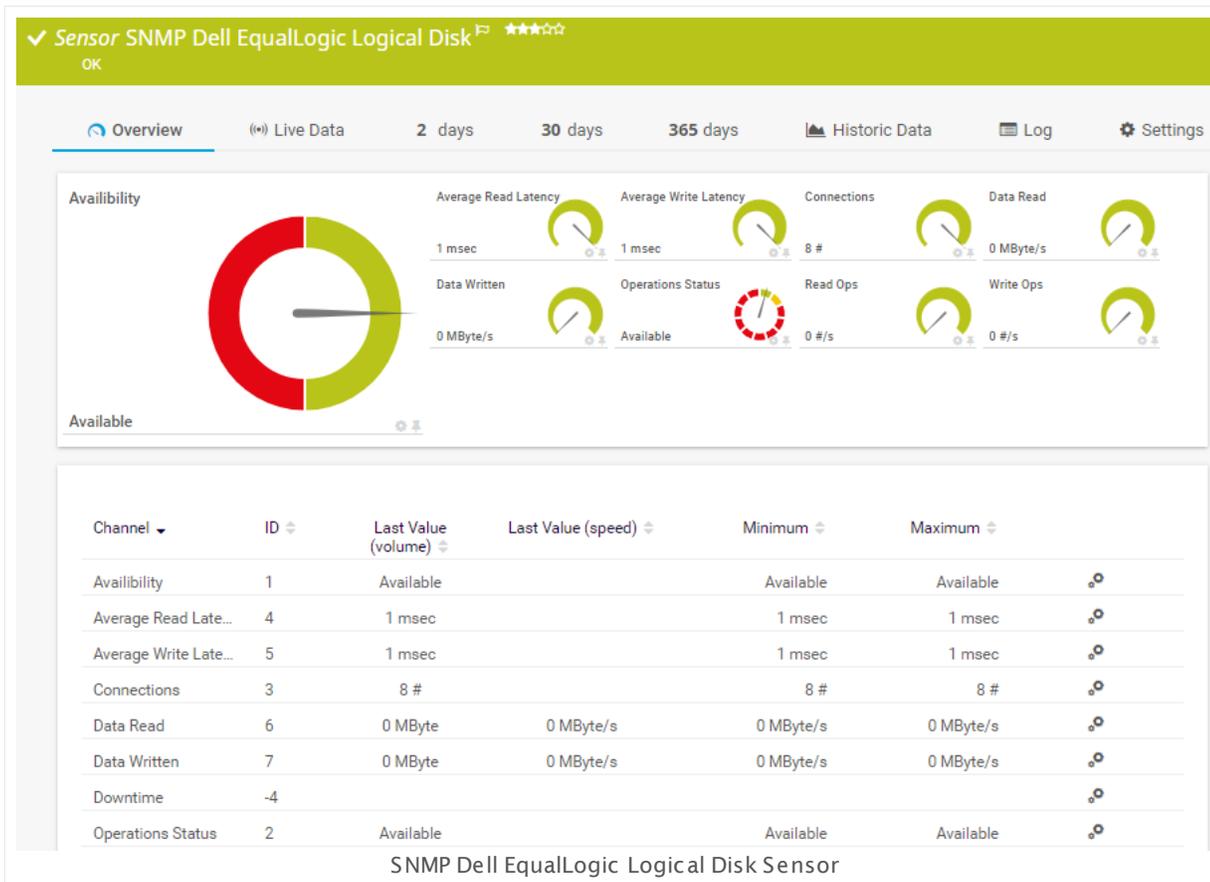

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.142 SNMP Dell EqualLogic Logical Disk Sensor

The SNMP Dell EqualLogic Logical Disk sensor monitors a volume of a Dell EqualLogic storage system via Simple Network Management Protocol (SNMP).

The sensor provides the following information:

- Availability
- Average read/write latency
- Number of connections
- Amount of read/written data
- Operational status
- Number of IOPS (Input/Output operations per second)

Sensor in Other Languages

Dutch: **SNMP Dell EqualLogic Logische Schijf**, French: **Disque logique Dell EqualLogic SNMP**, German: **SNMP Dell EqualLogic Logischer Datenträger**, Japanese: **SNMP Dell Equal Logic c? ? ? ? ?**, Portuguese: **Disco lógico SNMP Dell EqualLogic**, Russian: **Логический диск SNMP Dell EqualLogic**, Simplified Chinese: **SNMP Dell EqualLogic ? ? ? ?**, Spanish: **Disco lógico SNMP de Dell EqualLogic**

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the volume(s) from the storage system that you want to monitor. PRTG will create one sensor for each volume you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

DELL EQUALLOGIC SPECIFIC

Volume	Select the volume(s) you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
--------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DELL EQUALLOGIC SPECIFIC

Volume	Shows the volume that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Member ID	Shows the identifier of the array member. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Volume ID	Shows the ID of the volume that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DELL EQUALLOGIC SPECIFIC

Volume Description Shows the description of the volume that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ³³⁵ on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to Down status¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none"> ▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request. ▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests. ▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests. ▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests. ▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> <p> If a channel uses lookup³⁶⁹³ values, it will always show a Down status immediately, so no "wait" options will apply.</p> |

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>3311</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.143 SNMP Dell EqualLogic Member Health Sensor

The SNMP Dell EqualLogic Member Health sensor monitors the health of an array member of an EqualLogic storage system via Simple Network Management Protocol (SNMP).

The sensor provides the following information:

- Member status
- Cooling power of the fan module in rpm (rotations per minute)
- Power supply status of cooling system
- Temperature of the backplane
- Temperature measured by temperature control module
- System temperature
- Member health status
- RAID status
- Average read/write latency in milliseconds or as percentage of the largest value
- Free storage capacity
- Amount of data handled per second
- Number of spare drives available

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
 143 SNMP Dell EqualLogic Member Health Sensor

Sensor in Other Languages

Dutch: **SNMP Dell EqualLogic Lid Gezondheid**, French: **État du membre Dell EqualLogic SNMP**, German: **SNMP Dell EqualLogic Member-Zustand**, Japanese: **SNMP Dell EqualLogic** ? ? ? ? ? ? ? , Portuguese: **Funcionamento do membro SNMP Dell EqualLogic**, Russian: **Работоспособность элемента Dell EqualLogic по SNMP**, Simplified Chinese: **SNMP Dell EqualLogic** ? ? ? ? ? ? ? , Spanish: **Salud de miembro SNMP de Dell EqualLogic**

Remarks

- This sensor type works with **SNMP v2c** and **SNMP v3**. It does not support **SNMP v1**. Ensure you set the correct **SNMP Version** in the **Credentials for SNMP Devices** settings of the parent device or inherit it from objects higher in the [hierarchy](#)¹³³.

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the disk(s) on the drive you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

DELL EQUALLOGIC SPECIFIC

Array Member

Select the array member(s) you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DELL EQUALLOGIC SPECIFIC

Array Member	Shows the name of the member this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Group ID	Shows the group ID of the disk that this sensor monitors.. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Member ID	Shows the group member ID of the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.144 SNMP Dell EqualLogic Physical Disk Sensor

The SNMP Dell EqualLogic Physical Disk sensor monitors a disk in a Dell EqualLogic storage system via Simple Network Management Protocol (SNMP).

The sensor provides the following information:

- Disk status
- Bytes read/written
- Failed transfers
- Health status of disk

Sensor in Other Languages

Dutch: **SNMP Dell EqualLogic Fysieke Schijf**, French: **Disque physique Dell EqualLogic SNMP**, German: **SNMP Dell EqualLogic Physikalischer Datenträger**, Japanese: **SNMP Dell EqualLogic ? ? ? ? ?**, Portuguese: **Disco físico SNMP Dell EqualLogic**, Russian: **Физический диск Dell EqualLogic по SNMP**, Simplified Chinese: **SNMP Dell EqualLogic ? ? ? ?**, Spanish: **Disco físico SNMP de Dell EqualLogic**

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the array member(s) of the Dell EqualLogic storage system you want to monitor. PRTG will create one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

DELL EQUALLOGIC SPECIFIC

Disk	Select the disk(s) you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DELL EQUALLOGIC SPECIFIC

Disk	Shows the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Group ID	Shows the group ID of the disk that this sensor monitors.. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Member ID	Shows the group member ID of the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DELL EQUALLOGIC SPECIFIC

Disk Slot	Shows the slot number of disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Serial Number	Shows the serial number of the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Manufactured	Shows the production date of the disk that this sensor monitors. If this field is empty, the disk does not provide information about the date (this depends on the manufacturer). Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.145 SNMP Dell Hardware Sensor

The SNMP Dell Hardware sensor monitors performance counters on a Dell hardware device using Simple Network Management Protocol (SNMP). The data that you can monitor with this sensor depends on the available performance counters on the target system.

This sensor shows a value returned by a specific Dell hardware OID, for example:

- Data about the system management software
- Data about system status
- Information about chassis and BIOS
- Various hardware parameters
- Other valuable data

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

i The SNMP Dell Hardware sensor will not appear as running sensor, instead it will be created as [SNMP Custom Advanced](#) ¹⁹⁵⁹ or [SNMP Custom Table sensor](#) ¹⁹⁹².

The screenshot shows the PRTG Network Monitor interface for the 'Sensor SNMP Dell Hardware'. The top bar is green and shows a checkmark, the sensor name, and a status of 'OK'. Below this are navigation tabs: 'Overview' (selected), 'Live Data', '2 days', '30 days', '365 days', 'Historic Data', 'Log', and 'Settings'. The main content area displays a gauge for 'system state global system status' with a needle pointing to 0 on a scale from 0 to 4. Below the gauge is a table with the following data:

Channel	ID	Last Value	Minimum	Maximum
Downtime	-4			
system state global sys...	0	4 #	4 #	4 #

At the bottom of the interface, the text 'SNMP Dell Hardware Sensor' is displayed.

Sensor in Other Languages

Dutch: **SNMP Dell Hardware**, French: **Matériels SNMP Dell**, German: **SNMP Dell Hardware**, Japanese: **SNMP DELL ? ? ? ? ? ?**, Portuguese: **Hardware Dell SNMP**, Russian: **Оборудование Dell по SNMP**, Simplified Chinese: **SNMP DELL ? ?**, Spanish: **Hardware SNMP Dell**

Remarks

- [Requires](#)²⁰³³ the Dell OpenManage Server Administrator to be installed on the monitored Dell device.
- Knowledge Base: [What do I need to monitor Dell servers?](#)
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)³⁴⁸⁹.

Requirement: Dell OpenManage Server Administrator

 This sensor needs the Dell OpenManage Server Administrator tool to be installed on the Dell hardware device to monitor it. Please make sure that you enable SNMP in the OpenManage Server Administrator.

 For details, see the Knowledge Base: [What do I need to monitor Dell servers?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Dell performance counters you want to monitor. PRTG will create one [SNMP Custom Advanced](#)¹⁹⁵⁹ or [SNMP Custom Table sensor](#)¹⁹⁹² with up to 10 channels for each Library OID category you choose in the **Add Sensor** dialog. If your selection results in more than 10 channels, PRTG will create the corresponding amount of SNMP Custom Advanced or SNMP Custom Table sensors. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

DELL HARDWARE SPECIFIC

Library OIDs

Select the performance counters you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

 Choose the counters that you want to monitor with caution! We recommend that you select only a few counters in this dialog. Use the search function in the table head to filter for specific counters. Selecting too many library OIDs might result in thousands of sensors or in an aborted sensor creation.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DELL HARDWARE SPECIFIC

Selected Interface	Shows the name of the interface (performance counter) that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Unit String	Define the unit of the numerical data that the sensor receives at the given OID. Please enter a string.
Multiplication	If you want to multiply the received data with a certain value, enter the multiplier here. Please enter an integer value.
Division	If you want to divide the received data by a certain value, enter the divisor here. Please enter an integer value.
If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between: <ul style="list-style-type: none">▪ Ignore changes (default): The sensor takes no action on change.▪ Trigger 'change' notification: The sensor sends an internal message indicating that its value has changed. In combination with a Change Trigger, you can use this mechanism to trigger a notification <small>3170</small> whenever the sensor value changes.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.
Graph Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none">▪ Show channels independently (default): Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁸⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- ❗ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- ❗ If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- ❗ If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- ❗ Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#).

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

7.8.146 SNMP Dell PowerEdge Physical Disk Sensor

The SNMP Dell PowerEdge Physical Disk sensor monitors a physical disk in a Dell PowerEdge server using Simple Network Management Protocol (SNMP).

It can show the following:

- Disk status
- Roll up status
- Component status
- If there is currently a warning regarding the Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.) status

Sensor in Other Languages

Dutch: **SNMP-Dell PowerEdge Fysieke Schijf**, French: **Disque physique Dell PowerEdge SNMP**, German: **SNMP Dell PowerEdge Physikalischer Datenträger**, Japanese: **SNMP Dell PowerEdge ? ? ? ? ? ?**, Portuguese: **Disco físico SNMP Dell PowerEdge**, Russian: **Физический диск Dell PowerEdge по SNMP**, Simplified Chinese: **SNMP Dell PowerEdge ? ? ? ?**, Spanish: **Disco físico SNMP Dell PowerEdge**

Remarks

- [Requires](#) ²⁰⁵⁴ iDRAC 7 or the Dell OpenManage Server Administrator to be installed on the monitored server.

- Knowledge Base: [What do I need to monitor Dell servers?](#)
- Knowledge Base: [I can't add Dell PowerEdge sensors to PRTG. What can I do?](#)
- Knowledge Base: [Why does my Dell PowerEdge System Health sensor show a power unit status error after iDRAC update?](#)
- Knowledge Base: [My Dell PowerEdge sensor fails to validate disks and I can't add it. What can I do?](#)
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Requirement: Dell OpenManage Server Administrator or iDRAC 7

 This sensor needs the Dell OpenManage Server Administrator tool to be installed on the Dell PowerEdge server to monitor it. Please make sure that you enable SNMP in the OpenManage Server Administrator.

 For details, see the Knowledge Base: [What do I need to monitor Dell servers?](#)

 You can also monitor Dell PowerEdge servers with this sensor type via Integrated Dell Remote Access Controller (iDRAC) 7.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the disks you want to monitor. PRTG will create one sensor for each disk you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

DELL POWEREDGE PHYSICAL DISK SETTINGS

Disk	Select the disks you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DELL POWEREDGE PHYSICAL DISK SETTINGS

Disk	Shows the name of the disk that this sensor is monitoring. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Data Source	Shows the interface that is used to get monitoring data. This is either Dell OpenManage Server Administrator (OMSA) or Integrated Dell Remote Access Controller (iDRAC).

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

- | | |
|-------------------------|--|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ^[336] on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> |

SCANNING INTERVAL

- ❗ If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- ❗ Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- ❗ Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- ❗ To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies^[323] in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	<p>This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector^[240] to choose an object on which the current sensor will depend.</p>
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷ section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

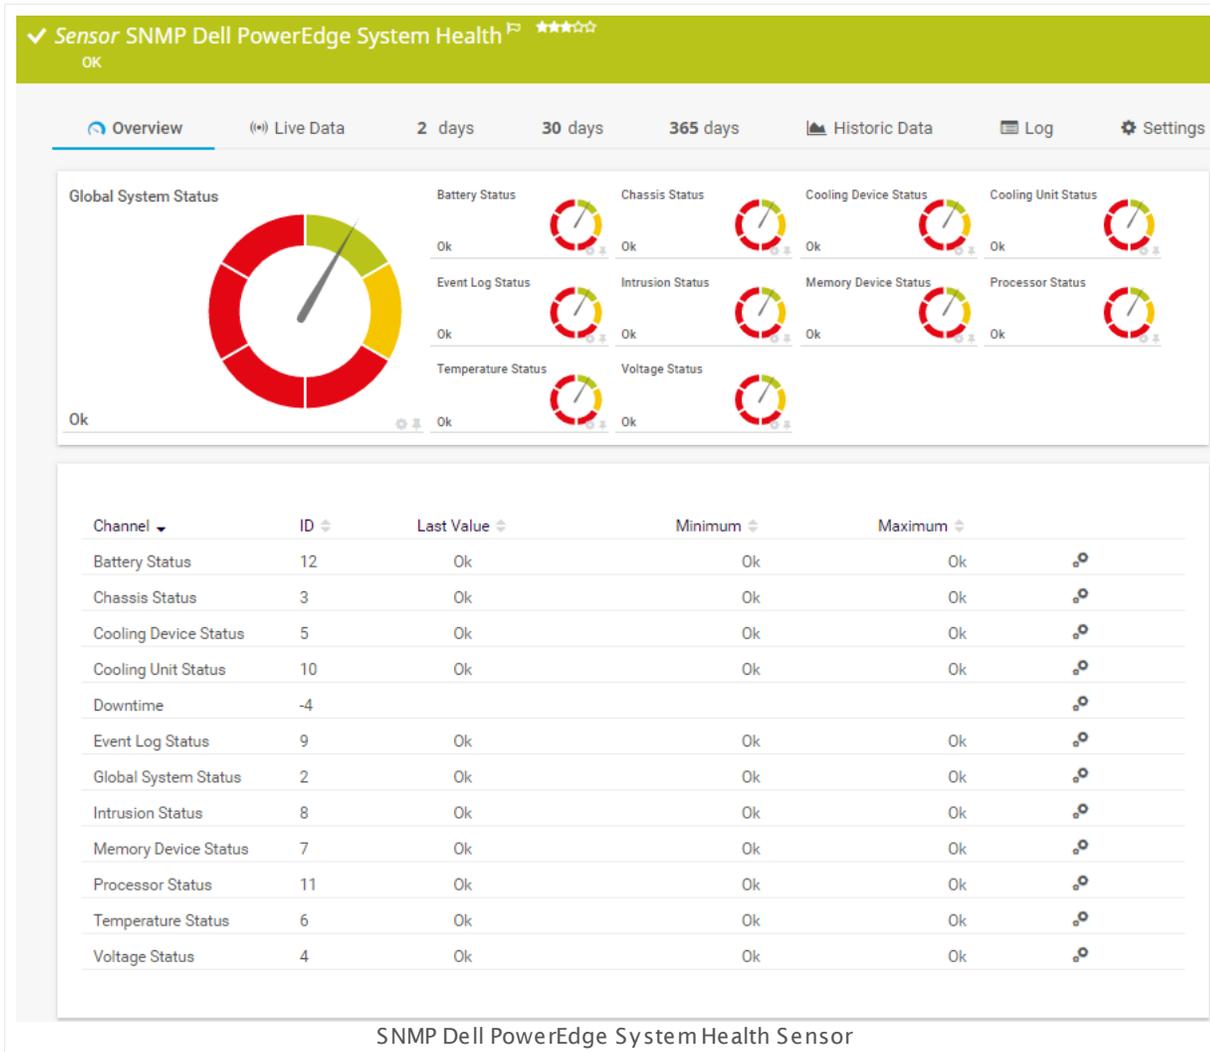

7.8.147 SNMP Dell PowerEdge System Health Sensor

The SNMP Dell PowerEdge System Health sensor monitors the system health of a Dell PowerEdge server using Simple Network Management Protocol (SNMP).

It can show the states of the following components, depending on their availability:

- Global system
- Power supply
- Temperature
- Cooling device
- Memory device
- Voltage

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **SNMP Dell PowerEdge System Status**, French: **État du système Dell PowerEdge SNMP**, German: **SNMP Dell PowerEdge Systemzustand**, Japanese: **SNMP Dell PowerEdge ? ? ? ? ? ?**, Portuguese: **Funcionamento do sistema SNMP Dell PowerEdge**, Russian: **Работоспособность системы Dell PowerEdge по SNMP**, Simplified Chinese: **SNMP Dell PowerEdge ? ? ? ? ? ?**, Spanish: **SNMP Salud de sistema Dell PowerEdge**

Remarks

- [Requires](#) ²⁰⁵⁴ iDRAC 7 or the Dell OpenManage Server Administrator to be installed on the monitored server.
- Knowledge Base: [What do I need to monitor Dell servers?](#)
- Knowledge Base: [I can't add Dell PowerEdge sensors to PRTG. What can I do?](#)
- Knowledge Base: [Why does my Dell PowerEdge System Health sensor show a power unit status error after iDRAC update?](#)

- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, refer to the manual section [Sensor Channels Settings](#)³¹⁶⁰.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)³⁴⁸⁹.

Requirement: Dell OpenManage Server Administrator or iDRAC 7

 This sensor needs the Dell OpenManage Server Administrator tool to be installed on the Dell PowerEdge server to monitor it. Please make sure that you enable SNMP in the OpenManage Server Administrator.

 For details, see the Knowledge Base: [What do I need to monitor Dell servers?](#)

 You can also monitor Dell PowerEdge servers with this sensor type via Integrated Dell Remote Access Controller (iDRAC) 7.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Dell PowerEdge chassis you want to monitor. PRTG will create one sensor for each chassis you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

DELL POWEREDGE SYSTEM HEALTH SPECIFIC

Chassis	Select the chassis you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
---------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DELL POWEREDGE SYSTEM HEALTH SPECIFIC

Chassis	Shows the chassis that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
---------	---

DELL POWEREDGE SYSTEM HEALTH SPECIFIC

Channel Mask	Shows the channel mask that describes which sensors are available. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Data Source	Shows the interface that is used to get monitoring data. This is either Dell OpenManage Server Administrator (OMSA) or Integrated Dell Remote Access Controller (iDRAC).

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

- | | |
|-------------------------|--|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ^[336] on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.</p> <p> If a sensor has defined error limits for channels, it will always show a Down status immediately, so no "wait" option will apply.</p> |

SCANNING INTERVAL

- ❗ If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- ❗ Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- ❗ Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- ❗ To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none">▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below.▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies^[323] in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	<p>This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector^[240] to choose an object on which the current sensor will depend.</p>
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

147 SNMP Dell PowerEdge System Health Sensor

Others

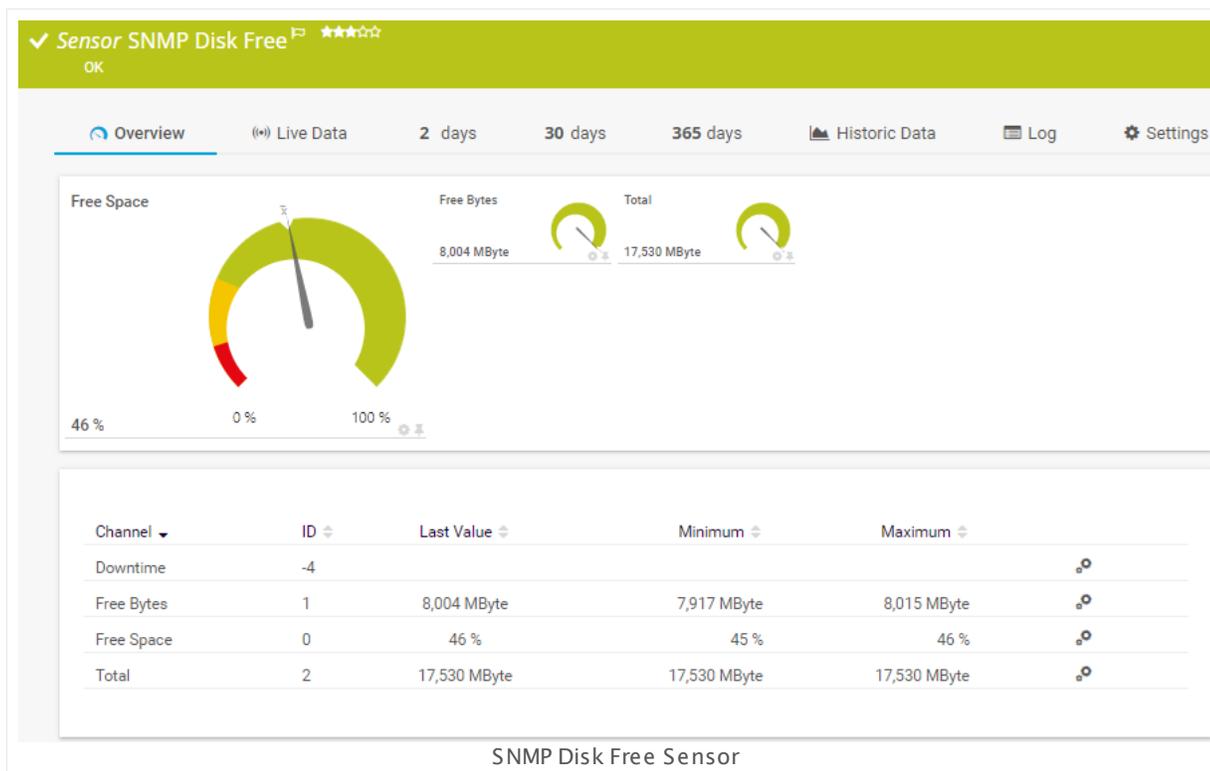

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.148 SNMP Disk Free Sensor

The SNMP Disk Free sensor monitors the free disk space on a logical disk via Simple Network Management Protocol (SNMP).

It can show the following:

- Free disk space in percent
- Free disk space in bytes
- Total disk space

Sensor in Other Languages

Dutch: **SNMP vrije schijf ruimte**, French: **Espace disque disponible SNMP**, German: **SNMP Datenträgerspeicher**, Japanese: **SNMP ? ? ? ? ? ? ? ?**, Portuguese: **Disco livre SNMP**, Russian: **Свободное пространство по SNMP**, Simplified Chinese: **SNMP ? ? ? ? ? ? ? ?**, Spanish: **SNMP Disco libre**

Remarks

- This sensor uses more generic Object Identifier (OID) values compared to the [SNMP Linux Disk Free Sensor](#).
- It might not work to query data from a probe device via SNMP (querying `localhost`, `127.0.0.1`, or `:::1`). [Add this device to PRTG](#) with the IP address that it has in your network and create the SNMP sensor on this device instead.

- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the disk(s) you want to monitor. PRTG will create one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

DISK FREE SETTINGS

Disk	Select one or more disks you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3276] , libraries ^[3235] , and tickets ^[230] .
-------------	--

BASIC SENSOR SETTINGS

Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DISK FREE SETTINGS

Disk	Shows the name of the disk that this sensor is monitoring. This value is shown for reference purposes only. We strongly recommend that you only change it if Paessler support explicitly asks you to do so. Wrong usage can result in incorrect monitoring data!
------	--

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

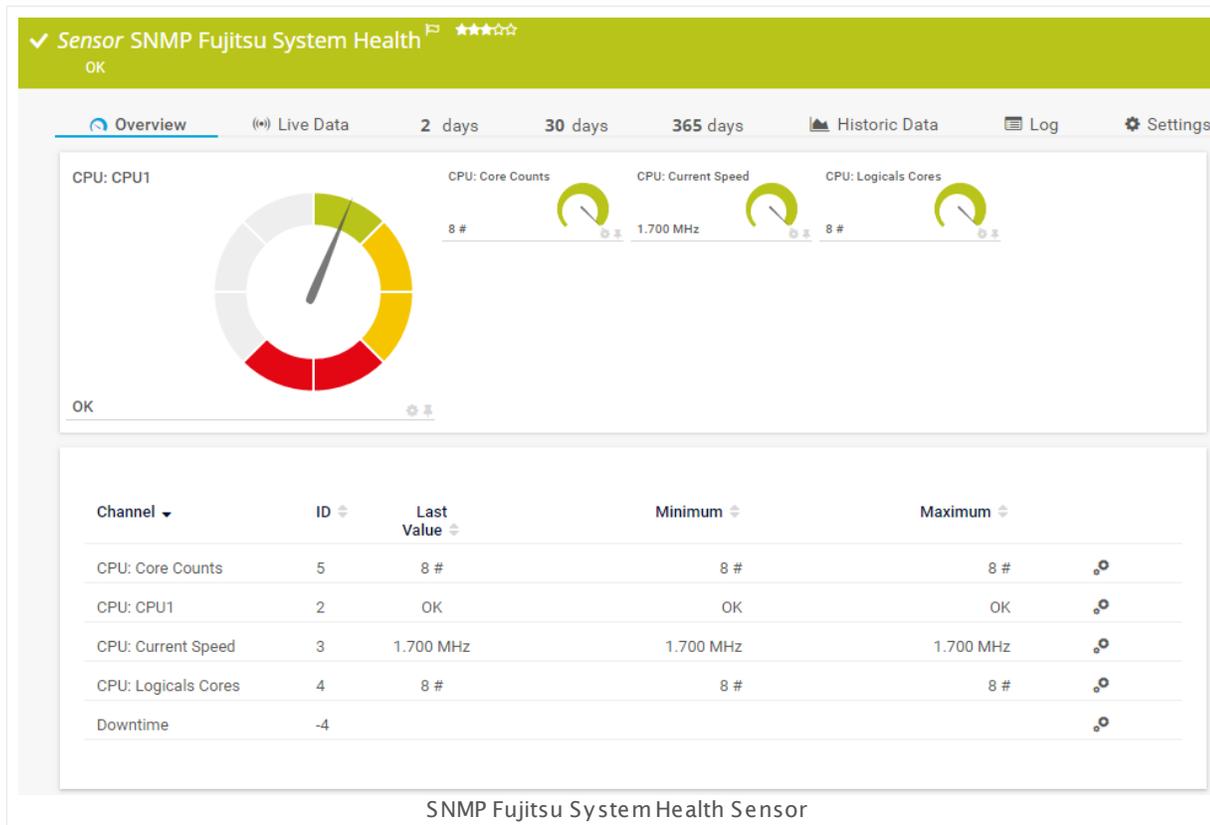

7.8.149 SNMP Fujitsu System Health Sensor

The SNMP Fujitsu System Health sensor monitors the status of a Fujitsu PRIMERGY server via the integrated Remote Management Controller (iRMC) and Simple Network Management Protocol (SNMP). The sensor might also work on other Fujitsu devices that have an iRMC available like PRIMEQUEST servers, some storage systems of the ETERNUS product line, and CELSIUS workstations in racks.

It can show the following:

- Overall status
- CPU status, speed, and core count
- Fan status and speed
- Memory module status
- Number of correctable and uncorrectable errors of the memory module
- Battery status
- Status and condition of the power supply
- Power limit status and power consumption
- Temperatures for various components of the server, for example, memory, power supply, CPU, system, and storage.

These channels are created at run-time, depending on the available measurement components. Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Remarks

- Use an iRMC interface as parent device for this sensor.
- Please make sure to enable SNMP in the iRMC via ServerView.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
- **BETA** Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the measurements you want to monitor. PRTG will create one sensor for each measurement you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

FUJITSU SYSTEM SPECIFIC

Measurement Select the measurements you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)^[181], as well as in [alarms](#)^[213], [logs](#)^[228], [notifications](#)^[3216], [reports](#)^[3262], [maps](#)^[3270], [libraries](#)^[3235], and [tickets](#)^[230].

Parent Tags Shows [Tags](#)^[139] that this sensor [inherits](#)^[140] from its [parent device, group, and probe](#)^[133]. This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#)^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

FUJITSU SYSTEM SPECIFIC

Measurement Shows the type of measurement that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Identifier Shows the value that identifies the row in the table. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

i The identifier has the following format: **RowIndex | Unique | Measurement**. For example, **1.1|BATT 3.0V|Voltage**.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

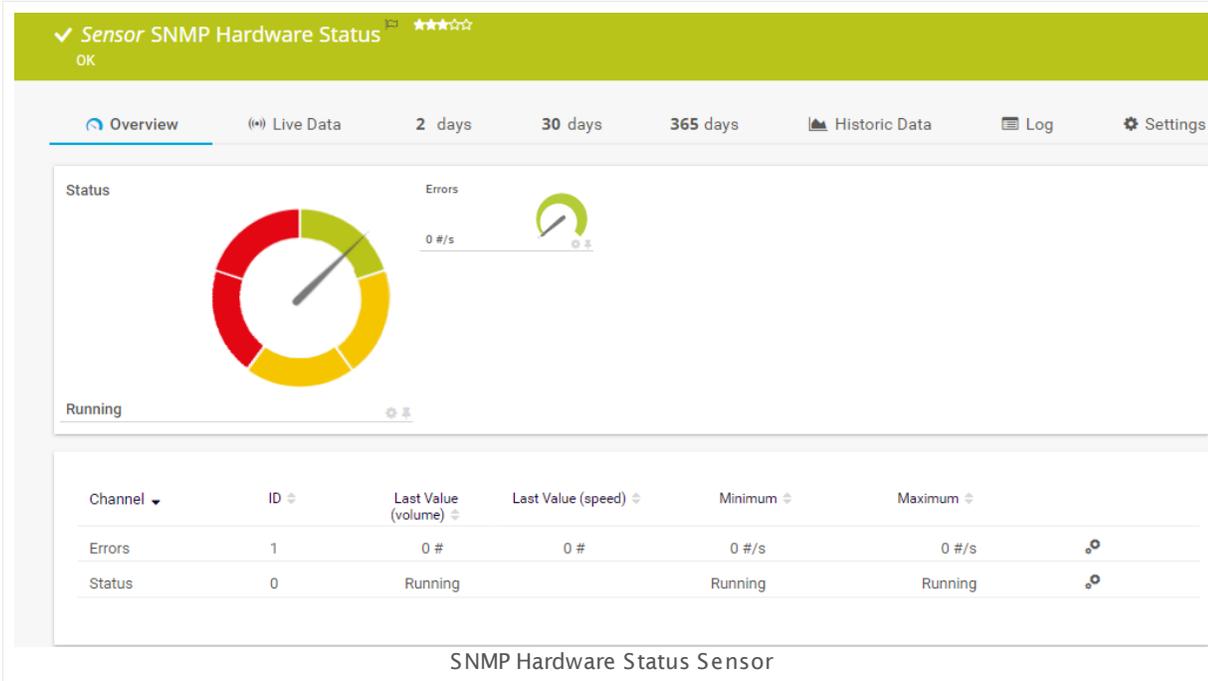

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.150 SNMP Hardware Status Sensor

The SNMP Hardware Status sensor monitors the status of a hardware component of a server via Simple Network Management Protocol (SNMP).

It shows the following:

- Current status of the monitored hardware component
- Number of errors per time period

Sensor in Other Languages

Dutch: **SNMP Hardware Status**, French: **Statut matériel SNMP**, German: **SNMP Hardwarezustand**, Japanese: **SNMP ? ? ? ? ? ? ? ?**, Portuguese: **Status do hardware SNMP**, Russian: **Статус оборудования по SNMP**, Simplified Chinese: **SNMP ? ? ? ?**, Spanish: **Estado del hardware de SNMP**

Remarks

- It might not work to query data from a probe device via SNMP (querying **localhost**, **127.0.0.1**, or **:::1**). [Add this device to PRTG](#) with the IP address that it has in your network and create the SNMP sensor on this device instead.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the hardware components you want to monitor. PRTG will create one sensor for each component you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

HARDWARE SPECIFIC

Hardware Component	Select the hardware components you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
--------------------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

HARDWARE SPECIFIC

Hardware Component	Shows further information about the hardware component. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Product ID	
Description	
Type	

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
150 SNMP Hardware Status Sensor

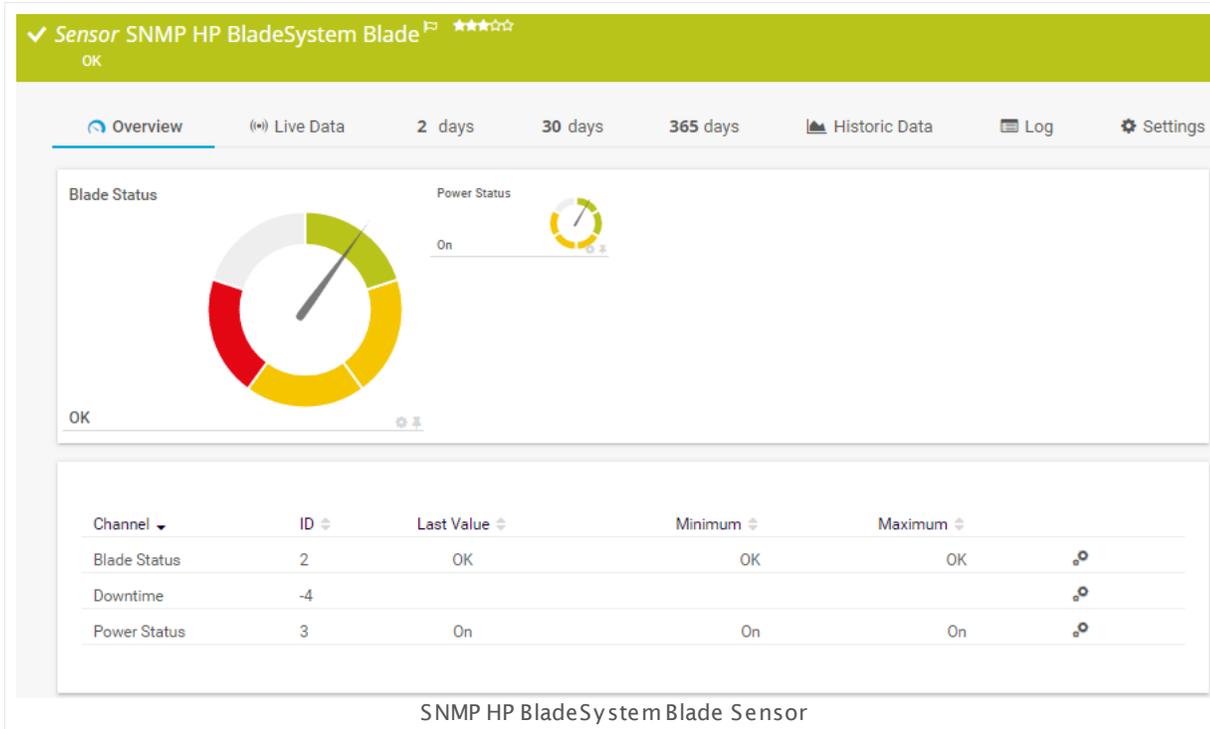

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.151 SNMP HP BladeSystem Blade Sensor

The SNMP HP BladeSystem Blade sensor monitors the status of an HP BladeSystem via Simple Network Management Protocol (SNMP). It can show the following:

- Blade status (OK, degraded, unknown, failed, other)
- Power status (OK, on, off, power staged off, unknown, other)

Sensor in Other Languages

Dutch: **SNMP HP BladeSystem Blade**, French: **Lame HP BladeSystem SNMP**, German: **SNMP HP BladeSystem Blade**, Japanese: **SNMP HP ? ? ? ? ? ? ? ? ? ? ? ?**, Portuguese: **Blade do SNMP HP BladeSystem**, Russian: **Блейд-модуль HP BladeSystem по SNMP**, Simplified Chinese: **SNMP HP BladeSystem ? ?**, Spanish: **Blade de SNMP de HP BladeSystem**

Remarks

- Make sure you add this sensor to a device whose IP/DNS name points to the HP BladeSystem Enclosure hosting the Onboard Administrator!
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the server blades you want to monitor. PRTG will create one sensor for each blade you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

HP BLADESYSTEM SPECIFIC

Server Blade	Select the blades you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
--------------	--

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[213] , logs ^[228] , notifications ^[3216] , reports ^[3262] , maps ^[3270] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

- Tags** Enter one or more [Tags](#)¹³⁹, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.
- You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)¹⁴⁰ from objects further up in the device tree. These are visible above as **Parent Tags**.
-  It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).
- Priority** Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HP BLADESYSTEM SPECIFIC

- Server Blade** Shows the server blade that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁸⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#).

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

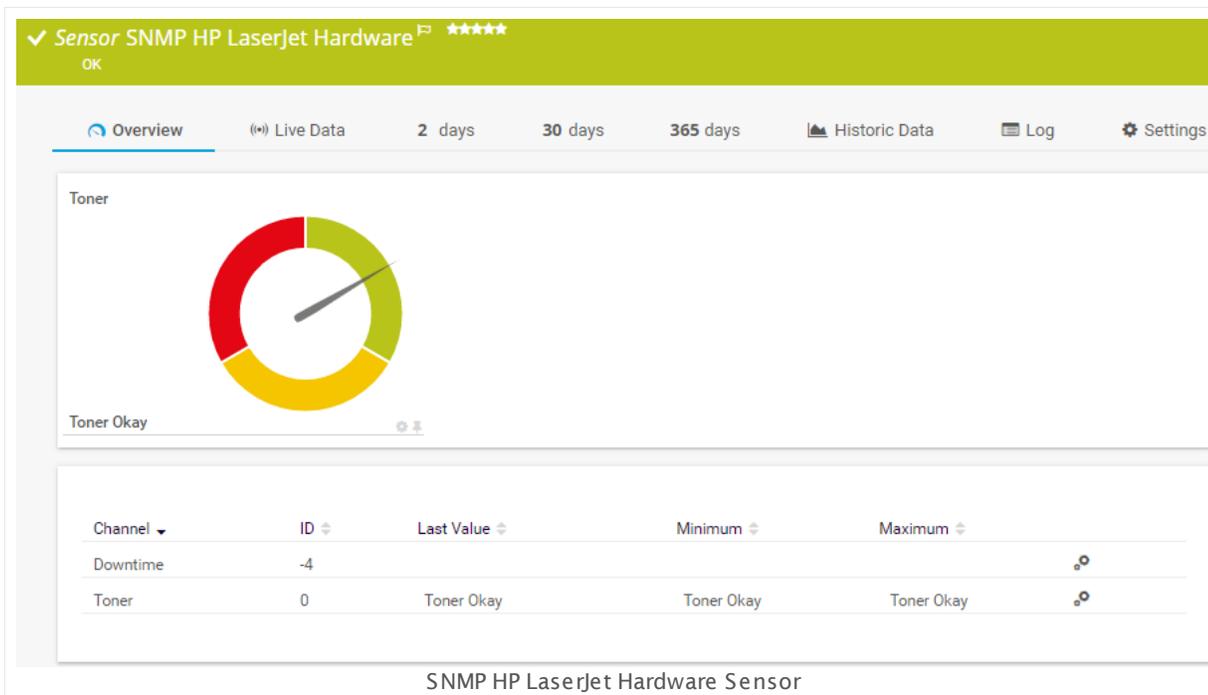

7.8.153 SNMP HP LaserJet Hardware Sensor

The SNMP HP LaserJet Hardware sensor monitors performance counters on a HP LaserJet hardware device using Simple Network Management Protocol (SNMP).

It can show the following, depending on what category you monitor:

- Status of toner
- Status of paper
- Paper jam status

 The SNMP HP LaserJet Hardware sensor will not appear as running sensor, instead it will be created as [SNMP Custom Advanced sensor](#)¹⁹⁵⁹.

Sensor in Other Languages

Dutch: **SNMP HP LaserJet Hardware**, French: **Matériels SNMP HP LaserJet**, German: **SNMP HP LaserJet Hardware**, Japanese: **SNMP HP LaserJet** ? ? ? ? ? ? , Portuguese: **Hardware da HP LaserJet SNMP**, Russian: **Оборудование HP LaserJet по SNMP**, Simplified Chinese: **SNMP HP LaserJet** ? ? , Spanish: **Hardware SNMP HP LaserJet**

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.

- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the categories you want to monitor. PRTG will create one [SNMP Custom Advanced sensor](#) including all performance counters you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

DELL HARDWARE SPECIFIC

Library OIDs

Select the categories you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

The following performance counters for your printer are available:

- **Toner/Status**
- **Paper/Status**
- **Jam/Status**

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HP LASERJET SPECIFIC

Selected Interface	Shows the name of the category (performance counter) that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
If Value Changes	<p>Define what this sensor will do when the sensor value changes. You can choose between:</p> <ul style="list-style-type: none"> ▪ Ignore changes (default): The sensor takes no action on change. ▪ Trigger 'change' notification: The sensor sends an internal message indicating that its value has changed. In combination with a Change Trigger, you can use this mechanism to trigger a notification whenever the sensor value changes.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵⁵ on PRTG on premises installations.</p>
-------------------	---

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Others

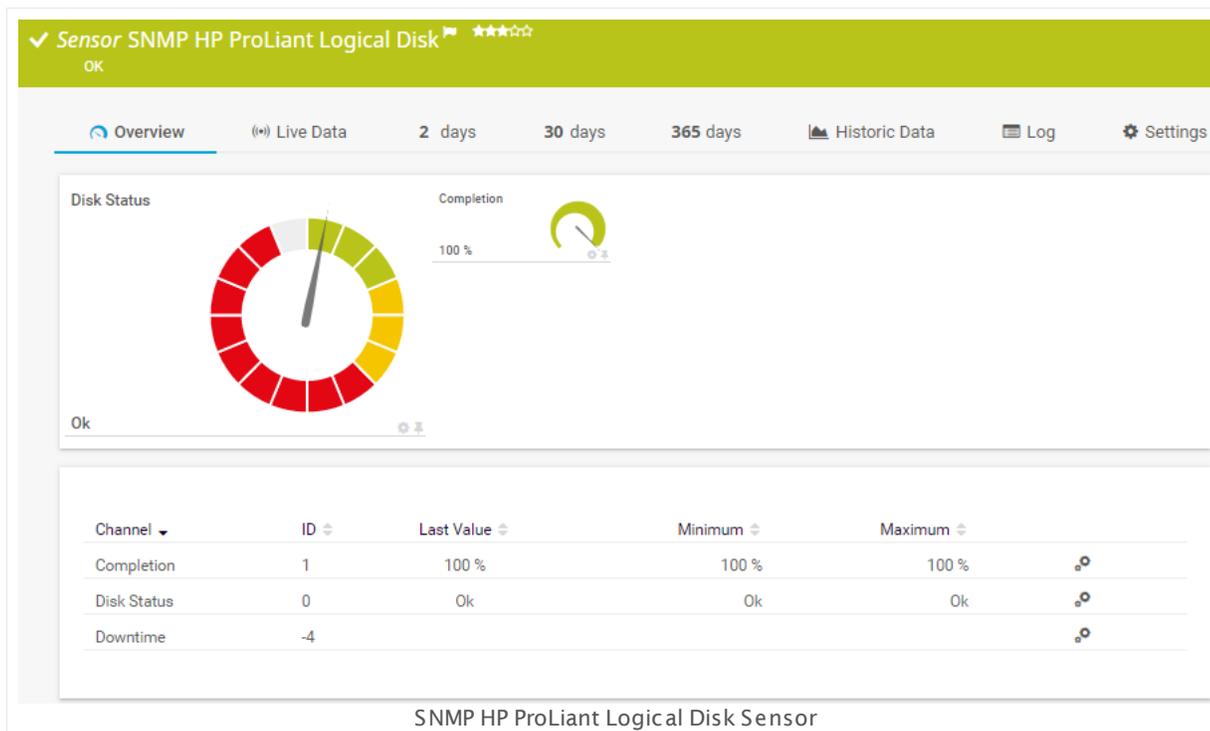

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.154 SNMP HP ProLiant Logical Disk Sensor

The SNMP HP ProLiant Logical Disk sensor monitors a logical disk in an HP server via Simple Network Management Protocol (SNMP).

It can show the following:

- Disk status
- Completion in percent: This is only important when the disk status is "Reconstructing" or "Expanding" and illustrates the progress of this task.

Sensor in Other Languages

Dutch: **SNMP HP ProLiant logische schijf**, French: **Disque logique HP ProLiant SNMP**, German: **SNMP HP ProLiant Logischer Datenträger**, Japanese: **SNMP HP ProLiant ? ? ? ?**, Portuguese: **Disco lógico SNMP HP ProLiant**, Russian: **Логический диск HP ProLiant по SNMP**, Simplified Chinese: **SNMP HP ProLiant ? ? ? ?**, Spanish: **Disco lógico SNMP HP ProLiant**

Remarks

- For Gen9 servers or earlier: [Requires](#) ²¹¹⁸ HP Insight Management Agents and HP Insight Management WBEM Providers to be installed on the target device.
- For Gen10 servers: [Requires](#) ²¹¹⁸ HPE Agentless Management and the HPE Agentless Management Service to be installed on the target device.
- For Gen10 servers: [Use the HP iLO interface](#) ²¹¹⁸ as parent device for this sensor.

- This sensor type supports monitoring HP Integrated Lights-Out (iLO) as of iLO version 3. We recommend that you use **iLO 4** or later.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)³⁴⁸⁹.

Requirement: HP System Management Tools

For Gen9 servers or earlier, this sensor needs a specific HP system management tool to be installed on the target device to report data via SNMP: **HP Insight Management Agents**. To receive SNMP data from RAID controllers, you additionally need **HP Insight Management WBEM Providers**. For Gen10 servers, this sensor no longer requires HP system management tools. Instead, the sensor needs the Agentless Management Service to be installed on the target device.

 For more details and download links, see the Knowledge Base: [Monitor HP ProLiant via SNMP?](#)

 For Gen9 servers or earlier, some of the HP **Object Identifiers (OIDs)** that this sensor type uses are only accessible via the HP Integrated Lights-Out (iLO) interface. If this sensor throws an error that it cannot find "such device types", please create a device in PRTG that points to the address of the HP iLO interface (if available) and add the sensor to this device. We recommend that you use the **Agentless Management** feature with configured SNMP. You can set this up in the iLO configuration interface under **Administration | Management | SNMP Settings**. For Gen10 servers, use the HP iLO interface as parent device for this sensor.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the disks in the HP server you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

HP PROLIANT LOGICAL DISK SETTINGS

Disk Select the disks you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HP PROLIANT LOGICAL DISK SETTINGS

Disk Shows the name of the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration ³³⁵ on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none"> ▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request. ▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests. ▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests. ▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests. ▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. <p> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

SNMP HP ProLiant Memory Controller Sensor

Sensor in Other Languages

Dutch: **SNMP HP ProLiant Memory Controller**, French: **Contrôleur de mémoire HP Proliant SNMP**, German: **SNMP HP ProLiant Speichercontroller**, Japanese: **SNMP HP Proliant ? ? ? ? ? ? ?**, Portuguese: **Controlador de memória SNMP HP Proliant**, Russian: **Контроллер памяти HP Proliant по SNMP**, Simplified Chinese: **SNMP HP Proliant ? ? ? ? ?**, Spanish: **Controlador de memoria SNMP HP Proliant**

Remarks

- For Gen9 servers or earlier: [Requires](#)²¹²⁷ HP Insight Management Agents and HP Insight Management WBEM Providers to be installed on the target device.
- For Gen10 servers: [Requires](#)²¹²⁷ HPE Agentless Management and the HPE Agentless Management Service to be installed on the target device.
- For Gen10 servers: [Use the HP iLO interface](#)²¹²⁷ as parent device for this sensor.
- Knowledge Base: [Which lookup values are supported by the SNMP HP ProLiant Memory Controller Sensor?](#)
- If modules are inserted at a later point, you have to add this sensor anew.
- This sensor type supports monitoring HP Integrated Lights-Out (iLO) as of iLO version 3. We recommend that you use **iLO 4** or later.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)³⁴⁸⁹.

Requirement: HP System Management Tools

For Gen9 servers or earlier, this sensor needs a specific HP system management tool to be installed on the target device to report data via SNMP: **HP Insight Management Agents**. To receive SNMP data from RAID controllers, you additionally need **HP Insight Management WBEM Providers**. For Gen10 servers, this sensor no longer requires HP system management tools. Instead, the sensor needs the Agentless Management Service to be installed on the target device.

 For more details and download links, see the Knowledge Base: [Monitor HP ProLiant via SNMP?](#)

 For Gen9 servers or earlier, some of the HP **Object Identifiers (OIDs)** that this sensor type uses are only accessible via the HP Integrated Lights-Out (iLO) interface. If this sensor throws an error that it cannot find "such device types", please create a device in PRTG that points to the address of the HP iLO interface (if available) and add the sensor to this device. We recommend that you use the **Agentless Management** feature with configured SNMP. You can set this up in the iLO configuration interface under **Administration | Management | SNMP Settings**. For Gen10 servers, use the HP iLO interface as parent device for this sensor.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the memory controllers in the HP server you want to monitor. PRTG will create one sensor for each controller you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

HP PROLIANT MEMORY CONTROLLER SETTINGS

Controller Select the controllers you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)^[181], as well as in [alarms](#)^[219], [logs](#)^[228], [notifications](#)^[3216], [reports](#)^[3252], [maps](#)^[3276], [libraries](#)^[3235], and [tickets](#)^[230].

Parent Tags Shows [Tags](#)^[139] that this sensor [inherits](#)^[140] from its [parent device, group, and probe](#)^[133]. This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#)^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HP PROLIANT MEMORY CONTROLLER SETTINGS

Controller Shows the name of the controller that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

i This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#) settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies <small>3209</small> in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

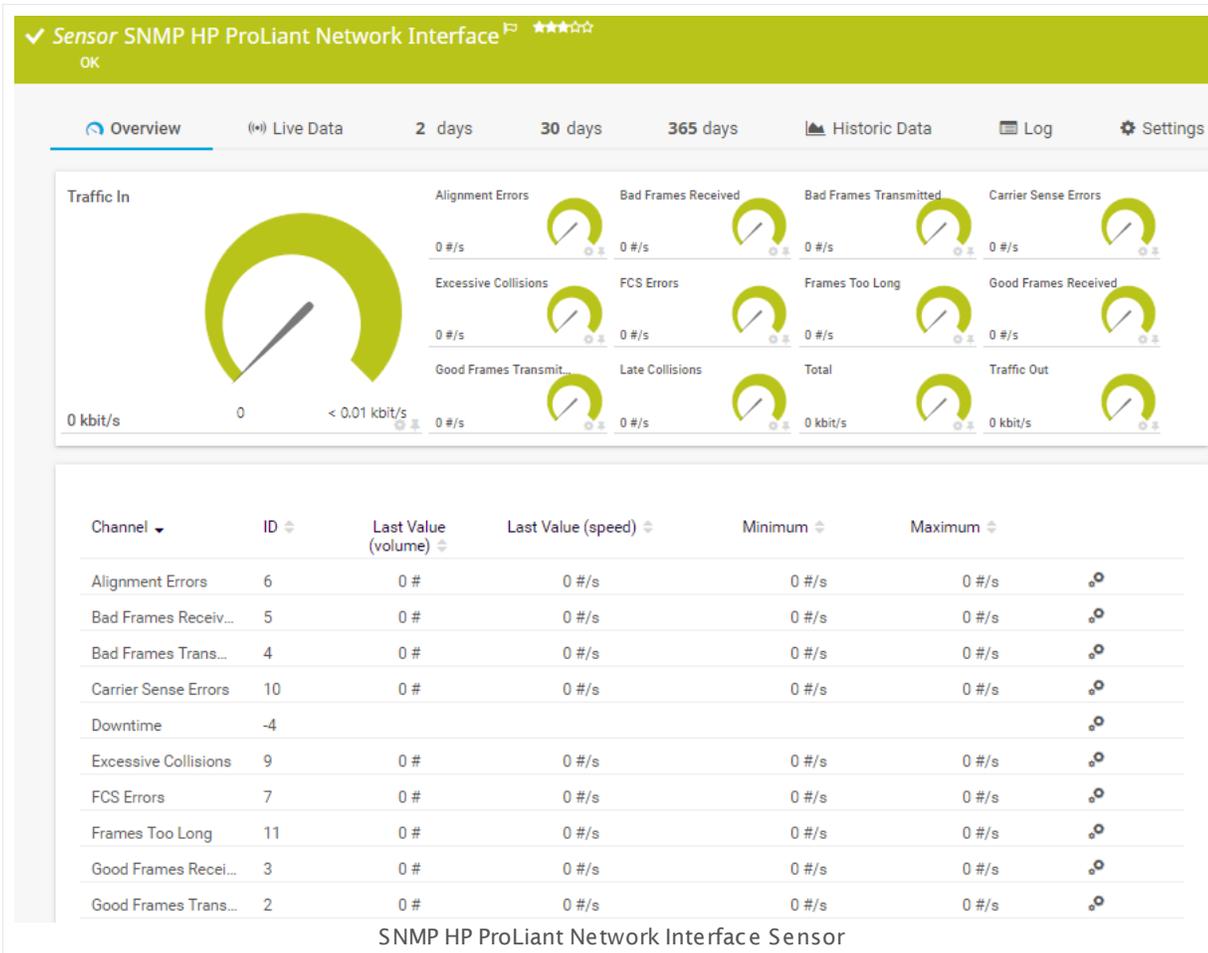

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.156 SNMP HP ProLiant Network Interface Sensor

The SNMP HP ProLiant Network Interface sensor monitors a network interface in an HP server via Simple Network Management Protocol (SNMP).

It can show the following:

- Traffic in
- Traffic out
- Number of transmitted and received good frames
- Number of transmitted and received bad frames
- Alignment errors
- FCS (Frame Check Sequence) errors
- Late and excessive collisions
- Carrier sense errors
- If frames are too long

Sensor in Other Languages

Dutch: **SNMP HP ProLiant Network Interface**, French: **Interface réseau HP ProLiant SNMP**, German: **SNMP HP ProLiant Netzwerkschnittstelle**, Japanese: **SNMP HP ProLiant ? ? ? ? ? ? ? ? ? ? ? ? ? ?**, Portuguese: **Interface de rede SNMP HP ProLiant**, Russian: **Сетевой интерфейс HP ProLiant по SNMP**, Simplified Chinese: **SNMP HP ProLiant ? ? ? ?**, Spanish: **SNMP Interface de red HP ProLiant**

Remarks

- For Gen9 servers or earlier: [Requires](#)²¹³⁷ HP Insight Management Agents and HP Insight Management WBEM Providers to be installed on the target device.
- For Gen10 servers: [Requires](#)²¹³⁷ HPE Agentless Management and the HPE Agentless Management Service to be installed on the target device.
- For Gen10 servers: [Use the HP iLO interface](#)²¹³⁷ as parent device for this sensor.
- When adding the sensor, the status of each available network interface is shown. If this status is **Link Failure**, it is still possible to add a sensor for the respective interface. Though, most likely the sensor for this interface will not work correctly. The error message in this case will be "No Such Name (SNMP error # 2)".
- This sensor type supports monitoring HP Integrated Lights-Out (iLO) as of iLO version 3. We recommend that you use **iLO 4** or later.
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)³⁴⁸⁹.

Requirement: HP System Management Tools

For Gen9 servers or earlier, this sensor needs a specific HP system management tool to be installed on the target device to report data via SNMP: **HP Insight Management Agents**. To receive SNMP data from RAID controllers, you additionally need **HP Insight Management WBEM Providers**. For Gen10 servers, this sensor no longer requires HP system management tools. Instead, the sensor needs the Agentless Management Service to be installed on the target device.

 For more details and download links, see the Knowledge Base: [Monitor HP ProLiant via SNMP?](#)

 For Gen9 servers or earlier, some of the HP **Object Identifiers (OIDs)** that this sensor type uses are only accessible via the HP Integrated Lights-Out (iLO) interface. If this sensor throws an error that it cannot find "such device types", please create a device in PRTG that points to the address of the HP iLO interface (if available) and add the sensor to this device. We recommend that you use the **Agentless Management** feature with configured SNMP. You can set this up in the iLO configuration interface under **Administration | Management | SNMP Settings**. For Gen10 servers, use the HP iLO interface as parent device for this sensor.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the network interfaces in the HP server you want to monitor. PRTG will create one sensor for each interface you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

HP PROLIANT NETWORK INTERFACE SETTINGS

Network Interface Select the interfaces you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

i If this status is **Link Failure**, it is still possible to add a sensor for the respective interface. Though, most likely the sensor for this interface will not work correctly. The error message in this case will be **No Such Name (SNMP error # 2)**.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)^[181], as well as in [alarms](#)^[219], [logs](#)^[228], [notifications](#)^[3216], [reports](#)^[3252], [maps](#)^[3276], [libraries](#)^[3235], and [tickets](#)^[230].

BASIC SENSOR SETTINGS

Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HP PROLIANT NETWORK INTERFACE SETTINGS

Network Interface	Shows the name of the interface that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
-------------------	---

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	Define how to show different channels for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ❗ You cannot use this option in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰). Manual scaling is not possible if you choose this option.
- **Show in and out traffic as positive and negative area chart:** Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way.
 - ❗ You cannot use this option in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰). Manual scaling is not possible if you choose this option.
 - ❗ You cannot show a positive/negative chart for a channel if you choose to display its data in percent of maximum (available in the [Sensor Channels Settings](#)³¹⁶⁰).

Stack Unit

This setting is only available if you choose **Stack channels on top of each other** above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

SCANNING INTERVAL

- Scanning Interval** Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#) ³³⁸⁵ on PRTG on premises installations.
- If a Sensor Query Fails** Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status** ¹⁹⁵¹. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:
- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) ³⁶⁸³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

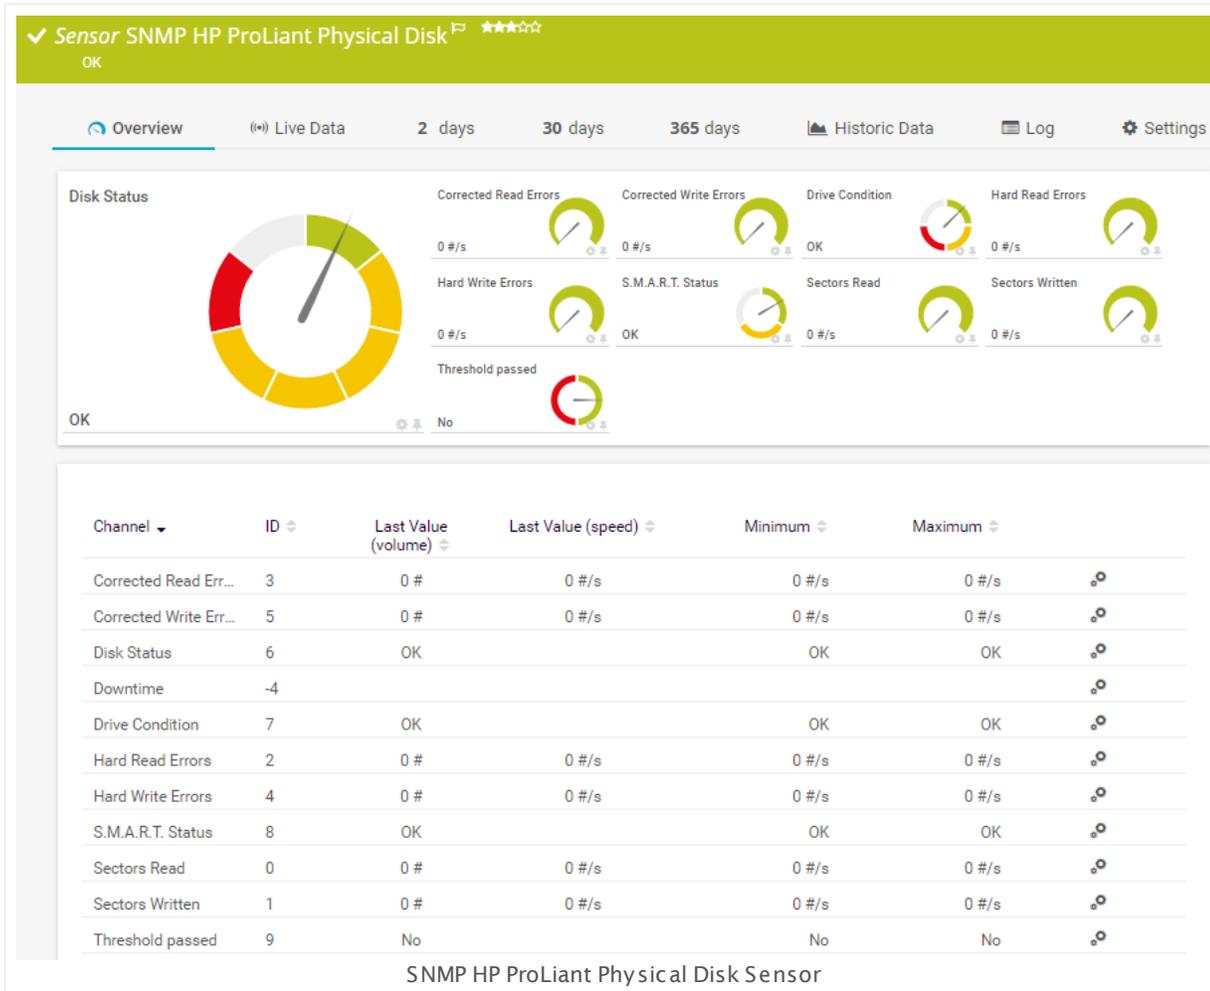

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.157 SNMP HP ProLiant Physical Disk Sensor

The SNMP HP ProLiant Physical Disk sensor monitors a physical disk in an HP server via Simple Network Management Protocol (SNMP).

It can show the following:

- Read and written sectors
- Hard and corrected read errors
- Hard and corrected write errors
- Disk status
 - **Up:** ok
 - **Warning:** predictive failure, erasing, erase done, erase queued, not authenticated
 - **Down:** failed, SSD wear out
- Drive condition
- Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.) status
- If the threshold is passed

Sensor in Other Languages

Dutch: **SNMP HP ProLiant Fysieke Schijf**, French: **Disque physique HP Proliant SNMP**, German: **SNMP HP Proliant Physikalischer Datenträger**, Japanese: **SNMP HP Proliant ? ? ? ? ?**, Portuguese: **Disco fisico SNMP HP ProLiant**, Russian: **Физический диск HP ProLiant no SNMP**, Simplified Chinese: **SNMP HP Proliant ? ? ? ?**, Spanish: **SNMP Disco fisico HP Proliant**

Remarks

- For Gen9 servers or earlier: [Requires](#) ²¹⁴⁸ HP Insight Management Agents and HP Insight Management WBEM Providers to be installed on the target device.
- For Gen10 servers: [Requires](#) ²¹⁴⁸ HPE Agentless Management and the HPE Agentless Management Service to be installed on the target device.
- For Gen10 servers: [Use the HP iLO interface](#) ²¹⁴⁸ as parent device for this sensor.
- The sensor will only show **Disk Status** and no other channels if it runs in "Limited Monitoring" mode. For more information, see [SNMP HP ProLiant Physical Disk sensor not showing all information](#).

- This sensor type supports monitoring HP Integrated Lights-Out (iLO) as of iLO version 3. We recommend that you use **iLO 4** or later.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)³⁴⁸⁹.

Requirement: HP System Management Tools

For Gen9 servers or earlier, this sensor needs a specific HP system management tool to be installed on the target device to report data via SNMP: **HP Insight Management Agents**. To receive SNMP data from RAID controllers, you additionally need **HP Insight Management WBEM Providers**. For Gen10 servers, this sensor no longer requires HP system management tools. Instead, the sensor needs the Agentless Management Service to be installed on the target device.

 For more details and download links, see the Knowledge Base: [Monitor HP ProLiant via SNMP?](#)

 For Gen9 servers or earlier, some of the HP **Object Identifiers (OIDs)** that this sensor type uses are only accessible via the HP Integrated Lights-Out (iLO) interface. If this sensor throws an error that it cannot find "such device types", please create a device in PRTG that points to the address of the HP iLO interface (if available) and add the sensor to this device. We recommend that you use the **Agentless Management** feature with configured SNMP. You can set this up in the iLO configuration interface under **Administration | Management | SNMP Settings**. For Gen10 servers, use the HP iLO interface as parent device for this sensor.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the physical disks in the HP server you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

HP PROLIANT PHYSICAL DISK SETTINGS

Disk Select the disks you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HP PROLIANT PHYSICAL DISK SETTINGS

Disk Shows the identifier of the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

i This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

- Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.
- If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:
- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
-  Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
-  If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
-  If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings <small>[3311]</small>.</p> <p>i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.</p>
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <p>i To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.</p>
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.158 SNMP HP ProLiant System Health Sensor

The SNMP HP ProLiant System Health sensor monitors the system health of an HP ProLiant server via Simple Network Management Protocol (SNMP).

It can show the following:

- Overall status
- Thermal status
- System fan status
- CPU fan status
- Number of broken and running fans
- Number of broken and running fans that are fault tolerant
- Status and condition of the power supply
- Temperatures for various components of the server, for example, memory, power supply, CPU, system, and storage.
- Power consumption
- Disk controller status

These channels are created at run-time, depending on the available measurement components. Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

SNMP HP ProLiant System Health Sensor

Sensor in Other Languages

Dutch: **SNMP HP ProLiant Systeemstatus**, French: **État du système HP ProLiant SNMP**, German: **SNMP HP Proliant Systemzustand**, Japanese: **SNMP HP Proliant ? ? ? ? ? ? ?** , Portuguese: **Funcionamento do sistema SNMP HP ProLiant** , Russian: **Работоспособность системы HP ProLiant по SNMP**, Simplified Chinese: **SNMP HP Proliant ? ? ? ? ? ? ?** , Spanish: **SNMP Salud de sistema HP Proliant**

Remarks

- For Gen9 servers or earlier: [Requires](#) ²¹⁵⁸ HP Insight Management Agents and HP Insight Management WBEM Providers to be installed on the target device.
- For Gen10 servers: [Use the HP iLO interface](#) ²¹⁵⁸ as parent device for this sensor.

8/14/2018

2157

- This sensor has predefined limits for temperatures and broken frames. You can change these limits individually in the [channel settings](#)^[3160].
- RAID controllers that have no hard disks assigned might cause a **Down status**^[195]. In this case, deactivate the respective controller(s) in the HP ProLiant BIOS to avoid sensor errors.
- This sensor type supports monitoring HP Integrated Lights-Out (iLO) as of iLO version 3. We recommend that you use **iLO 4** or later.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Requirement: HP System Management Tools

For Gen9 servers or earlier, this sensor needs a specific HP system management tool to be installed on the target device to report data via SNMP: **HP Insight Management Agents**. To receive SNMP data from RAID controllers, you additionally need **HP Insight Management WBEM Providers**. For Gen10 servers, this sensor no longer requires HP system management tools.

 For more details and download links, see the Knowledge Base: [Monitor HP ProLiant via SNMP?](#)

 For Gen9 servers or earlier, some of the HP **Object Identifiers (OIDs)** that this sensor type uses are only accessible via the HP Integrated Lights-Out (iLO) interface. If this sensor throws an error that it cannot find "such device types", please create a device in PRTG that points to the address of the HP iLO interface (if available) and add the sensor to this device. We recommend that you use the **Agentless Management** feature with configured SNMP. You can set this up in the iLO configuration interface under **Administration | Management | SNMP Settings**. For Gen10 servers, use the HP iLO interface as parent device for this sensor.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³⁷ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁸⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can [create](#) new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

- Knowledge Base: [What are the requirements to monitor IBM System x?](#)
- Knowledge Base: [IBM System X sensors could not find any disk/data on this device \(PE187/PE188/PE194\)](#)
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)³⁴⁸⁹.

Requirement: IBM Systems Director Platform Agent

-  This sensor type needs the IBM Systems Director Platform Agent to be installed on the target IBM device to monitor it via SNMP.
-  For more information, see the Knowledge Base: [What are the requirements to monitor IBM System x?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the logical disks of the IBM device you want to monitor. PRTG will create one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

IBM SYSTEM X LOGICAL DISK SETTINGS

Disk	Select the logical disks you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

-  Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IBM SYSTEM X LOGICAL DISK SETTINGS

Disk	Shows the ID of the logical disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
------	--

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-----------------	--

SENSOR DISPLAY

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

-  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁶⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷ section.

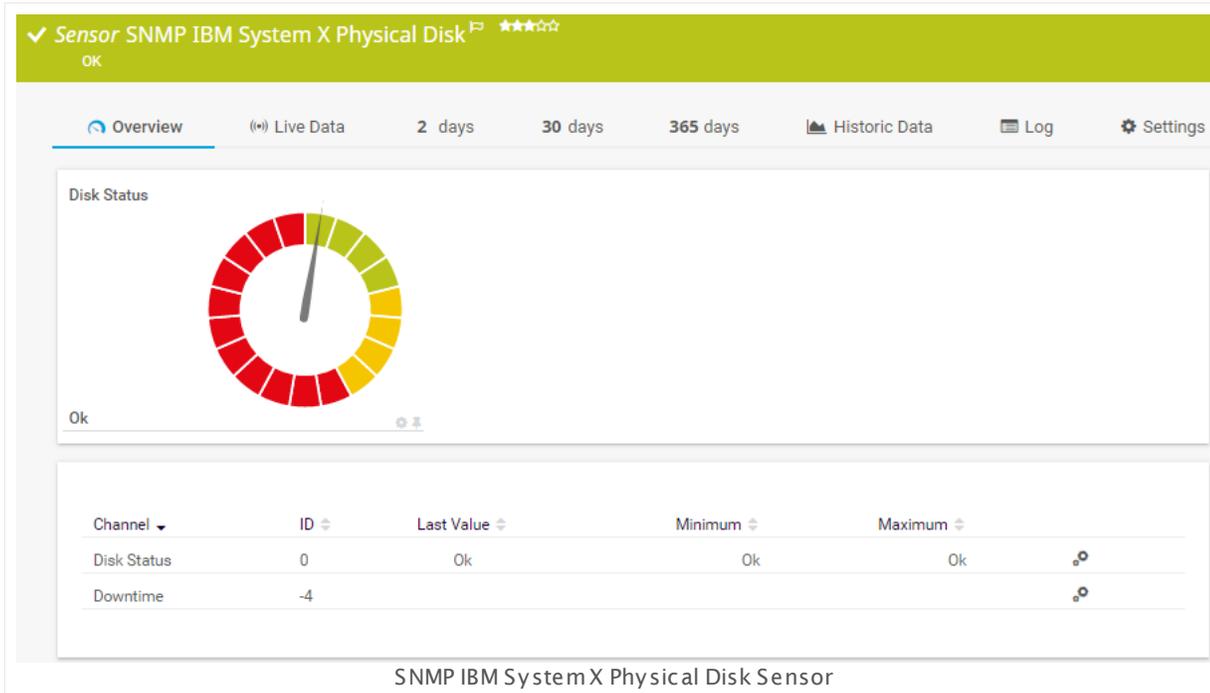

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.160 SNMP IBM System X Physical Disk Sensor

The SNMP IBM System X Physical Disk sensor monitors a physical disk in an IBM server via Simple Network Management Protocol (SNMP).

- It shows the status of a physical disk.

Sensor in Other Languages

Dutch: **SNMP IBM System X Physical Disk**, French: **Disques physiques IBM System X SNMP**, German: **SNMP IBM System X Physikalischer Datenträger**, Japanese: **SNMP IBM System X** ? ? ? ? ? ? , Portuguese: **Disco físico do IBM System X SNMP**, Russian: **Физический диск IBM System X no SNMP**, Simplified Chinese: **SNMP IBM ? ? X ? ? ? ?** , Spanish: **Disco físico de IBM System X con SNMP**

Remarks

- [Requires](#)^[2176] the IBM Systems Director Platform to be installed on the target device.
- Knowledge Base: [What are the requirements to monitor IBM System x?](#)
- Knowledge Base: [IBM System X sensors could not find any disk/data on this device \(PE187/PE188/PE194\)](#)
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Requirement: IBM Systems Director Platform Agent

-  This sensor type needs the IBM Systems Director Platform Agent to be installed on the target IBM device to monitor it via SNMP.
-  For more information, see the Knowledge Base: [What are the requirements to monitor IBM System x?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the physical disks of the IBM device you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

IBM SYSTEM X PHYSICAL DISK SETTINGS

Disk	Select the physical disks you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
------	--

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

-  Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IBM SYSTEM X PHYSICAL DISK SETTINGS

Disk	Shows the ID of the physical disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
------	---

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
-----------------	--

SENSOR DISPLAY

-  You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

-  This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁶⁵ on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

7.8.161 SNMP IBM System X Physical Memory Sensor

The SNMP IBM System X Physical Memory sensor monitors the memory modules in an IBM server via Simple Network Management Protocol (SNMP).

It shows the following:

- Condition of memory controller
- Power status (on or off)

Sensor in Other Languages

Dutch: **SNMP IBM System X Physical Memory**, French: **Mémoire physique SNMP IBM System X**, German: **SNMP IBM System X Physikalischer Speicher**, Japanese: **SNMP IBM System X ? ? ? ? ?**, Portuguese: **Memória física do IBM System X SNMP**, Russian: **Физическая память IBM System X по SNMP**, Simplified Chinese: **SNMP IBM ? ? X ? ? ? ?**, Spanish: **Memoria física de IBM System X con SNMP**

Remarks

- [Requires](#) ²¹⁸⁵ the IBM Systems Director Platform to be installed on the target device.
- Knowledge Base: [What are the requirements to monitor IBM System x?](#)
- Knowledge Base: [IBM System X sensors could not find any disk/data on this device \(PE187/PE188/PE194\)](#)

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Requirement: IBM Systems Director Platform Agent

- ✘ This sensor type needs the IBM Systems Director Platform Agent to be installed on the target IBM device to monitor it via SNMP.
- 💡 For more information, see the Knowledge Base: [What are the requirements to monitor IBM System x?](#)

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the memory modules of the IBM server you want to monitor. PRTG will create one sensor for each module you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

IBM SYSTEM X PHYSICAL MEMORY SETTINGS

Module	Select the memory modules you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
--------	--

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

- ❗ Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IBM SYSTEM X PHYSICAL MEMORY SETTINGS

Name	Shows further information about the module. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Caption	
Serial Number	
Size	

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

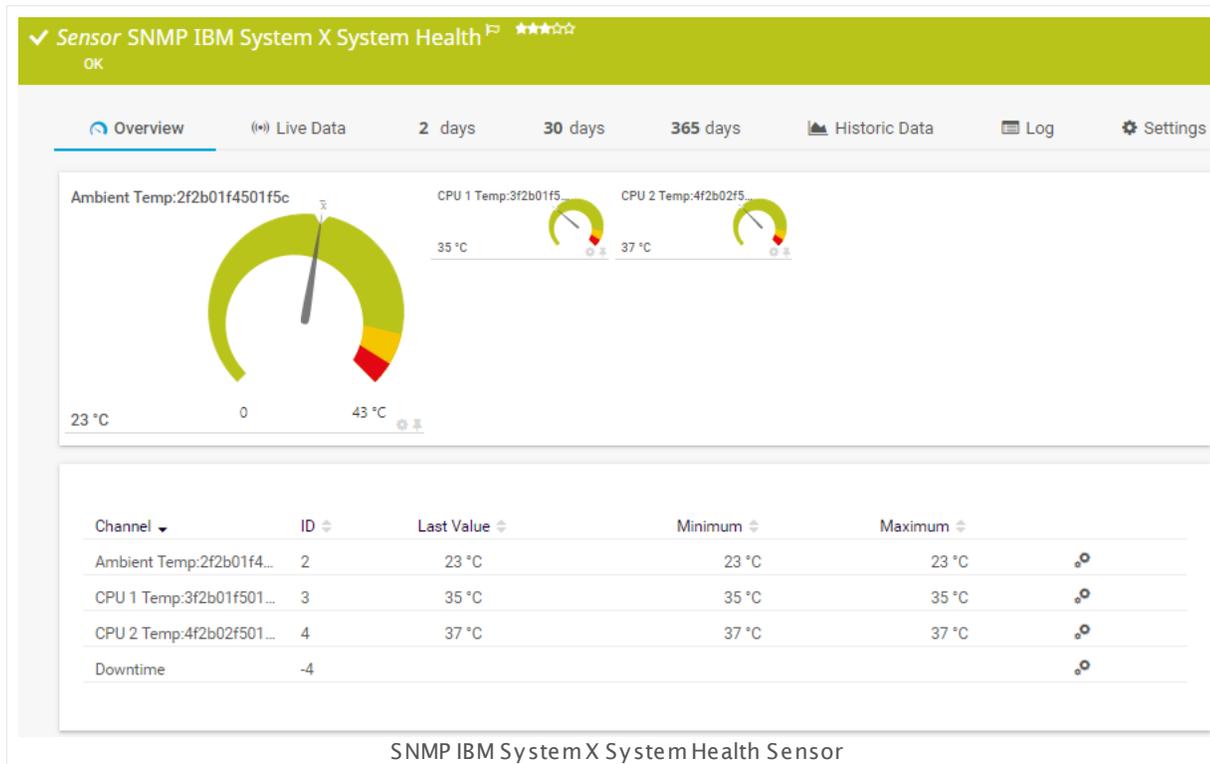

7.8.162 SNMP IBM System X System Health Sensor

The SNMP IBM System X System Health sensor monitors the system health of an IBM device via Simple Network Management Protocol (SNMP).

It can show the following, depending on what measurement you select:

- Overall health
 - **System level or Normal** ([sensor status](#) ¹⁹⁵ Up)
 - **Non Critical** (sensor status **Warning**)
 - **Critical** (sensor status **Down**)
- Temperatures of ambient and CPUs
- Voltages of planars
- Status of power supplies (**OK** or **Error**)
- Fans: RPM (revolutions per minute) or the current percentage of the possible maximum

These channels are created at run-time, depending on the available measurement components. Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **SNMP IBM System X System Health**, French: **État du système IBM System X SNMP**,

German: **SNMP IBM System X Systemzustand**, Japanese: **SNMP IBM System X ? ? ? ? ? ? ?**, Portuguese: **Funcionamento do sistema IBM System X SNMP**, Russian: **Работоспособность системы IBM System X по SNMP**, Simplified Chinese: **SNMP IBM ? ? X ? ? ? ? ? ?**, Spanish: **Salud del sistema de IBM System X con SNMP**

Remarks

- [Requires](#)^[2194] the IBM Systems Director Platform to be installed on the target device.
- This sensor can also run directly on an **Integrated Management Module (IMM)** network port and can show the overall health on IMMs.
- If the IBM device returns a string in an unexpected format for the percentage of fan revolutions (for example, "offline"), this sensor will show -1% in the corresponding channel. You can define a **Down status**^[195] for this via [channel limits](#)^[3162].
- Knowledge Base: [What are the requirements to monitor IBM System x?](#)
- Knowledge Base: [IBM System X sensors could not find any disk/data on this device \(PE187/PE188/PE194\)](#)
- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, refer to the manual section [Sensor Channels Settings](#)^[3160].
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Requirement: IBM Systems Director Platform Agent

- ✘ This sensor type needs the IBM Systems Director Platform Agent to be installed on the target IBM device to monitor it via SNMP.
- 📖 For more information, see the Knowledge Base: [What are the requirements to monitor IBM System x?](#)
- ℹ The SNMP IBM System X System Health sensor can also run directly on an **Integrated Management Module (IMM)** network port and can show the overall health on IMMs.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the measurements of the IBM device you want to monitor. PRTG will create one sensor for each measurement you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

IBM SYSTEM X SYSTEM HEALTH SPECIFIC

Measurement Select the measurements you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#), separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

BASIC SENSOR SETTINGS

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IBM SYSTEM X SYSTEM HEALTH SPECIFIC

Source Shows the source of the measurement that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Measurement Shows the measurement that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#) settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)^[331] group's settings, see section [Inheritance of Settings](#)^[137] for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)^[335] on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies <small>3209</small> in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

7.8.163 SNMP interSeptor Pro Environment Sensor

The SNMP interSeptor Pro Environment sensor queries data from a Jakarta interSeptor Pro environmental monitoring system via Simple Network Management Protocol (SNMP).

It can show the following as measured by the Jakarta interSeptor Pro device:

- Temperature
- Humidity

Sensor in Other Languages

Dutch: **SNMP interSeptor Pro Omgeving**, French: **Environnement interSeptor Pro SNMP**, German: **SNMP interSeptor Pro Umgebung**, Japanese: **SNMP InterSeptor Pro? ?**, Portuguese: **Ambiente do SNMP interSeptor Pro**, Russian: **Окружающая среда interSeptor Pro по SNMP**, Simplified Chinese: **SNMP interSeptor Pro? ?**, Spanish: **Entorno de interSeptor Pro de SNMP**

Remarks

- To monitor data of an interSeptor Pro device with this sensor, you have to add the IP address of your PRTG installation to **Access Control** in the interSeptor Pro control panel. Open the interSeptor Pro web interface, select **InterSeptor Pro Menu | System Configuration | Access Control**, and allow access for the IP address of PRTG.
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)³⁴⁸⁹.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the measuring points of interSeptor Pro device you want to monitor. PRTG will create one sensor for each measuring point you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

INTERSEPTOR ENVIRONMENT SPECIFIC

Measuring Point Select the measuring points you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#), as well as in [alarms](#), [logs](#), [notifications](#), [reports](#), [maps](#), [libraries](#), and [tickets](#).

Parent Tags Shows [Tags](#) that this sensor [inherits](#) from its [parent device, group, and probe](#). This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	<p>Enter one or more Tags¹³⁹, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited¹⁴⁰ from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	<p>Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).</p>

INTERSEPTOR ENVIRONMENT SPECIFIC

Name	<p>Shows information about the measurement that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p>
Measuring Point	<p>Shows the measuring point that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.</p>

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p>

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

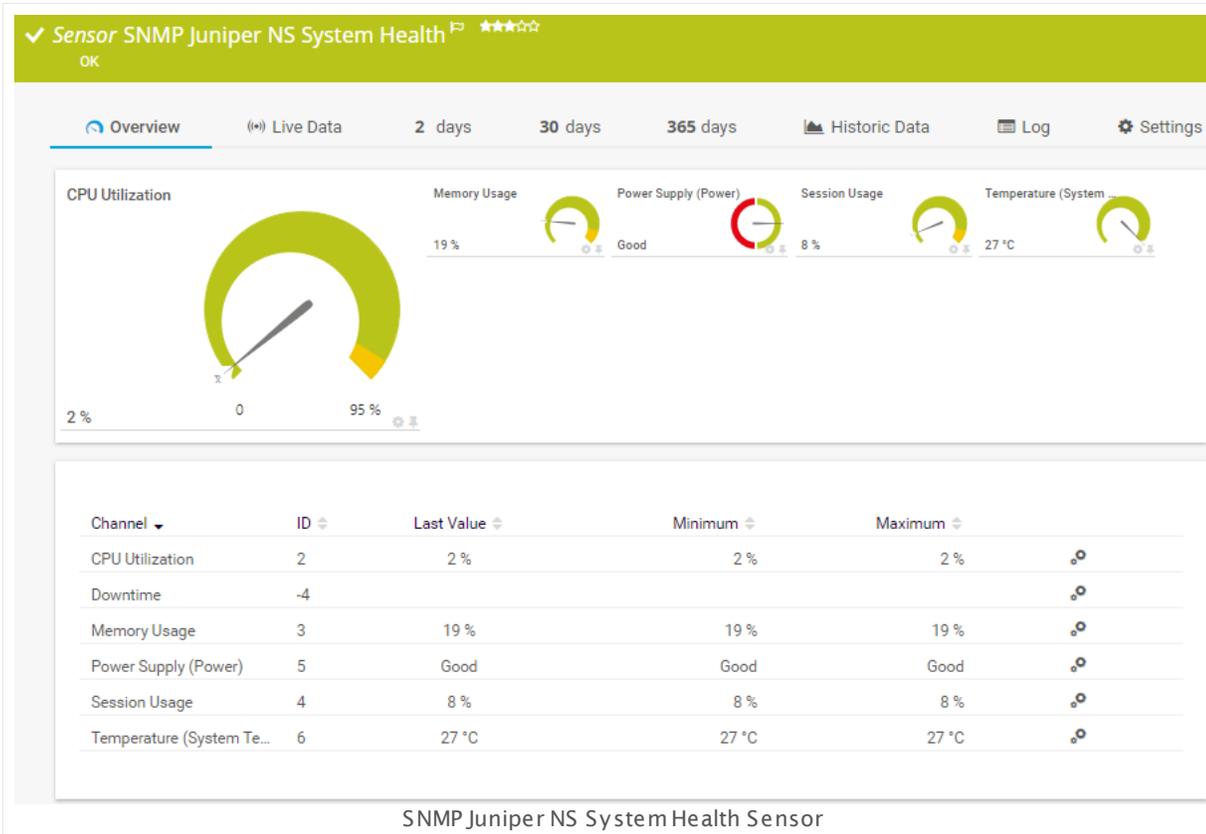

7.8.164 SNMP Juniper NS System Health Sensor

The SNMP Juniper NS System Health sensor monitors the system health of a Juniper NetScreen device using Simple Network Management Protocol (SNMP).

It can show the following:

- CPU utilization
- Fan status
- Power supply status
- System temperature
- Memory usage in percent
- Session usage in percent

These channels are created at run-time, depending on the available measurement components of your Juniper NetScreen device. Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **SNMP Juniper NS systeemstatus**, French: **État du système SNMP Juniper NS**,
 German: **SNMP Juniper NS Systemzustand**, Japanese: **SNMP Juniper NS ? ? ? ? ? ? ? ,**

Portuguese: **Funcionamento do sistema Juniper NS SNMP**, Russian: **Работоспособность системы Juniper NS no SNMP**, Simplified Chinese: **SNMP Juniper NS ? ? ? ? ?**, Spanish: **Salud del sistema NS de Juniper SNMP**

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)¹⁴⁰ from objects further up in the device tree. These are visible above as **Parent Tags**.

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

i This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

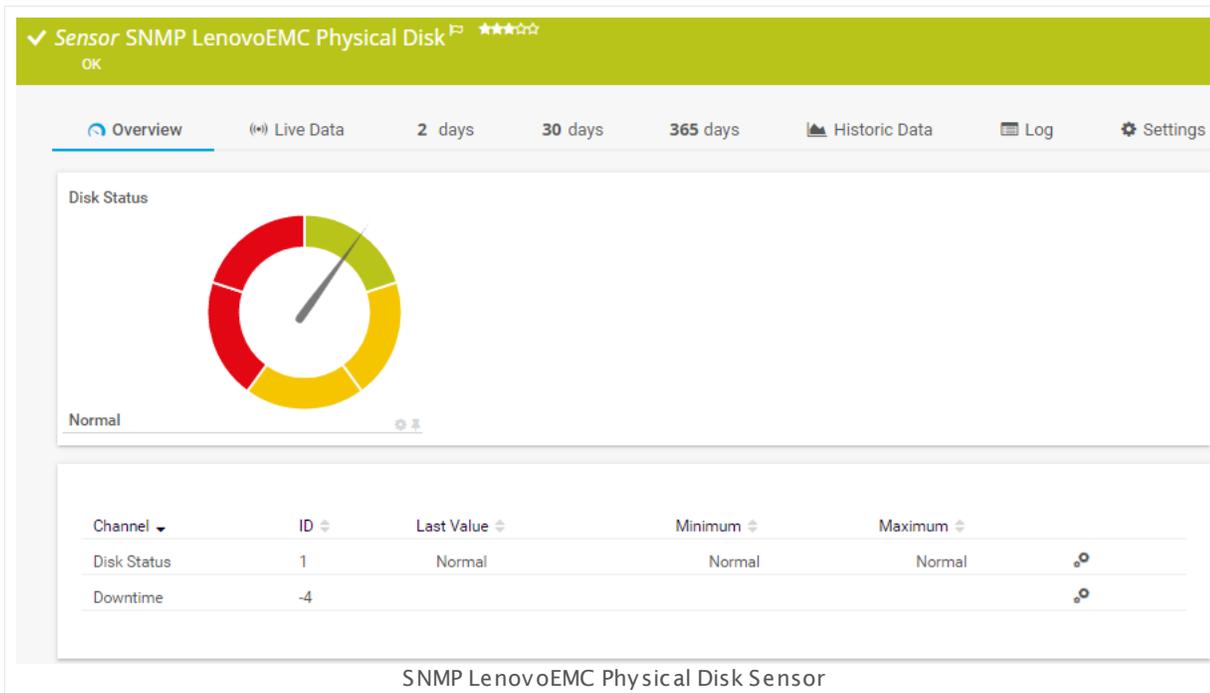

7.8.165 SNMP LenovoEMC Physical Disk Sensor

The SNMP Lenovo Physical Disk sensor monitors a physical disk in a LenovoEMC Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP).

- It shows the overall disk status.

States of the disk can be:

- **Normal** (sensor status **Up**),
- **Unknown** (sensor status **Warning**)
- **Foreign** (sensor status **Warning**)
- **Faulted** (sensor status **Down**)
- **Missing** (sensor status **Down**)

Sensor in Other Languages

Dutch: **SNMP LenovoEMC fysieke schijf**, French: **Disque physique SNMP LenovoEMC**, German: **SNMP LenovoEMC Physikalische Disk**, Japanese: **SNMP LenovoEMC ? ? ? ? ? ?**, Portuguese: **Disco físico LenovoEMC SNMP**, Russian: **Физический диск LenovoEMC по SNMP**, Simplified Chinese: **SNMP LenovoEMC ? ? ? ?**, Spanish: **Disco físico de LenovoEMC con SNMP**

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the physical disks in the LenovoEMC NAS. PRTG creates one sensor for each disk you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

LENOVOEMC PHYSICAL DISK SETTINGS

Disk	Select the disks you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

LENOVOEMC NAS SETTINGS

Disk	Shows the disk monitored by this sensor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the disk monitored by this sensor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Size	Shows the size of the disk monitored by this sensor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵⁵ on PRTG on premises installations.</p>
-------------------	---

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings
165 SNMP LenovoEMC Physical Disk Sensor

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.166 SNMP LenovoEMC System Health Sensor

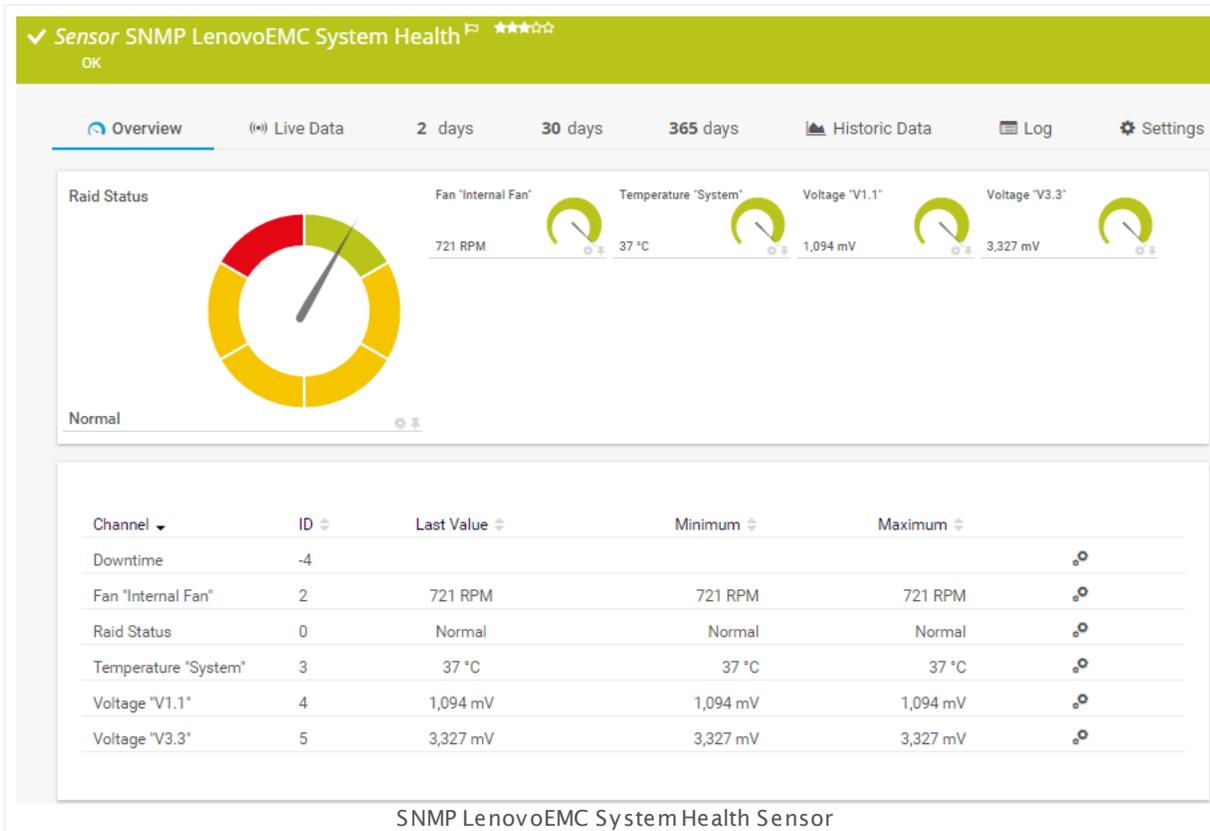

The SNMP LenovoEMC System Health sensor monitors the system health of a LenovoEMC Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP).

- It shows the overall status of the RAID.

[Sensor states](#) can be:

- **Normal** (sensor status **Up**)
- **Unknown** (sensor status **Warning**)
- **Rebuilding** (sensor status **Warning**)
- **Degraded** (sensor status **Warning**)
- **RebuildFS** (sensor status **Warning**)
- **Failed** (sensor status **Down**)

Furthermore, this sensor can show, for example, states of several fans, voltages, and temperatures. These channels are created at run-time depending on the available measurement components in the LenovoEMC NAS. Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Sensor in Other Languages

Dutch: **SNMP LenovoEMC System Status**, French: **État du système SNMP LenovoEMC**, German: **SNMP LenovoEMC Systemzustand**, Japanese: **SNMP LenovoEMC ? ? ? ? ? ? ?**, Portuguese: **Funcionamento do sistema LenovoEMC SNMP**, Russian: **Работоспособность системы LenovoEMC по SNMP**, Simplified Chinese: **SNMP LenovoEMC ? ? ? ? ? ? ?**, Spanish: **Estado del sistema de LenovoEMC del SNMP**

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#).
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

- Tags** Enter one or more [Tags](#)^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.
- You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.
- i** It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).
- Priority** Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

- Primary Channel** Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.
- i** You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
- Graph Type** Define how different channels will be shown for this sensor.
- **Show channels independently (default):** Show an own graph for each channel.
 - **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
- i** This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)^[3160] settings).
- Stack Unit** This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings, see section [Inheritance of Settings](#) for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#) for more information.

- | | |
|-------------------------|---|
| Scanning Interval | Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration on PRTG on premises installations. |
| If a Sensor Query Fails | <p>Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a Down status. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a Warning status. Choose between:</p> <ul style="list-style-type: none">▪ Set sensor to "down" immediately: The sensor will show an error immediately after the first failed request.▪ Set sensor to "warning" for 1 interval, then set to "down" (recommended): After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.▪ Set sensor to "warning" for 2 intervals, then set to "down": Show an error status only after three consecutively failed requests.▪ Set sensor to "warning" for 3 intervals, then set to "down": Show an error status only after four consecutively failed requests.▪ Set sensor to "warning" for 4 intervals, then set to "down": Show an error status only after five consecutively failed requests.▪ Set sensor to "warning" for 5 intervals, then set to "down": Show an error status only after six consecutively failed requests. |

SCANNING INTERVAL

- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

- i** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies³²⁰⁹ in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ²⁴⁰ to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)⁴⁰² or in the superior [Group Settings](#)³⁷⁵.

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

More

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.167 SNMP Library Sensor

The SNMP Library sensor uses a compiled Management Information Base (MIB) library file to create sensors that monitor a device via Simple Network Management Protocol (SNMP). This approach provides custom monitoring beyond the standard SNMP sensors of PRTG.

The content of the MIB file will determine which data types are available for monitoring. When you create the sensor, it will provide a list of counters that came back from the target device based on checking every Object Identifier (OID) in the MIB. From this list, you can choose what you want to monitor.

The SNMP Library sensor will automatically create the following custom SNMP sensor types based on the data types available in the MIB:

- [SNMP Custom Advanced sensors](#)¹⁹⁸⁹ for all OIDs that return single values
- [SNMP Custom String sensors](#)¹⁹⁷⁰ for all OIDs that return string values
- [SNMP Custom Table sensors](#)¹⁹⁹² for all OIDs that return tables

 The SNMP Library sensor is not actually a sensor type and will not appear as running sensor. It is a sensor that uses the meta-scan facility of the PRTG probe to find or match OIDs from an MIB and eases the creation of custom sensors, because you do not have to enter the OIDs manually.

To monitor SNMP capable devices and add sensors using the SNMP Library sensor, download the manufacturer's MIB files for the target device, convert the MIB file to the Paessler **oidlib** format, and import it into PRTG. To make setting up your monitoring as convenient as possible, PRTG comes with pre-compiled **oidlib** library files that already contain the OIDs of SNMP counters for the most common devices in a network.

 For more details, see the Knowledge Base: [How do SNMP, MIBs and OIDs work?](#)

Part 7: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings

167 SNMP Library Sensor

Sensor in Other Languages

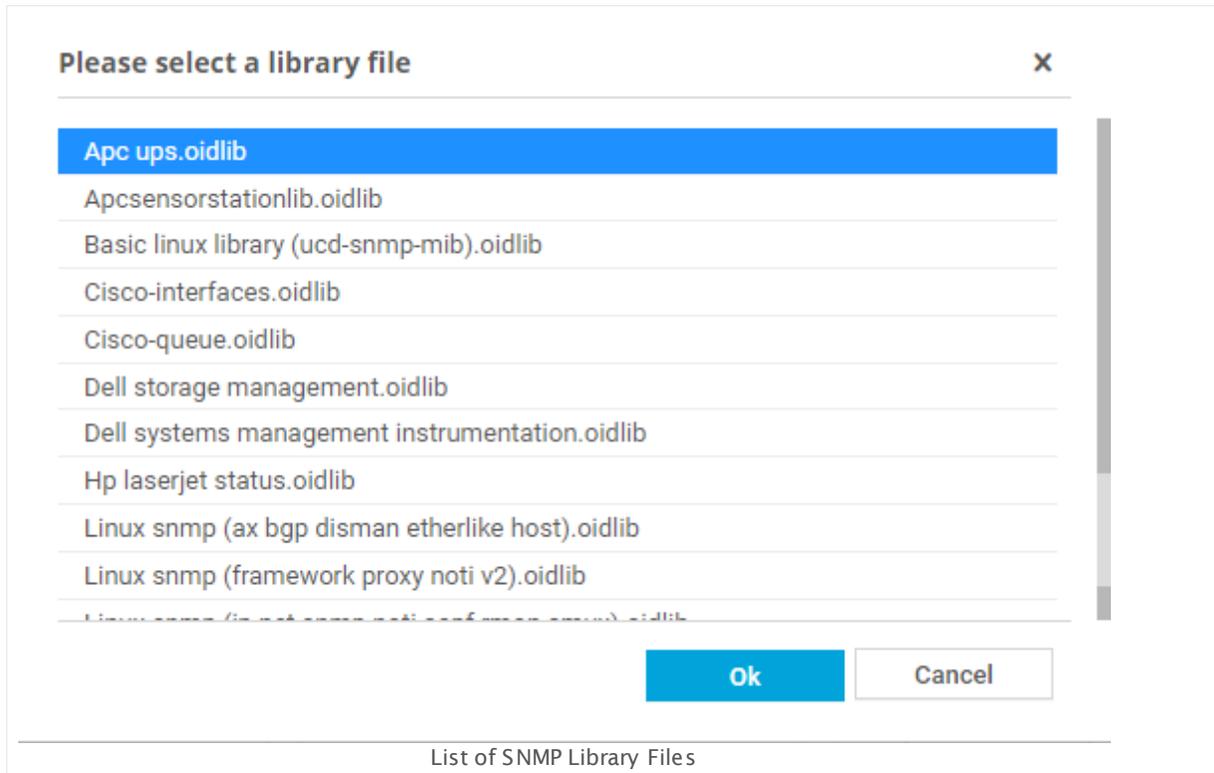

Dutch: **SNMP Bibliot heek**, French: **Bibliothèque SNMP**, German: **SNMP-Bibliot hek**, Japanese: **SNMP ? ? ? ? ?**, Portuguese: **Biblioteca SNMP**, Russian: **Библиотека SNMP**, Simplified Chinese: **SNMP ?**, Spanish: **Biblioteca SNMP**

Remarks

- Knowledge Base: [How do SNMP, MIBs and OIDs work?](#)
- Knowledge Base: [How can I import my MIB files into PRTG?](#)
- Knowledge Base: [Can't find a sensor for my device in PRTG but I believe it supports SNMP. How to proceed?](#)
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#) ³⁴⁸⁹.

Add Sensor

[Manually add](#)³²⁵ a new sensor to an SNMP device. From the **Add Sensor** dialog, select **SNMP Library** sensor. PRTG will show a list of **oidlib** files available on the system. This contains all library files stored at the `\snmplibs` folder of your PRTG server installation directory—both the ones delivered with PRTG and your own files.

The filenames on the list indicate the likely purpose. Select a name that appears appropriate for your device (for example, choose an MIB file that you imported before) and confirm via **OK**. Often, the **Paessler common oid library.oidlib** is a good start.

⚠ If the file does not fit to your device, this will result in the error message **the scan for available monitoring items has failed** on this device: **No such object (SNMP error # 222)**. If you see this message, click **Cancel** and try adding the sensor with another file.

The SNMP Library sensor takes a list of OIDs that you imported from an MIB file into an oidlib and tests the OIDs against a device to find the OIDs the device supports. This discovery process is the **meta-scan**.

✓ If counters were found for your device, the sensor settings will open with a list of available monitoring items for you to select from. PRTG sorts the list in advance to make the related values sequential in the list.

List of SNMP Table Values: Sorted by MIB, Category (Table Name/OID), Row, Name

The list of SNMP table values presents row values sequentially and makes it easier for you to select the values you are interested in.

You can also use the search function to find the desired group or category. The search matches individual strings so if your string has a space in it, enclose the search string in quotes.

- ✔ Select the desired counters and click **Save**. PRTG will now create sensors based on the OID types of the selected entries.
 - For selected SNMP single values, PRTG will create [SNMP Custom Advanced sensors](#) with up to 10 channels for 10 OIDs each. For example, 22 selected single values will result in 3 sensors: 2 sensors with 10 channels and 1 sensor with 2 channels.
 - If you select OIDs that return string values, PRTG will create one [SNMP Custom String sensor](#) for each selected entry that returns a string value.
 - For selected SNMP table entries, PRTG will create [SNMP Custom Table sensors](#) with up to 10 channels for 10 columns per row.
- ❗ Once a custom SNMP sensor is created, you can [create a device template](#) from it and prepare it for distribution. For example, you can refine the template with better name templates.

Default OIDLIB Files Overview

The following files are included in PRTG and allow the extension of your SNMP monitoring to many devices. Please be aware that not all devices and/or parameters may be supported by the libraries.

- **APC UPS.oidlib**
Can be used to monitor uninterruptible power supplies (UPS) from APC American Power Conversion Corp.
- **APCSensorstationlib.oidlib**
Can be used to monitor alarm status, communication status, humidity, and temperature as shown by an APC sensor station.
- **Basic Linux Library (UCD-SNMP-MIB).oidlib**
Can be used to monitor basic system parameters on Linux systems, such as memory, disk and swap, CPU, etc.
- **cisco-interfaces.oidlib**
Can be used to monitor Cisco specific parameters, for example, the number of present network interfaces on a system, several states of an interface (admin, oper, speed, type, errors, discards, etc.), and more.
- **cisco-queue.oidlib**
Can be used to monitor queues on a Cisco interface, for example, queue depth and its maximum, discarded messages from the queue, the number of the queue within the queue set, etc.
- **Dell Storage Management.oidlib**
Can be used to monitor Dell storage devices. Possible parameters include disk arrays, battery and power supply, fan and temperature, virtual disk, etc.

- **Dell Systems Management Instrumentation.oidlib**
Can be used to monitor the hardware of Dell systems. Possible parameters include ACPower and battery, alerts, base board, Bios, BMC, chassis, COO, cooling, event log, firmware, IDE, keyboard, memory, port, network, processor, SCSI, system, temperature, USB, UUID, etc.
- **HP LaserJet Status.oidlib**
Can be used to monitor toner, paper, and jam status of an HP LaserJet printer.
- **Linux SNMP (AX BGP DisMan EtherLike Host).oidlib**
Can be used to monitor different aspects of Linux systems.
 This file may detect a very large number of interfaces. It may take a few seconds until the selection table is shown.
- **Linux SNMP (Framework Proxy Not i v2).oidlib**
Can be used to monitor different aspects of Linux systems.
 This file may detect a very large number of interfaces. It may take a few seconds until the selection table is shown.
- **Linux SNMP (IP Net SNMP Not i OSPF RMON SMUX).oidlib**
Can be used to monitor different aspects of Linux systems.
 This file may detect a very large number of interfaces. It may take a few seconds until the selection table is shown.
- **Linux SNMP (Source TCP UCD UDP).oidlib**
Can be used to monitor different aspects of Linux systems.
 This file may detect a very large number of interfaces. It may take a few seconds until the selection table is shown.
- **Paessler Common OID Library.oidlib**
Can be used to monitor many common hardware devices. It is used for several sensors and is encrypted.
- **SNMP Informant std.oidlib**
Can be used to monitor logical disks, processor, memory, and network interface on Windows systems.

Import MIB Files

Additionally, you can create your own **oidlib** files by importing your device manufacturers' MIB files with the free tool Paessler **MIB Importer**. Simply convert your **mib** files and save the resulting **oidlib** files to the `\snmplibs` subfolder of your PRTG program directory.

 For details about directory paths, see section [Data Storage](#) .

 For more information about the **MIB Importer** and to download this tool, see the Knowledge Base: [How can I import my MIB files into PRTG?](#)

 If your imported **oidlib** file contains [lookups](#)  (you can see this in section **Lookup** in the MIB Importer), you can define your own sensor states for returning values. Add an SNMP Library sensor using this **oidlib**. PRTG will then create a lookup definition file using the **lookupname** of the chosen library as **id** parameter.

Important: The lookups will be added without state definitions, so the sensor will show a **Warning status** ^[195] by default! You have to edit the corresponding lookup files to get reliable alarms. Please override the lookup definition with your own custom lookup as described in section [Define Lookups—Customizing Lookups](#) ^[3698].

 PRTG hosted by Paessler does not support the import of MIB files. You can use the SNMP Library sensor only with the default **oidlib** files in PRTG hosted by Paessler.

SNMP Library Sensor—Add Sensor Settings

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SNMP LIBRARY SPECIFIC

Library	Shows the path to the oidlib file selected before. This setting is shown for your information only and cannot be changed here.
Library-OIDs	<p>Select the parameters of the device you want to monitor. A list specific to your setup is shown. It contains all counters found in the chosen library that match your device.</p> <p>Choose one or more items by adding a check mark in front of the respective line. You can also select and deselect all items by using the check box in the table head. Use the search box to narrow down to your desired items.</p> <p>Depending on the kind of the chosen entries, PRTG will create the following sensor types:</p> <ul style="list-style-type: none"> ▪ SNMP Custom Advanced sensor ^[1989]: one sensor for every 10 single values ▪ SNMP Custom String sensor ^[1970]: one sensor for each selected entry that returns a string value ▪ SNMP Custom Table sensor ^[1992]: one sensor for each selected table row with up to 10 channels representing values in the columns of the same row

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

 Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) ^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SPECIFIC

 The available sensor settings depend on the sensor type that the SNMP Library sensor has created. For details about settings, see the manual sections of these sensor types:

- [SNMP Custom Advanced sensor](#)^[1962]
- [SNMP Custom String sensor](#)^[1972]
- [SNMP Custom Table sensor](#)^[1996]

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p>i This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

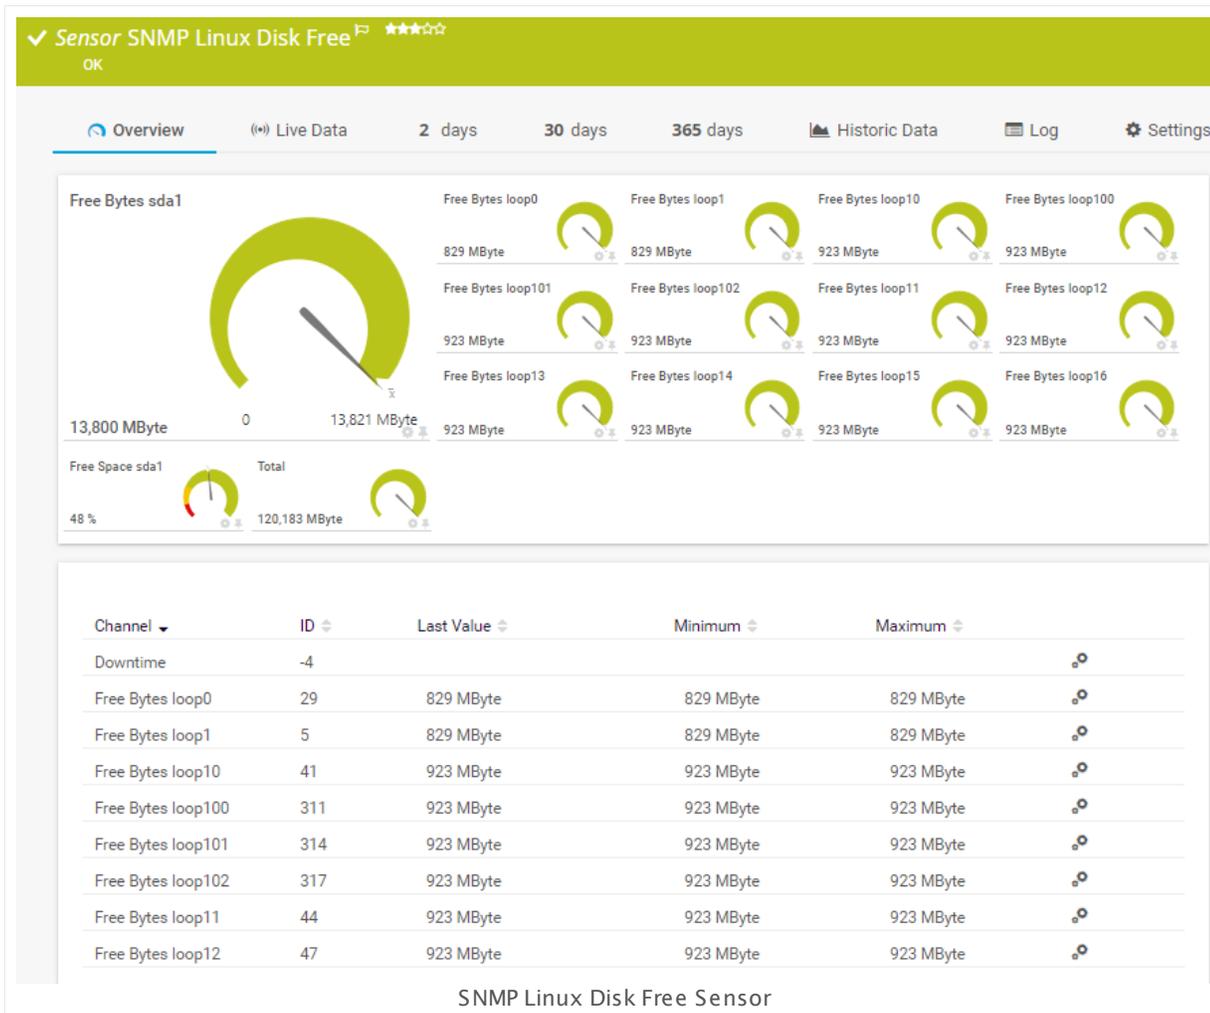

7.8.168 SNMP Linux Disk Free Sensor

The SNMP Linux Disk Free sensor monitors free space on disks of a Linux/Unix system using Simple Network Management Protocol (SNMP).

It shows the following:

- Free total disk space in bytes
- Free space in bytes for every mounted partition
- Free space in percent for every mounted partition
- Free inodes in percent for every mounted partition

 The free space returned by this sensor type shows the disk space that is not yet used. Not all of this space may be available for use, as a part of this space can be reserved by the system, for example, for redundancy purposes. For details, see the Knowledge Base: [Why do SSH Disk Free and SNMP Linux Disk Free show different values for my target Linux system?](#)

Sensor in Other Languages

Dutch: **SNMP Linux vrije schijf ruimte**, French: **Espace disque libre SNMP Linux**, German: **SNMP Linux Datenträgerspeicher**, Japanese: **SNMP Linux** ? ? ? ? ? ? ? , Portuguese: **Disco livre Linux SNMP**, Russian: **Свободное пространство диска в Linux по SNMP**, Simplified Chinese: **SNMP Linux** ? ? ? ? ? ? ? , Spanish: **SNMP disco libre Linux**

Remarks

- Knowledge Base: [Why do SSH Disk Free and SNMP Linux Disk Free show different values for my target Linux system?](#)
- Knowledge Base: [Checklist: Setting up SNMP on Linux](#)
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

- Tags** Enter one or more [Tags](#)^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.
- You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#)^[140] from objects further up in the device tree. These are visible above as **Parent Tags**.
- i** It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).
- Priority** Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SET LIMITS CHECKED AGAINST ALL DISKS

In this section you can set limits that are valid for all channels and all drives. By entering limits, you can define when the sensor will enter a **Warning** or **Down status**^[195], depending on the data provided by all drives that this sensor monitors. If you want to individually define limits for separate channels, please use the limit settings in the [Sensor Channels Settings](#)^[2160].

i All limits that you define here are valid in addition to the limits defined in the particular **Channel** settings! The limits are valid simultaneously, so the first limit that is breached applies.

- Percentage Limit Check** Enable or disable a limit check for the free space in percentage channels of all drives. By default, percentage limits are enabled with lower warning and lower error limit. Choose between:
- **Only use the limits in the settings of the percentage channels:** Do not define sensor limits that are valid for all percentage channels. The sensor only uses limits that you define in the settings of the particular "free space in percent" channels to determine the status.
 - **Use the limits of both the sensor and the channel settings:** Define limits for the sensor that are valid for all drives (percentage channels). Additional fields appear below. The sensor enters a **Warning** or **Down** status when free space limits are undercut or overrun.

SET LIMITS CHECKED AGAINST ALL DISKS

Upper Error Limit This field is only visible if you enable percentage limit check above. Specify an upper limit in percent for a **Down** status. If the free disk space of one of your drives overruns this percent value, the sensor switches to **Down**. Please enter an integer value or leave the field empty.

 The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!

Upper Warning Limit This field is only visible if you enable percentage limit check above. Specify an upper limit in percent for a **Warning** status. If the free disk space of one of your drives overruns this percent value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty.

 The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!

Lower Warning Limit This field is only visible if you enable percentage limit check above. Specify a lower limit in percent for a **Warning** status. If the free disk space of one of your drives undercuts this percent value, the sensor switches to warning. Please enter an integer value or leave the field empty.

 The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!

Lower Error Limit This field is only visible if you enable percentage limit check above. Specify a lower limit in percent for a **Down** status. If the free disk space of one of your drives undercuts this percent value, the sensor switches to **Down**. Please enter an integer value or leave the field empty.

 The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!

Size Limit Check Enable or disable a limit check for the free bytes channels of all drives. By default, byte size limits are not enabled for drives. Choose between:

SET LIMITS CHECKED AGAINST ALL DISKS

- **Only use the limits in the settings of the byte size channels:**
Do not define sensor limits that are valid for all byte size channels. The sensor only uses limits that you define in the settings of the particular free space in bytes channels to determine the status.
- **Use the limits of both the sensor and the channel settings:**
Define limits for the sensor that are valid for all drives (byte size channels). Additional fields appear below. The sensor enters a **Warning** or **Down** status when free space limits are undercut or overrun.

Upper Error Limit

This field is only visible if you enable byte limit check above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor will switch to **Down**. Please enter an integer value or leave the field empty.

 The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!

Upper Warning Limit

This field is only visible if you enable byte limit check above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty.

 The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!

Lower Warning Limit

This field is only visible if you enable byte limit check above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty.

 The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!

SET LIMITS CHECKED AGAINST ALL DISKS

Lower Error Limit This field is only visible if you enable byte limit check above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor switches to **Down**. Please enter an integer value or leave the field empty.

 The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the [Sensor Channels Settings](#)³¹⁶⁰. The limits set here and in the channel settings are valid simultaneously!

Alarm on Missing/Removed Disk If a monitored disk is removed or not found, values are set to zero. Select the alarming approach in this case. Choose between:

- **Deactivate alarm (default):** Select this option if you do not want an alarm for a removed disk.
- **Activate alarm:** Select this option if you want to be alerted if a monitored disk is removed.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies <small>3209</small> in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

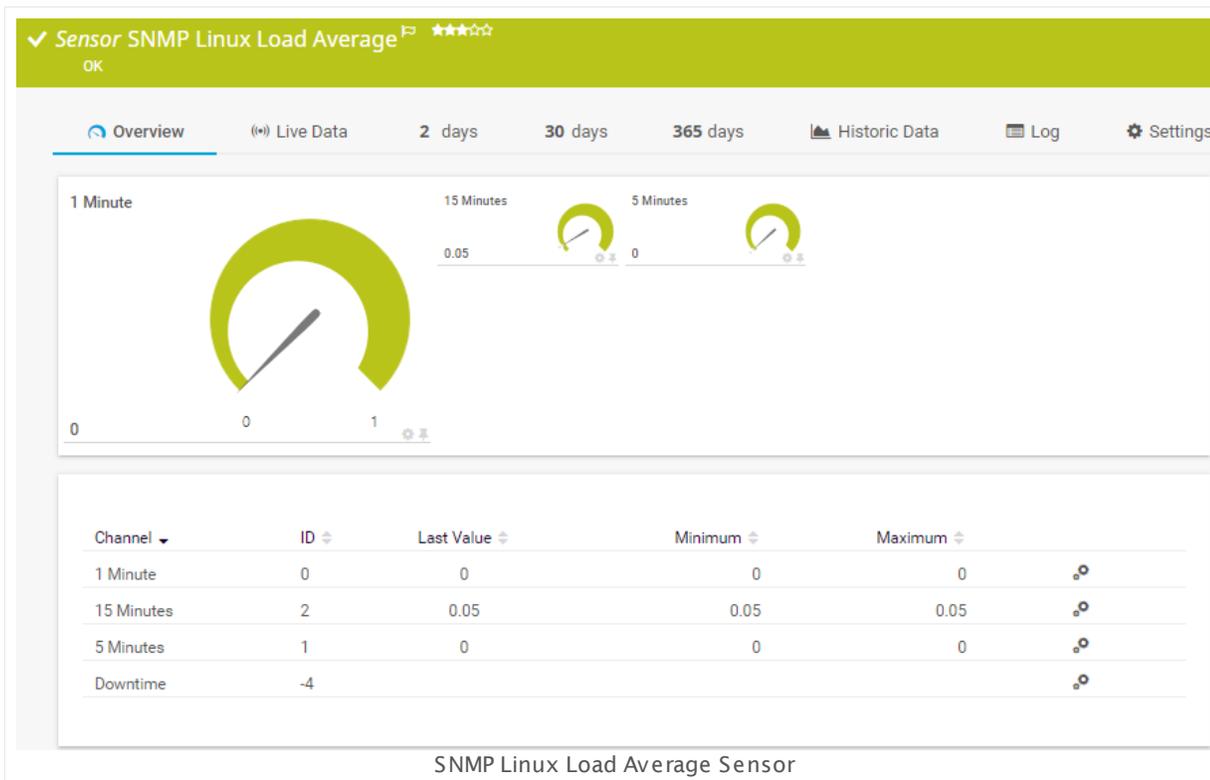

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

7.8.169 SNMP Linux Load Average Sensor

The SNMP Linux Load Average sensor monitors the system load average of a Linux/Unix system using Simple Network Management Protocol (SNMP).

It shows the following:

- Average system load within a 1-minute interval
- Average system load within a 5-minute interval
- Average system load within a 15-minute interval

Sensor in Other Languages

Dutch: **SNMP Linux Gemiddelde belasting**, French: **Moyenne de la charge Linux SNMP**, German: **SNMP Linux Durchschnittl. Last**, Japanese: **SNMP Linux 平均値**, Portuguese: **Carga média em Linux SNMP**, Russian: **Средняя загрузка Linux по SNMP**, Simplified Chinese: **SNMP Linux 平均值**, Spanish: **SNMP carga promedio Linux**

Remarks

- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

7.8.170 SNMP Linux Meminfo Sensor

The SNMP Linux Meminfo sensor monitors the memory usage of a Linux/Unix system using Simple Network Management Protocol (SNMP).

It shows the following :

- Available memory in absolute and percentage values
- Used physical memory (free memory plus buffer plus cache) in percent
- Free physical memory (free memory plus buffer plus cache) in bytes
- Used swap memory in percent
- Free swap memory in bytes
- Used memory on the whole system (physical memory plus swap) in percent
- Free memory on the whole system (physical memory plus swap) in bytes

Sensor in Other Languages

Speicherinfo, Japanese: **SNMP Linux** ? ? ? ? ? , Portuguese: **Linux Meminfo SNMP**, Russian: **Linux Meminfo no SNMP**, Simplified Chinese: **SNMP Linux** ? ? ? ? ? , Spanish: **SNMP información de memoria Linux**

Remarks

- Knowledge Base: [Checklist: Setting up SNMP on Linux](#)
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3276] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more Tags ^[139] , separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited ^[140] from objects further up in the device tree. These are visible above as Parent Tags .

BASIC SENSOR SETTINGS

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

i This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

- Scanning Interval** Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)^[336] on PRTG on premises installations.
- If a Sensor Query Fails** Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**^[195]. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:
- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
-  Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
-  If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

SCANNING INTERVAL

- ❗ If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- ❗ Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings.</p> <ul style="list-style-type: none"> ❗ Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	<p>Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:</p> <ul style="list-style-type: none"> ▪ Not set (monitor continuously): No maintenance window will be set and monitoring will always be active. ▪ Set up a one-time maintenance window: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. <ul style="list-style-type: none"> ❗ To terminate a current maintenance window before the defined end date, change the time entry in Maintenance Ends field to a date in the past.
Maintenance Begins	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance Ends	<p>This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p> Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies^[323] in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>
Dependency	<p>This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector^[240] to choose an object on which the current sensor will depend.</p>
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

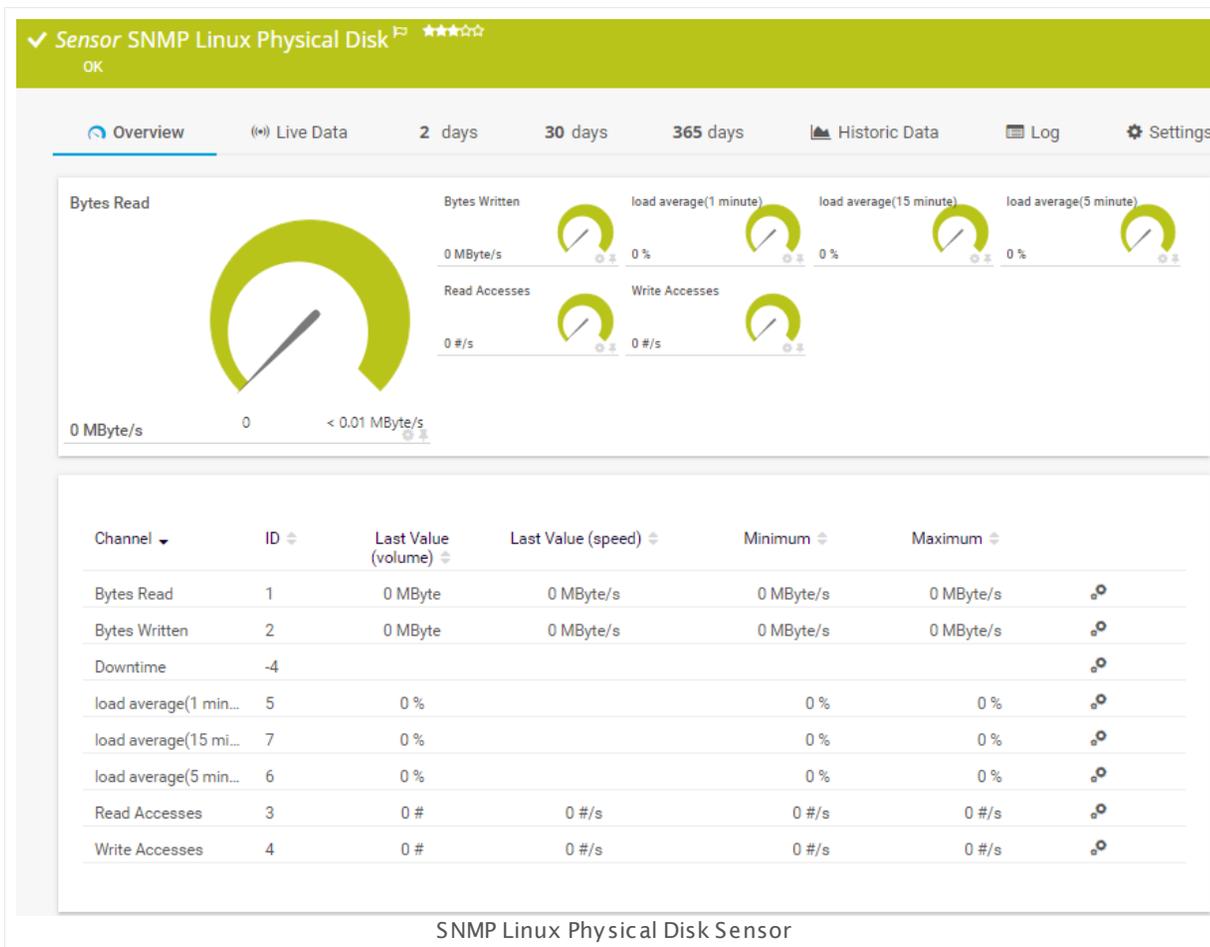

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.171 SNMP Linux Physical Disk Sensor

The SNMP Linux Physical Disk sensor monitors input/output (I/O) on disks of a Linux/Unix system using Simple Network Management Protocol (SNMP).

It shows the following:

- Read bytes per second
- Written bytes per second
- Number of read accesses per second
- Number of write accesses per second

Sensor in Other Languages

Dutch: **SNMP Linux Fysieke Schijf**, French: **Disque physique Linux SNMP**, German: **SNMP Linux Physikalischer Datenträger**, Japanese: **SNMP Linux** , Portuguese: **Disco físico Linux SNMP**, Russian: **Физический диск Linux по SNMP**, Simplified Chinese: **SNMP Linux** , Spanish: **Disco físico de Linux con SNMP**

Remarks

- Knowledge Base: [Checklist: Setting up SNMP on Linux](#)
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#).

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the disks of the Linux/Unix system you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

PHYSICAL DISK SETTINGS

Disk	Select the disks you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
-------------	--

BASIC SENSOR SETTINGS

Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

PHYSICAL DISK SETTINGS

Disk	Shows further information about the disk that this sensor monitors. Once a sensor is created, you cannot change this value.
Bitmask	It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁸⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

- <https://kb.paessler.com/en/topic/5353>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)³¹⁶⁰ section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)³¹⁷⁰ section.

Others

For more general information about settings, see the [Object Settings](#)²¹⁷ section.

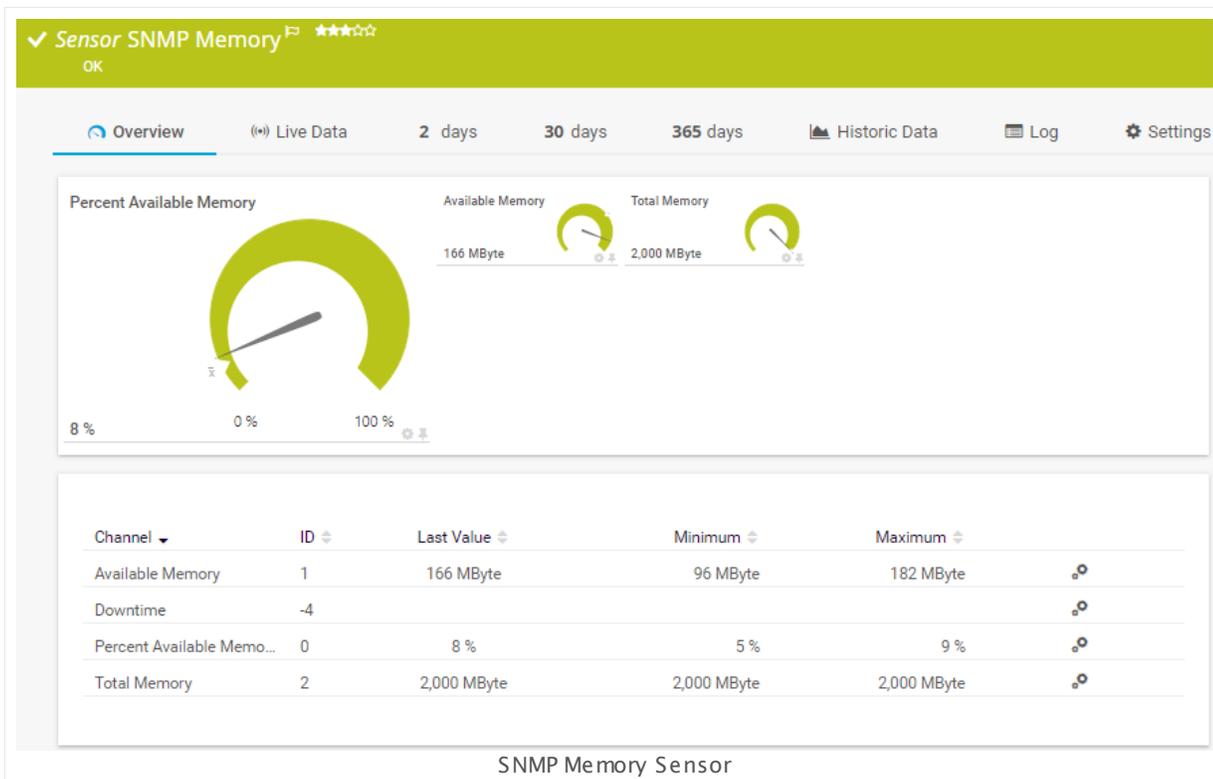

7.8.172 SNMP Memory Sensor

The SNMP Memory sensor monitors the memory usage of a system via Simple Network Management Protocol (SNMP).

It can show the following:

- Available memory in bytes
- Available memory in percent
- Total memory

 This sensor uses more generic Object Identifier (OID) values compared to the [SNMP Linux Meminfo Sensor](#).

Sensor in Other Languages

Dutch: **SNMP Geheugen**, French: **Mémoire SNMP**, German: **SNMP Speicher**, Japanese: **SNMP ? ? ?**, Portuguese: **Memória SNMP**, Russian: **Память по SNMP**, Simplified Chinese: **SNMP ? ?**, Spanish: **SNMP Memoria**

Remarks

- It might not work to query data from a probe device via SNMP (querying `localhost`, `127.0.0.1`, or `:::1`). [Add this device to PRTG](#) with the IP address that it has in your network and create the SNMP sensor on this device instead.

- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the memory types you want to monitor. PRTG will create one sensor for each memory type you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

MEMORY SETTINGS

Memory Select one or more memory types you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#)^[181], as well as in [alarms](#)^[219], [logs](#)^[228], [notifications](#)^[3216], [reports](#)^[3252], [maps](#)^[3276], [libraries](#)^[3235], and [tickets](#)^[230].

BASIC SENSOR SETTINGS

Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

MEMORY SETTINGS

Memory	Shows the type of the memory that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
--------	--

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
 - ⓘ This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)³¹⁶⁰ settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval

Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
 - **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
 - **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
 - **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- i** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)³³¹¹.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[3209] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.) Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

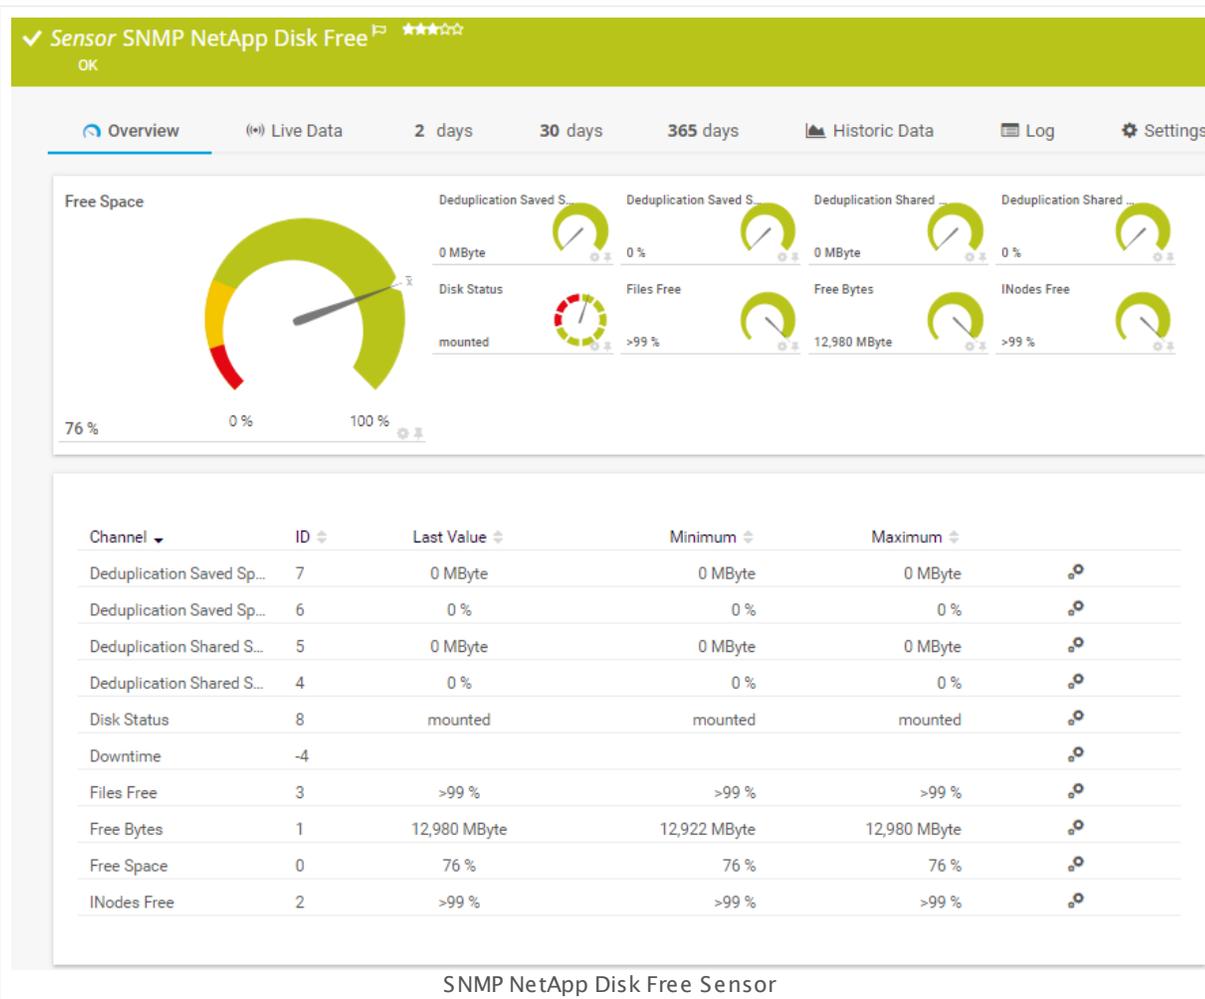

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.173 SNMP NetApp Disk Free Sensor

The SNMP NetApp Disk Free sensor monitors free space on disks of a NetApp storage system via Simple Network Management Protocol (SNMP).

It can show the following:

- Free disk space in bytes and percent
- Deduplication saved space in bytes and percent
- Deduplication shared space in bytes and percent
- Disk free status
- Free files in percent
- Free INodes in percent

Sensor in Other Languages

Dutch: **SNMP NetApp Schijf Vrije Ruimte**, French: **Espace disque libre NetApp SNMP**,

German: **SNMP NetApp-Datenträgerspeicher**, Japanese: **SNMP NetApp ? ? ? ? ? ?** ,
Portuguese: **Disco livre SNMP NetApp**, Russian: **Свободное пространство диска NetApp по SNMP**,
Simplified Chinese: **SNMP NetApp ? ? ? ? ? ?** , Spanish: **SNMP Disco libre NetApp**

Remarks

- Knowledge Base: [How can I monitor capacity and used disk space on a NetApp?](#)
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)^[3693].
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)^[3489].

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)^[325] add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the disk on the NetApp you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

NETAPP DISK FREE SETTINGS

File System	Select the disks you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
-------------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP DISK FREE SETTINGS

File System	Shows the name of the disk that this sensor is monitoring. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Virtual Disk	Shows the name of the virtual disk that this sensor is monitoring (if applicable). Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

 Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

 If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

 If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay
(Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

7.8.174 SNMP NetApp Enclosure Sensor

The SNMP NetApp Enclosure sensor monitors the power supply and cooling of an enclosure that is part of a NetApp storage system via Simple Network Management Protocol (SNMP).

It can show the following, depending on the measurements you choose:

- Temperatures
- Rotations per minute (RPM) of fans and the number of failed fans
- Voltages in mV, the number of broken electronic parts, and the number of broken power supplies
- Currents in mA

Downtime	-4				
Voltage 4	5	12.220 mV	-148.440 mV	12.300 mV	
Voltage 5	6	5.070 mV	-12.790 mV	5.070 mV	
Voltage 6	7	12.220 mV	-148.440 mV	12.300 mV	
Voltage 7	8	5.070 mV	-12.790 mV	5.150 mV	
Voltage 8	9	12.220 mV	-148.440 mV	12.340 mV	
Voltage 1	2	5.070 mV	-12.790 mV	5.110 mV	

SNMP NetApp Enclosure Sensor

Sensor in Other Languages

Dutch: **SNMP NetApp Behuizing**, French: **Baie NetApp SNMP**, German: **SNMP NetApp Enclosure**, Japanese: **SNMP NetApp** ? ? ? ? ? ? ? , Portuguese: **Gabinete SNMP NetApp**, Russian: **Kopnye NetApp no SNMP**, Simplified Chinese: **SNMP NetApp** ? ? , Spanish: **SNMP NetApp**

Enclosure

Remarks

- This sensor type only supports NetApp versions up to 8.2.
- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, refer to the manual section [Sensor Channels Settings](#)³¹⁶⁰.
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)³⁴⁸⁹.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the power supply and cooling measurements of an enclosure on a NetApp you want to monitor. PRTG will create one sensor for each enclosure/measurement combination you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

NETAPP ENCLOSURE SETTINGS

Enclosure	Select the enclosures with the measurement you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
-----------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)⁴⁰² for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP ENCLOSURE SETTINGS

Enclosure	Shows the identifier of the enclosure that this sensor is monitoring. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Measurement	Shows the monitored measurement. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

NETAPP SPECIFIC

N/A Measurements

Define the sensor behavior if the requested NetApp value is not available (N/A values). Choose between:

- **Interpret as error (default):** Choose this option to set the sensor to a **Down status** if a measurement is not available. We recommend that you use this setting to not miss any hardware errors.
- **Interpret as valid:** Choose this option to handle unavailable measurements as valid sensor results to keep the sensor in **Up status**. This might be useful, for example, if a hardware sensor on the NetApp is disabled for some reason but actually there is no hardware error. If the NetApp returns an N/A measurement, the sensor will interpret this as 0.

 We recommend that you use the lookup file **prtg.standardlookups.netapp.notavailable.ovl** for channels with unavailable measurements if you choose this option. This will replace 0 with the message **Not Available**. Open the **Sensor Channels Settings** of the affected channel(s) and choose this file in section **Value Lookup**. For details, see section **Define Lookups**.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

 You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

 This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the **Sensor Channels Settings** settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

i Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#) 3209 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

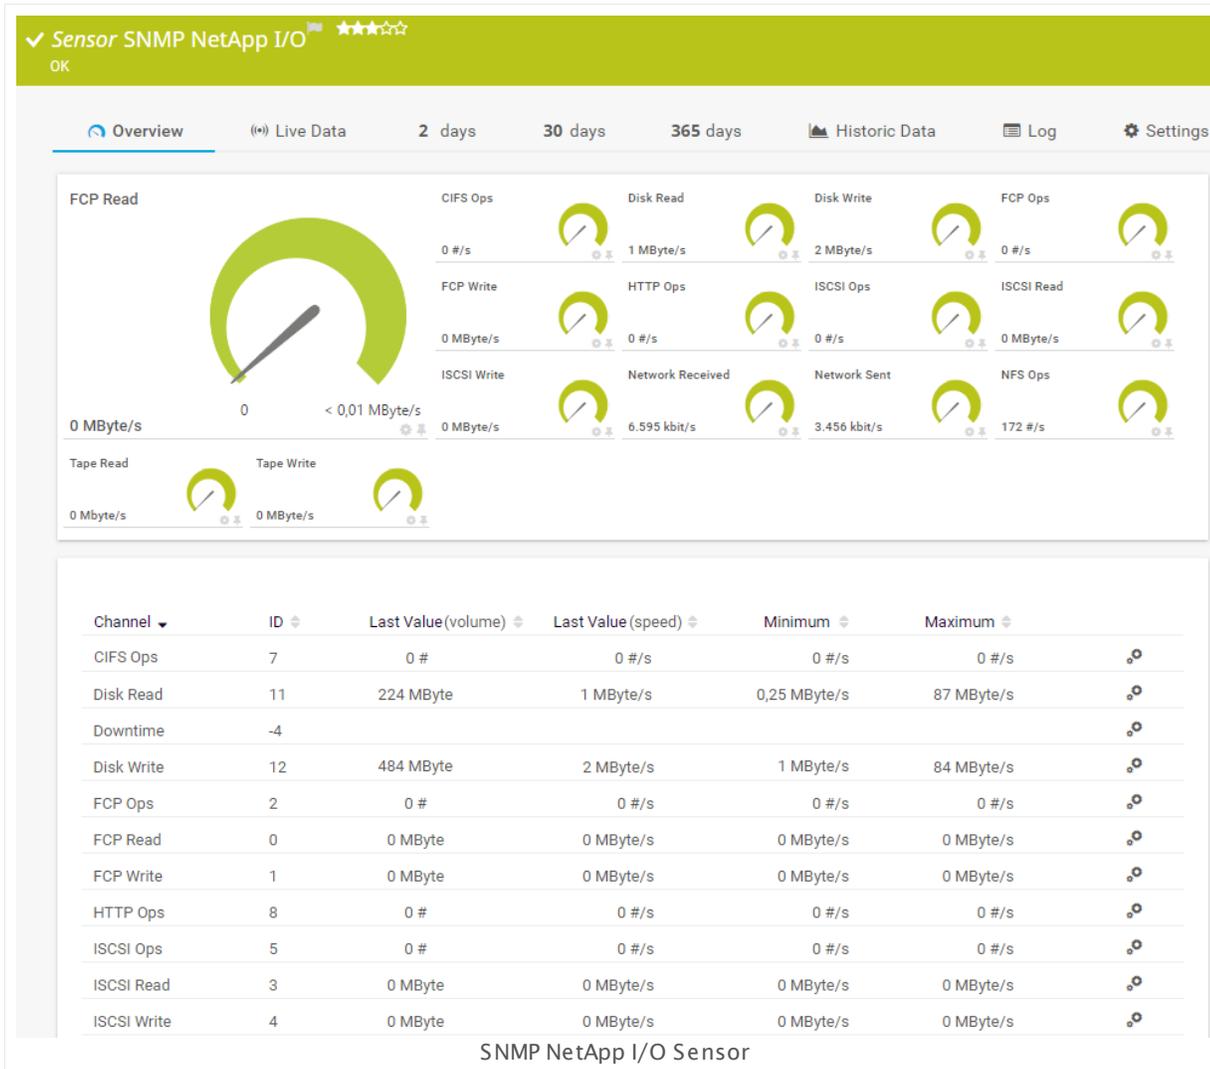

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.175 SNMP NetApp I/O Sensor

The SNMP NetApp I/O sensor monitors input/output operations (IOPS) on a NetApp storage system via Simple Network Management Protocol (SNMP).

It can show the following:

- FCP read speed
- CIFS operations per second
- Disk read speed
- Disk write speed
- FCP operations per second
- FCP read speed
- FCP write speed
- HTTP operations per second
- iSCSI operations per second
- iSCSI read speed
- iSCSI write speed
- Network received bytes
- Network sent bytes
- NFS operations per second
- Tape read speed
- Tape write speed

Sensor in Other Languages

Dutch: **SNMP NetApp I/O**, French: **NetApp SNMP E/S**, German: **SNMP NetApp E/A**, Japanese: **SNMP NetApp I/O**, Portuguese: **E/S SNMP Net App**, Russian: **Ввод-вывод NetApp по SNMP**, Simplified Chinese: **SNMP NetApp I/O**, Spanish: **SNMP NetApp I/O**

Remarks

- This sensor type only supports NetApp versions up to 8.2.
- If you use NetApp cDOT 8.3 or NetApp ONTAP 9.0 or later, we recommend that you use the [NetApp I/O sensor](#) ¹³¹¹ instead.
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#) ³⁴⁸⁹.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree , as well as in alarms , logs , notifications , reports , maps , libraries , and tickets .
Parent Tags	Shows Tags that this sensor inherits from its parent device, group, and probe . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
Graph Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> ▪ Show channels independently (default): Show an own graph for each channel. ▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. <p> This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings³¹⁶⁰ settings).</p>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval	<p>Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration³³⁵ on PRTG on premises installations.</p>
-------------------	--

SCANNING INTERVAL

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down":** Show an error status only after four consecutively failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down":** Show an error status only after five consecutively failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down":** Show an error status only after six consecutively failed requests.

i Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

i If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

i If a channel uses [lookup](#)³⁶⁹³ values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) 3311.

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

i To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object:** Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

 Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can [check all dependencies](#)^[329] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the [object selector](#)^[240] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

 This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)^[402] or in the superior [Group Settings](#)^[375].

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

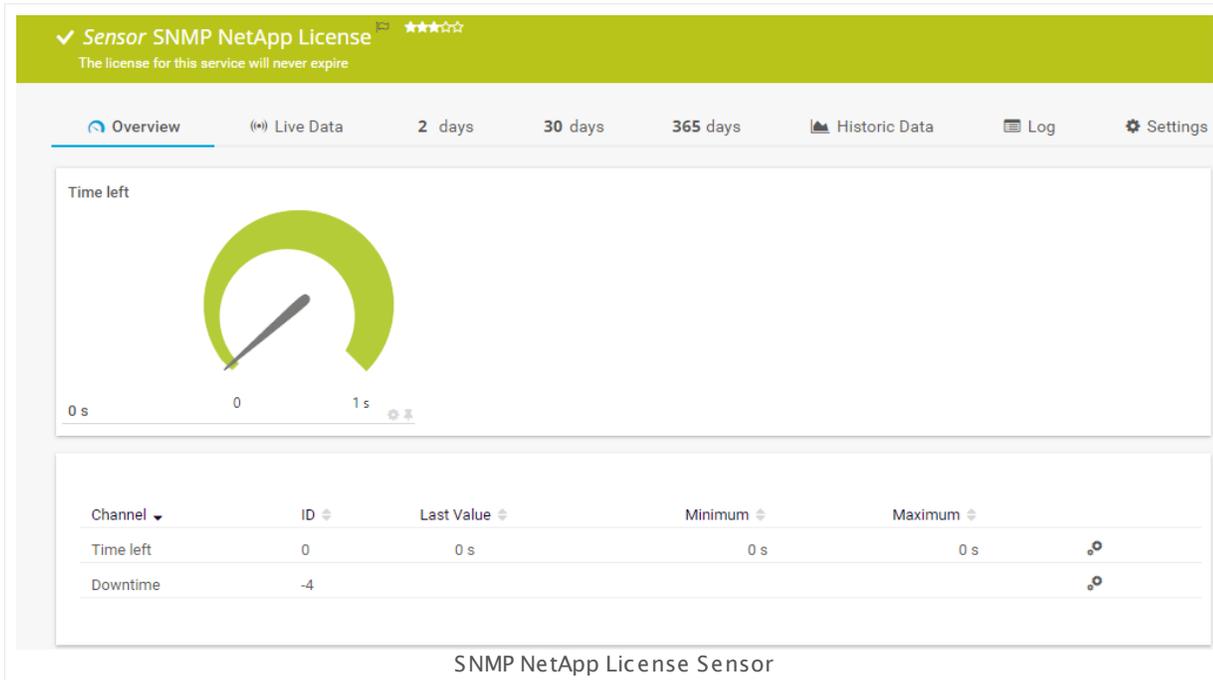

Others

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.176 SNMP NetApp License Sensor

The SNMP NetApp License sensor monitors the licenses for the services of a NetApp storage system via Simple Network Management Protocol (SNMP).

- It shows how much time is left until the license for a service expires. This can help you detect when a NetApp license is going to expire.

Sensor in Other Languages

Dutch: **SNMP NetApp licentie**, French: **Licence Net App SNMP**, German: **SNMP Net App Lizenz**, Japanese: **SNMP NetApp** ? ? ? ? ? , Portuguese: **Licença SNMP Net App**, Russian: **Лицензия NetApp по SNMP**, Simplified Chinese: **SNMP NetApp** ? ? ? , Spanish: **SNMP Licencia Net App**

Remarks

- This sensor type only supports NetApp versions up to 8.2.
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#) ³⁴⁸⁹.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#) ³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the NetApp license you want to monitor. PRTG will create one sensor for each license you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

NETAPP LICENSE SETTINGS

License for Service Select the licenses you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#) [402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the [device tree](#) [181], as well as in [alarms](#) [219], [logs](#) [228], [notifications](#) [3216], [reports](#) [3252], [maps](#) [3276], [libraries](#) [3235], and [tickets](#) [230].

Parent Tags Shows [Tags](#) [139] that this sensor [inherits](#) [140] from its [parent device, group, and probe](#) [133]. This setting is shown for your information only and cannot be changed here.

Tags Enter one or more [Tags](#) [139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

You can add additional tags to the sensor if you like. Other tags are automatically [inherited](#) [140] from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).

Priority Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP LICENSE SETTINGS

License for Service Shows the name of the service whose license this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.

i This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#) settings).

SENSOR DISPLAY

Stack Unit This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)³³¹ group's settings, see section [Inheritance of Settings](#)¹³⁷ for more information. To change a setting only for this object, disable inheritance by clicking the button next to **inherit from** under the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

Scanning Interval Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the [system administration](#)³³⁵ on PRTG on premises installations.

If a Sensor Query Fails Define the number of scanning intervals that a sensor has time to reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down status**¹⁹⁵. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately:** The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended):** After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down":** Show an error status only after three consecutively failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 3 intervals, then set to "down":**
Show an error status only after four consecutively failed requests.
 - **Set sensor to "warning" for 4 intervals, then set to "down":**
Show an error status only after five consecutively failed requests.
 - **Set sensor to "warning" for 5 intervals, then set to "down":**
Show an error status only after six consecutively failed requests.
- i** Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.
- i** If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.
- i** If a channel uses [lookup](#) values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

i Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#).

i Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Not set (monitor continuously):** No maintenance window will be set and monitoring will always be active.
 - **Set up a one-time maintenance window:** Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.
- i** To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> ▪ Use parent: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. ▪ Select object: Pause the current sensor if the device, where it is created on, is in Down status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in Down status, or is paused by another dependency. Select below. ▪ Master object for parent: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in Down status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in Down status, or if it is paused by another dependency. <p>i Testing your dependencies is easy! Simply choose Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies <small>3209</small> in your PRTG installation by selecting Devices Dependencies from the main menu bar.</p>

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency	This field is only visible if the Select object option is enabled above. Click on the reading-glasses and use the object selector ^[240] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	<p>Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to Up status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.</p> <p> This setting is not available if you choose this sensor to Use parent or to be the Master object for parent. In this case, please define delays in the parent Device Settings^[402] or in the superior Group Settings^[375].</p>

ACCESS RIGHTS

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)¹³⁷ for more information.

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group, you can choose from the following access rights:

- **Inherited:** Use the access rights settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)³³⁸³ settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

 For more details on access rights, see the section [User Access Rights](#)¹⁵⁸.

CHANNEL UNIT CONFIGURATION

Click  to disrupt the inheritance. See section [Inheritance of Settings](#)^[137] for more information.

Channel Unit Types For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

 Custom channel types can be set on sensor level only.

Knowledge Base: My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, see the [Sensor Channels Settings](#)^[316] section.

Notifications

Click the **Notification Triggers** tab to change notification triggers. For detailed information, see the [Sensor Notification Triggers Settings](#)^[317] section.

Others

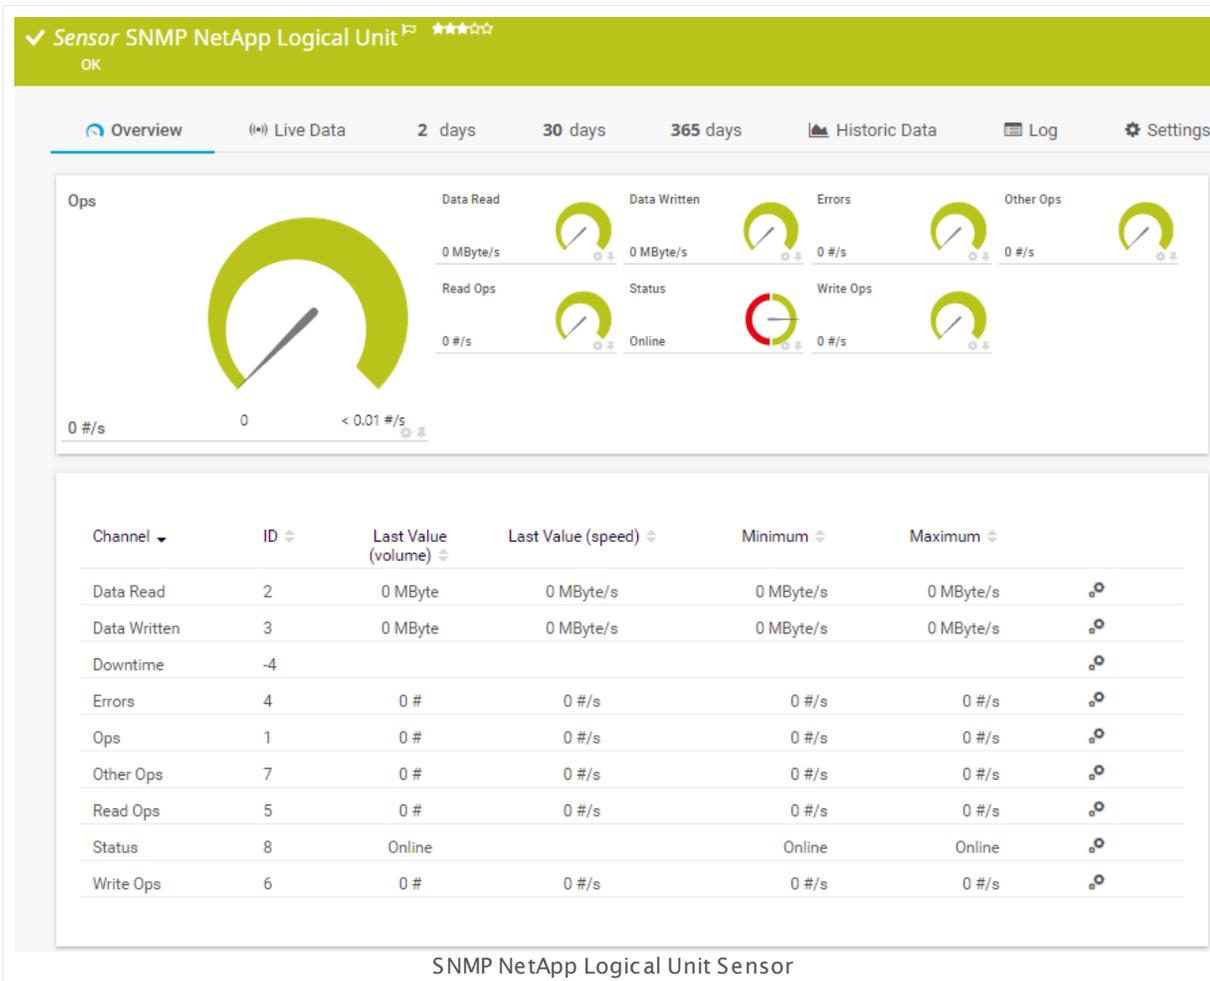

For more general information about settings, see the [Object Settings](#)^[217] section.

7.8.177 SNMP NetApp Logical Unit Sensor

The SNMP NetApp Logical Unit sensor monitors the input/output operations (IOPS) on a logical unit of a NetApp storage system via Simple Network Management Protocol (SNMP).

It can show the following:

- Total number of operations per second
- Data read speed
- Data write speed
- Number of errors per second
- Number of read operations per second
- Number of write operations per second
- Number of other operations per second
- Status of the logical unit (online or offline)

Sensor in Other Languages

Dutch: **SNMP NetApp Logical Unit**, French: **Unité logique NetApp SNMP**, German: **SNMP NetApp Logische Unit**, Japanese: **SNMP NetApp ? ? ? ? ? ?**, Portuguese: **Unidade lógica SNMP NetApp**, Russian: **Логический блок NetApp по SNMP**, Simplified Chinese: **SNMP NetApp ? ? ? ?**, Spanish: **Unidad lógica NetApp por SNMP**

Remarks

- This sensor type only supports NetApp versions up to 8.2.
- If you use NetApp cDOT 8.3 or NetApp ONTAP 9.0 or later, we recommend that you use the [NetApp LUN sensor](#)¹³³⁴ instead.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, see the manual section [Define Lookups](#)³⁶⁹³.
- For a general introduction to the technology behind SNMP, please see the manual section [Monitoring via SNMP](#)³⁴⁸⁹.

Add Sensor

The **Add Sensor** dialog appears when you [manually](#)³²⁵ add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the logical units on the NetApp you want to monitor. PRTG creates one sensor for each unit you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

NETAPP DISK FREE SETTINGS

Logical Unit	Select the logical units you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.
--------------	---

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

i Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the [Device Settings](#)^[402] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree ^[181] , as well as in alarms ^[219] , logs ^[228] , notifications ^[3216] , reports ^[3252] , maps ^[3278] , libraries ^[3235] , and tickets ^[230] .
Parent Tags	Shows Tags ^[139] that this sensor inherits ^[140] from its parent device, group, and probe ^[133] . This setting is shown for your information only and cannot be changed here.
Tags	<p>Enter one or more Tags^[139], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.</p> <p>You can add additional tags to the sensor if you like. Other tags are automatically inherited^[140] from objects further up in the device tree. These are visible above as Parent Tags.</p> <p>i It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with round parentheses (()) or angle brackets (<>).</p>
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP LOGICAL UNIT SETTINGS

Logical Unit	Shows the name of the logical unit that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
--------------	--

SENSOR DISPLAY

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>i You can set another primary channel later by clicking the pin symbol of a channel in the sensor's Overview tab.</p>
